RINDOMS, a town of Spain, in Catalonia; 11 miles N.W. of Tarragona.

RINDSAKER, a town of Norway; 60 miles N.N.E. of Chriftiania.

RINEKENBERG, a town of the duchy of Carinthia; 6 miles E. of Wolkenmarck.

RINEUS Marinus, a name given by fome botanical writers to the crithmum, or famphire, a fea-plant, ufed as a pickle.

RING, Annulus, a little moveable, put on the finger, either by way of ceremony, or of ornament.

The bifhop's ring makes a part of the pontifical apparatus; and is efteemed a pledge of the fpiritual marriage between the bifhop and his church.

The epifcopal ring is of a very ancient ftanding. The fourth council of Toledo, held in 633, appoints that a bifhop condemned by one council, and found afterwards innocent by a fecond, fhall be reftored, by giving him the ring, ftaff, &c.

From bifhops, the cuftom of the ring has paffed to cardinals, who are to pay a very great fum, *pro jure annuli cardinalitii.*

Rings, *Origin of.* Pliny (lib. xxxvii. cap. 1.) obferves, that we are in the dark as to the perfon who firft invented, or wore the ring; becaufe what is faid of Prometheus, as alfo of Midas's ring, are fables. The firft people among whom we find the ring in ufe, are the Hebrews, (Gen. xxxviii.) where Judah, Jacob's fon, gives Tamar his ring, or fignet, as a pledge of his promife; but the ring appears to have been in ufe at the fame time among the Egyptians, from Gen. xli. where Pharaoh puts his ring upon Jofeph's hand, as a mark of the power he gave him. And in the firft book of Kings, chap. xxi. Jezebel feals the warrant fhe fent for the killing of Naboth, with the king's ring.

The ancient Chaldeans, Babylonians, Perfians, and Greeks, had likewife the ufe of the ring; as appears from feveral paffages in Scripture, and from Quintus Curtius, who tells us, that Alexander fealed the letters he wrote into Europe with his own feal; and thofe in Afia with Darius's ring.

The Perfians will have Guiamfchild, the fourth king of the firft race, to have firft introduced the ring, for fealing his letters and other acts. The Greeks, Pliny thinks, knew nothing of the ring in the time of the Trojan war; the reafon he gives is, that we find no mention of it in Homer, but that when letters, &c. were to be fent away, they were tied up, and the ftrings knotted.

The Sabines had rings in Romulus's time; and it is to them, probably, the practice firft came from the Greeks; and from them that it paffed to the Romans; though it was fome time before it got footing there. Pliny cannot learn which of the kings of Rome firft adopted it; but there are no figns of it in any of their ftatutes, before thofe of Numa and Servius Tullius. He adds, that it was alfo in ufe among the ancient Gauls and Britons.

Rings, *Matter of Ancient.* There were fome of one fingle metal, and others of a mixture, or two. For the iron and filver were frequently gilt; or at leaft the gold part was fixed within the iron, as appears from Artemidorus, lib. ii. cap. 5. The Romans were contented with iron rings a long time; and Pliny affures us, that Marius firft wore a gold one in his third confulate, which was in the year of Rome 650. Sometimes the ring was iron, and the feal gold; fometimes it was hollow, and fometimes folid; fometimes the ftone was engraven, and fometimes plain; and the graving fometimes was in relievo, and fometimes in creux: the laft were called *gemmæ ectypæ;* the former *gemmæ fculptura prominente.*

Ring, *the manner of wearing the,* has been various. From Jeremiah, chap. xxii. it appears, that the Hebrews wore it on their right hand. Among the Romans, before they came to be adorned with ftones, and while the graving was yet on the metal itfelf, every one wore them at pleafure, on what hand and finger he pleafed. When ftones came to be added, they wore them altogether on the left hand; and it would have been held an exceffive foppery to have put them on the right.

Pliny fays, they were at firft worn on the fourth finger; then on the fecond or index; then on the little finger; and at laft on all the fingers, excepting the middle one.

The Greeks wore them altogether on the fourth finger of the left hand, as we are informed by Aul. Gellius, lib. x. and the reafon he gives for it is, that having found from anatomy, that this finger had a little nerve that went ftraight to the heart, they efteemed it the moft honourable, by reafon of this communication with that noble part. Pliny fays, the Gauls and ancient Britons wore the ring on the middle finger.

At firft they only wore a fingle ring, then one on each finger, and at length feveral on each finger. (Martial, lib. xi. epig. 60.) At laft one on each joint of each finger. (Ariftoph. in Nub. &c.) Their foppery at length arofe to that pitch, that they had their weekly rings.

Juvenal, Sat. vii. fpeaks of *annuli femeftres;* as alfo of winter and fummer rings. But of all others, Lampridius, cap. 32. obferves, that Heliogabalus carried the point fartheft, who never wore the fame ring, or the fame fhoe, twice.

Rings have been alfo worn in the nofe, and as pendants in the ears. Bartholin has an exprefs treatife, "De Annulis Narium," *Of Rings of the Noftrils.* St. Auguftine affures us, it was in his time the fafhion of the Moors; and Pietro della Valle obferves the fame of the modern orientals.

In effect, there is no part of the body where rings have not been worn. Several Eaft India travellers affirm, that the natives now commonly wear them on their nofe, lips, cheeks and chin. Ramufio tells us, that the ladies of Narfinguay, in the Levant, and Diodorus Siculus, lib. iii. that thofe of Ethiopia ufed to adorn their lips with iron rings.

As to the ears, the cuftom ftill obtains of wearing rings in them, both of men and women, almoft all over the world. See Pendant.

The Indians, particularly the Guzzarats, have worn rings on their feet. And when Peter Alvarez had his firft audience of the king of Calicut, he found him all covered with ftones fet in rings, having bracelets and rings both on the hands and fingers, and even on the feet and toes.

Louis Bartome reprefents a king of Pegu as ftill more extravagant, having rings fet with precious ftones on every toe.

Rings, *Ufe of.*—The ancients had three different kinds; the

the firſt ſerved to diſtinguiſh conditions or quality. Pliny aſſures us, that the ſenators at firſt were not allowed to wear the gold ring, unleſs they had been ambaſſadors at ſome foreign court. Nor was it even allowed them to wear the gold ring which was given them in public, except on public occaſions; at other times they wore an iron one. And thoſe who had a triumph obſerved the ſame rules.

At length the ſenators and knights were allowed the common uſe of the gold ring; but Acron on Horace, lib. ii. ſat. vii. obſerves, they could not do it unleſs it were given them by the prætor.

In after days the gold ring became the badge of the knights, the people wearing ſilver rings, and the ſlaves iron ones; though the gold ring was ſometimes alſo allowed the people, and Severus granted it to his common ſoldiers. Auguſtus allowed it to the liberti or freedmen; and though Nero made a regulation to the contrary, yet it was ſoon ſet aſide.

A ſecond kind of rings comprehended the *annuli ſponſalitii*, wedding-rings. Some carry the origin of this cuſtom as far back as the Hebrews, on the authority of a text in Exodus, xxxv. 22. Leo of Modena, however, maintains, that the ancient Hebrews did not uſe any nuptial ring. Selden, in his Uxor. Ebraica, lib. ii. chap. xiv. owns, that they gave a ring in the marriage, but that it was only in lieu of a piece of money of the ſame value which had uſed to have been given before. The Greeks and Romans did the ſame, and from them the Chriſtians took it up very early, as appears from Tertullian, and in ſome ancient liturgies, where we find the form of bleſſing the nuptial ring.

The third kind of rings included thoſe uſed as ſeals, called *cerographi* or *cirographi*; an account of which, ſee under the article SEAL.

Richard, biſhop of Saliſbury, in his Conſtitutions, anno 1217, forbids the putting of ruſh rings, or any the like matter, on women's fingers, in order to the debauching them more readily; and he inſinuates the reaſon of his prohibition, that there were ſome people weak enough to believe, that what was thus done in jeſt was a real marriage.

De Breveil, in his Antiquities of Paris, ſays, it was an ancient cuſtom to uſe a ruſh-ring in the nuptials of ſuch as had had an affair together before their marriage.

RING, in *Angling*, an inſtrument intended to free the hook when accidentally entangled among weeds. See ANGLING.

RING, in *Aſtronomy*. The ring of Saturn is a thin, broad, opaque, circular arch, encompaſſing the body of that planet, like the horizon of an artificial globe, without touching it, and appearing double, when ſeen through a good teleſcope.

The diſcovery of it is owing to M. Huygens, who, after frequent obſervation of Saturn, with teleſcopes which magnified two or three times more than any that had been before made, perceived two lucid points, or anſæ, ariſing out from the body in a right line.

Hence, as in ſubſequent obſervations, he always found the ſame appearance, he concluded that Saturn was encompaſſed with a permanent ring; and accordingly produced his new ſyſtem of Saturn in 1659.

However, Galileo firſt diſcovered that the figure of Saturn was not round. It appeared to him like a large globe between two ſmall ones; and he announced this diſcovery in the year 1610. Proſecuting his obſervations till the year 1612, he was then ſurpriſed to find only the middle globe; but in proceſs of time he again diſcovered the globes on each ſide, which appeared to change their form; ſometimes appearing round, ſometimes like an acorn, ſometimes ſemicircular, then with horns towards the globe in the middle, and growing by degrees ſo long and wide as to encompaſs it, as it were, with an oval ring. Huygens, who, as we have ſaid, completed the diſcovery, makes the ſpace between the globe of Saturn and the ring equal to, or rather bigger than, the breadth of the ring; and the greateſt diameter of the ring, in proportion to that of the globe, as 9 to 4. But Mr. Pound, with an excellent micrometer, applied to the Huygenian teleſcope of 123 feet in length, determined this proportion to be as 7 to 3.

Mr. Whiſton, in his "Memoirs of the Life of Dr. Clarke," informs us, that the doctor's father once ſaw a fixed ſtar between the ring and the body of Saturn. M. Caſſini, in 1675, obſerved upon the ring a dark elliptical line, dividing it, as it were, into two rings; the inner of which appeared brighter than the other. He alſo perceived a dark belt upon the planet, parallel to the greater axis of the ring. Mr. Hadley obſerved, that the outer part of the ring ſeemed narrower than the inner part, and that the dark line was fainter towards its upper edge; he alſo ſaw two belts, and obſerved the ſhadow of the ring upon Saturn. In October, 1714, when the plane of the ring very nearly paſſed through the earth, and was approaching it, M. Maraldi obſerved, that while the arms were decreaſing, both in length and breadth, the eaſtern arm appeared a little larger than the other for three or four nights, and yet it vaniſhed firſt; for after an interruption for two nights by clouds, he ſaw the weſtern arm alone. This inequality of the ring made him ſuſpect that it was not bounded by exactly parallel planes, and that it turned about its axis. In the ſequel of this article we ſhall give the ſubſtance of Dr. Herſchel's obſervations, which, on account of his accuracy as an obſerver, and the ſuperior excellence of his teleſcopes, are much more important than any others, as he has diſcovered many circumſtances which had eſcaped all other obſervers.

This ring, ſeen from Saturn, appears like a large luminous arc in the heavens, as if it did not belong to the planet. When we ſee the ring moſt open, its ſhadow upon the planet is broadeſt; and from that time the ſhadow grows narrower, as the ring appears to do to us; until, by Saturn's annual motion, the ſun comes to the plane of the ring, or even with its edge; which, being then directed towards us, becomes inviſible, on account of its thinneſs.

The principal phenomena of Saturn's ring are familiarly illuſtrated by a view of *Plate* XIX. *Aſtronomy*, *fig.* 14. Let S be the ſun, A B C D E F G H Saturn's orbit, and I K L M N O the earth's orbit. Both Saturn and the earth move according to the order of the letters; and when Saturn is at A, his ring is turned edgewiſe to the ſun S, and he is then ſeen from the earth as if he had loſt his ring, let the earth be in any part of the orbit whatever, except betwnen N and O; for whilſt it deſcribes that ſpace, Saturn is apparently ſo near the ſun as to be hid in his beams. As Saturn goes from A to C, his ring appears more and more open to the earth; at C the ring appears moſt open of all; and ſeems to grow narrower and narrower as Saturn goes from C to E; and when he comes to E, the ring is again turned edgewiſe both to the ſun and earth: and as neither of its ſides is illuminated, it is inviſible to us, becauſe its edge is too thin to be perceptible; and Saturn appears again as if he had loſt his ring. But as he goes from E to G, his ring opens more and more to our view on the under ſide; and ſeems juſt as open at G as it was at C; and may be ſeen in the night-time from the earth in any part of its orbit, except about M, when the ſun hides the planet from our view. As

Saturn

Saturn goes from G to A, his ring turns more and more edgewise to us, and therefore it seems to grow narrower and narrower; and at A it disappears as before. Hence, while Saturn goes from A to E, the sun shines on the upper side of his ring, and the under side is dark; and whilst he goes from E to A, the sun shines on the under side of his ring, and the upper side is dark. The ring disappears twice in every annual revolution of Saturn, *viz.* when he is in 19th degree of Pisces and of Virgo, and when Saturn is in the middle between these points, or in the 19th degree either of Gemini or of Sagittarius, his ring appears most open to us; and then its longest diameter is to its shortest, as 9 to 4. Ferguson's Astr. sect. 204.

Dr. Herschel (Phil. Trans. for 1790, vol. lxxx. pt. 1.) observes, that the black disc, or belt, upon the ring of Saturn, which we have already mentioned, is not in the middle of its breadth; and that the ring is not subdivided by many such lines, as some astronomers have represented; but there is one single, dark, considerably broad line, belt, or zone, which he has constantly found on the north side of the ring. (See *Plate* XIX. *Astronomy*, *fig.* 15.) "Since the year 1774, to the present time," as Dr. Herschel says (Phil. Trans. for 1792, vol. lxxxii. pt. 1.) "I can find only four observations where any other black division of the ring is mentioned, than the one which I have constantly observed: these were all in June, 1780." As this dark belt is subject to no change, it is probably owing, as the doctor remarks, to some permanent construction of the surface of the ring. This belt cannot be the shadow of a chain of mountains, since it is visible all round on the ring; for at the ends of the ansæ there could be no shade visible on account of the direction of the sun's illumination, which would be in the line of the chain; and the same argument will hold against any caverns or concavities. It is, moreover, fully evident, that this dark zone is contained between two concentric circles, as all the phenomena answer to the projection of such a zone. Thus in *fig.* 16, we may see that the zone is continued all round the ring, with a gradual decrease of breadth towards the middle, answering to the appearance of a narrow circular plane, projected into an ellipsis. The matter of the ring is undoubtedly no less solid than the planet itself; and it is observed to cast a strong shadow upon the planet. The light of the ring is also generally brighter than that of the planet; for the ring appears sufficiently bright when the telescope affords scarcely light enough for Saturn. From many repeated observations, which we cannot here detail, Dr. Herschel establishes the fact of the extreme thinness of the ring. He farther observes, that there may be a refraction through a very rare atmosphere on the two planes of the ring, by which the satellite may be elevated and depressed, so as to become visible on both sides of the ring, even though the ring should be equal in thickness to the diameter of the smallest satellite, which may amount to 1000 miles. From a series of observations upon luminous points of this ring, (Phil. Trans. vol. lxxx. pt. 2.) he has discovered that it has a rotation about its axis, in $10^h\ 32'\ 15''.4$.

The ring is invisible when its plane passes through the sun, or the earth, or between them: in the first case, the sun shines only upon its edge, which is too thin to reflect sufficient light to render it visible; in the second case, the edge only being opposed to us, it is not visible, for the same reason; in the third case, the dark side of the ring is exposed to us, and therefore the edge being the only luminous part which is towards the earth, it is invisible, for the same reason as before. Observers have differed ten or twelve days as to the time of its becoming invisible, owing to the difference of the telescopes, and of the state of the atmosphere. The disappearance of the ring seems to occur only with the telescopes in common use among astronomers; for Dr. Herschel, with his large telescopes, has been able to see it in every situation. He thinks the edge of the ring is not flat, but spherical, or spheridical. He observes, that the ring was seen in his telescope, when we were turned towards the unenlightened side; so that he either saw the light reflected from the edge, or else the reflection of the light of Saturn upon the dark side of the ring, as we sometimes see the dark part of the moon. He cannot, however, say which of the two might be the case; especially as there are very strong reasons for thinking, that the edge of the ring is of such a nature as not to reflect much light. M. de la Lande thinks, that the ring is just visible, with the best telescopes in common use, when the sun is elevated $3'$ above its plane, or three days before its plane passes through the sun; and when the earth is elevated $2'\ 20''$ above the plane, or one day from the earth's passing it. In the Phil. Trans. for 1790, Dr. Herschel ventured to suggest a suspicion that the ring was divided; this conjecture was strengthened by subsequent observations, after he had an opportunity of seeing both sides of the ring. His reasons are these; 1st, the black division upon the northern side of the ring, is in the same place, of the same breadth, and at the same distance from the outer edge, that it always appeared upon the northern side; 2dly, with his seven-feet reflector and an excellent speculum, he saw the division in the ring, and the open space between the ring and the body, equally dark, and of the same colour with the heavens about the planet; 3dly, the black division is equally broad on each of the rings. From these observations, Dr. Herschel thinks himself authorised to say, that Saturn has two concentric rings, situated in one plane, which is probably not much inclined to the equator of the planet. The dimensions of the ring are in the following proportions, as nearly as they could be ascertained.

	Parts.
Inside diameter of the smaller ring - -	5900
Outside diameter - - - - - -	7510
Inside diameter of the largest ring - -	7740
Outside diameter - - - - - -	8300
Breadth of the inner ring - - - -	805
Breadth of the outer ring - - -	280
Breadth of the space between the rings -	115

M. de la Place, in the "Mem. de l'Acad. at Paris," supposes that the ring may have many divisions; but Dr. Herschel remarks, that no observations will justify this supposition.

From the mean of a great many measures of the diameter of the larger ring, Dr. Herschel makes it $46''.677$, at the mean distance of Saturn. Hence, its diameter : the diameter of the earth :: 25.8914 : 1. From the above proportions, therefore, the diameter of the ring must be upwards of 204,883 miles; and the distance of the two rings 2839 miles.

The ring being a circle, appears elliptical from its oblique position; and it appears most open, when Saturn is 90° from the nodes of the ring, upon the orbit of Saturn; or when Saturn's longitude is about $2^s\ 17°$, and $8^s\ 17°$. In such a situation, the lesser axis is very nearly equal to half the greater, when the observations are reduced to the sun; consequently the plane of the ring makes an angle of about 30° with the orbit of Saturn.

The breadth of the ring (as stated by Dr. Herschel, Phil. Trans. vol. xcvi. pt. 2. p. 467.) is to the space between the ring and the body of Saturn as about 5 to 4.

Kepler,

Kepler, in his Epitom. Aſtron. Copern., and after him Dr. Halley, in his Inquiry into the Cauſes of the Variation of the Needle, Phil. Tranſ. N° 195, ſuppoſe our earth may be compoſed of ſeveral cruſts or ſhells, one within another, and concentric to each other. If this be the caſe, it is poſſible the ring of Saturn may be the fragment or remaining ruin of his former exterior ſhell, the reſt of which is broken or fallen down upon the body of the planet.

Ring is alſo the name of an inſtrument uſed in navigation, for taking the altitudes of the ſun, &c.

It is uſually of braſs, about nine inches diameter, ſuſpended by a little ſwivel, 45° from the point of which is a perforation, which is the centre of a quadrant of 90°, divided in the inner concave ſurface.

To uſe it, they hold it up by the ſwivel, and turn it to the ſun, till the ſun-beams, falling through the hole, make a ſpot among the degrees, which marks the altitude required.

This inſtrument is preferred to the aſtrolabe, becauſe the diviſions are here larger than on the aſtrolable. See Astrolabe.

Ring is alſo uſed for the ſound or tone of a *bell;* which ſee.

The ringing of bells, though now a recreation chiefly of the lower claſs of people, is a very curious exerciſe. As for the tolling of a bell, this is nothing more than the producing of a ſound by the ſtroke of the clapper againſt the ſide of a bell; the bell itſelf being in a pendant poſition, and at reſt. In ringing, the bell, by means of a wheel and rope, is elevated to a perpendicular: in its motion to this ſituation, the clapper ſtrikes forcibly on one ſide, and, in its return downwards, on the other ſide of the bell, producing at each ſtroke a ſound. The muſic of bells is altogether melody; but the pleaſure ariſing from it conſiſts in the variety of interchanges, and the various ſucceſſion and general predominance of the conſonances in the ſounds produced.

The practice of ringing bells in change is ſaid to be peculiar to this country, which for this reaſon is called the ringing iſland; but the antiquity of it is not eaſily aſcertained. There are in London ſeveral ſocieties of ringers, particularly one known by the name of the College Youths. Merſennus has ſaid nothing of the ringing of bells in changes; and Kircher has only calculated the poſſible combinations ariſing from a given number. See Alternations.

In England, the practice of ringing is reduced to a ſcience; and peals have been compoſed, which bear the names of the inventors. Some of the moſt celebrated peals now known were compoſed about fifty years ago, by Mr. Patrick, ſo well known as the maker of barometers.

For the method of ringing in the Low Countries, ſee Carillons.

Ring, or *Annulus*, in *Geometry*. See Annulus.

The area of the ring included between the circumferences, A B P A, D E Q D, of two concentric circles, (*Plate* XII. *Geometry*, *fig.* 12.) is obtained by the rule given under Annulus: *viz.* Multiply the ſum of the diameters by their difference, and the product by .7854, and the ultimate product will be the area required: for the ring being equal to the difference of the two circles, if the diameters be called D, *d*, and .785398, &c. $= a$, we ſhall have the ring $= aD^2 - ad^2 = a \times \overline{D + d} \times \overline{D - d}$. Hence if D W be a perpendicular to the radius C D A, DW^2 will be equal to $AD \times \overline{AC + CD} = \overline{D - d} \times \overline{D + d}$, and aDW^2, or the area of a circle whoſe radius is D W, will be $= aD^2 - ad^2 =$ the area of the ring. Hence alſo it appears, that the ring is equal to an ellipſe whoſe axes are $D + d$ and $D - d$. See Ellipse.

The area of the ring may alſo be had, by multiplying half the ſum of the circumferences by half the difference of the diameters, the product being the area. For the circumferences are equal to $4aD$, $4ad$: therefore $a \times \overline{D + d} = \frac{1}{4}C + \frac{1}{4}c$; which, by ſubſtitution in the laſt rule, will give $a \times \overline{D + d} \times \overline{D - d} = \overline{\frac{1}{4}C + \frac{1}{4}c} \times \overline{D - d} = \overline{\frac{1}{2}C + \frac{1}{2}c} \times \overline{\frac{1}{2}D - \frac{1}{2}d}$, as in the rule. The ſame rule will ſerve alſo for a part of the ring, A B E D A, included between the parts, A D, B E, of two radii, uſing for C and *c* the lengths of the intercepted arcs.

Another rule for finding the area of the ring is as follows: Multiply the perpendicular breadth of the ring, that is, the difference of the radii, by the circumference R S T, (or part R S for the part A B E D A,) having the ſame centre with, and equally diſtant from, the bounding arcs. For this circumference, being equally diſtant from the other two, will be equal to half their ſum. Hence the whole ring, or any part of it A B E D A, included between two radii, is equal to a parallelogram on the ſame baſe A D, and whoſe altitude is equal to R S, the middle circumference.

Ring, *Solid*, is a ſolid returning into itſelf; of which every ſection perpendicular to the axis, or line paſſing through the middle, of the ſolid, is every where the ſame figure, and of the ſame magnitude.

To find the Surface of a ſolid Ring.—Multiply the axis by the perimeter of a ſection perpendicular to it, and the product will be the ſurface. *E. gr.* a workman having made for a jeweller a circular ring, or a ring whoſe axis forms the circumference of a circle; it is required to find the expence of the gilding, at a penny the ſquare inch; the thickneſs of the ring, or the diameter of a ſection of it, being 2 inches; and the inner diameter, acroſs from ſide to ſide, 18 inches. Here $18 + 2 = 20 =$ the diameter of the circle formed by the axis; and conſequently $20 \times 3.14159 =$ the length of the axis. But $2 \times 3.14159 =$ the circumference of a ſection of it; therefore $20 \times 3.14159 \times 2 \times 3.14159 = 40 \times 3.14159^2 = 394.785$ ſquare inches, nearly, $= 394.785$ pence $=$ 1*l.* 12*s.* 10¼*d.* nearly, the expence required.

To find the Solidity of a Ring.—Multiply the axis by a ſection perpendicular to it, and the product will be the ſolidity. *E. gr.* required the price of a ring of iron, whoſe dimenſions are the ſame with thoſe in the laſt example, at four-pence a pound; a cubic inch of iron weighing 4.423 ounces avoirdupois. Here the area of a ſection being $2^2 \times .785398 = 3.14159$, which expreſſes half the circumference, and the axis being the ſame as before, the ſolidity will evidently be expreſſed by half the ſurface in the laſt example; *i. e.* the ſolidity $= 197.3925$ cubic inches, which multiplied by 4.423, gives 873.065 ounces $= 54.56657$ pounds; which, at 4*d.* each, will amount to 18*s.* 2¼*d.*, the price required.

It is needleſs to multiply examples, as the mode of operation is the ſame in all forms, with thoſe for priſms, both with regard to the ſurfaces and ſolidities: for it is evident that any ring is equal to a priſm, whoſe altitude and end are reſpectively equal to the axis and ſection of the ring, both as to ſurface and ſolidity, and, therefore, the rules for them both muſt be the ſame; and, on this account, any demonſtration of the rules for rings is unneceſſary. Hutton's Menſuration.

Rings *of Colours*, in *Optics*, a phenomenon firſt obſerved in thin plates of various fubftances, by Mr. Boyle, and Dr. Hooke, but afterwards more fully explained by fir Ifaac Newton. Mr. Boyle having exhibited a variety of colours in colourlefs liquors, by fhaking them till they rofe in bubbles, as well as in bubbles of foap and water, and alfo in turpentine, procured glafs blown fo thin as to exhibit fimilar colours; and he obferves, that a feather of a proper fhape and fize, and alfo a black ribband held at a proper diftance between his eye and the fun, fhewed a variety of little rainbows, as he calls them, with very vivid colours. Boyle's Works by Shaw, vol. ii. p. 70.

Dr. Hooke, about nine years after the publication of Mr. Boyle's Treatife on Colours, exhibited the coloured bubble of foap and water, and obferved, that though at firft it apppeared white and clear, yet as the film of water became thinner, there appeared upon it all the colours of the rainbow. He alfo defcribed the beautiful colours that appear in thin plates of Mufcovy glafs; which appeared, through the microfcope, to be ranged in rings furrounding the white fpecks or flaws in them, and with the fame order of colours as thofe of the rainbow, and which were often repeated ten times. He alfo took two thin pieces of glafs, ground plain and polifhed, and putting them one upon another, preffed them till there began to appear a red coloured fpot in the middle; and preffing them clofer, he obferved feveral rings of colours encompaffing the firft place, till, at laft, all the colours difappeared out of the middle of the circles, and the central fpot appeared white. The firft colour that appeared was red, then yellow, then green, then blue, then purple, then red again; yellow, green, blue, and purple; and again in the fame order, fo that he fometimes counted nine or ten of thefe circles, the red immediately next to the purple; and the laft colour that appeared before the white was blue; fo that it began with red, and ended with purple. Thefe rings, he fays, would change their places, by changing the pofition of the eye, fo that, the glaffes remaining the fame, that part which was red in one pofition of the eye, was blue in a fecond, green in the third, &c. Birch's Hift. of the Royal Society, vol. iii. p. 54.

Sir Ifaac Newton, having demonftrated that every different colour confifts of rays which have a different and fpecific degree of refrangibility, and that natural bodies appear of this or that colour, according to their difpofition to reflect this or that fpecies of rays (fee COLOUR), purfued the hint fuggefted by the experiments of Dr. Hooke, already recited, and cafually noticed by himfelf, with regard to thin tranfparent fubftances. Upon compreffing two prifms hard together, in order to make their fides touch one another, he obferved, that in the place of contact they were perfectly tranfparent, which appeared like a dark fpot; and when it was looked through, it feemed like a hole in that air, which was formed into a thin plate, by being impreffed between the glaffes. When this plate of air, by turning the prifms about their common axis, became fo little inclined to the incident rays, that fome of them began to be tranfmitted, there arofe in it many flender arcs of colours, which increafed, as the motion of the prifms was continued, and bended more and more about the tranfparent fpot, till they were completed into circles, or rings, furrounding it; and afterwards they became continually more and more contracted.

By another experiment with two object-glaffes, he was enabled to obferve diftinctly the order and quality of the colours from the central fpot, to a very confiderable diftance. Next to the pellucid central fpot, made by the contact of the glaffes, fucceeded blue, white, yellow, and red. The next circuit immediately furrounding thefe confifted of violet, blue, green, yellow, and red. The third circle of colours was purple, blue, green, yellow, and red. The fourth circle confifted of green and red. All the fucceeding colours became more and more imperfect and dilute, till, after three or four revolutions, they ended in perfect whitenefs.

In order to determine the thicknefs of the plate of air, by which he fuppofed the colours were produced, he meafured the diameters of the firft fix circles, at their moft lucid parts, and found their fquares to be in the arithmetical progreffion of the odd numbers 1, 3, 5, 7, 9, 11; and hence he concluded, that the intervals of the glaffes at thefe circles muft be in the fame progreffion. He alfo meafured the diameters of the dark or faint rings between the more lucid colours, and found their fquares to be in the arithmetical progreffion of the even numbers 2, 4, 6, 8, 10, 12; and he concluded, after an accurate menfuration, the thicknefs of the air at the darkeft part of the firft dark ring, made by perpendicular rays, to be in the neareft round numbers $\frac{1}{89000}$th part of an inch, half of which, multiplied by the progreffion 1, 3, 5, 7, 9, 11, &c. gives the thicknefs of the air at the moft luminous parts of all the brighteft rings, their arithmetical means being its thicknefs at the darkeft parts of all the dark ones. In examining the under fide of the thin plate, in order to obferve what light was tranfmitted, he found that the central fpot was white, and the order of the colours was yellowifh-red; black, violet, blue, white, yellow, red; violet, blue, green, yellow, red, &c.; but thefe colours were very faint and dilute, except when the light was tranfmitted very obliquely through the glaffes. When he put water between the glaffes, and meafured the rings again, he found the proportion of their diameters to the diameters of the like circles made by air, to be about 7 to 8; fo that the intervals of the glaffes, at fimilar circles, caufed by water and air, were about 3 to 4.

When thefe rings were examined in a darkened room, by the coloured light of a prifm caft on a fheet of white paper, they became more diftinct, and vifible to a far greater number than in the open air. He fometimes faw more than twenty of them, whereas in the open air he could not difcern above eight or nine.

From other curious obfervations on thefe rings, made by different kinds of light thrown upon them, he inferred, that the thickneffes of the air between the glaffes, where the rings are fucceffively made, by the limits of the feven colours, red, orange, yellow, green, blue, indigo, and violet, in order, are one to another as the cube roots of the fquares of the eight lengths of a chord, which found the notes in an octave, *fol, la, fa, fol, la, mi, fa, fol*; that is, as the cube roots of the fquares of the numbers 1, $\frac{8}{9}$, $\frac{5}{6}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{3}{5}$, $\frac{9}{16}$, $\frac{1}{2}$. Thefe rings appeared of that prifmatic colour with which they were illuminated; and by projecting the prifmatic colours immediately upon the glaffes, he found that the light, which fell on the dark places between the coloured rings, was tranfmitted through the glaffes without any change of colour. From this circumftance he thought that the origin of thefe rings is manifeft; becaufe the air between the glaffes is difpofed, according to its various thicknefs, in fome places to reflect, and in others to tranfmit the light of any particular colour, and in the fame place to reflect that of one colour, where it tranfmits that of another.

In examining the phenomena of colours made by a denfer medium furrounded by a rarer, fuch as thofe which appear in plates of Mufcovy glafs, bubbles of foap and water, &c. the colours were found to be much more vivid than the others, which were made with a rarer medium furrounded by by a denser. From the preceding phenomena it is an obvious deduction, that the transparent parts of bodies, according to their several sizes, reflect rays of one colour, and transmit those of another; on the same account that thin plates, or bubbles, reflect or transmit those rays; and this Newton supposed to be the reason of all their colours. Hence also he has inferred, that the size of those component parts of natural bodies that affect the light, may be conjectured by their colours. See Colour and Reflection.

Sir Isaac Newton, pursuing his discoveries concerning the colours of thin substances, found that the same were also produced by plates of a considerable thickness, divisible into lesser thicknesses. The rings formed in both cases have the same origin, with this difference, that those of the thin plates are made by the alternate reflections and transmissions of the rays at the second surface of the plate, after one passage through it; but that, in the case of a glass speculum, concave on one side, and convex on the other, and quick-silvered over on the convex side, the rays go through the plate, and return before they are alternately reflected and transmitted. Newton's Optics, p. 169, &c. or Newton's Opera, Horsley's edit. vol. iv. p. 121, &c. p. 184, &c.

The abbé Mazeas, in his experiments on the rings of colours that appear in thin plates, has discovered several important circumstances attending them, which were overlooked by the sagacious Newton, and which tend to invalidate his theory for explaining them. In rubbing the flat side of an object-glass against another piece of flat and smooth glass, he found that they adhered very firmly together after this friction, and that the same colours were exhibited between these plane glasses, which Newton had observed between the convex object-glass of a telescope, and another that was plane; and that the colours were in proportion to their adhesion. When the surfaces of pieces of glass, that are transparent and well polished, are equally pressed, a resistance will be perceived; and wherever this is felt, two or three very fine curve lines will be discovered, some of a pale red, and others of a faint green. If the friction be continued, the red and green lines increase in number at the place of contact; the colours being sometimes mixed without any order, and sometimes disposed in a regular manner; in which case the coloured lines are generally concentric circles, or ovals, more or less elongated, as the surfaces are more or less united. When the colours are formed, the glasses adhere with considerable force; but if the glasses be separated suddenly, the colours will appear immediately upon their being put together, without the least friction. Beginning with the slightest touch, and increasing the pressure by insensible degrees, there first appears an oval plate of a faint red, and in the centre of it a spot of light green, which enlarges by the pressure, and becomes a green oval, with a red spot in the centre; and this enlarging, in its turn, discovers a green spot in its centre. Thus the red and green succeed one another in turns, assuming different shades, and having other colours mixed with them. The greatest difference between these colours exhibited between plane surfaces, and those by curve ones, is, that, in the former case, pressure alone will not produce them, except in the case above-mentioned. In rubbing together two prisms, with very small refracting angles, which were joined so as to form a parallelepiped, the colours appeared with a surprising lustre at the places of contact, and differently coloured ovals appeared. In the centre there was a black spot, bordered by a deep purple; next to this appeared violet, blue, orange, red tinged with purple, light green, and faint purple. The other rings appeared to the naked eye to consist of nothing but faint reds and greens. When these coloured glasses were suspended over the flame of a candle, the colours disappeared suddenly, though they still adhered; but being suffered to cool, the colours returned to their former places, in the same order as before. At first the abbé Mazeas had no doubt but that these colours were owing to a thin plate of air between the glasses, to which Newton has ascribed them; but the remarkable differences in the circumstances attending those produced by the flat plates, and those produced by the object-glasses of Newton, convinced him that the air was not the cause of this appearance. The colours of the flat plates vanished at the approach of flame, but those of the object-glasses did not. Nor was this difference owing to the plane glasses being less compressed than the convex ones; for though the former were compressed ever so much by a pair of forceps, it did not in the least hinder the effect of the flame. Afterwards he put both the plane glasses and the convex ones into the receiver of an air-pump, suspending the former by a thread, and keeping the latter compressed by two strings; but he observed no change in the colours of either of them, in the most perfect vacuum that he could make. Suspecting still that the air adhered to the surface of the glasses, so as not to be separated from them by the force of the pump, he had recourse to other experiments, which rendered it still more improbable that the air should be the cause of these colours. Having laid the coloured plates, after warming them gradually, on burning coals; and thus, when they were nearly red, rubbing them together, he observed the same coloured circles and ovals as before. When he ceased to press upon them, the colours seemed to vanish; but they returned, as he renewed the friction. In order to determine whether the colours were owing to the thickness of some matter interposed between the glasses, he rubbed them together with suet and other soft substances between them; yet his endeavours to produce the colours had no effect. However, by continuing the friction with some degrees of violence, he observed, that a candle appeared through them encompassed with two or three concentric greens, and with a lively red inclining to yellow, and a green like that of an emerald; and at length the rings assumed the colours of blue, yellow, and violet. The abbé was confirmed in his opinion that there must be some error in Newton's hypothesis, by considering that, according to his measures, the colours of the plates varied with the difference of a millionth part of an inch; whereas he was satisfied that there must have been much greater differences in the distance between his glasses, when the colours remained unchanged. From other experiments he concluded, that the plate of water introduced between the glasses was not the cause of their colours, as Newton apprehended; and that the coloured rings could not be owing to the compression of the glasses. After all he adds, that the theory of light, thus reflected from thin plates, is too delicate a subject to be completely ascertained by a small number of observations. Berlin Mem. for 1752, or Memoirs Presentes, vol. ii. p. 28—43.

For M. du Tour's experiments and observations, see Mem. Pref. vol. iv. p. 288.

M. Muschenbroeck is also of opinion, that the colours of thin plates do not depend upon the air; but as to the cause he is not satisfied. Introd. ad Phil. Nat. vol. ii. p. 738. See on this subject Priestley's Hist. of Light, &c. per. 6. sect. 5. p. 498, &c.

Sir Isaac Newton's explanation of the appearance of the above-mentioned coloured concentric rings, who accounts for the production of them by ascribing to the rays of light certain fits of easy reflection and easy transmission alternately returning and taking place with each ray at certain

certain stated intervals, not being satisfactory to Dr. Herschel, he instituted a series of experiments with a view of investigating the cause of these phenomena. Newton's hypothesis appears to him not easily reconcileable with the minuteness and extreme velocity of the particles of which these rays, according to the Newtonian theory, are composed. The detail of this celebrated astronomer's experiments would far exceed our limits; we must therefore content ourselves with referring for an account of them to the Phil. Trans. for 1807, vol. xcvii. pt. 2. and with merely stating the consequences which he has deduced from them.

It is evident, says our author, that the phenomena of concentric rings must have an adequate cause, either in the very nature or motion of the rays of light, or in the modifications that are given to them by the two essential surfaces that act upon them at the time of the formation of the rings. Hence he infers, that the true cause may be reduced to an alternative that may be determined; for if it can be shewn, that a disposition of the rays of light to be alternately reflected and transmitted cannot account for the phenomena which this hypothesis is to explain, a proposal of accounting for them by modifications that may be proved, even on the principles of sir Isaac Newton, to have an existence, will be readily admitted. Accordingly Dr. Herschel offers some arguments for removing an obstacle to the investigation of the real cause of the formation of the concentric rings; for after the very plausible supposition of the alternate fits, which agrees so wonderfully well with a number of facts that have been related, it will hardly be attempted, if these should be set aside, to ascribe some other inherent property to the rays of light, by which we might account for them: and thus we shall be at liberty to turn our thoughts to a cause, that may be found in the modifications arising from the action of the surfaces, which have been proved to be the only essential ones in the formation of rings. Our author proceeds to observe, that concentric rings cannot be formed by an alternate reflection and transmission of the rays of light; for if we adopt one of the most simple methods of obtaining a set of concentric rings, which is that of laying a convex lens upon a plain metalline mirror, we can in this case have no transmission of rays, nor consequently any alternate reflection and transmission of them. He further observes, that alternate fits of easy reflection and easy transmission, if they exist, do not exert themselves according to the various thicknesses of thin plates of air. In the following experiment, he placed a plain well-polished piece of glass 5.6 inches long, and 2.3 thick, upon a plain metalline mirror of the same length with the glass, and in order to keep the mirror and glass at a distance from each other, he laid between them, at one end, a narrow strip of such paper as is commonly put between prints. The thickness of that which was used in this case was the 640th part of an inch. Upon the glass was put a 39-inch double convex lens; and having exposed this combination to a proper light, two complete sets of coloured rings were visible in this arrangement. The rays which convey the secondary set of rings to the eye must pass through a thin wedge of air, and if these rays are endowed with permanent fits of easy reflection and easy transmission, or absorption, their exertion, according to sir I. Newton, should be repeated at every different thickness of the plate of air, which amounts to the $\frac{1}{89952}$d part of an inch, of which he says, "hæc est crassitudo aeris in primo annulo obscuro radiis ad perpendiculum incidentibus exhibito, qua parte is annulus obscurissimus est." The length of the thin wedge of air, reckoned from the line of contact, to the beginning of the interposed strip of paper, is 5.2 inches, from which, by calculation, it will have the above-mentioned thickness at $\frac{1}{53}$th of an inch from the contact; and therefore at $\frac{1}{53}$, $\frac{3}{53}$, $\frac{5}{53}$, $\frac{7}{53}$, $\frac{9}{53}$, $\frac{11}{53}$, &c. we shall have the thickness of air between the mirror and glass equal to $\frac{1}{178000}$, $\frac{3}{178000}$, $\frac{5}{178000}$, $\frac{7}{178000}$, &c. of which the same author says that they give "crassitudines aeris in omnibus annulis lucidis, qua parte illi lucidissimi sunt." Hence it follows that, according to the above hypothesis, the rings of the secondary set, which extended over a space of .14 of an inch, should suffer more than seven interruptions of shape and colour in the direction of the wedge of air.

In order to ascertain whether such an effect had any existence, Dr. Herschel viewed the secondary set of rings upon every part of the glass-plate, by moving the convex lens from one end of it gradually to the other; and his attention being particularly directed to the third, fourth, and fifth rings, which were extremely distinct, he saw them retain their shape and colour all the time without the smallest alteration.

The same experiment was repeated with a piece of plate-glass instead of the metalline mirror, in order to give room for the fits of easy transmission, if they existed, to exert themselves, but the result was still the same; and the constancy of the brightness and colours of the rings of the secondary set plainly proved, that the rays of light were not affected by the thickness of the plate of air through which they passed.

Our author next proceeds to shew, that alternate fits of easy reflection and easy transmission, if they exist, do not exert themselves according to the various thicknesses of thin plates of glass. In proof of this he selected a well-polished plate of coach-glass 17 inches long, and about 9 broad. Its thickness at one end was $\frac{33}{200}$ths, and at the other $\frac{31}{200}$ths of an inch; so that in its whole length it differed $\frac{1}{100}$th of an inch in thickness; and it was regularly tapering from one end to the other. This plate, with a double convex lens of 55 inches laid upon it, being placed upon a small metalline mirror, and properly exposed to the light, exhibited the usual two sets of rings. In the secondary set, which was the object of attention, 12 rings were counted, and the central space between them was estimated to be about $1\frac{1}{2}$ times as broad as the space occupied by the 12 rings on either side; so that the whole space taken up might be reckoned equal to the breadth of 40 rings of a mean size; for the 12 rings, as usual, were gradually contracted in breadth as they receded from the centre, and by a measure of the whole space thus occupied, it was found that the breadth of a ring of a mean size was about the 308th part of an inch.

According to sir I. Newton's calculation of the action of the fits of easy reflection and easy transmission in thick glass-plates, an alternation from a reflecting to a transmitting fit requires a difference of $\frac{1}{137545}$th part of an inch in thickness (Newton's Optics, p. 277.); and by calculation this difference took place in the glass-plate, that was used at every 80th part of an inch of its whole length. The 12 rings, as well as the central colour of the secondary set, should consequently have been broken by the exertion of the fits at every 80th part of an inch; and from the space over which these rings extended, which was about .13 inch, it was found, that there must have been more than 10 such interruptions or breaks in a set of which the 308th part was plainly to be distinguished. But when the glass-

plate

plate was drawn gently over the ſmall mirror, keeping the ſecondary ſet of rings in view, their ſhape and colour were found to be always completely formed.

This experiment was alſo repeated with a ſmall plain glaſs, inſtead of the metalline mirror put under the large plate. In this manner it ſtill gave the ſame reſult, with no other difference but that only ſix rings could be diſtinctly ſeen in the ſecondary ſet, on account of the inferior reflection of the ſubjacent glaſs.

Our author next ſhews, that coloured rings may be completely formed without the aſſiſtance of any thin or thick plates, either of glaſs or of air. Sir I. Newton placed a concave glaſs mirror at double its focal length from a chart, and obſerved, that the reflection of a beam of light admitted into a dark room, when thrown upon this mirror, gave "four or five concentric iriſes or rings of colours like rainbows" (Optics, p. 265.); and he accounts for them by alternate fits of eaſy reflection and eaſy tranſmiſſion, exerted in their paſſage through the glaſs-plate of the concave mirror. Ibid. p. 277.

The duke de Chaulnes concluded from his own experiments of the ſame phenomena, that theſe coloured rings depended upon "the firſt ſurface of the mirror, and that the ſecond ſurface, or that which reflects them after they had paſſed the firſt, only ſerved to collect them, and throw them upon the paſteboard, in a quantity ſufficient to make them viſible." (Prieſtley's Hiſt. &c. p. 515.) Mr. Brougham, after having conſidered what the two laſt-mentioned authors had done, ſays, "that upon the whole there appears reaſon to believe, that the rings are formed by the firſt ſurface out of the light, which, after reflection from the ſecond ſurface, is ſcattered, and paſſes on to the chart." Phil. Tranſ. for 1796, p. 216.

Dr. Herſchel's experiment is as follows. He placed a highly poliſhed ſeven-feet mirror, but of metal inſtead of glaſs, that he might not have two ſurfaces, at the diſtance of fourteen feet from a white ſcreen, and through a hole in the middle of it, one-tenth of an inch in diameter, he admitted a beam of the ſun into his dark room, ſo directed as to fall perpendicularly on the mirror. In this arrangement the whole ſcreen remained perfectly free from light, becauſe the focus of all the rays, which came to the mirror, was by reflection thrown back into the hole through which they entered. After this preparation, an aſſiſtant ſtrewed ſome hair-powder with a puff into the beam of light, while he kept his attention fixed upon the ſcreen. As ſoon as the hair-powder reached the beam of light the ſcreen was ſuddenly covered with the moſt beautiful arrangement of concentric circles, diſplaying all the brilliant colours of the rainbow. A great variety in the ſize of the rings was obtained by making the aſſiſtant ſtrew the powder into the beam at a greater diſtance from the mirror; for the rings contract by an increaſe of the diſtance, and dilate on a nearer approach of the powder. This experiment, ſays our author, is ſo ſimple, and points out the general cauſes of the rings which are here produced in ſo plain a manner, that we may confidently ſay, they ariſe from the flection of the rays of light on the particles of the floating powder, modified by the curvature of the reflecting ſurface of the mirror. From this experiment our author concludes, that the principle of thin or thick plates, either of air or glaſs, on which the rays might alternately exert their fits of eaſy reflection and eaſy tranſmiſſion, muſt be given up: and that the fits themſelves of courſe cannot be ſhewn to have any exiſtence. It will hardly be neceſſary to add further, that the whole theory relating to the ſize of the parts of natural bodies and their interſtices, which ſir I. Newton has founded upon the exiſtence of fits of eaſy reflection and eaſy tranſmiſſion, exerted differently, according to the different thickneſs of the thin plates of which he ſuppoſes the parts of natural bodies to conſiſt, will remain unſupported; for if theſe fits have no exiſtence, the whole foundation on which the theory of the ſize of ſuch parts is placed, will be taken away, and it will be neceſſary to explore another baſis for a ſimilar edifice. This baſis, our author conceives, is to be found in the modifying power, which the two ſurfaces that have been proved to be eſſential to the formation of rings, exert upon the rays of light.

Our author having pointed out a variety of methods that ſerve to produce coloured concentric rings between two glaſſes of a proper figure applied to each other, and having proved that only two ſurfaces, namely, thoſe that are in contact with each other, are eſſential to their formation, proceeds in the inveſtigation of the ſubject to ſhew, that priſmatic phenomena aſſume the ſhape of rings, in conſequence of the ſole uſe of ſpherical curves in producing them. Our author found, by an appropriate experiment, that, as ſpherical curves gave circular rings, cylindrical forms produce ſtreaks; that cylindrical and ſpherical ſurfaces combined produce coloured elliptical rings; and that irregular curves produce irregular figures. Hence he infers, that the curvature of ſurfaces is the cauſe of the appearance, as well as of the ſhape of the coloured phenomena which are produced. If we can invariably predict, from the nature of the curves that are employed in an experiment, what will be the appearance and form of the colours that will be ſeen, it certainly muſt prove the efficacy of theſe curvatures in the production of ſuch phenomena. This concluſion is further confirmed by the conſideration, that coloured appearances cannot be produced between the plain ſurfaces of two parallel pieces of glaſs applied to one another.

Having proved that no more than two ſurfaces are eſſential to the formation of Newton's coloured rings, and that the configuration of the coloured phenomena ariſes from the curvature of one or both of the two eſſential ſurfaces, Dr. Herſchel infers from theſe principles, that we are to diſtinguiſh between the production of the colours and that of their configuration when produced. The cauſe of the configuration has been already explained; and our author next proceeds to inveſtigate the production and arrangement of the colours. The order of the colours is priſmatic; that is, red, orange, yellow, green, blue, indigo, and violet. Dr. Herſchel's experiments for aſcertaining this arrangement are too numerous and various to be here recited. We ſhall therefore ſtate the general propoſition, and ſpecify the reſults of the experiments by which it is eſtabliſhed. The general propoſition is, that the critical ſeparation of the colours, which takes place at certain angles of incidence, is the primary cauſe of the Newtonian coloured rings between optic glaſſes. The reſults of the experiments are as follow: theſe expeririments (for which we refer to Phil. Tranſ. for 1809, vol. xcix. pt. 2.) explain in what manner a critical ſeparation of the colours, which takes place at certain angles of incidence, is the cauſe of the appearance of the blue and red bows; ſince the different reflexibility of the rays of light, by which Newton has accounted for the blue bow, brings on a critical ſeparation of the blue colours, and ſince alſo the different intromiſſibility by which the author has explained the red bow, occaſions an equally critical ſeparation of the red ones. Dr. Herſchel has not only proved that all the various appearances, which were produced by convex glaſſes, may be equally

equally well obtained by the use of a prism, but he has also shewn, that the great simplicity of this valuable optical instrument has cleared up great difficulties, by pointing out to us that the colours which are modified into such various shapes, are in all prismatic experiments exclusively produced by the critical separation of the rays of light. As this fact must be admitted, it certainly will not be philosophical to look for a different cause of the same or similar effects, when convex glasses, which have all the required prismatic properties, are used to produce them. In order to shew the great similarity, or rather the identity of these effects, it will be sufficient to take the most simple case of each, namely, the coloured rings that are produced when a plano-convex lens is laid with its convex side upon a plain reflecting surface: and the coloured streaks which are produced when the base of a right-angled prism is in the same manner placed upon such a surface. The results of the experiments, with the reasonings annexed to them, are contained in the following propositions. The form of rings arises from the spherical figure of the lens: the right-lined appearance of the streaks is owing to the straight figure of the plain surface of the prism. The colour of the rings may suddenly be changed; the colours of the blue bow-streak may as instantly be converted into those of the red bow. The cause of the sudden change of the rings has been shewn to be that the sets of one colour are seen by reflection, and those of the other by transmission; it has also been shewn, that the blue bow-streaks are seen by reflection, and those of the red bow by transmission. In a lens we may, at the same time, see, in half the set, the colours of the reflected, and in the other half, the colours of the transmitted rings; and in a prism held before an open window, when the eye is close to it, and when half the bow falls on the side of the room, we may see blue streaks by reflection from half the blue bow, and green streaks by transmission from half the red bow. When deep convex, or concave, glasses are laid upon the first surface of a lens, the rings are not affected by it; and when the same glasses are laid upon the first surface of a prism the streaks remain unaltered. When the convexity of the lens, which is placed on the reflecting surface, is changed, the size of the rings is also changed; and when the angle of the prism is increased or diminished, the distance of the streaks undergoes a proportional alteration. When the lens is pressed upon the plain glass, the rings increase in diameter; and by a pressure of the plain glass against the prism the distance of the streaks grows larger. To form rings by a lens, scattered rays only are required: and the same light is best for the production of streaks by a prism. Many other instances of similarity might be adduced, but it is needless. Now, as it has been clearly proved, that the critical separation of the colours, which takes place at certain angles of incidence, occasions all the phenomena of the blue and red bows, and of the streaks, rings, and other regular or irregular appearances, that may be seen in a prism, it cannot be doubted that the Newtonian rings observed between object-glasses are owing to the same cause.

Dr. Herschel concludes an elaborate paper on this subject with the following remarks on the Newtonian alternate fits of easy reflection and easy transmission.

"In attempting to rescue the science of optics from what has been so long considered as unsatisfactory for explaining the great question about the cause of the coloured rings, I have made use of a principle, the effects of which have so near a resemblance to those of the supposititious fits of easy reflection and easy transmission, that the author of them might easily be misled by appearances. But although the principle of a critical separation of the colours, substituted for these fits, admits the reflection of some rays at the same angles of incidence at which others are transmitted, yet since the Newtonian different refrangibility of light will account for these critical reflections within glass, and equally critical intromissions from without, we can have no longer any reason to ascribe original fits to the rays of light, which in the first part of this paper they have already been proved not to possess, and which now, in all prismatic experiments, I have shewn are not necessary for explaining appearances that may be accounted for without them."

In the Philos. Transactions for 1810, vol. c. pt. 2, we have a third paper, as a supplement to the other two papers, containing additional observations on the cause of coloured concentric rings between object-glasses, and other appearances of a similar nature, in which Dr. Herschel further explains what some may have thought obscure, and obviates certain objections against his theory. His fundamental principle for explaining the colour of the rings, which he has illustrated both by reasoning and experiment, is this: that the colours in all prismatic phenomena are produced either by the interior critical separation arising from the different reflexibility of the rays which cause the blue bow, or by the exterior critical separation arising from the different intromissibility of the rays which cause the red bow. In this paper he subjoins some additional arguments to those before given, in order to prove, that there are two primary prismatic bows, a blue one and a red one; and he maintains, that the red bow is a phenomenon of equal originality with the Newtonian blue bow, and that as one of these bows cannot be the converse of the other, we have two critical separations essentially different, *viz.* the reflective and intromissive. But we must refer to the author's own account, *ubi supra*.

For an account of the rings of colours produced by electrical explosions, see COLOURS *of Natural Bodies*, CIRCULAR *Spots*, and FAIRY *Circles*.

RINGS *of Flies*, in *Natural History*, the several rounds or circular portions, of which the bodies of these and other insects are composed.

In the fly kind these are crustaceous or cartilaginous, and consequently of a matter little capable of extension; many actions of these insects require, however, that their bodies, or a part at least of their bodies, should be able to inflate or distend, and contract their size occasionally. Were every ring of the body one entire scale, or shelly substance, these changes could not be easily effected; nature has therefore so provided, that the tender bodies of these little creatures are sufficiently defended, and yet all the necessary motions may be performed.

RING, in *Agriculture*, a sort of hoop made of iron, which is used for various purposes, as fastening horses and cattle by in the stalls. In these cases they should be made large and strong.

RING, in *Commerce*, a term used in reckoning at Hamburgh, and is equivalent to 240 of things that are sold by number. Staves are sold in rings of 4 schoaks (a schoak being 60) and 8 pieces: 3 rings of hogshead staves, or 6 rings of barrel staves, are reckoned equal to 2 rings of pipe staves.

RING, a stout circle of iron in the upper part of the shank of an anchor, to which the cable is bent.

RINGS are also circles of iron or other metal, let over the points of bolts, whereon they are clenched, to prevent their drawing. Hatch-rings, or ring and starts, are those which are fixed in the hatches or scuttles to open or shut them with.

RINGS *in Timber*, in *Rural Economy*, the concentric layers by which the wood is formed. These rings are, according to Dr. Darwin, annually produced from the alburnum, and are

are ſuppoſed to be thicker on that ſide of the trunk of the tree which has a ſouthern aſpect than on the contrary, and thicker in thoſe ſummers moſt favourable to vegetation than in others. It is added, that theſe rings, as they loſe their vegetable life, and at the ſame time a part of their moiſture, by evaporation or abſorption, gradually become harder and of a darker colour, inſomuch, that by counting their number, it is ſaid, that not only the age of the tree, but the mildneſs or moiſture of each ſummer, during the time of its growth, may be eſtimated by the reſpective thickneſs of the rings of timber.

RING, *Baſe*. See BASE.

RING-*Bolt*, in a *Ship*, is an iron bolt with an eye at one end, in which is fitted a circular ring, and uſed for various purpoſes; particularly for hooking the tackles, by which the cannon of a ſhip is managed and ſecured. They are driven by the ſides of the gun-ports in ſhips for ſecuring the guns; and in the deck for ſtopping the cable, and are therefore called ſtopper-bolts. The rings are ſometimes made angular, to receive many turns of laſhing; ſuch are the ring-bolts driven through the ſhip's ſide along the waiſt for laſhing the booms and ſpare anchors.

RING-*Bone*, among *Farriers*, &c. a hard callous ſubſtance, growing in the hollow circle of the little paſtern of a horſe, above the coronet.

It ſometimes goes quite round, like a ring, whence its name; ſometimes it is hereditary, derived from the ſtallion or mare; but it oftener comes by accident, as from a ſtrain, a blow of a horſe, &c.

RING, *Corniche*. See CORNICHE.

RING-*Dial*. See DIAL.

RING-*Dove*. See DOVE, and COLUMBA *Palumbus*.

RING, *Fairy*. See FAIRY.

RING-*Head*, an engine uſed in ſtretching of cloth.

RING, *Natal*. See NATAL.

RING *Ouzel* or *Amſel*. See OUZEL, and TURDUS *torquatus*.

RING, *Reinforce*. See REINFORCE.

RING-*Ropes*, in a *Ship*, ſhort pieces of rope, tied occaſionally to the ring-bolts of the deck, to faſten the cable more ſecurely, when the ſhip rides in a tempeſt, or turbulent ſea, or rapid current. They are uſed more particularly in veering away the cable gradually in thoſe circumſtances, in order to freſhen the hauſe.

RING-*Scalpel*. We have a deſcription and a figure of a ring-ſcalpel, for aſſiſting the delivery of women in childbirth, by Dr. Thomas Simſon, in the Medical Eſſays of Edinburgh, vol. v. art. 39.

RING-*Tail*, in *Ornithology*, the Engliſh name for the *ſubbuteo*, or *pygargus accipiter*; which has been generally ſuppoſed to be the female of the hen-harrier; but males have lately been found of this ſpecies. See FALCO *Pygargus*.

The ring-tail is a moderately large bird. It has a ſort of ring, or chain of feathers, round the back part of its head, reaching to its chin on each ſide, which ſtand erect, and are brown in the middle, and of a reddiſh-white at the edges, and make a ſort of crown, which ſurrounds the head; on the top of the head and cheeks the feathers are duſky, bordered with ruſt-colour; under each eye is a white ſpot; the back is duſky, the rump white, with oblong yellowiſh ſpots on each ſhaft; the tail is long, and its tip white; the breaſt and belly are of a yellowiſh-brown, marked with oblong duſky ſpots; its legs are yellow, and the inſide of its mouth is black; it feeds on ſmall birds, and its eggs are of a reddiſh hue, with very little clear white appearing in them. Theſe birds fly higher than the hen-harrier, and ſometimes perch on trees.

RING-*Tail Eagle*. See *White-tailed* EAGLE, and FALCO *Albicilla*.

RING-*Tail*, in a *Ship*, is a quadrilateral ſail, occaſionally hoiſted abaft the after-leech of the boom-mainſails, to which the fore-leech is made to correſpond. The head is bent to a ſmall yard at the outer end of the gaff, and the foot is ſpread on the boom, which is prolonged by a piece laſhed to the outer end. A triangular ſail of this ſort is uſed in light favourable winds, extended on a ſmall maſt, occaſionally erected for that purpoſe on the taffarel of ſmall veſſels.

RING, *Trunnion*. See TRUNNION.

RING-*Walk*, among *Hunters*, a round walk. See HUNTING.

RING-*Worm*, in *Medicine*. See RINGWORM.

RING *Iſland*, in *Geography*, a ſmall iſland off the coaſt of Maſſachuſetts, oppoſite to Newbury port, to the eaſtward.

RINGAN, a town of Germany, in the principality of Culmbach; 14 miles S. of Culmbach.

RINGANDEE, a town of Bengal; 30 miles W. of Rogonatpour.

RINGELBERGIUS, JOACHIM-FORTIUS, in *Biography*, vernacularly Sterck, an eminent Flemiſh philoſopher and mathematician, who flouriſhed in the 16th century, was born at Antwerp. He was patronized by the emperor Maximilian I., in whoſe palace he had an apartment, and he there received his firſt inſtructions in the rudiments of learning. When he was ſeventeen years of age, he was ſent to the univerſity of Louvain, where he ſtudied the learned languages, philoſophy, and the mathematical ſciences. He became a public profeſſor in that univerſity, and taught rhetoric, coſmography, the mathematics, and the Greek language, with very high reputation. So numerous were the claſſes which attended his lectures, that they frequently occupied his attention twelve hours every day, for a month together. In the year 1528 he went into Germany, and taught the mathematical ſciences and the Greek tongue in various ſeminaries of that country. From Germany he went to France, where he filled the profeſſor's chair at Paris, Orleans, Bourdeaux, and other places. He died about the year 1536. He wrote a number of eſteemed works, which were publiſhed at Baſil, Antwerp, and other places, and reflected honour on his learning and judgment. The titles of ſome of them are, "De Ratione Studii;" "De Uſu et Differentiis vocum quarundam apud Latinos;" "De Uſu Vocum quæ non flectuntur;" "Grammaticæ Græcæ Elementa;" "Dialectica, et Tabulæ Dialecticæ;" "De conſcribendis Epiſtolis Lib.;" "Rhetoricæ, et quæ ad eam ſpectant;" "Sententiæ;" "De Formis dicendi, Lib.;" "De Periodis;" "Synonyma;" "Sphæra, ſive Inſtitutionum Aſtronomicarum, Lib. iii.;" "Coſmographia;" "Optica;" "Chaos Mathematicum;" "Arithmetica." The whole of his works were collected and publiſhed at Leyden, in 1531.

RINGELSLOFF, in *Geography*, a town of Auſtria; 4 miles E.N.E. of Ziſterſdorff.

RINGEN, a town of Ruſſia, in the government of Riga; the birth-place of the empreſs Catharine I., near Dorpat.

RINGENDORF, a town of France, in the department of the Lower Rhine; 7 miles W. of Haguenau.

RINGENT COROLLA, in *Botany* and *Vegetable Phyſiology*, named from its reſemblance to the mouth and ſnout of ſome animal; ſee COROLLA. Certain Engliſh authors, literally tranſlating the original word (*ringens*), uſe the ludicrous term of *a grinning corolla*.

RIN-

RINGENTHAL, in *Geography*, a town of Saxony, in the circle of Erzgebirg; 1 mile N. of Mitweyda.

RINGERIKE, a town of Norway; 24 miles N.N.E. of Chriftiania.

RINGES, in *Rural Economy*, a provincial term, fignifying rows of hay, mown corn, quicks, &c.

RINGKIOBING, in *Geography*, a town of Denmark, on the coaft of a large gulf of the North fea, to which it gives name. The inhabitants are almoft wholly employed in trading to Holland and Norway. The bay affords plenty of good fifh, particularly oyfters. It is of a good depth, and fecure, except at the entrance, which is rendered dangerous by fand-banks; 48 miles N.W. of Ripen. N. lat. 56° 2′. W. long. 8° 18′.

RINGLEBEN, a town of Saxony, in the principality of Eifenach; 6 miles N. of Erfurt. N. lat. 51° 6′. E. long. 11° 2′.

RINGO's Town, a town of America, in Hunterden county, New Jerfey; 15 miles N.W. of Princeton.

RINGSTED, a town of Denmark, in the ifland of Zealand, anciently a large city, but reduced by fires into a fmall town: but it is ftill famous for its court of judicature, to which lies an appeal from almoft all the courts of Zealand, whereas no appeal lies from this but to the fupreme court at Copenhagen; 29 miles S.W. of Copenhagen. N. lat. 55° 28′. E. long. 11° 48′.

RINGWOOD, a town of America, in Hunterden county; 25 miles N. of Morriftown, containing 2605 inhabitants.

Ringwood, a market-town and parifh in the hundred of Ringwood, New Foreft, weft divifion, county of Southampton, England, is fituated on the eaftern bank of the river Avon, at the diftance of 14 miles W. by S. from Southampton, and 90 miles S.W. by W. from London. This town is of great antiquity, and is fuppofed by Camden to have been the Regnum of the Romans, which others, however, have fixed, with greater probability, at Chichefter, in Suffex. But whatever it may have been during the Roman government, it unqueftionably attained confiderable importance in the time of the Saxons; and in Domefday book, it is eftimated at a higher value than Thuinam, or Chriftchurch.

Ringwood is noted for its breweries of ftrong beer and ale. A market is held here on Wednefday, weekly; and there are fairs on the 10th of July, and 11th of December. The petty feffions for New Foreft, weft divifion, are holden in this town. The unfortunate duke of Monmouth is very generally ftated to have been taken in a field near Ringwood, after his defeat at Sedgemoor; but this ftatement is erroneous, that prince having been actually feized in the woodlands in Dorfetfhire. According to the parliamentary returns of 1811, the town and parifh contained 658 houfes, and a population of 3269 perfons.

North from Ringwood is the village of Ellingham, where formerly was a religious houfe, founded by William de Salariis, in the reign of Henry II., and appropriated as a cell to the abbey of St. Saviour le Vicompte, in Normandy. When the alien priories in this country were diffolved, Henry VI. granted Ellingham and its poffeffions to the college at Eton. Some remains of the buildings of this eftablifhment are fuppofed to form the nave of the prefent church, and the opinion is certainly not improbable, as it is more ancient than the reft of the fabric. The altar-piece here is a painting of the Day of Judgment, prefented to the parifh by the late lord Windfor, whofe anceftor, brigadier Windfor, brought it from Port St. Mary, in the bay of Cadiz, among the trophies of an expedition againft that city in the year 1702. In the church-yard is a plain ftone, to the memory of dame Alicia Lifle, whom the blood-thirfty Jeffreys condemned to be executed in her old age, on a charge of harbouring known rebels in her manfion at Moyles-Court. This manfion is ftill ftanding, furrounded by a very pleafant, but fmall, park. Its former poffeffors, the Lifles, were originally fettled in the Ifle of Wight, where they had large eftates, and whence they derived their name. Colonel John Lifle, hufband to the above-mentioned Alicia, was one of the judges who paffed fentence on king Charles I. and alfo one of the lords commiffioners of the great feal during the protectorate of Cromwell. On the eve of the reftoration he fled to the continent, was profcribed by the parliament of Charles II., and affaffinated at Laufanne, in Switzerland, by three villains, hired for that purpofe by fome of the royal family, or their friends. Beauties of England and Wales, vol. vi. by John Britton, F.S.A. and E. W. Brayley, Lond. 1805.

RINGWORM, in *Medicine*, a popular appellation, applied to various fuperficial affections of the fkin, which affume fomewhat of a circular form. But the fact is, that almoft all the partial cutaneous difeafes have more or lefs a tendency to the annular figure, and rife in fomewhat irregular patches, approximating to the oval or the circle, which is fometimes perfect, and fometimes broken. It is only by referring to an intelligible nomenclature, fuch as that propofed by the late Dr. Willan, that any difcrimination can be clearly made in the varieties of thefe eruptions. If we examine thefe ringworms according to this fyftem, we fhall find, that there are feveral difeafes, to which the term is applicable, and daily applied, and confequently the fame remedies recommended for their cure, which are, neverthelefs, very different in their nature, and therefore require very different modes of treatment. Thus there is a circular eruption, which confifts of patches of *pimples*, the lichen circumfcriptus of Dr. Willan; even the *fcaly* lepra occurs in circles of various fizes, and is fometimes called ringworm: the *puftular* difeafe, called impetigo figurata, or moift tetter, and the *veficular* eruption termed herpes circinatus, (fee Dr. Bateman's Pract. Synopf. of Cutan. Difeafes,) are alfo diftinguifhed by their circular form, and it is to thefe two laft that the term *ringworm* is moft popularly applied. And above all, the contagious difeafe of the fcalp, the porrigo fcutulata, is fo diftinctly circular in its form, as to be diftinguifhed from the other fpecies of the fame diforder, by the appellation of *ringworm*, or by fome the *ringworm of the fcalp*. See the fame Synopfis, ord. v. gen. 2. See alfo Porrigo, Lichen, Herpes, &c. above.

The general treatment recommended for ringworms by the vulgar, is the application of common *ink*; and this, by its aftringency, which is flight, may be partially ufeful in the decline of the *herpetic* ringworm, above-mentioned, or in the mildeft forms of that of the fcalp: but it will be certainly injurious if applied to the moift *tetter*, or to the *lichen* in its early ftage; and the fame effect can be produced by fimilar aftringents, in a more manageable and lefs dirty form; as by folutions of the fulphate of iron or zinc in rofe-water or other diftilled water. But in fact, the ringworm of the fcalp requires much more active remedies, on the one hand; and on the other, the herpetic ringworm difappears in a fhort time fpontaneoufly; fo that the remedy may be deemed in both cafes ufelefs. It is obvious, then, that difeafes, which are puftular, fcaly, veficular, and papular refpectively; fome of which are inflamed, and others not; fome contagious, and others not; fome difappearing fpontaneoufly, and others refifting the moft active applications; fome connected with diforder of the conftitution, and others merely local, cannot be treated with advantage, or even with impunity, by the ſame ſet of medicines, and ought not to be confounded under the ſame appellation; but popularly, the *name* of a diſeaſe is alone inquired for, and the remedy is appropriated to the name. By diſcarding the term ringworm, or uniting with it the epithets puſtular, veſicular, or herpetic, porriginous, &c. this practical error may be avoided.

RINLING, or AINLING, in *Geography*, a town of Bavaria; 8 miles N.N.W. of Aicha.

RINNE, a river of Thuringia, which runs into the Saale, two miles below Rudelſtadt.

RINOREA, in *Botany*, a name of uncertain derivation, but probably beſtowed on this genus by Aublet, from its native appellation in Guiana.—Aubl. Guian. 235. Juſſ. 287. Lamarck Dict. v. 6. 211. Illuſtr. t. 134.—Claſs and order, *Pentandria Monogynia.* Nat. Ord. *Berberides*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, villous, cloven into five, oblong, acute ſegments. *Cor.* Petals ten, concave, ovate, oblong; the five inner ones ſmaller; all inſerted below the germen. *Stam.* Filaments five, ſhort, inſerted at the baſe of the outer petals; anthers oblong, two-celled, with two valves burſting from the baſe to the top. *Piſt.* Germen ſuperior, roundiſh, villous; ſtyle oblong, villous; ſtigma obtuſe. *Peric.* unknown.

Obſ. Juſſieu deſcribes *Rinorea* as having five longer petals, each furniſhed with an inner one at its claw or baſe.

Eſſ. Ch. Calyx five-cleft. Petals ten, the five inner ones ſmaller. Style one Stigma one.

1. R. *guianenſis.* Aubl. Guian. t. 93.—Native of cultivated ground in Guiana, where it flowered in January.—A *tree* ſix or ſeven feet high, whoſe *trunk* is branched very thickly, to the very ſummit, in a ſtraight alternate manner. *Leaves* alternate, ſtalked, ovate-oblong, acute, toothed. *Stipulas* ſhort, deciduous. *Flowers* white, in axillary, terminal cluſters, each placed on a ſhort ſtalk, which is furniſhed with two ſcales at its baſe.

RINTELN, in *Geography*, a town of Germany, in the county of Schauenburg, ſituated on the S. ſide of the Weſer. The univerſity of Stadthagen was removed to this town in the year 1621; its profeſſors of divinity are Lutheran, but thoſe of the other faculties are Calviniſts. The town church belongs to the Lutherans; the Calviniſts and garriſons uſe the univerſity church for their ſervice. The ramparts, ditches, and bulwarks, that environ the town, were begun in 1665, and finiſhed in 1668. The inhabitants are chiefly employed in agriculture, breeding of cattle, and brewing; 9 miles S.S.E. of Minden. N. lat. 52° 11′. E. long. 9° 8′.

RINUCCINI, OTTAVIO, in *Biography*, an Italian poet of Florence, who went into France in the ſuite of Mary of Medicis, queen to Henry IV. He was the inventor of the muſical drama or opera, that is, of the manner of writing or repreſenting comedies or tragedies in muſic, to which the firſt recitative was applied. (See RECITATIVE.) Others give this invention to a Roman gentleman of the name of Emilio del Cavaliere, who was more properly the inventor of the ſacred drama or oratorio, in a ſimilar ſpecies of muſic or recitative, ſo nearly at the ſame time, that it is difficult to determine which was firſt: both had their beginning in 1600. See CAVALIERE, and ORATORIO.

It is certain that Rinuccini was author of three lyric pieces, "Daphne," "Euridice," and "Ariadne," which all Italy applauded. Euridice, written for the nuptials of Mary of Medicis, was firſt performed with great ſplendour and magnificence at Florence, at the court and expence of the grand duke.

The poetry of Rinuccini is truly lyrical, ſmooth, poliſhed, and mellifluous. He died in 1621, at Florence; and his works were publiſhed in 1622, in the ſame city, in 4to. by his ſon, Pietro Franceſco Rinuccini. The family is noble, and was ſubſiſting in 1770.

RINVEEL POINT, in *Geography*, a cape of Ireland, in the county of Galway, N. of Ballinakiel bay. N. lat. 53° 41′. E. long. 9° 58′.

RINUM, a town of Perſia, in the province of Segeſtan or Seiſtan; 60 miles E.N.E. of Zareng.

RIO *de los Anzuelos*, a river of Mexico, which runs into the Spaniſh Main, N. lat. 11° 10′.—R. *dos Apoſtolos*, a river of North America, which runs into the northern part of the gulf of California.—R. *de Bogota*, a river of New Granada, which collects all the waters of the valley of Bogota, the bottom of which valley, according to Humboldt, is no leſs than 7460 feet above the level of the ſea, and finds its way through the mountains to the S.W. of the town of Santa Fé. (See BOGOTA.) The perfect level of the plain, its geological ſtructure, and the form of the rocks, which reſemble ſmall iſlands in the middle of the Savannahs, appeared to M. Humboldt to indicate the exiſtence of an ancient lake. If the ſingle outlet of the river were to be ſtopped, the valley would again be converted into a lake. The river, where it leaves the valley, is about 144 feet wide, half the breadth nearly of the Seine at Paris, between the Louvre and the Palace of the Arts. It then enters into a narrow rocky channel, not more than 40 feet wide, which appears, ſays the ſame intelligent and inſtructive traveller, to have been formed by an earthquake. After running for a little way in this crevice, the river precipitates itſelf, at two bounds, to the depth of 574 feet. After this tremendous fall, it purſues its way to the Magdalena, about 50 miles, ſtill deſcending with great rapidity, and at the rate of 150 feet to a mile. Although this is not the greateſt fall in the globe, there is not probably any which, from ſo great a height, precipitates ſo large a body of water. Bouguer makes the height between 1500 and 2000 feet; but he ſpeaks only from the information of others who had ſeen the fall, and pointed out to him ſuch heights as they thought might be nearly equal to it. The accompaniments of this waterfall, upon which the effect ſo much depends, are an aſſemblage of every thing that is ſublime, beautiful, and pictureſque. Independent, ſays M. Humboldt, of the height and the ſize of the column of water, the figure of the landſcape, and the aſpect of the rocks; the peculiar character ſtamped on theſe great ſcenes of nature is owing to the luxuriant form of the trees and herbaceous plants, their diſtribution into groups, or into ſcattered thickets, the extent of the craggy precipice, and the freſhneſs of vegetation. Another feature in the character of this extraordinary cataract is probably quite peculiar to it:—the water deſcends from a cold region to a warm one. The plain of Bogota, eſpecially near the fall, is extremely fertile, and is ſuppoſed to owe ſome of its fruitfulneſs to the irrigation occaſioned by the great quantity of water from the fall, which is diſſolved in the air, and afterwards precipitated. The fine crops of wheat, the oak, the elm, and other plants, recall to mind the vegetation of Europe. Looking down from this terrace, one ſees, with ſurpriſe, at the bottom, a country producing the palm, the banana, and the ſugar-cane. This cannot ariſe from the difference of height; as it is known, that no very great change of temperature can be produced by a difference of level of 570 feet. M. Humboldt ſuggeſts, that it is probably owing to the ſhelter which

which the high country affords to the low. It is one of the circumftances that has added much to the marvellous height of the cataract; as the height is naturally fuppofed to be great, that carries one at once from the temperature of Europe, and one where the thermometer is fometimes at the freezing point, to that of the torrid zone. Although the river lofes a great part of its water in falling, which is reduced into vapour, the rapidity of the lower current forces the obferver to keep at the diftance of 150 yards from the bafin dug out by the fall. The folitude of the place, the richnefs of the vegetation, and the dreadful roar that ftrikes the ear, contribute to render the foot of the cataract of Tequendama one of the wildeft fcenes that can be found in the Cordilleras. (Humboldt's Refearches, &c. tranflated by Helm M'Williams, Lond. 1814.)—R. *Bueno*, a river of the ifland of Jamaica, which runs into the fea on the north coaft, N. lat. 18° 30′. W. long. 77° 19′.—R. *de Cedros*, a river of South America, which runs into the Pacific ocean, N. lat. 2° 30′.—R. *Cobre*, a river of Jamaica, which paffes by Spanifh Town, and runs into the fea, 4 miles N.W. of Kingfton.—R. *del Conches*, or *de Salinas*, a river of Mexico, which joins the Brava at its mouth.—R. *Dolce*, or *Frefh-water river*, a river of Brazil, which runs into the Atlantic, S. lat. 19° 20′.—R. *Dolce*, or *Dulce*, a river of South America, in the province of Tucuman, formed by the confluence of feveral rivers. After paffing by St. Yago del Eftero, &c. and purfuing a courfe of about 300 miles, it lofes itfelf in a falt lake, S. lat. 30° 40′.—R. *de los Draces*, a river of Mexico, which runs into the Spanifh Main, N. lat. 9° 45′.—R. *dos Efmeraldas*, a river of America, on the ifthmus of Darien, which runs into the Pacific ocean, N. lat. 2° 42′.—R. *dos Efmeraldos*, a river of Peru, which runs into the Pacific ocean, N. lat. 0° 57′.—R. *Frifco*, a river of Africa, which runs from the Ivory coaft into the Atlantic, N. lat. 5° 8′. W. long. 5° 55′.—R. *dos Galinas*. See Magualbari.—R. *Grande*, a river of South America, which runs into the Spanifh Main, between Carthagena and St. Martha.—Alfo, a river of the ifland of Jamaica, which runs into the fea, on the N. coaft, N. lat. 18° 15′. W. long. 76° 14′.—R. *Grande*, or *Civdad Nova*, a town of Brafil, in the jurifdiction of Fernambuco, formerly the feat of a jurifdiction. S. lat. 5° 44′.—R. *Grande*, a river of Brafil, fcarcely deferving the name, the mouth of which is fituated in S. lat. 3° 2′.—Alfo, a river of Africa, which paffes the coaft of Zanguebar, and runs into the Indian fea, forming the iflands of Patta and Lamo at its mouth. S. lat. 2° 5′. E. long. 41° 30′.—Alfo, a river of Africa, navigable for boats near 400 miles from the mouth, which lies on the Atlantic, N. lat. 11°. W. long. 14° 36′.—Alfo, a river of America, which rifes in the ifthmus of Darien, and runs into the Pacific ocean, three miles W. of Panama. See alfo Vermejo, Patixa, and Hacha.—R. *Hondo*, a river of Yucatan, which runs into the bay of Honduras.

Rio *de Janeiro*, a jurifdiction or independent government of Brafil, fo called by the Portuguefe when they became mafters of the country, from the river Janeiro, which runs through the middle of it; and the river probably derived its name from its having been difcovered on the day of the feaft of St. Januarius, or on the 1ft day of January, in 1516, by Solis. The province and the river are called by the natives "Genabara." At the mouth of the river, on the eaft fide, is the fort of Santa Cruz, and on the weft, that of St. Jago, together with the capital. The rivers in this government are few, and none of them large, except the Janeiro, which is rather a falt bay or gulf than a river, and two rivers that difcharge themfelves into this bay. At the mouth of it are feveral fmall iflands, that render its entrance fomewhat difficult and dangerous. Although the foil of this province is for the greateft part rich and fertile, the inhabitants manifeft little induftry either in the cultivation of the foil or the improvement of the country. It confifts chiefly, at leaft near the capital, in raifing garden vegetables for the whites, and rice and manioc for the blacks. Wheat is found to grow in other parts of the Brafils, with an increafe beyond what is known in Europe. A corn-mill, diftinguifhed by the fimplicity of its ftructure, attracted the notice of fir George Staunton; and he has thought it worthy of being defcribed. A wheel, a few feet only in diameter, was placed horizontally, much below the current of a ftream, as it fell from a fteep bank, and was received in hollows, 10 or 12 in number, fo obliquely fcolloped into the upper rim of the wheel, as to impel it to a quick rotatory motion, while its upright fhaft, paffing through an opening in the centre of an immoveable mill-ftone above the wheel, but of a narrower diameter, was fixed to a fmaller mill-ftone, which, forced round with the motion of the wheel and dependent fhaft, crufhed between it and the larger ftone beneath, the grain infinuated between them from a hopper. Thus that effect was produced by one wheel only, which is generally the refult of a much more expenfive and complicated machinery. A fimilar mill, it is faid, is in ufe in the Crimea. A foreft, not far from the capital, was found, by fir George and his affociates, to abound in palms and maftic wood; alfo mango and gouyava trees are found growing to the fize of trees, befides many other vegetables, never obferved before by thofe who were then travelling through it. The ipecacuanha plant is faid to grow at St. Catharine's within the government of Rio. The fize and vivid hue of many of the flowers throughout the foreft, and the gaudy plumage of the birds, which came occafionally in fight, were very ftriking. The woods, it is faid, abound in fnakes, fome of which are extremely large and formidable. But their hiffing noife puts thofe who hear it on their guard, and they feldom, without provocation, advance to an attack. The foreft now mentioned led to the cultivated valley of "Tijouca," fituated, as it were, in the bottom of a funnel, being furrounded on all fides by mountains, excepting to the fouthward, where a fmall opening admitted an arm of the fea. The valley was watered by a clear ftream, which, upon firft entering it, was precipitated down a fteep and broad rock of granite, forming a magnificent cafcade. Very little labour appeared neceffary in the plantations of Tijouca. Indigo, manioc, coffee, cacao, and chocolate-trees, fugar-canes, plantains, and orange and lime-trees, were commonly feen all growing promifcuoufly, and fome fpontaneoufly, in the fpace of 20 fquare yards. Coffee and indigo were the principal objects of attention. The temperature of the valley was exceffively hot, on account of its confined fituation, and the reflection of the fun's rays from the fides of the mountains, which in many places were very rocky. Fahrenheit's thermometer, about four in the afternoon, ftood, in the fhade, at 88°. Several diftricts of the government of Rio produced cotton, fugar, coffee, and cacao or chocolate, rice, pepper, and tobacco, in great abundance. That of Rio Grandé yielded plenty of excellent wheat. The vine grew in great perfection; but the grape is not fuffered to be preffed for wine, as fuch a procefs might interfere with the fale of the fame article from Portugal. But probably lefs caution may be exercifed in this refpect fince the removal of the Portuguefe government to the Brafils. Moft of the land, as far as Cook and his companions had an opportunity of obferving it, was laid down in grafs, upon which cattle were paftured in great plenty; but they were fo lean, that an Englifhman would fcarcely eat their flefh: the herbage of thefe paftures confifts chiefly of creffes, and confequently is fo fhort, that though it may afford a bite for horfes and fheep, it can hardly be grazed by horned cattle in a fufficient quantity for keeping them alive. For other particulars relating to the climate, productions, commerce, and inhabitants of this province, fee BRASIL, and the next article.

RIO *de Janeiro*, a city of Brafil, and capital of the abovementioned government, and alfo of the whole country, and the Portuguefe dominions in America, fituated on a river, or rather an arm of the fea, of the fame name. Formerly Bahia dos Todos, or Santos, was the principal feat of government, and chief mart for commerce in the Brafils; but the difcovery and improvement of the gold and diamond mines, within about 100 leagues of Rio de Janeiro, and communicating immediately with it, gave a decided preponderancy to the latter. The city ftands on a plain, clofe to the fhore, on the W. fide of the bay, at the foot of feveral high mountains which rife behind it. It is neither ill-defigned nor ill-built; the houfes in general are of ftone, and two ftories high; every houfe having, after the manner of the Portuguefe, a little balcony before its windows, and a lattice of wood before the balcony. Its circuit was computed by lieutenant, afterwards captain, Cook, to be about three miles, and it appeared to be equal in fize to the largeft country towns of England, Briftol and Liverpool not excepted; the ftreets are ftraight, and conveniently broad, interfecting each other at right angles; moft of them, however, lie in a line with the citadel, called St. Sebaftian, which ftands on the top of a hill, that commands the town. The harbour is fafe and capacious, and very convenient for commerce. Captain Mackintofh, from experience, recommends to fhips bound for this harbour, after getting in with cape Frio, inftead of fteering along fhore, to fhape their courfe between S.W. and S.W. by W. for 12 or 14 leagues. To this diftance the land wind extends. The forenoons in general are calm, but almoft every afternoon a frefh fea-breeze fets in from the S.W. It is proper to fteer, in a direct courfe, from hence to the fmall iflands lying under the great inclining Sugar-loaf on the weftern fide of the entrance into Rio harbour. From thefe fmall iflands the wind will carry the fhip to the oppofite fide of the harbour's mouth, where the fort of Santa Cruz is fituated, and which may be approached within 50 yards, and from thence, fafely and quickly, into harbour. The entrance of the harbour, as fir Erafmus Gower obferves, will fhew itfelf by difcovering the caftle or fort of Santa Cruz, and a fmall fortified ifland, called Fort Lucia, nearly abreaft of it. Between thefe is the channel into the harbour, near a mile wide; both fhores are fteep; that of Santa Cruz is perpendicular, there being fix fathoms in the wafh of the fea. The narrownefs of the channel caufes ftrong tides; but as the fea-breeze blows frefh, they do not impede entering into the harbour. In going in it is beft to keep mid channel, or even nearer to Santa Cruz. About four miles outfide the harbour's mouth, the depth of water is 18 and 19 fathoms, which will decreafe gradually to 8 or 7; and this, being the fhalloweft part, may be called the bar, which is about two miles outfide the fort. The water again deepens, on approaching to Santa Cruz, to 17 and 18 fathoms, nor will lefs be found in the fair way of the great road. Large fhips may moor in fhoaler water, but that depth, or thereabouts, is more advifeable, as fuch a fituation affords the full advantage of the fea-breeze, as well as that of avoiding the infects, which are very troublefome when nearer to the fhore. In the inner harbour, formed by an ifland called "Ilheo dos Cobras," or Serpent ifland, are proper wharfs for heaving fhips down by; but the mode of doing it alongfide hulks is now preferred. In the fame harbour will fhips anchor, which are loading or unloading goods, or want repairing; but the outer is the more healthy fituation. Rio is fituated in S. lat. 22° 54′, and W. long. 42° 44′. The variation of the compafs is 4° 55′ W. of the pole. The tide flows $7\frac{1}{2}$ hours, and rifes about $5\frac{1}{2}$ feet perpendicular. Fahrenheit's thermometer, during fir G. Staunton's ftay, was between 77° and 82°.

The entrance into the harbour, from the fea, is bounded, on one fide, by the leaning cone already mentioned, meafuring 700 feet in height, and by the huge mafs of granite, fupporting the caftle of Santa Cruz, on the other; and is interrupted, near the middle, by the little ifland on which Fort Lucia is erected. On entering into the harbour it was found to enlarge to a width of three or four miles, and to penetrate, in feveral branches, farther than the eye could reach. It is interrupted with many iflands, fome entirely green, and fome covered with batteries or habitations. The fhores of the harbour were diverfified and embellifhed with villages, farms, and plantations, feparated by rivulets, ridges of the rocks, indentures of little fandy bays, or the fkirtings of a foreft; the whole terminated, in diftant profpect, by an amphitheatre or fcreen of mountains, rifing in a vaft variety of rude and fantaftic forms, but covered with trees to their very fummits.

Within four miles of the harbour's mouth is fituated, on the W., the city of St. Sebaftian, ufually called Rio, built on a projecting tongue of land; but all the ground behind it is broken into hills and rocks, with woods, houfes, convents, and churches on their tops. A convent of Benedictines, and alfo a fort commanding the town, are fituated upon the extreme point jetting into the harbour; oppofite to this point is Serpent ifland, between which and the town is a narrow channel, fufficiently deep, however, for the paffage of the largeft fhips. Upon the ifland are, a dock-yard, magazines, and naval ftore-houfes; and round its fhores are the ufual anchoring places for the fhipping which frequent this port. Beyond the town the harbour begins to widen confiderably, and refembles a large lake with many iflands upon its furface. In the late improved ftate of the town, the ftreets are paved, with the addition of foot-paths, and though fome of them are narrow, they are convenient in a hot climate by the fhade which they afford. In the fquares are refrefhing fountains, which fupply the water conveyed to them by an aqueduct of confiderable length; a circumftance of moment, as Rio has no river clofe to it of any note. This aqueduct is carried over vallies by a double row of arches, one placed above another; and thus prefents a ftructure that adds great ornament to the town. A guard conftantly attends at the fountains throughout Rio, to regulate the diftribution of the water, which is, probably, fcanty, as there are people who wait a long time with buckets for their fhare. A fufficient proportion of the water from the fountain upon the quay oppofite to the palace, is allotted for the ufe of the fhipping, and is conveyed to the cafks, remaining in the boat, by means of a woollen or canvas tube, called a hofe, ftretching from the fountain to the cafk. Capt. Cook complained that the water was not good; but this circumftance fir Erafmus Gower afcribes to fome accidental impurities that muft have remained in the cafks which he filled with it.

The fhops of Rio, fays Staunton, were full of Manchefter manufactures, and other Britifh goods, even to Englifh prints, both ferious and caricature. A Portuguefe merchant adverting to thefe fupplies of goods, and the advantages gained by the country that furnifhed them, obferved that the profperity both of Portugal and its dependencies redounded

redounded chiefly to the benefit of England. The benefit has probably been reciprocal; and, it is hoped, will thus continue. The exterior appearance of the inhabitants indicated eafe and comfort; their dwellings were generally in good condition, many of them large, and well adapted to the climate; the magazines and markets well ftored with merchandize; new buildings, private and public, erected; tradefmen bufily employed; and befides the aqueduct and fountains, which adorned the city, it had fome public walks, and a fpacious quay of granite, of which material, found upon the fpot, many of the chief edifices were conftructed. The place, however, is faid to be unhealthy; and inftances of longevity are rare. This infalubrity may be owing, perhaps, to local and temporary circumftances, more than to the neceffary influence of the climate. The fituation of the town upon a plain, almoft wholly furrounded by hills thickly covered with foreft trees, deprives it of a free circulation of air, and expofes it to the morning and evening damps of humid nights, preceded by fcorching days, and of courfe putrid and intermitting fevers muft often be the confequence. Water is alfo fuffered to ftagnate in marfhes near the town; and to thefe difadvantages we may add the tormenting influence of infinite fwarms of mufquitoes, or large gnats, which attack ftrangers for fome time after their arrival. But none of thefe real, or any imaginary, evils reftrain the propenfity of all claffes of fociety towards gaiety and pleafures. See Brasil.

The inhabitants of Rio are very numerous, and confift of Portuguefe, Negroes, and Indians, the original natives of the country. This townfhip, which is but a fmall part of the capitanea, or province, is faid, according to Cook, to contain 37,000 white perfons, and 629,000 blacks, many of whom are free, amounting together to 666,000, in the proportion of 17 to 1. The Indians, who are employed to do the king's work in this neigbourhood, can fcarcely be confidered as inhabitants; their refidence is at a diftance, from whence they come by turns to their tafk, which they are obliged to perform for a fmall pay. The guard-boat was conftantly rowed by thefe people, who are of a light copper colour, and have long black hair. See Brasil.

When walking abroad, men of the lower claffes generally wear cloaks; and thofe of the middling and higher ranks never appear without fwords. The ladies wear their hair hanging down in treffes, tied with ribbands, and adorned with flowers; their heads being uncovered. In their vifits to the churches, both at matins and vefpers, they are regular; at other times they are generally feated at their windows or balconies. Many of them have fine dark eyes, with animated countenances. In the evenings they amufe themfelves by playing on fome kind of mufical inftrument, chiefly the harpfichord or guitar. At this time the doors and windows are thrown open for the admiffion of cool air. If a ftranger fhould happen to ftop to hear the mufic, it often happens that the father, hufband, or brother of the lady that is playing, fteps out and politely invites him into the houfe; and the ladies, not unfrequently, having bunches of flowers in their hands, exchange them with gentlemen as they pafs by. This practice may perhaps be an imitation of that of the ladies of Lifbon, who on particular days, called "days of intrufion," throw nofegays from their balconies upon perfons walking under them. Captain Cook charges the fame indelicate want of referve on the ladies of Rio; but we truft the accufation which fome perfons have brought againft them, that there is not one modeft woman among them, is not only too general, but founded on a mifreprefentation of what they may conceive to be an allowable practice, founded in cuftom and courtefy. Some of the men, however, have been accufed of much worfe practices, in yielding to depraved and unnatural appetites.

Among the more innocent pleafures of both fexes are operas, plays, and mafquerades. Company often affembles at a garden, fituated near the fea, at one extremity of the town, and laid out in grafs plats, fhrubberies, and parterres, ornamented in various ways. In thefe receffes the gay fociety of Rio, after taking the exercife of walking in the evening, and after hearing fongs and mufic, fit down to partake of banquets, occafionally accompanied by mufic and fire-works. On the fide of this garden next the fea is a terrace, and at the extremities of the terrace there are two neat fquare buildings, like Englifh fummer-houfes. In one the walls are decorated with paintings, reprefenting views of the harbour, and particularly of the whale-fifhery, which was formerly carried on in it; until the large black whale, which formerly frequented it, was difturbed and driven away, in confequence of the increafed concourfe of fhipping. The cieling of this and the other fummer-houfe are covered with various appropriate devices, in fhell or feather work; and the walls of the latter are decorated with eight large paintings, defcriptive of the principal productions to which the country is indebted for its opulence, including views of the diamond and gold mines, with the operations performed in them; of the cultivation of the fugar-cane, and the proceffes by which its juice is extracted and granulated into fugar; of the manner of collecting the fmall animals which produce the cochineal, and preparing the rich dye from them; of the culture of the manioc, with the procefs of making caffada and tapioca; and of the culture and preparation of coffee, rice, and indigo. Near the town is another garden, originally intended for promoting the progrefs of botany, but now chiefly curious for a fmall manufacture of cochineal; but the garden at Rio does not produce annually above 30 pounds of this commodity. The preparation of cochineal, however, is now encouraged by the trade being laid open, which was formerly a monopoly to the crown. Another fpecies of manufacture is carried on in the vicinity of Rio; an exclufive privilege having been given to a company, upon paying one-fifth of its profits to the crown. To this harbour was brought, for the purpofe of converting it into oil, the blubber or firm fat of the black whales. The whalebone or cartilages of the jaw were alfo properly feparated and cleanfed here, before they were fent to Europe. In another part of the harbour of Rio, called Val Lengo, are warehoufes for the reception and fale of flaves. See Brasil.

The eftablifhment for the defence of Rio confifts of two fquadrons of cavalry, two regiments of artillery, fix regiments of infantry, two battalions of difciplined militia, befide above 200 difciplined free Negroes; making, in the whole, a body of at leaft 10,000 men, exclufively of a very numerous regiftered but undifciplined militia, of whom a confiderable proportion is in the city and its neighbourhood. The entrance of the harbour, which is fcarcely a mile from point to point, is croffed in every direction by heavy batteries. The fort of Santa Cruz is a work of fome ftrength, and the principal defence of the harbour. But the defence of the city of Rio is fuppofed to depend chiefly on the works erected on the Serpent ifland, which is about 300 yards long: it mounts 46 guns, 20 facing the fouth and fouth-eaft, and the remainder looking to the oppofite points. The parapet, along the front of the town, recently conftructed, will afford a good line for mufquetry and light guns.

The high conical rocks at the entrance of the harbour of Rio, and the furrounding hills, are all of granite, in which the only remarkable circumſtance is the large proportion of feld-ſpath contained in it. About two miles within the harbour, on the ſouth-weſt ſide, is one high rock, entirely compoſed of columnar maſſes, bearing the reſemblance of baſaltes: it reſts upon clay. In all the quarries of granite it is found incumbent upon clay and ſand. Here are three ſpecies of granite: the firſt, red-coloured, ſoft, and ſhining; the ſecond, deep blue coloured, harder, and of a cloſer texture; and the third of a whitiſh ſhining colour, containing much mica, and little feld-ſpath; its texture ſoft, and incapable of a good poliſh.

The government of Rio is, as to its form, mixed; and yet, in fact, very deſpotic. It conſiſts (we are now ſpeaking of its ſtate before the removal of the Portugueſe government thither) of the viceroy, the governor of the town, and a council. To reſtrain the people from travelling into the country, and penetrating into any diſtrict where gold or diamonds may be found, certain bounds are preſcribed to them, at the diſcretion of the viceroy, ſometimes at a few, and ſometimes at many, miles diſtance from the city. On the verge of theſe limits a guard conſtantly patroles, and any perſon that goes beyond it is ſeized and thrown into priſon.

The riches of this place conſiſt chiefly in the mines, that lie at a conſiderable diſtance in the country, from which much gold is brought, at the expence of many lives. Precious ſtones are alſo found here in ſuch plenty, that a certain quantity only is allowed to be collected in a year: they are diamonds, topazes of ſeveral kinds, and amethyſts. The mines called "general" are the neareſt to the city, at the diſtance, according to the ſtatement of M. Bougainville, in his account of his voyage round the world, of about 75 leagues. They yield to the king every year, for his right of fifths, at leaſt 112 arrobas of gold: in 1762 they yielded 119. Under the captaincy, the MINAES *Geraes* (which ſee) are comprehended thoſe of Rio de Morte, of Sabara, and of Serro-frio. The laſt, beſides gold, produces all the diamonds that come from Braſil. They are found at the bottom of a river, of which they turn the courſe, in order to ſeparate from the pebbles in its bed the diamonds, topazes, chryſolites, and other ſtones of inferior quality. Of all theſe ſtones, the diamonds alone are contraband: they belong to the undertakers, who are obliged to give an exact account of the diamonds found, and to place them in the hands of the intendant appointed by the king for this purpoſe, who depoſits them immediately in a caſket encircled with iron, and ſhut with three locks. He has one of the keys, the viceroy another, and the aſſayer of the royal treaſury the third. This caſket is encloſed in a ſecond, ſealed by the three perſons above-mentioned, and which contains the three keys of the firſt. The viceroy has not the power of viſiting its contents: he only conſigns the whole to a third ſtrong coffer, which he ſends to Liſbon, after having ſet his ſeal on the lock. They are opened in the preſence of the king, who chooſes what diamonds he pleaſes, and pays the price to the undertakers at the rate fixed by their agreement. The undertakers pay to his moſt faithful majeſty the value of a piaſtre Spaniſh money, for every ſlave employed in ſearching for diamonds; and the number of theſe ſlaves may amount to 800. Of all kinds of contraband trade, that of diamonds is the moſt ſeverely puniſhed.

The gold drawn from the mines cannot be carried to Rio de Janeiro, without being firſt brought to the ſmelting houſes eſtabliſhed in each diſtrict, where the right of the crown is received. What reſults to private perſons is remitted in bars, with their weight, number, and the royal arms. Thoſe bars belonging to individuals are regiſtered in the factory of La Prayburia, 30 leagues from Rio de Janeiro. In this ſtation are a captain, lieutenant, and 50 men; here is paid the right of fifths; and, beſides, a toll of a real and a half *per* head on men, cattle, and beaſts of burthen. Half of the product of this duty belongs to the king, and the other half is divided between the detachment according to rank. As it is impoſſible to return from the mines without paſſing by this office, all perſons are there ſtopped, and ſearched with the greateſt ſeverity. Individuals are afterwards obliged to carry all the gold in bars, which belongs to them, to the mint of Rio de Janeiro, where the value is given in coin, commonly in half doubloons, each worth eight Spaniſh dollars. Upon each of theſe half doubloons the king gains a dollar, by the alloy and the right of coinage. The mint of Rio Janeiro is one of the moſt beautiful which exiſt; it is furniſhed with every convenience to work with the greateſt celerity. As the gold arrives from the mines at the ſame time that the fleets arrive from Portugal, it is neceſſary to accelerate the work of the mint, and the coinage proceeds with ſurpriſing quickneſs. The arrival of theſe fleets renders the commerce of Rio Janeiro very flouriſhing, but chiefly that of the Liſbon fleet. The mines of St. Paolo and Parnaqua yield to the king four arrobas for the fifths every year. The moſt diſtant mines, as thoſe of Pracaton and Quiaba (Cuyaba), depend on the captaincy of Matogroſo. The fifth of the above mines is not received at Rio Janeiro, but that of the mines of Goyas is deducted. This captaincy alſo poſſeſſes diamond mines, the working of which is prohibited.

The whole of the expence of the king of Portugal at Rio Janeiro, for the payment of the troops and civil officers, and for the charges of the mines, the maintenance of the public buildings, the careening of veſſels, amounts to about 600,000 dollars. The expences of building ſhips of the line and frigates there ſtationed are not included.

Recapitulation, and Amount of the Average of different Objects of royal Revenue.

	Dollars.
150 arrobas of gold, the average produced by the royal fifths, are in Spaniſh money	1,125,000
The duty on diamonds	240,000
The duty on coinage	400,000
Ten *per cent.* from the cuſtom-houſe	350,000
Two and a half *per cent.* of free gift	87,000
Right of toll, ſale of employments, officers, and generally all the profits of the mines	225,000
Duty on ſlaves	110,000
Duty on fiſh-oil, ſalt, ſoap, and the tenth on the proviſions of the country	130,000
Total	2,667,000

From which, deducting the above expences, it will appear that the king of Portugal draws from Rio Janeiro a revenue exceeding 10,000,000 of French livres, or 416,666*l.*

The coin that is current here, is either that of Portugal, conſiſting chiefly of 36*s.* pieces, or pieces both of gold and ſilver, which are ſtruck at this place: the pieces of ſilver, which are very much debaſed, are called patacks, and are of different value, being eaſily diſtinguiſhed by the number of rees marked on the outſide. Here is alſo a copper coin, like that in Portugal, of five and ten ree pieces. See REE.

Upon the whole, Rio de Janeiro is a very good place for ſhips to put in at that want refreſhment: the harbour is ſafe and commodious; and proviſions, except wheaten bread and flour, may be eaſily procured: as a ſuccedaneum for bread, here

here are yams and caſſada in plenty: beef, both freſh and jerked, may be bought, ſays Cook in 1768, at about $2\frac{1}{4}d.$ a pound, but it is very lean. The people here jerk their beef by taking out the bones, cutting it into large but thin ſlices, then curing it with ſalt, and drying it in the ſhade: it eats very well, and if kept dry, will remain good a long time at ſea. Mutton is ſcarcely to be procured, and hogs, and poultry, are dear. Of garden-ſtuff and fruit there is abundance; but none can be kept at ſea except the pumpkin: rum, ſugar, and molaſſes, all excellent in their kind, may be had at a reaſonable price; tobacco is alſo cheap, but not good. Cook's Voyages by Hawkeſworth, vol. ii. Staunton's Embaſſy, vol. i.

Rio *Infanta*. See *Great* Fish *river*.

Rio *de Limones*, a river of the iſland of Cuba, which runs into the Spaniſh Main, N. lat. 20° 21′. W. long. 78°.—R. *Mino*, a river of Jamaica, which runs into the ſea, on the W. ſide of Carliſle bay.

Rio *das Mortes*, a town of Braſil, in the juriſdiction of Minaes Geraes, ſituated on a river of the ſame name, which runs into the Parana.

Rio *Negro*, a conſiderable river of South America, which runs from the river Oronoko, in the kingdom of Granada, and enters the river of the Amazons, near Fort Rio Negro. S. lat. 3° 15′. W. long. 61° 31′.—R. *Nuevo Bay*, a bay on the N. coaſt of Jamaica. N. lat. 18° 26′. W. long. 76° 46′.—R. *de Oro*, a river of the iſland of Chiloe, which runs into the Pacific ocean, S. lat. 42° 45′.—R. *de Ouro*, a river of Africa, which runs into the Atlantic, N. lat. 23° 52′. W. long. 16°.—R. *de las Palmas*. See Palmas.—R. *das Palmas*. See Scherbro.—R. *de la Plata*. See Plata.—R. *dos Patos*, a river of Braſil, which runs into the Atlantic, S. lat. 28° 30′.—R. *dos Pedras*, a river of Africa, which runs into the Atlantic, N. lat. 9° 10′.—R. *de Pinos*, a river of the Iſthmus of Darien, which runs into the Spaniſh Main, N. lat. 9° 12′. W. long. 80° 25′.—R. *de Puercos*, a harbour on the N. coaſt of Cuba, S.W. of Bahia Honda.—R. *de los Rabados*, a river of Chili, which runs into the Pacific ocean, S. lat. 45° 10′.—R. *dos Ramos*, a river of Africa, which runs into the Atlantic, S. lat. 14° 37′.—R. *Real*, a river of Braſil, which divides the captainſhip of Sergippe from that of All-Saints. This river, if it were not for the bar at the entrance, on which there is but ten feet of water, would be an inlet to the moſt fertile and pleaſant part of the Braſils. Over the bar there is room enough, and depth of water ſufficient, for the whole navy of England to ride in ſafety. About four leagues above the mouth, this river divides itſelf into four large branches, one running N.N.W. called Rio Fundo, another N.W. navigable for any veſſel that can get near the bar, as far as the towns of St. Lucia and St. Euſtatia, from the latter of which it takes its name, a third, called Rio de Pao Grand, or Great Timber river, which runs W.N.W. The main branch, which runs W.S.W. is alſo navigable as far as the town of Bahia, about 20 leagues from its mouth. On the banks of theſe branches there are many fine plantations, and ſmall villages, which ſend great quantities of ſugar, tobacco, and mandioc to Bahia or Fernambuco, as the wind permits. This river runs into the ſea through four channels, formed by three ſmall ſandy iſlands, lying in the mouth of it. About 12 leagues to the S. of Rio Real is a ſmall harbour, called Torre Garcia de Avilla, defended by four pieces of cannon; the town lies about a mile above the port, on the higheſt land on this coaſt; and it is the beſt for a ſhip to make, that is bound to Bahia, while the N.E. wind blows.—R. *del Rey*, or *River Real*, a river of Africa, which runs into the Atlantic, N. lat. 4° 30′. E. long. 8° 5′. This river may be diſtinguiſhed by the extreme high lands of Amboyes, between it and the river Camarones, ſituated S.E. from the mouth. It appears like a deep large bay running N., 21 or 24 miles wide at the entrance, where the ground is oozy; the channel being exactly in the middle, free from ſhoals and ſands, except near the E. ſide, which is foul; the ſhore on both ſides is low and marſhy. The river which comes far from the N., is wide for a long interval into the country, and receives ſeveral conſiderable rivers in its courſe: the adjacent lands are populous and full of villages. The principal trade conſiſts in ſlaves and large elephants' teeth, and akkori or blue coral. The inhabitants are called *Calbongas* (which ſee).—R. *dos Reyes Magos*, a river of Braſil, which runs into the Atlantic, S. lat. 19° 20′.—R. *St. Balardo*, a river of New Albion, which runs into the Pacific ocean, N. lat. 34° 44′.—R. *St. Andre*, a river of Chili, which runs into the Pacific ocean, S. lat. 35° 40′.—R. *St. Maria*, a river of Chili, which runs into the Pacific ocean, S. lat. 51° 36′.—R. *de Sal*, a river of Mexico, which riſes in the province of Culiacan, on the borders of New Biſcay, and runs into the Pacific ocean, N. lat. 23° 40′.—R. *Salado*, a river of South America, in the province of Tucuman, which riſes about 60 miles W. of Salta, and firſt bears the name of "Rio del Paſſage," but being joined by ſeveral ſmaller ſtreams, it changes its name to Salado, and runs into the Parana at Santa Fé, in the province of Buenos Ayres; its whole courſe being about 500 miles.—R. *Salado*, or R. *des Apaches*, a river of North America, one of the branches of the river Bravo, which joins the main ſtream, about N. lat. 30° 40′. W. long. 86°.—R. *Salado*, a river of South America, which in the latter part of its courſe, divides Chili from Peru, and runs into the Pacific ocean, S. lat. 26° 15′.—R. *de los Sauces*, a river of South America, which riſes in Patagonia, and runs into the Atlantic by two ſtreams, forming between them a conſiderable iſland and the ſouthern mouth of the bay of Anegada, S. lat. 39° 45′.

Rio *Seco*, a town of Portugal, in the province of Beira, on the borders of Spain; 7 miles S.S.E. of Almeida.—R. *Seco*, a river of Peru, which runs into the Pacific ocean, S. lat. 7° 6′.

Rio *Secundo*, a town of South America, in the province of Cordova, on the river Secundo; 30 miles S. of Cordova.—R. *Selbola*. See Scherbro.—R. *Sin Fondo*, a river of Chili, which runs into the Pacific ocean, S. lat. 43° 50′.—R. *del Spiritu Santo*. See Manica.—R. *das Trombetas*, a river of Braſil, which runs into the river of the Amazons at Pauxi.—R. *de Vacas*, a river of Mexico, which runs into the Pacific ocean, N. lat. 14°.—R. *Verde*, a river of Peru, which runs into the Pacific ocean, N. lat. 1°.

Rio *Verde*, a town of Mexico, in the province of Guaſteca; 90 miles N.W. of St. Yago de los Valles.

RIOBAMBA, a juriſdiction of South America, in the viceroyalty of New Granada and audience of Quito; ſituated to the ſouth of the aſſiento of Latacunga. This juriſdiction is divided into two departments; the corregidor, who reſides at Riobamba, appointing a deputy, who lives at the aſſiento of Hambato, ſituated between the capital and Latacunga. The firſt department contains 18 principal villages. The productions and manufactures of the province of Riobamba excel all the reſt of the provinces of Peru. In various parts it has rich mines of gold and ſilver. The juriſdictions of Riobamba, Alauſi, and Cuença, by means of the warehouſes at Yaguache and Noranjel, carry on a conſiderable trade with Guayaquil. This trade, in the manufactures of the country, which conſiſt only of three ſorts,

cloth,

cloth, bags, and linen, is attended with confiderable profit to the dealers, and advantage to the country, as all the poor people, who are remarkably numerous, and perfons of fubftance, except thofe of the capital, wear the goods manufactured in the country. Part of the wheat produced in the jurifdiction of Riobamba and Chimbo is fent to Guayaquil. This jurifdiction is (by miftake) defcribed under *Hambato* (which fee). We fhall here fubjoin an account of Hambato. This affiento ftands in a wide plain at the bottom of a mountain, N. of Riobamba. On its N. fide runs a large river, which has a bridge; the river having never been fordable on account of its depth and extreme rapidity. It is finely fituated, and in extent of populoufnefs nearly equal to Latacunga; the number of its inhabitants amounting to eight or nine thoufand. The houfes are built of unburnt bricks, well planned, and make a good appearance. They are of low elevation, for the purpofe of avoiding the deftructive effects of earthquakes. Here are a parifh church, two chapels of eafe, and a convent of Francifcans. The earthquake which made fuch terrible havock in the affiento of Latacunga proved alfo fatal to this, the horrors of which were augmented by the terrible eruptions from mount Carguarifo, in confequence of which a muddy torrent, formed of afhes, cinders, and fnow melted by the flames of the aperture, precipitated down the fides of the mountain, overflowing the fields, fweeping away the cattle, and every thing elfe in the way by its violence. The inhabitants, in their manners and cuftoms, refemble thofe of Quero; but it has fewer families of diftinction than Riobamba. The bread made at this affiento is famous all over the province, and accordingly it is fent to Quito and other parts, without being deteriorated by length of time. It has fix villages. The Indian inhabitants of the village of Quero make all forts of cabinet work; that of Petate is equally famous for abundance of fugar-canes and the excellent quality of its fugar; and that of Santa Rofa de Pilaguin, which, with its fields, lies on the fide of Carguarifo, is famous for the goodnefs of its barley, as the diftrict bordering on the affiento is for its exquifite fruits; and to this diftrict Quito owes moft of the European kinds fold in that city. See Quito and Granada.

Riobamba, the capital of the jurifdiction above-mentioned, and defcribed under Hambato. This elegant town, by the devaftation occafioned by the terrible earthquake on the 4th of February 1797, became a heap of ruins, and foon totally difappeared; for the peak of Sicalpa falling on the town, and ftopping the two rivers which pafs by it, formed a lake, fo that even the ruins were not vifible. Of 9000 inhabitants, only about 400 efcaped. Although Quito fuftained little damage, Latacunga, and all the hamlets in its corregiamento, were utterly deftroyed. Many perfons perifhed, and the furvivors were infected by the putridity of the dead bodies. Near Hambato many mountains fplit, and by their fudden fall occafioned ftill more awful deftruction among the human race. Quero, mentioned in the preceding article, with all its people were buried, in an inftant, under a cliff which fell on the town. Pelileo was overwhelmed by a ftream of water and mud; the circumjacent lands were all tranfpofed; and a deadly filence indicated the general ruin. Alaufi and Guaranda alfo fuffered greatly. The fate of Cuença, Loja, Jaen, and Guayaquil, was, at that time, unknown; but the fhocks do not feem to have extended fo far. The caufe of this defolation feems to have proceeded from the volcano Tangarunga or Tangurugua, between Latacunga and Riobamba; as the tremendous fubterraneous thunders all proceeded from that quarter, and the greateft ruin was in its vicinity; towards the N. the earthquake was faintly perceived at Pafto. Riobamba is diftant 90 miles S. from Quito. S. lat. 1° 20'. W. long. 78° 30'. See Quito.

RIOCHICO, a town of New Mexico, in the province of Hiaqui, on the river Hiaqui; 800 miles N.W. of Mexico. N. lat. 29° 4'. W. long. 111° 36'.

RIOFRIO, a town of Spain, in Old Caftile; feven miles S. of Segovia.

RIOJA, a town of South America, in the province of Tucuman; 240 miles W.S.W. of St. Yago del Efteros. N. lat. 29° 15'. W. long. 70°.

RIOLAN, John, in *Biography*, an able French phyfician, was born at Amiens. He was greatly diftinguifhed by his attainments both in literature and fcience, and is faid not only to have written and fpoken the learned languages with facility, but to have been thoroughly intimate with the contents of almoft all the writings of the ancients. He gave leffons in natural philofophy at the college of Boncour, at Paris, where he took his degree in the year 1574. Little is recorded refpecting his life, but that he was elected dean of the faculty in 1586, and continued in that office in the following year. He died on the 18th of October 1606. He was one of the greateft ornaments of the profeffion at Paris in his time; and was a ftrenuous advocate for the doctrine of Hippocrates and the ancients, whom he defended with great ardour againft the chemifts. His works are indicative of genius; they were collected and publifhed, together with fome pofthumous tracts, at Paris, in 1610, under the title of "Opera Omnia." Separately, we find the following; "De Primis Principiis Rerum Naturalium, Libri tres," Paris, 1571. "Ad Impudentiam quorundam Chirurgorum, qui Medicis æquare et Chirurgiam publicè profiteri volunt; pro veteri dignitate Medicinæ Apologia philofophica," ib. 1577. This was a fort of declaration of war againft the furgeons, whom he attacked for attempting to teach without any knowledge of literature; it was followed by feveral pieces on both fides. "Commentarii in fex pofteriores Phyfiologiæ Fernelii Libros," 1577. "Ars bene Medendi," Lugd. 1589. "Ad Libros Fernelii de abditis rerum caufis Commentarii," Par. 1598. "Univerfæ Medicinæ Compendium," 1598. "Ad Libavii Maniam Refponfio, pro Cenfura Scholæ Parifienfis contra Alchymiam latâ," 1600. "Chirurgia," Lipf. 1601. "Prælectiones in Libros Phyfiologicos et de abditis rerum caufis. Accefferunt Opufcula quædam Philofophica," 1602. "De Febribus," 1640.

Riolan, John, the fon of the preceding, was born at Paris in the year 1577. His father did not fail to afford every encouragement and opportunity for the cultivation of his rifing talents, and his mind was naturally turned to the ftudy of medicine by the reputation, zeal, and love of the profeffion, which the former poffeffed; his early ftudies were alfo greatly facilitated, and many difficulties removed, by the domeftic inftruction which he thus received. His progrefs accordingly was uncommonly rapid; and a very few years after he had received his degree in 1604, he came forward as an author in a way that laid the foundation of his fubfequent reputation. In 1613 he was appointed royal profeffor of anatomy and botany by Louis XIII.; and in this latter capacity he petitioned the king for the eftablifhment of a botanic garden in the univerfity of Paris. He fubfequently held the appointment of phyfician to queen Mary de Medicis, and accompanied that princefs in her travels; he arrived at Cologne, after her death, in July 1642, and returned to Paris, where he refumed the practice of of his profession. After having twice undergone the operation of lithotomy, he lived to the age of eighty years, and died at Paris in February 1657.

Riolan was devoted to the study of anatomy, and was one of the most expert and learned anatomists of his time; his learning, indeed, was rather an obstacle in the way of his progress as a discoverer, or perhaps we should say his devotion to the ancients; for, in many cases, he seemed to see only through their eyes. Yet he was arrogant in his claims to originality, and by his pertinacity and sarcastic contempt of others, he raised himself many opponents and enemies. He published several original observations, however, respecting many parts of anatomical science, especially respecting the structure of the colon, the biliary ducts, the uterus and vagina, the tongue, os hyoides, &c. None of his anatomical works contain any engravings; as he maintained that no representations could supersede the study of nature. All his studies, however, were not confined to anatomy, as the following list of his works will evince. "Brevis excursus in Battologiam Quercetani, quo Alchemiæ principia funditus diruuntur, et Artis veritas demonstratur," Par. 1604. "Comparatio veteris Medicinæ cum nova, Hippocraticæ in Hermetica, Dogmaticæ cum Spagyrica," 1605. "Disputatio de Monstro Lutetiæ 1605 nato." "Incursionum Quercetani depulsio," id. "Censura demonstrationis Harveti pro veritate Alchymiæ," 1606. "Schola Anatomica novis et raris observationibus illustrata. Adjuncta est accurata fœtus humani historia," 1607; enlarged by the author with the title of "Anatome corporis humani," 1610. "In Librum Cl. Galeni de Ossibus, ad Tyrones explanationes apologetica pro Galeno, adversus novitios et novatores Anatomicos," 1613. "Gigantomachie," 1613, written in refutation of Habicot's account of the discovery of the bones of the giant Teutobochus. Riolan published two other tracts, or more, upon this controversy, which ended with the appearance of his "Gigantologie; discours sur la grandeur des Géants, &c." in 1618. "Osteologia ex veterum et recentiorum præceptis descripta," 1614. "Discours sur les Hermaphrodits, où il est démontré, contre l'opinion commune, qu'il n'y a point de vrais Hermaphrodits," 1614. "Anatomica, seu Anthropographia," 1618. "Enchiridium anatomicum et pathologicum," 1648, and many times reprinted; the best edition is of Paris, 1658. "Opuscula anatomica nova," Lond. 1649, containing remarks on the anatomical works of the most celebrated physicians, and an attack upon Harvey, and his doctrine of the circulation, of which Riolan was a great antagonist. "Curieuses Récherches sur les écoles de Médécine de Paris et de Montpelier," 1651. He also published three different works, entitled "Opuscula anatomica," in 1650, and the three following years, opposing the doctrines of Bartholine and Pecquet, respecting the absorbents and lacteals, and Harvey's on the circulation; and two more on the same subjects, with the titles of "Responsio prima, et altera," 1652 and 1655. Eloy Dict. Hist. de la Med.

RIOLI, in *Geography*, a town of Naples, in Capitanata; 11 miles S. of Manfredonia.

RIOLO, a town of Italy, in the department of the Amone; nine miles W. of Faenza.

RIOM, a town of France, in the department of the Cantal, and chief place of a canton, in the district of Mauriac; 15 miles E.N.E. of Mauriac. The place contains 714, and the canton 7498 inhabitants, on a territory of 210 kiliometres, in 12 communes.

Riom, a town of France, and principal place of a district, in the department of the Puy-de-Dôme; eight miles N. of Clermont-Ferrand. The place contains 13,328 inhabitants in both its E. and W. divisions; the canton of the former includes 12,433, and the latter 12,441 inhabitants; the territory of the former being 70, and that of the latter $24\frac{1}{2}$ kiliometres, the former having seven, and the latter five, communes. N. lat. 45° 43′. E. long. 3° 11′.

RIONDO, in *Ichthyology*, a name used by some for the fish more commonly called *aper*, a small fish, of the shape of the faber or doree, caught in the Mediterranean.

RIONE, or Rioni, in *Geography*, a river of Asia, anciently called "Phasis," which rises in the principality of Georgia, and forming the southern boundary of Mingrelia, runs into the Black sea, N. lat. 42° 15′. E. long. 41° 25′.

RIONS, a town of France, in the department of the Gironde; three miles N.W. of Cadillac.

RIOPA, a town of Spain, in New Castile; 13 miles S. of Alcaraz.

RIOS, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Vesoul. The place contains 578, and the canton 9028 inhabitants, on a territory of 230 kiliometres, in 34 communes.

Rios, a town of Chili; 90 miles N.N.E. of Valparayso.

RIOSECO, a town of Spain, in the province of Leon; 96 miles N.N.W. of Madrid. N. lat. 41° 52′. W. long. 5° 7′.

RIOT, in *Law*, the forcible doing of an unlawful thing, of a private nature, by three or more persons assembled together for that purpose; either with or without a common cause or quarrel (3 Inst. 176.): as if they beat a man; or hunt and kill game in another's park, chase, warren, or liberty; or do any other unlawful act with force and violence; or even do a lawful act, as removing a nuisance, in a violent and tumultuous manner.

The word is formed from the Latin *riota*, of *arietare*, to run at each other as rams do. Though, from an ancient Gaulish version of the bible, quoted by Skinner, *riot* should rather seem originally to signify luxury and excess; whence our law *riot* might proceed; because these are frequently attended with quarrels.

For the difference between a riot, rout, and unlawful assembly, see Rout, and Unlawful *Assembly*.

The punishment of riots and routs, where a number of persons from three to eleven are concerned, is, by the common law, fine and imprisonment only; to which, in very enormous cases, the pillory has been sometimes superadded. (1 Hawk. P.C. 159.) And by the stat. 13 Hen. IV. c. 7. any two justices, together with the sheriff or under-sheriff of the county, may come with the posse comitatus, if need be, and suppress any such riot, assembly, or rout, arrest the rioters, and record upon the spot the nature and circumstances of the whole transaction; which record alone shall be a sufficient conviction of the offenders; and it is held that any battery, wounding, or killing the rioters, that may happen in suppressing the riot, is justifiable. The riotous assembling of twelve persons or more, and not dispersing upon proclamation, was first made high treason by stat. 3 & 4 Edward VI. c. 5. but repealed by stat. 1 Mary, c. 1. Nevertheless, the offence was made a single felony by 1 Mar. stat. 2. c. 12. and by 1 Eliz. c. 16. with whom the law expired. However, it was revived, in order to support the execution of the act of settlement, and made perpetual by 1 Geo. I. c. 5. which enacts, that if any twelve persons are unlawfully assembled to the disturbance of the peace, and any one justice of the peace, sheriff, under-sheriff, or mayor of a town, shall think

proper

proper to command them by proclamation to disperse, if they contemn his orders, and continue together for one hour afterwards, such contempt shall be felony, without benefit of clergy. And farther, if the reading of the proclamation be by force opposed, or in any manner wilfully hindered, such opposers and hinderers are felons, without benefit of clergy; and all persons concerned, knowing of such hindrance, and not dispersing, are felons, without benefit of clergy. And the act indemnifies the peace officers, and their assistants, if they kill any of the mob in endeavouring to disperse them. Moreover, if any persons, so riotously assembled, begin, even before proclamation, to pull down any church, chapel, meeting-house, dwelling-house, or out-houses, they shall be felons, without benefit of clergy. Blackst. Comm. book iv. ch. xi.

RIOU, in *Geography*, a small island in the Mediterranean, near the coast of France. N. lat. 43° 11'. E. long. 6° 25'.

RIOU'*s Island*, or *Rovahoga*, an island in the Pacific ocean, about 24 miles in circumference; discovered in the year 1792, by lieutenant Herget, commander of the Dædalus storeship. S. lat. 8° 50'. E. long. 220° 50'.

RIOXA, a province of Spain, situated in Old Castile, on the borders of Biscay, on the banks of the Ebro.

RIPA CANDITA, a town of Naples, in the province of Basilicata; six miles S.W. of Venosa.

RIPA *Limosara*, a town of Naples, in the county of Molise; nine miles E. of Molise.

RIPA *Transona*, a town of the marquisate of Ancona, the see of a bishop, suffragan of Fermo; 12 miles N.E. of Ascoli. N. lat. 42° 58'. E. long. 13° 49'.

RIPAILLE, a town of France, in the department of the Leman lake, on the S. side of the lake of Geneva, with a convent; one mile N. of Thenon.

RIPEN, a sea-port of Denmark, in North Jutland, on the Gram; the see of a bishop, and capital of the diocese. This town was probably built about the time of the introduction of Christianity into this kingdom, and, next to Wiborg, is deemed the most ancient town in North Jutland. It was formerly one of the most celebrated and flourishing cities in the North; as it had four parish churches and five chapels, besides the cathedral, four convents with their churches, a strong castle, and between 600 and 700 free burghers. A considerable number of ships traded to Norway, France, England, Holland, &c. from this port; and the city had the privilege of coining money. But its grandeur and opulence were almost annihilated by a dreadful fire in 1580, and other conflagrations, by inundations, and by the ravages of war. The merchants' old Exchange is converted into a town-house. Some little trade is still carried on at this place, in grain, horned cattle, horses, &c.; but the shallowness of the river admits only small vessels to come up to the city, and these only at high water; 77 miles S. of Wiborg. N. lat. 55° 21'. E. long. 8° 46'.

RIPENERS, in *Medicine*, a sort of topical remedies, called also *drawers, digestives, maturantia, suppuratives*, &c. See MATURATION.

RIPENING *of Fruit*, in *Gardening*, may be forwarded several ways. See CAPRIFICATION, HOT-*Beds*, and FORCING.

RIPERA, in *Geography*, a town of Hindoostan, in Berar; 25 miles N.E. of Notchegong.

RIPERTNAU, a town of Westphalia, in the county of Lippe; three miles E.N.E. of Lemgow.

RIPIENO, Ital. in *Music*, implies full, in opposition to solo. In Corelli's concertos, the solo parts are said to be *del concertino*, the little concert; and the *tutti* parts, or *ripieno, del concerto grosso*, of the great concert. The first eight of Corelli's concertos were composed for the church, *a due cori*, for two bands or choirs, which are often in dialogue. By ripieno is always meant a subordinate part, to which few difficulties are entrusted; being what the French call *complissage*, or parts to fill up and complete the harmony.

RIPIERS, RIPIARII, in our *Old Writers*, those that bring fish from the sea-coast to the inner parts of the land.

They were thus called a *fiscella, qua in devehendis piscibus utuntur, Anglice*, a rip.

RIPLEY, in *Geography*, a market-town and parish, partly in the lower, and partly in the upper division of the wapentake of Claro, West-riding of Yorkshire, England, is five miles N.W. from Knaresborough, and 214 miles N.N.W. from London. The town had formerly a castle attached to it, some part of which is yet standing. The market here is held on Monday, weekly; and there are annual fairs on Easter Monday, and the 25th, 26th, and 27th days of August, for horses, horned cattle, and sheep. A free-school at this place, as appears from an inscription over its entrance, was built and endowed in the year 1702, by Mary, and Catharine Ingilby, daughters of sir William Ingilby, then lord of the manor. The church is ancient, and contains many monumental erections in memory of that family. In the church-yard stands the pedestal of an ancient cross, which contains eight niches curiously ornamented, but the effigies are gone, as likewise the shaft of the cross. This parish, according to the parliamentary returns of 1811, contains 222 houses, and 1053 inhabitants.

Ripley-castle, the seat of sir John Ingilby, baronet, adjoins the town. The chief part of it was built by sir William Ingilby, in the reign of Philip and Mary, but the great tower is far more ancient, having belonged to a former structure. It has been much enlarged of late years; and is now a stately and commodious family mansion. Some of the apartments are finished with great elegance; and the staircase displays a large Venetian window of stained glass, on which is represented a series of shields, shewing the quarterings and inter-marriages of the Ingilby family, since their settlement at Ripley, towards the close of the fourteenth century.

Eastward from Ripley is Copgrove, an elegant mansion belonging to H. Duncombe, esq. which contains an excellent collection of paintings, busts, and prints from the most celebrated masters. The pleasure-grounds are extensive, and are ornamented with a fine lake. Near this seat is that of Allerton-Mauleverer, the property of lord Stourton. The house is a modern edifice, built by his royal highness the duke of York. It is surrounded by a park, containing 400 acres of land, chequered by hills and dales. At this place was formerly a priory of Benedictines, subject to the abbey of Marmontier in France. It was founded by Richard Mauleverer in the reign of Henry II., and was dissolved by Henry VI. who settled its revenues on King's college, Cambridge. Beauties of England Wales, vol. xvi. by John Bigland.

RIPOGONUM, in *Botany*, so called by Forster, from ῥὶψ, ῥιπὸς, *a slender twig*, and γόνυ, *a joint*, because of its slender, jointed, twining habit, was referred by the son of the author, as well as by the younger Linnæus, to SMILAX; (see that article.) Mr. Brown, nevertheless, retains *Ripogonum*, in Prodr. Nov. Holl. v. 1. 293, because of its hermaphrodite flowers, the two bracteas at the base of each, and the racemose inflorescence. Two species are mentioned,

 R. album

R. album and *parviflorum*, the latter of which is Forster's plant, *Smilax Ripogonum*, Forst. Prodr. 70.

RIPOLL, in *Geography*, a town of Spain, in Catalonia; 14 miles N. of Vique.

RIPON, or RIPPON, a market and borough town in the lower division of the wapentake of Claro, liberty of Ripon, West-riding of Yorkshire, England, is situated at the distance of 11 miles N. from Harrowgate, and 222 miles N.N.W. from London. It occupies the declivity of a gentle eminence, between the rivers Ure and Skell, and not far from their confluence. Over these rivers are six bridges, within a mile of the town. One of these is a very handsome structure of stone, and has seventeen arches. The town is large, and the buildings are in general good; particularly in the principal street. According to the parliamentary returns of 1811, the parish contains 452 houses, and 2346 inhabitants, but this does not appear to include the borough, which is omitted in the reports.

The origin of Ripon is to be referred to a very remote era. By Salmon, it is supposed to have been the Roman Isurium, but this opinion is erroneous. The probability on the subject is, that it owes its foundation to the monastery which was established here in the year 661, by Eata, abbot of Melross, in Scotland. About that period we find it first mentioned in historical record, when it is said to have consisted only of thirty houses. This town was destroyed by the Danes, and remained a heap of ruins for several years. At length, however, it was rebuilt; and in the year 886, king Alfred is said to have incorporated it as a royal borough, to be governed by a vigillarius, or wakeman, twelve elders, and twenty-four assistants. Ripon was destroyed a second time by king Edred in revenge of a revolt of the Northumbrian Danes. This event occurred in the year 950; after which Ripon was again rebuilt and began to flourish, but did not long remain in a state of tranquillity. In the year 1069 it once more shared in the fatal consequences of a revolt of the Northumbrians against the Norman Conqueror; and sixteen years later, at the time of the general survey, the town, and the country around it, still remained waste and uncultivated. Peace having been restored, however, Ripon again revived from its embers, and continued in a prosperous condition, till the wars between England and Scotland, in the reign of Edward. II. subjected it to new misfortunes. In the year 1323, Robert I. king of Scotland, having driven Edward and his army out of his kingdom, invaded England, laying waste the country with fire and sword to the very walls of York. Ripon suffered in the general devastation, the houses having been destroyed by fire, and most of its inhabitants put to the sword. No sooner, however, had the victorious career of Edward III. freed the country from the invaders, than it was restored to a prosperous condition, principally through the exertions of the archbishop of York, and the liberality of the neighbouring gentry, many of whom fixed their residence here. Since that time Ripon has been occasionally honoured by royal visits. Henry IV. retired hither, with his whole court, in 1405, when the plague raged in London. In the year 1604, a similar cause occasioned the removal of the lord president's court from York to this town.

Ripon first sent members to parliament in the 23d year of Edward I., but this privilege was soon after discontinued, and was not revived till the reign of Edward VI. The patronage of the borough is vested in Miss Laurence, of Studley-Royal, who possesses all the burgage tenements to which the right of election is attached. The number of voters is 146, and the mayor is the returning officer. The corporation, by virtue of a charter granted by king James I., and since confirmed, and, in some degree, extended, by succeeding monarchs, consists of a mayor, recorder, 12 aldermen, 24 assistants, a town-clerk, and other inferior officers. Ripon was formerly celebrated for its manufacture of spurs, which were, indeed, so highly esteemed, that it became a proverbial expression to say "As true steel as Ripon rowels," when speaking of a man of fidelity, honesty, or intrepidity. The manufacture of woollens likewise flourished here, in former times, but this branch of business is now completely decayed. The archbishop of York has his court and prison here for the liberty of Ripon. On the nomination of the archbishop, and by his majesty's commission, justices are appointed, who, in conjunction with the mayor and recorder, hold sessions for the town and liberty. The dean and chapter of Ripon minster have likewise a prison here, and hold a court for the decision of causes arising within their manor. The market day here is Thursday; and there are fairs on Thursday after 13th January, 12th and 13th May, first Thursday in June, first Thursday after 22d August, and 22d November. The market-place is a handsome and spacious square, surrounded by well-built houses, and having in the centre an obelisk 90 feet high, erected, in 1781, by William Aislabie, esq. of Studley, who represented this borough in parliament during the long period of sixty years. Here also stands the town-hall, built in 1801, from designs by Mr. Wyatt, and at the expence of the late Mrs. Allanson of Studley. A theatre was erected here in 1792, by the late George Hassell, esq. The free-grammar school was founded by king Edward VI., and was finished, and amply endowed, by his successor, queen Mary, in 1553. The other public establishments belonging to the town are, a dispensary, Sunday schools, a school of industry, and four hospitals, *viz.* that of St. Mary Magdalen, for six poor women; of St. John, a small building, appropriated to two poor women; St. Anne, which supports eight women; and Jepson's hospital, in which twelve poor boys are maintained, clothed, and educated. This hospital was founded, in 1672, by Zacharias Jepson, a citizen of York.

The monastery, previously mentioned as the probable nucleus which gave rise to the town, appears to have been of considerable celebrity. After the destruction of the original buildings in the reign of Alfred, king of Northumbria, it was re-erected in a style of more magnificence than was usual in that age, by the famous Wilfrid, archbishop of York. William of Malmesbury mentions the new structure as remarkable "for its curious arches, its fine pavements, and winding entries." The same author says it was much resorted to by the northern nobility, and was endowed with very extensive possessions. The memory of St. Wilfrid is still honoured by an annual feast and procession at this town. His monastery received extraordinary marks of royal munificence. The great king Athelstan granted to it many immunities, and particularly the privilege of sanctuary. From that period history records few particulars respecting this establishment, except its destruction by the Scotch in the reign of Edward II., when it ceased to be a monastic foundation. The church, however, was rebuilt and made collegiate by archbishop Melton, from whose time, till the reign of Henry VIII., it had seven prebends, with distinct revenues, attached to it; besides nine chantries within the church, which were dissolved by Edward VI. King James I. renewed the collegiate privileges of this church, by the establishment therein of a dean and six prebendaries, to whom he granted "divers lands, prebends, chantries, and rectories, belonging to the said church before the dissolution." In 1607 the same monarch added a subdean, and thus completed the college as it still exists.

Ripon church is dedicated to St. Peter and St. Wilfrid, and has, attached to it, a peculiar jurifdiction, under the archbifhop of York. The king is patron of the deanery; and the fubdean is nominated by the dean from among the prebendaries. When a vacancy occurs in the number of the latter, the dean and chapter prefent three perfons to the archbifhop, who collates one of them. As a building, this church has confiderable claims to the notice of the antiquary, though its appearanee has been much injured by additions and alterations executed at different periods and in different ftyles of architecture. Its general form is that of a crofs, having two uniform fquare towers, each 110 feet high, at the weft end, and a third, called St. Wilfrid's great tower, in the centre of the tranfept. From the laft, there formerly rofe a very noble fpire, which was blown down Dec. 8th, 1660.

The fepulchral monuments in the church are too numerous to be mentioned in detail. There are many in commemoration of different branches of the principal families in the neighbourhood, efpecially the Blackets; the Kitchenmans; the Ridfdales; the Wanleys; the Oxleys; the Nortons, of Sawley; the Weddels, of Newby; the Mallories and Aiflabies, of Studley; and the Markenfields, of Markenfield. Among thefe may be noticed a beautiful monument to the memory of W. Weddel, efq. the defign of which was taken from that curious relic of antiquity, the Lantern of Demofthenes, at Athens. An altar-tomb, of grey marble, fituated in the fouth aifle of the nave, is faid to commemorate an Irifh prince, who died at Ripon on his return from the Holy Land. On the entablature are reprefented the fculptured figures of a man and a lion in a grove of trees.

The environs of Ripon are rich, fertile, well wooded, in a high ftate of cultivation, and interfperfed with villages, and feats of the nobility and gentry. Among the latter the principal are, Studley-Royal, and Newby-Hall. The firft is the property of Mifs Laurence, and is fituated at the diftance of nearly three miles S.W. from Ripon. The houfe is commodious and elegant, and contains many excellent pictures, and portraits by the beft mafters. But the chief objects of attention here, are the park and pleafure-grounds, which are generally ranked among the fineft in England. The park, which is fituated neareft the houfe, is diverfified with gentle fwells and declivities, and is adorned with ranges of lofty trees. The entrance to the pleafure-grounds difplays a mafs of the moft luxuriant foliage, and the widely extended plantations which compofe them, are judicioufly varied, and finely adapted to the different fituations. On one hand the hills gradually afcend with tufts of fhade, interfperfed over the verdure; on the other fide they precipitately rife with lofty woods covering their brows, below which the rivulet, in one place, glides with a filent ftream, and in another falls in cafcades. Near the entrance is a building, called the Cold Bath, which is conftantly fupplied by a fpring of pure water. Adjoining is the figure of a dying gladiator, and further on is a fine ruftic bridge with the river rufhing through it, and the back-ground fo darkened by trees as to excite the idea of a cafcade foaming through a cavern. Near this is a ftatue of Hercules deftroying Antæus. The view now opens with a beautiful affemblage of new objects, moft charmingly diverfified. From a little grotto not far diftant a fine expanfive lake is feen winding round the bafe of an eminence, called Tent Hill, encircled by a magnificent amphitheatre of hanging wood. The lawn is laid out with exquifite tafte, and here the water divides itfelf into various and beautiful forms, embellifhed at different points by ftatues of Neptune, Bacchus, Galen, a dying gladiator, and Roman wreftlers. On rifing grounds are fituated a temple of Piety, a Chinefe temple, a temple of Fame, a banquetting-houfe, and various other ornamental buildings.

Near Studley-Royal are the venerable ruins of the once celebrated Abbey of Fountains, which was founded in the year 1132, for the monks of the Ciftertian order, but foon afterwards fuffered total demolition by fire. It was rebuilt, however, in 1204, in the early pointed ftyle of architecture, which then began to prevail; this houfe continued to flourifh till the general diffolution in the reign of Henry VIII., when its annual revenues, according to Speed, were valued at 1073*l.* 0*s.* 7½*d.* This abbey, with all its offices and appendages, covered about twelve acres of ground. The church, the walls of which are ftill almoft entire, appears to have been a very large and magnificent ftructure. The nave, in particular, is a moft majeftic fpecimen of building, uniting fimplicity with lightnefs and elegance. The Ancient and Modern Hiftory of the Loyal Town of Rippon, by Thomas Gent of York, 8vo. 1733. Hiftory of Ripon, 12mo. 1801. Beauties of England and Wales, vol. xvi., by John Bigland. Drake's Eboracum, folio.

RIPOSTE, in the *Manege*, is the vindictive motion of a horfe that anfwers the fpur with the kick of his foot.

RIPOUR, in *Geography*, a town of Hindooftan, in the circar of Gohud; 40 miles S.S.W. of Gwalior.

RIPPACANOT Creek, a river of America, near the weftern branch of the river Wabafh.

RIPPERDA, John William, in *Biography*, baron of, was born in 1680, of a noble family, in the province of Groningen. He was educated in the principles of the Catholic religion, but upon marrying a Proteftant heirefs, he conformed to the Proteftant faith. He appears to have entered the army while he was young, and for fome time he was in the fervice of the States-General as colonel of the infantry, which poft he occupied in the year 1715, when he was fent from the States to the court of Spain, to negociate a commercial treaty. Having ingratiated himfelf with the king, Philip V., he returned to the Catholic religion, and took up his abode at Madrid. His firft wife being dead, he married, in 1721, a Caftilian lady of high birth, and rapidly rofe in the confidence of the king. In 1725 he was fent to Vienna to negociate an accommodation with the imperial court. In the fame year he figned a treaty at Luxembourg with the emperor's plenipotentiaries; and on his return to Madrid he was created a grandee of the third clafs, and duke of Ripperda. He alfo obtained the office of fecretary of ftate for foreign affairs; and the management of the war, marine, and financial departments, was entrufted to him, fo that he had all the power, without the name, of prime minifter. In a fhort time he was not only difmiffed from his employments, but confined in the caftle of Segovia, where he remained two years, when, having found means to make his efcape into Portugal, he paffed from thence into England, where he remained till 1730, when he went to the Hague, and refumed the Proteftant religion. After this he formed a connection with an envoy from Morocco, and in 1731 embarked for that country. He was favourably received by the fovereign, Muley Abdallah, to whom he propofed a fcheme of uniting the Barbary ftates againft Spain, and of invading that country. He engaged the Moors to undertake the fiege of Ceuta, and having declared himfelf a convert to the Mahometan religion, and affumed the name of Ofman, he was nominated to the chief command of the army employed for that purpofe. By his military talents he infpired the Moors with confidence in their enterprize, when the arrival of a Spanifh army in Africa, which laid fiege to Oran, difconcerted his plans. Neverthelefs, he perfifted in the fiege of Ceuta,

Ceuta, and defeated the garrifon which had fallied out againft him. But a nocturnal furprife of the Moors in the trenches broke up the fiege, and Ripperda, who fled in his fhirt to Tetuan, was received fo coldly at the court of Morocco, that he meditated an efcape to fome other country. He was ftopped by the emperor, and fully expected to pay the forfeit of his life, on account of his fuccefs; but he pleaded his caufe with fo much effect, that he was, after a fhort imprifonment, fet at liberty. He now formed a new project, which was a confolidation of different religions, efpecially the Mahometan and Jewifh, which he endeavoured to render compatible by admitting the prophetic character of Mahomet, and inculcating the expectation of a future Meffiah. He made fome converts to his opinions; but at length became fufpected of difhoneft motives, and was obliged to retire. His projecting fpirit continued to the laft, and he advanced confiderable fums to Theodore for his attempts on the crown of Corfica. He died at Tetuan, in 1737. Univerfal Hiftory. Gen. Biog.

RIPPERS, in the *Wire-works*, are the people who attend in the mills, take the prepared fmall rods of iron, and work at the barrels where they are drawn into wire.

RIPPIN, or RUPULAM, in *Geography*, a town of Hungary; eight miles N.N.E. of Leopoldftadt.

RIPPINICA, a town of the duchy of Warfaw; 25 miles N. of Wladiflaw.

RIPPLE, in *Agriculture*, a flight fcratch or tear, fometimes applied to very flight ploughings, hence called ripplings.

RIPPLE, in *Rural Economy*, an implement of the comb kind, conftructed with feveral upright triangular prongs, fet near together in a ftrong piece of wood, for the purpofe of rippling flax and hemp.

RIPPLING, in *Sea Language*, a broken and interrupted noife, produced by a current on or near the fea-coaft.

RIPPLING *of Flax*, in *Rural Economy*, the operation of taking off the feed from the flax by drawing it through a ripple or large comb. See FLAX, and RIPPLE.

RIPPON, in *Geography*. See RIPON.

RIPRAPPS, a narrow fhoal in the Englifh channel, between Folkftone and Boulogne, S.W. and N.E. about 10 miles; with a ftrong bottom, and at a low fpring-tide not covered above 14 feet with the fea.

RIPRESA, Ital., the fame as *reprife* in French, and *repeat* in Englifh; which fee.

RIPSA, in *Geography*, a town of Sweden, in Sudermanland; 13 miles N. of Nykoping.

RIPTON, a townfhip of America, in the county of Addifon and ftate of Vermont; containing 15 inhabitants.

RIQUEVILLE. See RICHENVEIR.

RIQUEURIA, in *Botany*, a name in the Flora Peruviana, deftined to commemorate Lewis Riqueur, apothecary to king Philip V. of Spain. *De Theis*.

RIS, in *Geography*, a town of France, in the department of the Puy-de-Dôme, near the Allier; nine miles N. of Thiers.

RISACO, a town of Dalmatia, in the bay of Cataro; 20 miles N.N.W. of Ragufa.—Alfo, a river of Iftria, which runs into the gulf of Triefte, about three miles from Capo d'Iftria.

RISARD, FRANCIS, in *Biography*, a French mathematical writer in the eighteenth century, publifhed feveral efteemed elementary works for the inftruction of the young in the fciences. He was a native of Neufchateau, in Lorrain, and was made profeffor of philofophy in the college of Beauvais; he died at Paris in the year 1778. His productions confift of "Elements of the Mathematics," in 4to., of which the author publifhed an abridgment, in 8vo.; "A Treatife on the Sphere," in 8vo.; "A Treatife on Gnomonics," in 8vo.; "Tables of Sines," in 8vo.; "Rectilinear Trigonometry," 8vo.; "Elements of Geometry," in 4to.; and "Inftitutiones Philofophicæ," in 2 vols.

RISBOROUGH, or PRINCE'S RISBOROUGH, in *Geography*, a market-town and parifh in the fecond divifion of the three hundreds of Aylefbury, county of Buckingham, England, is fituated at the diftance of 5 miles S.W. from Wendover, and 37 N.W. from London. The right of holding a market was granted to the inhabitants by king Henry III., who, at the fame time, beftowed upon the townfmen many privileges. The market day is Saturday, weekly; befides which there is an annual fair on the 6th of May. The manor here was anciently vefted in the families of Gifford and Humet; but having fubfequently become vefted in the crown, it was granted to Richard, earl of Cornwall, and king of the Romans, who died in 1272. It was afterwards the property of Edward the black prince, who is faid "to have had a palace here, fuppofed to have ftood within the fcite of a fpacious moat, now dry, which is in a field adjoining the church-yard." In the reign of Henry V. this manor was affigned to his queen, Catharine, in dower. Charles I. fold it to certain citizens of London, who, in 1637, conveyed it to the family of the Chibnalls; one of whom gave a confiderable fum of money to the parifh to fupply clothing annually to 24 poor women. Since the Chibnalls, it has been occupied fucceffively by the families of Abraham, Adeane, Pelham, Panton, and Grub, the prefent poffeffors. According to the parliamentary returns of 1811, this parifh contains 324 houfes, and 1644 inhabitants.

Adjoining to Prince's Rifborough is the village of Monk's Rifborough, at which place, it is faid, there was formerly a cell of Benedictine monks, fubject to the monaftery of Chrift-church, in Hampfhire. The church here is a handfome building, in the later pointed ftyle of architecture, and contains many monuments. Lyfons's Magna Britannia, vol. i. Bucks, 4to.

RISBY, a town of Sweden, in the province of Finland, near the gulf of Bothnia; 32 miles N. of Biorneborg.

RISCHEBACH, a river of Saxony, which runs into the Elbe, near Wittenberg.

RISCHIN, a town of Bohemia, in the circle of Rakonitz; 30 miles S.E. of Rakonitz.

RISCLE, a town of France, in the department of the Gers; fix miles S. of Nogaro.

RISCUS, among the Romans, fometimes fignifies a cheft or trunk covered with fkins; fometimes it is ufed for a hamper, made of twigs or rufhes to hold lint; and fometimes for a hollow place in the wall of a houfe, ufed likewife for holding lint, or the like.

RISEBERGA, in *Geography*, a town of Sweden, in the province of Skone; 28 miles N. of Lund.

RISENBURG, a town of Pruffia, in the province of Oberland; 12 miles E. of Marienwerder.

RISENKIRCH, a town of Pruffia, in the province of Oberland; 14 miles E. of Marienwerder.

RISENTITO, in the *Italian Mufic*, a brifk, lively, or expreffive manner of playing.

RISHI, in *Hindoo Mythology*, is a general name for ancient fages or faints. Confiderable difficulty occurs in determining, with any exactitude, who they were, whether they had any hiftorical exiftence, or are merely the creatures

tures of the imagination. Seven of them are most frequently spoken of; by some said to be the first rational beings created by Brahma. Each has a wife, and a numerous offspring. The names of these seven differ in different authorities; but the following list is that usually received. 1. Kasyapa; 2. *Atri*; 3. Vasishta; 4. Viswamitra; 5. Gautama or Godama; 6. Jamadagni; 7. *Bharadwaja.* (The names distinguished by capitals have furnished articles in this work.) The wives of these patriarchs have been transferred to the heavens, and are the stars called by western astronomers the Pleiades; by the Hindoos, Kritika, under which word will be found some information respecting them, shewing that the astronomical fabulists of both races have common legends. The Rishis are said to be the bright stars in the great bear. How they became so distant from their sparkling spouses is explained in the article just referred to. In several languages of India, a bear is called Rish; and there may be some allusion both to the constellation and the sages in question. Sometimes the seven Rishis, and the seven Menus, are confounded. (See Menu.) Another race of patriarchal sages is also sometimes confounded with both. These are the Munis. See Muni; in which article the reader is requested to correct a typographical error, in the second column, third line from bottom, for *many-mothered, for*, read *many-mothered son.* Jamadagni, for instance, is usually called a Rishi; yet in our article given under the name of his wife, Runeka, he is, on Puranic authority, called "a great Muni." The Rishis, as the immediate production of Brahma, are sometimes called Brahmadikas, of whom likewise there are seven; but they are not usually supposed to be the same with the Rishis: some lists have no names in common with those of the Rishis; others have several. As the production of Brahma, there is another set of seven beings of different names from any of the above-named lists, but employed in early days in peopling the world; these are called Sanakadikas, of whom something is said under the name of their principal, Sanaka. The Hindoo books differ very much in their accounts of these varieties of persons interposed between the Supreme Being and the created world; and it is not easy, if at all practicable, to reconcile their disagreements; nor perhaps worth the pains were it otherwise.

We shall not attempt to notice the disagreements, that could be picked out from high Hindoo authorities, respecting the equivocal personages named in this article. It may be briefly observed, that although *the seven* Rishis are very commonly adverted to, the appellation is by no means confined to that number. In the Siva Purana, Brahma is said to have produced Brighu and the seven Rishis, and after that Nareda, from his thigh, Kardama the Rishi from his shadow, and from the fore-finger of his right-hand, Daksha. These persons are sometimes called Rishis, Brahmadikas, Maharshis, Devarshis, &c. A sage of the name of Dadichi occurs in the Skanda Purana, as having swallowed the sacred books, for their security, at a period of great wickedness and tumult. He is called a Rishi; as is another named Uddalaka, who was half betrothed to Lakshmi, the goddess of wealth; but espoused her sister Jyeshta, goddess of poverty. These allegories may be explained. (See Uddalaka, and Kardama.) Other Puranas seem to identify in some parts the Rishis and Munis, calling both "the virtuous sages, who delight in protecting the people." In other parts distinctions are made. In the beginning of this article we have stated the term Rishi to be, as it were, generic; meaning sages, saints, patriarchs. This seems authorised by the Ramayana, where this note occurs. "There are four kinds of Rishis, or sages; the Rajarshi, or royal sage; the Maharshi, or great sage; the Brahmarshi, or sacred sage; and the Devarshi, or divine sage. Of these the first is esteemed the lowest, and the last the highest." These appear to be the specific varieties. In addition to the articles already referred to, some farther points connected with the subjects of this will be found noticed under the following: Maharshis, Matsyavatara, Pikeswari, Pitris, Pulaha, Pulastya, Rajarshi, Ravena, Runeka.

RISIBILITY, the faculty of *laughter;* which see.

Risibility is commonly supposed an attribute peculiar to man; as being the only creature capable of judging what is ridiculous.

Some philosophers go so far as to assert, that the degree of judgment is always seen in that of laughter; fools always either have too little or too much of it.

Authors do not agree as to the peculiar mechanism in man, by which laughter is raised. It is usually attributed to the communication between the plexus nervosus, and the diaphragmatic nerves. See Lungs.

RISIGALLUM, in the *Materia Medica.* See Realgar.

RISING, in *Astronomy*, the appearance of the sun, a star, or other luminary, above the horizon, which before was hid beneath it.

By reason of the refraction of the atmosphere, the heavenly bodies always rise before their time; *i. e.* they are seen above the horizon, while they really are below it. See Refraction *of the Atmosphere.*

There are three poetical kinds of rising of the stars. The *Acronychal, Cosmical,* and *Heliacal*; which see respectively.

To find the rising, &c. *of the sun and stars by the globe,* see Globe.

Rising, in *Rural Economy*, a term sometimes applied to yeast, or barm used for the purpose of fermenting different matters.

Rising, in *Ship Building*, a term derived from the figure of a ship's bottom in general, which gradually narrows or becomes sharper towards the stem and stern-post. On this account it is that the floors, towards the extremities of the ship, are raised or lifted above the keel; otherwise the shape would be so very acute, as not to be obtained from timber with sufficient strength in the middle or cutting-down. The floor-timbers forward and abaft are therefore gradually lifted or raised upon a solid body of wood, called the *dead* or *rising-wood,* which must of course have more or less rising as the body of the ship assumes more or less fullness or capacity.

Rising *of Boats,* is a narrow strake of board fastened withinside to support the thwarts.

Rising-*Floors* are the foremost and aftermost floors, which, on account of the rising of the body, are the most difficult to be obtained, as they increase in the acuteness of shape; and to preserve strength in the throat, the cutting-down must be deeper.

Rising-*Line,* an elliptical line drawn in the plan of elevation, by which line, with its corresponding half-breadth or narrowing line, the figure of the bottom near the floor-heads is determined.

Rising-*Square,* a square used in whole moulding, upon which is marked the height of the rising-line above the upper edge of the keel.

Rising-*Straight,* is a curve line used in whole moulding drawn in the sheer plan, at the intersection of the straight part

part of the bend mould, when continued to the middle line at each timber.

Rising-*Wood*, that part of the basis of a ship's body, forward and abaft, which is formed by solid pieces of timber scarfed together lengthwise on the keel. The rising-wood must be sufficiently high to seat the floors; and afore and abaft the floors, it is continued up to the cutting-down or upper side of the floors, for the purpose of securing the heels of the cant-timbers, and there left sufficiently broad to admit of a stepping or rabbit for the heels of those timbers, that they may not be continued downwards to sharp edges.

RISK, or Risque, the hazard or chance of a loss, damage, &c.

There is a great risk run in letting goods go upon credit to great lords, wives not authorized by their husbands, and young people not yet arrived at the age of majority.

Skinner derives the word from the Spanish *risco, steep;* Covarruvias, from *rigeo.* In the barbarous Greek, they say, ῥιζικαρειν, for *periclitor, I hazard;* and ῥιζικον, for *lot* or *chance;* which words, as well as *risque,* Skinner thinks, may be deduced from ῥιπτω, for αναρριπτω τον κυβον, *I cast the dye.*

To prevent any risk in invoices of merchandizes by sea, it is usual to insure them.

Accordingly the risk is a subject of primary consideration in cases of marine insurance. All the risks or perils, that are incident to sea-voyages, may be provided against by insurances, with certain exceptions founded on public policy and the interests of humanity. Thus, the insurer can, in no case, upon principles of natural justice, make himself answerable for any loss or damage, proceeding directly from the fault of the insured. No insurance can be made, even against the perils of the sea, upon illegal commerce. In most foreign countries, insurances on the lives of men are prohibited. In France they have been always deemed illegal, and are expressly forbidden by the ordinance of Lewis XIV.; nevertheless, French writers have held that this does not apply to Negro slaves. According to Valin, who has, by curious reasoning, attempted to vindicate this doctrine, the disposition to suicide is natural in Negro slaves, and imputable, as he expresses himself, to the "inherent vice of the article;" and, therefore, their death, proceeding from this cause, must be deemed natural death. But the killing of them, or the throwing of them overboard in a revolt, is a loss incident to this trade, and a peril within the policy. It is to be lamented, that, whilst the slave trade was countenanced and carried on in this country, the objects of this cruel traffic have been too much considered as mere merchandize; and the insured upon this trade formerly recovered, under the common policy, for any loss sustained in the voyage by the mortality of the slaves, whether they were thrown overboard, in cases of supposed necessity, or died a natural death, or perished by the perils of the sea. The legislature, however, while this infamous and savage traffic subsisted, interposed, and by an annual act, passed with a view to *interest* the persons concerned in this trade in the preservation of the lives and health of the slaves, declared, that though the policy remained in the same form as before, it cannot protect the insured against losses occasioned by natural death, ill treatment, throwing overboard, or by restraints of princes proceeding from attempts to get slaves by force. (See stat. 30 Geo. III. c. 33. § 8. 34 Geo. III. c. 80. § 10. and 39 Geo. III. c. 80. § 24.) But we trust the provisions of these and similar statutes are become wholly unnecessary in this country, and that the trade, of which we shall give some account in its proper place, is abolished never to revive.

The words of an English policy, which specify the various risks against which insurances are usually made, are these: "Touching the adventures and perils which we, the assurers, are contented to bear, and do take upon us in this voyage, they are of the seas, men of war, fire, enemies, pirates, rovers, thieves, jettisons, letters of mart and countermart, surprizals, takings at sea, arrests, restraints, and detainments, of all kings, princes, and people, of what nation, condition, or quality soever; barratry of the master and mariners; and of all other perils, losses, and misfortunes, that have or shall come to the hurt, detriment, or damage of the said goods and merchandizes, and ship, &c. or any part thereof, without prejudice to this insurance." The latter clause seems to be sufficiently comprehensive to embrace every species of risk to which ships and goods are exposed from the perils of sea-voyages. However, by the agreement of the parties, the general words of the policy may be altered or qualified; and any of the risks may be wholly or in part excluded, and the insurance may be made only against some particular risks, or up to, or beyond certain degrees, or upon particular articles. In England, it is now constantly stipulated in all policies, that upon certain enumerated articles of a quality peculiarly perishable, the insurer shall not be answerable for any partial loss whatever; that upon certain others, liable to partial injuries, but less difficult to be preserved at sea, he shall only be liable for partial losses above *five per cent.;* and that, as to all other goods, and also the ship and freight, he shall only be liable for partial losses above *three per cent.* This stipulation is made by a memorandum, in the form of a warranty, inserted at the bottom of all English policies. It was first introduced here about the year 1749; before which time the insurer was liable for every injury, however small, that happened to the thing insured. This clause prevented the necessity of adapting the premium to the nature of the commodity. Nevertheless our policies indemnify the insured against every loss, let it be ever so inconsiderable, arising from any cause affecting the general safety of the ship and cargo. Losses of this sort, being of the nature of "general average," are so called in the memorandum; and there is, therefore, annexed to each of the provisions above-mentioned, an exception of general average. In the policies of private insurers, the case of the "stranding of the ship" is likewise excepted. In the common policies, used in London by private underwriters, the memorandum runs thus: "Corn, (comprehending every sort of grain, and also pease and beans,) fish, salt, (excluding salt-petre,) fruit, flour, and seed, are warranted free from average, unless general, or the ship be stranded: sugar, tobacco, hemp, flax, hides, and skins, are warranted free from average, under *five per cent.;* and all other goods, also the ship and freight, are warranted free from average, under *three per cent.*, unless general, or the ship be stranded."

This form of the memorandum was generally used, not only by private underwriters, but also by the two insurance companies, from its first introduction in 1749, till the year 1754; when, in consequence of a particular case that occurred, the London Insurance Company left out of the memorandum in their policies the words, "or the ship be stranded;" and the same alteration was soon after adopted by the Royal Exchange Assurance Company. Private underwriters have, however, continued the memorandum in the old form. Many questions have arisen as to the true meaning of the words, "free from average, unless general,

or

or the ſhip be ſtranded." The word "unleſs" has been held to make an *exception*, and not a *condition;* and caſes have occurred in which judges of the higheſt eminence have put a different conſtruction upon the fore-mentioned clauſe. It is now ſettled, that if the ſhip be ſtranded, the inſurer is liable for any partial loſs in any of the articles in the memorandum, though ſuch loſs did not ariſe from the ſtranding, but from ſome other cauſe. Notwithſtanding the number of caſes, which have been decided upon the conſtruction of the memorandum, it ſtill remains a queſtion, whether the partial loſſes, from which the inſurer is exempted by it, comprehend the *total loſs* of an *entire individual*, as well as a partial injury to the *whole* of the ſpecies of goods exempted by the memorandum from ſmall average loſſes; as, *e. gr.* if out of 101 hogſheads of ſugar of equal value, five are ſo completely ſpoiled in the voyage, as to be worth nothing, and therefore *totally loſt*. If this loſs be calculated upon the whole 101 hogſheads, it will not amount to *five per cent.* In ſuch a caſe, it has been thought, that the inſurer would be protected by the memorandum, and not liable for the loſs. But the queſtion has not been decided.

There are certain injuries or loſſes, to which goods on ſhip-board are liable, that do not ariſe from the perils of the ſea; and for theſe the owners are liable. Theſe may be owing to ſome fault or defect of the ſhip: in this caſe the inſurer is not liable, becauſe, in every contract of inſurance, there is an implied warranty, that the ſhip is ſea-worthy; and if it appear otherwiſe, the contract is void. In many caſes, the maſter alſo, as well as the owners, is anſwerable. He is bound to deliver goods in the ſame ſtate in which he received them; and of courſe he, as well as the owners, is liable for all loſs or damage not proceeding from ſome inevitable misfortune. They are anſwerable for loſs or damage occaſioned by bad ſtowage, wet, theft, embezzlement, rats, &c. This is the rule of the marine law, and agrees with the common law. At common law, the owners and maſter were liable to the full value of the goods loſt; but now by 7 Geo. II. c. 15. they ſhall only be liable to the value of the ſhip and freight for any act done by the maſter or mariners. The maſter's liability, and that of the mariners, remains the ſame. But as this proviſion only extended to the caſe of embezzlement, &c. by the maſter or mariners, it did not afford a ſufficient protection to ſhip-owners. Therefore the 26 Geo. III. c. 86. limits the liability of the owners to the value of the ſhip and freight, though the maſter or mariners ſhould not be privy to ſuch robbery, &c.; and they are exempt from all liability for any loſs by fire. But though the owners are reſponſible to the amount of the value of the ſhip and freight, for loſſes occaſioned by external thieves; yet, under the policy, the inſurers are alſo liable; and, therefore, in ſuch caſes, the proprietor of the goods, or the inſurers in his name, may recover againſt the owners.

In order to charge the inſurer, the loſs muſt happen during the continuance of the riſk. This brings under conſideration a ſubject of importance. Every voyage inſured muſt have a fixed commencement and termination. It is proper, therefore, to inquire what is the duration of the riſk, with reference to inſurances upon *goods*, upon the *ſhip*, and upon *freight*. In France, and moſt other countries, it is provided, that if the time of the riſk be not regulated by the contract, it ſhall commence, as to *goods*, from the time they are put on board the ſhip, or put into barges, to be conveyed on board, that is, from the moment of their leaving the ſhore; and it continues till they are ſafely landed at the place of their deſtination. It is alleged, that the perils of the ſea commence from the moment in which the goods are on the water. In our policies, the words uſually employed to expreſs the commencement and end of the riſk on *goods* are theſe: "Beginning the adventure upon the ſaid goods and merchandize *from the loading thereof aboard the ſaid ſhip*, and ſo ſhall continue and endure until the ſaid ſhip, with the ſaid goods, ſhall be arrived at —— (her port of delivery), and until the ſame be diſcharged and ſafely landed." With us, therefore, the riſk does not commence until the goods are actually on board the ſhip; and, therefore, the inſurer is not anſwerable for any loſs or damage which may happen to them, while they are on their paſſage to the ſhip. And it may be laid down as a general rule, that the riſk on goods continues no longer than they are actually on board the ſhip mentioned in the policy; and that if they be removed from on board that ſhip, and landed, or put on board another ſhip, without the conſent of the inſurers, the contract is at an end, and the inſurers are diſcharged from all ſubſequent reſponſibility.

To this rule, however, there are ſeveral exceptions: as where the ſhip is diſabled, and the goods are put on board another veſſel, to be forwarded to their port of delivery; ſo, if it be agreed, that the goods ſhall be removed into another ſhip, at a particular place in the voyage, and no ſhip being there, they are put on board a ſtore-ſhip. The inſured is protected by the policy in carrying the goods in lighters to any part of the port of delivery, where ſuch goods are uſually landed. It is a general principle, that policies ought to be conſtrued according to the uſage of trade; and in doubtful caſes, in favour of the inſured. Although the general rule is, that the inſurance on goods ſhall continue "till they are diſcharged and ſafely landed," yet it has been holden by a very eminent and learned judge, that if the inſured take goods from on board the ſhip in his own lighter, the inſurer is diſcharged. Where goods are put into a public lighter, for the purpoſe of being landed, the riſk continues; but if the merchant ſend his own lighter, this will be a delivery to him, and the inſurer is diſcharged. Although the riſk on goods, according to the uſual words of the policy, is to continue till they are diſcharged and ſafely landed at the port of delivery, this is not to be underſtood as an authority for prolonging the riſk, after the ſhip's arrival at her port of delivery, for any indefinite length of time, at the pleaſure of the inſured; but the fair conſtruction of the clauſe is, that the goods ſhall remain under the protection of the policy for a *reaſonable time*, till they can be conveniently landed, and no longer.

As to the inſurance of the *ſhip*, the riſk, in ſome countries, is made to commence from the time ſhe begins to take in her firſt goods, or ballaſt, and to continue till after ſhe arrives at her place of deſtination, and is entirely diſcharged. In others, the riſk is made to end twenty-one days after the ſhip's arrival, or ſooner, if ſhe be unloaded. In France, if the time of the riſk on the ſhip be not regulated by the contract, it runs from the time ſhe ſets ſail, till her arrival at her port of deſtination, and till ſhe be there anchored and moored at the quay. In England, the commencement of the riſk on the ſhip varies in almoſt every caſe. In outward-bound voyages, it is generally made to commence from her beginning to load at her port of departure. Sometimes privateers on a cruize, ſhips engaged in the coaſting trade, or in ſhort voyages, are inſured for a limited period of time; and, in ſuch caſes, the riſk commences and ends with the term, wherever the ſhip may then happen to be. If a ſhip be inſured "*from*" the port of London to any other port, and before ſhe breaks ground, an accident happen to her, the inſurers are not anſwerable;

for

for the risk does not commence till she sets sail on her departure from the port of London: but if the insurance be "*at and from*" the port of London, the insurers are liable for any accident that may happen to her, *from the time of subscribing the policy*. When a ship, expected to arrive at a certain place abroad, is insured "*at and from*" that place, or "*from her arrival*" there, the risk begins from the first moment of *her arrival at the place* specified; and the words "*first arrival*" are implied, and always understood in policies so worded. In such cases, the risk continues there as long as the ship is preparing for the voyage insured; but if all thoughts of the voyage be laid aside, and the ship be suffered to lie there for a length of time, with the owner's privity, the insurer is not liable; for this would be to subject him to the whim and caprice of the owner, who might choose to let the ship lie and rot there. In English policies, the risk on the ship is usually made to continue "until the ship hath moored at anchor twenty-four hours in good safety," and the insurer is answerable for no loss after the expiration of that time. If the ship, before the twenty-four hours are expired, be ordered to the proper place to perform quarantine, the risk continues, though she do not leave her moorings till long after the expiration of the twenty-four hours. Upon the same principle, if the ship, on her arrival at her port of destination, be subject to seizure under an embargo, and a declaration of reprisals, and she be in fact seized within the twenty-four hours, though she be permitted afterwards to load her cargo, the insurer is liable. The risk on the rigging, tackle, furniture, and provisions of the ship insured, continues no longer than they are attached to, or remain on board, the ship. But if it be necessary to put these articles on shore during a repair, which is the usual practice in such cases, the risk continues on them while on shore, and if they are lost or damaged by any of the perils mentioned in the policy, the insured is liable. An insurance upon an India voyage includes the risk of the country voyage by the usage of the trade, with which, in this and other instances, the underwriter is presumed to be fully acquainted. Thus an insurance was made on a ship "at and from Bengal to any ports or places in the East Indies, China, Persia, or elsewhere beyond the Cape of Good Hope, forwards and backwards, and during her stay at each place, until her arrival at London." In an action on this policy, tried before lord Mansfield, the plaintiff obtained a verdict. Upon a motion for a new trial, the court determined that, under all the circumstances, the plaintiff was entitled to recover. The reasons were, that the underwriters are presumed to know the course of the East India trade, the terms of the charter-party, and the destination of the India ships, (which are under the direction of the company and not of their owners): that the charter-party is a printed form of very long standing: that, besides the liberty thereby given, to prolong the ship's stay for a year, it is very common, by a new agreement, to detain her a year longer; for no ship comes home in ballast, and the longer a ship is kept, the more beneficial to the owners: that the words of the policy are adapted to this usage, being without limitation of time or place, and without any reference to the first voyage particularly mentioned in the charter-party: that the terms of the policy precisely describe the risk in its utmost latitude, and necessarily extend to every prolongation of stay, and every country voyage: that the usage of the India trade, and the course of the voyages in it, were notorious to insurers, who must be supposed sufficiently conusant of them, and the obligation of the policy is taken from the usage, and the words of the charter-party, which refer to that usage, in the same manner as if it were expressly inserted in the policy; whereas if every person insured should be obliged to state to the insurer all the grounds of his expectations, as to the ship's continuance in India, or her returning to England, it might produce great litigation and confusion in cases arising upon these policies: besides, it would be contradictory to the policy, to say that the underwriter did not insure for a country voyage.

If in a policy on an India voyage, there be liberty "to *touch*, *stay*, and *trade* at any ports or places;" this covers the risk, even of a *second* country voyage. In a like policy, the liberty was only to *touch* and *stay* at any port, &c. in the voyage, by the usage of the trade. This covered the risk on the intermediate voyages. Nevertheless, the general rule is, that a liberty to touch and stay at any ports and places, means only places in the usual course of the voyage. A liberty to *touch* and *stay* does not authorise the insured to break bulk and trade. If the voyage described in the policy has really been commenced, though at a time, and under circumstances very different from those which were in the contemplation of the parties at the time when the policy was effected; yet if there be no fraud, misrepresentation, or concealment on the part of the insured, this shall be a good commencement of the risk. Although the ship, through necessity, change the order of the places at which she is to touch, yet if she do not abandon the original voyage, the risk continues.

In an insurance upon *freight*, the risk generally begins from the time when the goods are put on board. If an accident happen to the ship before any goods are put on board, which prevents her from sailing, the insured cannot recover for the loss of freight, which the ship might have earned, if the accident had not happened; but if part of the cargo be put on board, and the rest be ready to be shipped, the insured may recover for the whole freight, upon a valued policy. If the ship be lost on her way to her port of loading, or to a distant place where she is to take in her cargo, the insurer is liable for the whole freight.

If, after the insurance is effected, any thing be done by the insured to alter the nature of the risk, this must be done with the consent of the insurers, otherwise it will avoid the contract. If a ship insured as a private trader afterwards takes letters of marque, without the consent of the underwriters, they are thus discharged, although no use be made of the letters of marque.

In connection with the subject of this article, we may add a few words on the loss, *i. e.* the injury, or damage, which may be incurred by those perils of the sea that constitute the risk, against which the insurer undertakes to indemnify the insured. This loss may be either total or partial; the total loss signifying, in a natural sense, the absolute destruction of the thing insured; but, in a legal sense, it means not only the total destruction, but likewise such damage to the thing insured, though it may specifically remain, as renders it of little or no value to the owner. A loss is also said to be total, when, in consequence of the misfortune that has happened, the voyage is lost, or not worth pursuing; or, if the value of what is saved be less than the freight, &c. A partial loss is any loss or damage not amounting to a total loss. Partial losses are sometimes denominated "average" losses, because they are such as are the subjects of average contributions; and they are distinguished into general and particular averages. These losses may be incurred by the perils of the sea, such as the ship's foundering, stranding, or striking suddenly against a rock, by running foul of another vessel, by fire, by capture, (see RECAPTURE and RANSOM), by arrest and detention of princes, by barratry, (see BARRATRY), by average contributions, by expence of salvage, or they may be wilful and fraudulent. The term *average*, derived from *averagium*, formed

formed from the verb *averare*, to carry, has been explained under that article. It is here ufed to fignify a contribution made by the owners of the fhip, freight, and goods on board, in proportion to their refpective interefts, towards any particular lofs or expence fuftained for the general fafety of the fhip and cargo; fo as that the particular lofer may not be a greater fufferer than the owner of the fhip and the other owners of goods on board. This juft and equitable contribution is called *general* or grofs average, becaufe it falls generally upon the whole or grofs amount of the fhip, freight, and cargo; and alfo to diftinguifh it from what is often, though improperly, termed *particular* average, but what, in reality, means a particular, and not a general lofs, and has no affinity to average properly fo denominated. The *petty* and *accuftomed* averages are fuch as pilotage, towage, light-money, beaconage, anchorage, bridge-toll, quarantine, river-charges, fignals, inftructions, caftle-money, pier-money, digging the fhip out of the ice, &c. When thefe petty charges are incurred in the ufual courfe of the voyage, they are not confidered as a *lofs* within the meaning of the policy, but only a neceffary and ordinary expence; but if incurred for any extraordinary purpofe in the voyage, as to provide againft any impending danger, or in confequence of the fhip's being driven out of her courfe by ftrefs of weather, they will then be deemed grofs or general average, for which the infurer will be liable. A contribution upon a general average can only be claimed when the facrifice, occafioning the lofs, was, after due deliberation, found to be indifpenfably neceffary for the prefervation of the fhip and cargo, whenever it appears to have conduced to this purpofe, and when the fhip and reft of the cargo were actually faved. If goods put into lighters to enable a fhip to get up a river be loft, the reft fhall contribute; but if the fhip be loft, the goods in the lighters fhall not contribute. It has been faid that the wages and expences of the crew during the detention of a fhip unjuftly captured, as well as the charge of reclaiming her, and that the charges of wages, &c. upon a fhip that is obliged to go into port to refit after a ftorm, fhould be brought into a general average. This point has never been decided in a court of juftice, but the principle feems to have been allowed by judges of great authority in cafes that have occurred.

No injury occafioned by mere fea-damage can be the proper fubject of a general average: as if the fhip be damaged in her hull or her rigging, the goods on board fhall not contribute; alfo, if a fhip fpring a-leak in a ftorm, by which goods on board are fpoiled, this is a fimple damage, or particular lofs, and cannot be the fubject of an average contribution.

The rule with regard to average contribution feems to be, that the fhip, freight, and every thing remaining on board that can properly be deemed a part of the cargo, fhall be fubject to this charge; and therefore money, plate, and even jewels, muft contribute according to their value. But the perfons on board, their wearing apparel, and alfo the jewels and ornaments belonging to their perfons, fhall not contribute; neither are feamen's wages liable to contribution. When the captain arrives at his port of deftination, it is his duty to fettle the contribution; and the average, if not fettled before, fhould be paid before the cargo is landed: for the owners of the fhip have a *lien* on the goods on board, not only for the freight, but alfo to *anfwer all averages and contributions* that may be due. If he neglect his duty in this refpect, Mr. Serjeant Marfhall conceives that an action would lie againft him, or againft the owners. If the lofs was in money paid, an action on the cafe for money paid would unqueftionably lie againft each perfon bound to contribute for his fhare; if in goods, a fpecial action on the cafe, founded on the cuftom of trade, would lie againft each perfon liable to contribute; or a bill in equity might be filed againft them all. The mode of afcertaining each perfon's contribution, though not very accurately defined, is ufually effected by afcertaining, after the fhip's arrival at her port of difcharge, the neat value of the fhip, freight, and cargo, as if nothing had been loft; and valuing thefe at the price they would fetch in ready money at the port of difcharge; and the neat amount, after deducting all charges, is the fum which is fubject to the contribution; and each perfon's fhare of the lofs will bear the fame proportion to the value of his property, as the whole lofs bears to the aggregate value of the fhip, freight, and cargo. In England, fome perfons make the fhip contribute for her full value and the freight; others, for half her value and one-third of the freight; and others, again, for half the value of the fhip and freight: and fhe fhall be valued at the price fhe was worth on her arrival at her port of delivery. The freight is valued at the fum the fhip has earned on her arrival there.

As to the mode of valuing the jettifon, it is now the fettled practice with us to eftimate the goods loft at the price they would have fetched at the port of delivery, on the fhip's arrival there; freight, duties, and other charges being deducted. Thefe contributions, under the general words of the policy, are a charge which the infurer is bound to pay; and it makes no difference whether the infured pay towards, or receive, this: he ought, in either cafe, to bear the proportion of the general lofs, and that muft fall on the infurers. For the lofs by expence of falvage, fee SALVAGE.

With regard to cafes of wilful and fraudulent loffes, the ftat. 1 Ann. ft. 2. c. 9. § 4 and 5. makes it a fimple felony to deftroy any fhip, to the prejudice of the owners of the fhip or goods on board; and takes away clergy, if committed on the high feas. And the 4 Geo. I. c. 12. extends this to the cafe of the owner or mafter who fhall deftroy any fhip, to the prejudice of the owners of, or underwriters upon, goods. The 11 Geo. I. c. 29. takes away clergy from fuch offenders in all cafes. See PIRATE.

In cafes where the infured is entitled to call upon the infurer as for a total lofs, he muft "abandon;" that is, he muft renounce and yield up to the infurer all his right, title, and claim to what may be faved, and leave it to him to make the moft of it for his own benefit. The infurer then ftands in the place of the infured, and becomes legally entitled to all that can be refcued from deftruction. The idea of "abandonment," therefore, prefuppofes a total lofs in this latter fenfe, and implies that fomething remains which may be faved, and which may be given up, or abandoned to the infurers. For if the infured could only abandon, in the cafe of a total lofs, in the ftrict and natural fenfe of the words, there would be nothing to abandon, and abandonment would then be only an ufelefs form. Some have faid that the practice of abandoning dates its origin from the period when the contract of infurance itfelf firft came into ufe; and yet it does not feem to be a right which neceffarily refults from the nature of the contract. It feems more probable that abandonment arofe from the practice of occafionally introducing into policies particular ftipulations, that if the thing infured fhould be fpoiled, or greatly damaged, by any of the perils infured againft, it fhould be abandoned to the infurers, who fhould be thereupon obliged to pay the entire fum infured; and that fimply making good the damage fhould not be fufficient to difcharge them: and fuch ftipulations, being frequently introduced into the con-

tract,

tract, became at length the foundation of general rules, which have been established in some countries by positive law, and adopted in others as part of the general law of insurance. In the first case of abandonment, that came before lord Hardwicke in the court of chancery, in the year 1744, he determined that where a recaptured ship and cargo were sold to pay the salvage, the insured had a right to abandon the surplus, and claim as for a total loss.

By the law of insurance, as understood in England, the insured may abandon in every case, where, by the happening of any of the misfortunes or perils insured against, the voyage is lost, or not worth pursuing, and the projected adventure is frustrated; or where the thing insured is so damaged, as to be of little or no value to the owner; or where the salvage is very high; or where what is saved is of less value than the freight; or where further expence is necessary, and the insurer will not undertake, at all events, to pay that expence, &c. The ordinance of the marine of Lewis XIV. confines abandonment to the following five cases: capture, shipwreck, stranding, arrest of princes, or the entire loss of the effects insured. By the French law, the right to abandon seems to depend on the "species of misfortune" which has happened: with us, it depends rather on the "degree of loss" sustained in consequence of it. These general principles have been exemplified in cases comprehending losses by capture and arrest of princes, and also other losses. Capture, or arrest of princes, is, *primâ facie*, a total loss; and immediately upon the capture, or mere arrest, or at any time while the ship continues under detention, the insured may abandon, and give notice to the insurer of his intention to do so; and thus entitle himself to claim as for a total loss from the insurer. There is, however, this difference between a policy *upon interest*, and a *wager* policy, that, in the one case, the insured may, if he think proper, abandon the moment he has notice of a capture or detention; and this will bind the underwriters, whatever may be the ultimate fate of the ship. But in the case of a wager policy, there can be no abandonment, because the insured has nothing to abandon. Nevertheless, a capture or arrest does not necessarily terminate in a total loss: for if a captured ship be retaken, and permitted to proceed on her voyage, so that she suffers but a small temporary inconvenience, this would only be a partial, and not a total loss. Neither does a recapture necessarily deprive the insured of the right to abandon. The rule is, that if the thing insured be recovered before any loss is paid, the insured is entitled to claim as for a total, or a partial loss, according to the final event; that is, according to the state of the case at the time he makes his claim. But if, after a total loss has been actually paid, the thing insured be recovered, the insurer cannot oblige the insured to refund the money he has received; but he shall stand in the place of the insured: thus no injustice is done. Two cases are adduced to shew that, though a captured ship be recaptured, yet if the voyage be lost, the loss will be total, and the insured will have a right to abandon. In one case, a ship is taken and retaken, and sold in a distant country to pay the recaptors for the salvage, and the residue of the produce of the sales remains in the court of admiralty there; and in this case the insured may abandon, and recover as for a total loss. In the second case, a ship, after throwing part of the cargo overboard in a storm, and being disabled from proceeding on her voyage, till refitted, was captured, and her crew taken out; but, after being eight days in possession of the enemy, was recaptured, and carried into an English port; upon which the insured gave notice to abandon. Before the ship could be refitted, the rest of the cargo was spoiled. This was a total loss, and the insured entitled to abandon. A title to restitution, arising from recapture, cannot take away a vested right to abandon, if the ship is unfit to perform the voyage. Serjeant Marshall observes, that he cannot find a single book, ancient or modern, which does not say that, in case of a ship *being taken*, the insured may demand as for a total loss, and abandon; and the proposition is proved more strongly by the general law which warrants him to abandon, in the case merely of arrest, or an embargo, by a prince not an enemy. If, indeed, the capture proves but a small temporary hindrance, the insured cannot abandon. The insured is in no case obliged to abandon; but he may abandon, if the voyage be defeated, or not worth pursuing: nevertheless he cannot, merely by abandoning, turn a partial into a total loss. It is not universally true, that because a ship has once been captured, the insured may abandon at any time afterwards. The rule is, that if the thing insured be recovered before any loss is paid, the insured is only entitled to a partial or a total loss, according to the final event. By the marine law, the property was not changed by the capture, till after condemnation; but since the 29 Geo. II. c. 34. the "jus postliminii" continues for ever. While the ship is in the hands of the enemy, she is considered as totally lost; yet the property is not changed, but reverts to the original owner, upon a recapture. But a recapture does not, in all cases, prevent the loss being total. If the voyage be absolutely lost, or not worth pursuing; if the salvage be very high; if further expence be necessary; if the insurer will not engage, at all events, to bear that expence, though it should exceed the value, or fail of success:—under these, and many other similar circumstances, the insured may disentangle himself, and abandon, notwithstanding a recapture. Upon a recapture, the property returns to the original owner, pledged for the salvage. Although there has at one time been a total loss, yet the insured cannot abandon, after the *final event* has determined it to be only a partial loss at the time of the action brought. There is no vested right to recover as for a total loss, till the insured, having a right to abandon, elects to do so. If the thing insured be recovered before the loss is paid, the insured can only recover according to the final event. If a ship be recovered after a long detention, it is not a total loss, even upon a wager policy. When the ship is safe, and the voyage is not lost, the insured ought not to be permitted to abandon. The insurer ought never to pay less than the value of the loss, nor the insured receive more. The insured can only recover an indemnity for his loss, at the time of the action brought, or offer to abandon. If, after a total loss has been paid, the ship be restored, the insured shall not be obliged to refund the money, and take the ship or goods. If, upon a recapture, the captain sell the ship and cargo, as being the best course to take for all parties concerned, the insured may abandon, and recover as for a total loss. If the captain purchase the ship from the captors, for account of his owners; the money paid, being in nature of a salvage, is only a partial loss.

There are other cases, besides capture and arrest of princes, in which the right of abandoning may be considered. Shipwreck is generally a total loss; but the mere stranding of the ship is not, of itself, deemed a total loss, so as to entitle the insured immediately to abandon. It is a rule that, to entitle the insured to abandon, there must have been, at some period of the voyage insured, or during the continuance of the risk, a total loss, and cases have occurred, from which it appears that no partial loss, however great, occaſioned by the perils of the ſea, can be turned into a total loſs. But if the voyage be loſt, from whatever cauſe, it is a total loſs, not only of the ſhip and freight, but alſo of the cargo, if no other ſhip can be procured to carry it to its port of deſtination. If a cargo be damaged ſo as to be reduced in value to leſs than the freight, it will be a total loſs.

Another circumſtance to be here conſidered is the time within which the inſured may abandon. In France, Spain, and Holland, the times are limited by law, according to the diſtance of the place where the loſs happens, within which the abandonment muſt be made. In England no time is limited by law for abandoning; but our courts have laid down a rule, which ſeems better ſuited to the practice of commerce, and more likely to prevent frauds than thoſe juſt alluded to. This rule is, that as ſoon as the inſured has received advice of a total loſs, he muſt make his election whether he will abandon or not; if he determines to abandon, he muſt give the underwriters notice of this "within a reaſonable time" after the intelligence arrives; and any unneceſſary delay in giving this notice will amount to a waver of his right to abandon, for unleſs the owner does ſome act, ſignifying his intention to abandon, it will be only a partial loſs, whatever may be the nature of the caſe, or the extent of the damage. When the inſured has determined to abandon, and to demand as for a total loſs, he is not obliged, as in ſome foreign countries, to make a formal proteſt, but merely to give notice of the loſs to the underwriters, and of his determination to abandon. But there is no particular form for this purpoſe; in whatever form an abandonment is declared, it muſt be explicit, and it is not to be taken as matter of inference from an equivocal act. The notice may be given either to the underwriter himſelf, or to the agent who has ſubſcribed for him. If the inſurance be entire, the inſured cannot abandon for part only; but if different articles be ſeparately inſured, or ſeparately valued, any one of them may be abandoned. The abandonment muſt be ſimple and unconditional, otherwiſe it will not transfer the entire property to the inſurers, which conſtitutes the eſſence of the abandonment. If, therefore, I abandon a captured ſhip, on condition that in caſe ſhe ſhall be releaſed, ſhe ſhall continue my property, and I ſhall repay with intereſt the ſum which the inſurers ſhall have paid me, ſuch an abandonment would be void.

As to the effect of an abandonment, we obſerve that it transfers the property inſured to the inſurers in proportion to their reſpective ſubſcriptions; and this transfer relates back to the commencement of the voyage. As in England freight is inſurable ſeparately from the ſhip, the abandonment of the ſhip does not, as in France, transfer to the inſurer the freight ſhe has earned. Where the intereſt of the inſured is not entirely covered by the inſurance, he may abandon to the extent of the ſum inſured; for he is his own inſurer for the reſidue. If goods be partly inſured, and money borrowed on reſpondentia for the reſidue, the inſurer will have the legal title to what is abandoned, and the lender only an equitable claim to his proportion. If there be three inſurances; one on the ſhip and cargo, one on the ſhip only, and one on the cargo only; Emerigon thinks, that the inſurers on the ſhip and cargo have an equal claim on the effects ſaved, with the inſurers on the cargo only, and that they have a like claim on the freight, and the remains of the ſhip, with the inſurers on the ſhip only, in proportion to their reſpective ſubſcriptions; *e. g.* If a ſhip be valued at 5000*l.*, the cargo 5000*l.*, making a total of 10,000*l.*, and theſe are inſured by different policies, thus:

On ſhip and cargo - -	£3000
On the ſhip only - -	3000
On the cargo only - -	3000
Uninſured - - -	1000
	10,000

A ſhipwreck happens, and the net proceeds of the wreck of the ſhip are 500*l.*, and of the cargo 500*l.*, total 1000*l.*; Emerigon would adjuſt the claims of all parties thus:

To the owners for their part of ſhip and cargo uninſured, - - - - - -	£100
To the inſurers on ſhip and cargo, a moiety of the produce of the wreck, - - -	225
The like to the inſurers on the ſhip, - -	225
To the inſurers on the cargo, a moiety of the produce of the goods ſaved, - - -	225
The like to the inſurers on the ſhip and cargo, -	225
	1000

By this adjuſtment the inſurers on the ſhip and cargo would have a double ſhare of the effects abandoned, which is manifeſtly unjuſt. An Engliſh merchant would, we conceive, adjuſt the different claims thus:

To the owners for their part of ſhip and cargo uninſured, - - - - - -	£100
To the inſurers on ſhip and cargo, a moiety of three-fifths of the produce of the wreck, - -	150
To the inſurers on the ſhip, three-fifths of the produce of the wreck, - - - - -	300
To the inſurers on the cargo, three-fifths of the produce of the goods ſaved, - - -	300
To the inſurers on the ſhip and cargo, a moiety of three-fifths of the produce of the goods ſaved, -	150
	1000

The abandonment does not only entitle the underwriters to all that can be ſaved of the effects inſured; but if compenſation be made to the inſured for the injury from which the loſs aroſe, this compenſation ſhall go to the underwriters; for when they have paid the loſs, they, and not the inſured, are the real ſufferers.

If, after a total loſs happening, the ſhip be abandoned, but ſhe afterwards arrives ſafe, this ſhall not avoid the abandonment; but the inſurers ſhall have all the profit of the voyage. But they cannot compel the inſured to take back the thing inſured and refund the money.

An abandonment once properly made upon a ſufficient ground, and accepted by the inſurers, is abſolute and binding upon both parties; nor can it be revoked but by mutual conſent; but if it be not upon ſufficient ground, it will be void.

In caſe of misfortune, the inſured is bound to uſe his endeavours to ſave as much as poſſible; and to enable him to do this, without prejudicing his right of abandonment, our policies make ſeveral proviſions for certain acts to be performed for this purpoſe, without prejudice to the inſurance, "to the charges of which, the inſurers agree to contribute, each according to the rate and quantity of his ſubſcription." The captain, in particular, is to exert himſelf to the utmoſt of his power in the preſervation both of the ſhip and cargo; and for whatever is recovered of the effects inſured, he is accountable to the inſurers.

 We

We ſhall here ſubjoin a few remarks on the adjuſtment of loſſes. In the adjuſtment of a loſs, the firſt thing to be conſidered is how to aſcertain the "quantity of damage" for which the underwriters are liable; and the next point to be ſettled is by what rule this ſhall be "appretiated." In order to aſcertain the quantity of damage, the inſured ought to know whether the loſs be total or partial; if it be total, and the policy is a valued one, the inſured is entitled to receive the whole ſum inſured, ſubject to ſuch deductions as may have been agreed, by the policy, to be made in caſe of loſs. On a valued policy, the value is admitted, and the inſured has only to prove, if the inſurance was on goods, that the goods valued were on board. Upon an open policy, it is moreover neceſſary to prove the value of them, for which value (not exceeding the ſum inſured) the inſurers are reſponſible. But in the caſe of a partial loſs, the indemnity, ſecured by either ſort of policy, is, that if the thing inſured do not come ſafe to the deſtined port, but is leſſened in value by damage received in the voyage, the loſs ſhall be borne by the inſurer. When the loſs conſiſts in the total loſs of one entire individual parcel of the goods inſured, and this is capable of a diſtinct valuation; as if, out of 100 hogſheads of ſugar, 10 are loſt, the inſurer muſt pay the value of the 10. When a part of the goods inſured is ſaved, and this exceeds the amount of the freight, the practice is to deduct the freight from the ſalvage, and to make up the loſs upon the difference. But where the freight exceeds the ſalvage, then it is a total loſs. Where the goods inſured are damaged in the whole or in part, it is neceſſary to aſcertain the quantity of ſuch damage, by taking the value of the damaged goods from the prime coſt, and the remainder will be the amount of the loſs. If ſeveral articles be inſured for one entire ſum, but with a diſtinct valuation to each, and only one be put in riſk; if that one be loſt, the inſured ſhall recover ſuch a proportion of the ſum inſured as the value of the article bore to the value of the whole. If there be a clauſe in the policy, to be free of average from a particular riſk, under ſo much *per cent.*, and a loſs occaſioned by that riſk takes place, the proportion which the loſs bears to the cargo muſt be calculated upon the cargo which was on board when the loſs happened, not upon that which was on board at any other time.

In appretiating the loſs, averages are ſettled according to the price of the articles at the time of ſettling. This is the rule of the Rhodian law, and of the laws of Wiſbuy. In France, where almoſt all policies are valued, the inſured has his election to fix the previous valuation, either at the prime coſt, or at the current price at the time and place of loading. The ſame rule that applies to goods, applies alſo to the ſhip, which is always valued at the ſum ſhe is worth at the time of her departure, or at leaſt at the commencement of the riſk. Goods brought from a diſtance, may be valued at their improved price; but in France it is uſually ſtipulated in the policy, that the ſhip ſhall remain of the ſame value during the voyage.

In England, if the policy be an open one, it is an invariable rule to eſtimate a total loſs at the prime coſt of the goods; that is, the invoice price, and all duties and expences till they are put on board, together with the premium of inſurance. A ſhip is valued at the ſum ſhe is worth at the time ſhe ſails on the voyage inſured, including the expences of repairs, the value of her furniture, proviſions and ſtores, the money advanced to the ſailors, and, in general, every expence of the out-fit, to which is added the premium of inſurance.

A partial loſs, upon either ſhip or goods, is that proportion of the prime coſt, which is equal to the diminution in value occaſioned by the damage. And in a caſe which occurred with regard to a valued policy upon goods, it was determined that the diminution in value was that proportion of the value, in the policy, which the difference between the price of the ſound, and the price of the damaged, bore to the price of the ſound in the port of delivery. An inſurer is never to be involved in the riſe or fall of the market.

An adjuſtment being indorſed on the policy, and ſigned by the underwriters, with a promiſe to pay in a given time, is *primâ facie* evidence againſt them, and amounts to an admiſſion of all the facts neceſſary to be proved by the inſured to entitle him to recover in an action on the policy. It is like a note of hand, and being proved, the inſured has no occaſion to go into proof of any other circumſtance. An adjuſtment, however, may be impeached by ſhewing that the underwriter was induced to ſign it by ſome fraud or concealment, or by ſome miſconception of the law or fact. Marſhall's Treatiſe on the Law of Inſurance. See Policy, Recapture, and Warranty.

In matters of inſurance, it is a maxim, that all is never to be riſked on one bottom, or in the ſame veſſel; to denote, that aſſurers muſt act with diſcretion in the ſigning of policies, and not hazard too much on each veſſel; there being more to be expected from ſeveral than from one.

RISKUPITZ, in *Geography*, a town of Moravia, in the circle of Znaym; 9 miles W. of Krumau.

RISÖER, a ſea-port town of Norway, in the province of Chriſtianſand, on a peninſula projecting into the North ſea; 52 miles N.E. of Chriſtianſand. N. lat. 58° 43′. E. long. 9° 29′.

RISOLUTIONE, Ital. in *Muſic*, the reſolution of a diſcord. See Discord, and Preparation.

RISOLUTO, Ital. reſolved ſolution, as of a cloſe canon by putting it in ſcore, or by ſigns.

RISORIUS Novus, in *Anatomy*, a name given by Santorini to a muſcle, formed of that part of the quadratus genæ which ariſes from the cheek. See Quadratus *Genæ*.

RISPOSTA, or Riposta, Ital. an *anſwer*, whether in a dialogue or to a regular fugue. For the bringing in the anſwer to a fugue agreeable to the rigid laws eſtabliſhed by the fathers of the ſcience, the old eccleſiaſtical compoſers, there are many rules to be obſerved. See Fugue.

RISS, or Russ, in *Geography*, a river of Germany, which paſſes by Biberach, and runs into the Danube, about ſix miles above Ulm.

RISTI, a town of Sweden, in the province of Cajana; 25 miles N.E. of Cajanaborg.

RISTIGOUCHE River, a river of Canada, which runs into Chaleur bay, navigable for ſhips 20 miles from its mouth. It abounds with ſalmon and wild fowl. On its N. bank, near its mouth, is an Indian village.

RISTORFF, a town of Auſtria, near Schwannaſtadt.

RISVIGLIATO, Ital. in *Muſic*, when applied to a gay and lively movement ſucceeding one that is ſorrowful, implies vivacity and ſpirit.

RISUM, in *Geography*, a town of Eaſt Frieſland; 6 miles W. of Emden.

RISUS. See Laughter, and Lungs.

Risus *Caninus* is a kind of laughter in which the lips are contracted, ſo as to ſhew all the teeth.

Risus *Sardonius*, Sardonian laughter, is a forced, ſpiteful laughter; or a laughter that does not go beyond the teeth. The phraſe is by ſome ſaid to be founded on this, that in Sardinia there is a venomous plant, which occaſions ſuch a contraction of the muſcles of the face in perſons it kills, that they ſeem to die laughing in this manner.

RISZOW, in *Geography*, a town of Poland, in the palatinate of Kiev; 30 miles N.E. of Bialacerkiev.

RITA, a town of Brasil, in the government of Goyas; 80 miles E. of Villaboa.

RITARDATO, and RITARDANDO, Ital. in *Music*, is relaxing the measure; better expressed now by *rallentando*, which see.

RITCHEL, in *Geography*, a branch of the river Indus, which separates a little above Tatta, and runs into the Arabian sea, N. lat. 24° 15′. E. long. 66° 43′.

RITE, RITUS, in *Theology*, denotes the particular manner or form of celebrating or performing the religious ceremonies, which obtains in this or that place.

The eastern people, Armenians, &c. celebrate divine service according to the Greek rite. The western world follow the Latin rite; or that of the Roman church.

The English observe the rite of the church of England, prescribed in the book of Common Prayer, &c.

RITHER, or RIDER, in *Mining*, is a stone or thin clift that lies in the vein; the ore sometimes runs on both sides it. Sometimes the rither is so thick, that it parts the vein, and makes one vein two.

RITIA, in *Ancient Geography*, *Sheebah*, a town of the interior of Africa, in Mauritania Cæsariensis, situated S. of Victoria. It is mentioned by Ptolemy; and still exhibits some fragments of Roman walls.

RITORNELLO, or REFRET, in *Music*, the burden of a song, or a repetition of the first or other verses of the song, at the end of each stanza or couplet.

The word is Italian, and signifies properly a *little return*, or a short repetition, such as that of an echo, or of the last words of a song; especially when the repetition is made after a voice, by one or more instruments.

But custom has extended the use of the word to all symphonies, played before the voices begin, and which serve by way of prelude or introduction to what follows.

In the partitions or score of the Italian music, we frequently find the ritornellos signified by the words *si suona*, to shew that the organ, harpsichord, piano-forte, or the like, are to repeat what the voice has been singing.

In accompanied recitatives, the ritornels, or interstitial symphonies, are not repetitions of vocal passages; but are often beautiful and picturesque periods of symphony, expressive of the sentiments and situation of the singer.

RITRO, in *Botany*, corrupted, as it seems, from the ῥυτρον of Theophrastus, as far as can be conjectured, appears to have been some plant of the thistle kind. The name is now used as the specific appellation of a kind of ECHINOPS; see that article.

RITROGRADO, Ital. in *Music*. See RETROGRADO.

RITSCHA, in *Geography*, a town of Bohemia, in the circle of Kaurzim; 12 miles S.E. of Prague.

RITSCHENHAUSEN, a town of Germany, in the county of Henneberg; 3 miles S.S.E. of Meinungen.

RITSCHIEN, a river of Stiria, which runs into the Laufnitz, 4 miles S.E. of Furstenfeld.

RITSON, TRISTRAM, in *Biography*, born about the year 1580, at Winscott, in Devon, was educated at Great Torrington, and by his rapid progress in learning he very soon became fitted for the higher improvements of the university of Oxford, of which he was admitted a member, being entered probably of Exeter or Pembroke college, about the latter end of the reign of queen Elizabeth. At Oxford he was much distinguished for his learning, and his accomplishments as a gentleman. He, however, appears to have left college without taking any scholastic degree, and retired into his own country, which, according to his biographer, was probably owing to the death of a sister, upon which he became possessed of the estate of Winscott. Here he drew up a large volume, entitled "The Chorographical Description or Survey of the County of Devon, with the City and County of Exeter, containing Matter of History, Antiquity, Chronology, the Nature of the Country," &c. It was begun in 1605, and finished in 1630.

The author did not print this Description, but a great many manuscript copies were long in circulation in the county. A mutilated edition of it was printed in two volumes 8vo. in 1714: it was afterwards printed from the original in one volume 4to. in 1735. But the most perfect and valuable edition was published in 1811, from a manuscript edition in the possession of John Coles, esq. of Stonehenge; to which the editors made some important additions, and prefixed, as an introduction, which renders the volume much more interesting, "Remarks on the present State of the County of Devon," the object of which was to compare the present and past conditions of the county in those particulars to which the author directed his attention, and to add a brief account of such subjects as either escaped his notice, or have acquired their existence or importance since his time.

Mr. Ritson lived to a great age, dying in the year 1640; he was interred at St. Giles Winscott, without tomb or monument. "He," says Prince in the Worthies of Devon, "that with great expence of money, time, and labour, sought to perpetuate the memory of many persons and families, hath no monument to continue his own; unless that lasting one his "Survey of the County of Devon."" See Chorographical Description, ed. 1811.

RITSON, JOSEPH, was born in 1752, at Stockton on Tees, in the county of Durham, and was brought up to the profession of the law. As a consulting barrister and conveyancer he was very much distinguished; but his literary enquiries were by no means confined within the limits of his profession; he very successfully investigated the old English literature, particularly of the seventeenth century. He died in the year 1803. His works are "Observations on Johnson's and Stevens's Edition of Shakspeare;" "Cursory Criticisms on Malone's Edition of Shakspeare;" "Observations on Warton's History of English Poetry;" "Descent of the Crown of England;" "Collection of English Songs, 3 vols. and of Scotch Songs, in 2 vols.;" "English Anthology;" "Metrical Romances," 3 vols.; "Bibliographia Poetica;" "A Treatise on Abstinence from Animal Food;" and other pieces. As an historian, he was rigidly accurate; as a critic, he was uncharitable and severe. The language of his writings is harsh, rugged, and barren; and all his publications are farther disfigured by the affected singularity of their orthography. Monthly Mag. Nov. and Dec. 1803, and Gent. Mag.

RITTANGEL, JOHN-JOSEPH, a learned professor of the Oriental languages, at Königsberg, in the 17th century. According to some writers he was born of Jewish parents, and educated in the religion of his fore-fathers, but afterwards became a convert to Christianity; others assume that he was a German by birth, and educated in the principles of Popery, and that he became a convert to the institutions of Moses, and received circumcision at Hamburgh, but that in more mature life he embraced the Protestant religion, becoming at first a Calvinist and afterwards a Lutheran. On the authority of a letter given by Bayle, he was a native of Forcheim in Franconia, in the diocese of Bamberg, and brought up to the Roman Catholic faith. Having become a proficient in classical learning, his attention was directed to the study of the oriental languages, and he went to Constantinople, where he remained twelve years, and during that time

time had much intercourſe with the learned Jews in that city. Upon his return into Germany he embraced the Lutheran religion, and went to Königſberg, where the elector of Brandenburg appointed him profeſſor extraordinary of the Hebrew tongue. He devoted himſelf now to the illuſtration of the antiquities of the Jews, and the production of evidence from their writings in ſupport of the truth of Chriſtianity, or of doctrines commonly reputed orthodox. His writings contain ſevere criticiſms on the productions of Kircher, Scaliger, Vorſtius, the Buxtorfs, and other learned men, whoſe proficiency in the Hebrew tongue he affected to hold in low eſtimation. The time of his death is uncertain, but by a dedication to one of his pieces, it is known that he was living in the year 1652. He was author of the following works: "Liber Jezira, qui Abrahamo Patriarchæ adſcribitur, una cum Comment.;" "Liber Veritatis, &c." intended to prove that the ancient Jewiſh church believed the myſtery of the Trinity, and the eternal divinity of the Meſſiah; and ſeveral others.

RITTEBURG, in *Geography*, a town of the county of Mansfeld; 2 miles S.S.E. of Artern.

RITTENHOUSE, David, in *Biography*, a diſtinguiſhed American philoſopher and mathematician in the 18th century, was a native of Pennſylvania, and born in the year 1732. By the dint of genius and application, he was enabled to mingle the purſuits of ſcience with the active employments of a farmer and watch-maker. The latter of theſe occupations he filled with unrivalled eminence among his countrymen. Some of its nicer operations continued to be his favourite mode of relaxation during all the ſubſequent periods of his life. In the year 1769, he was invited by the American Philoſophical Society to join a number of gentlemen who undertook to obſerve the tranſit of Venus; when he particularly diſtinguiſhed himſelf by his obſervations and calculations. He afterwards conſtructed an obſervatory, where he made ſuch valuable obſervations and diſcoveries, as tended to the general diffuſion of ſcience in the weſtern world. During the American war, the philoſopher did not claim an exemption from the duties of patriotiſm; he thought, ſpoke, and acted like a free man. After the concluſion of it, he ſucceſſively filled the offices of treaſurer of the ſtate of Pennſylvania, and director of the national mint: in the firſt of which he manifeſted incorruptible integrity, and in the laſt, the rare talent of combining theories in ſuch a way as to produce correct practical effects. He ſucceeded the illuſtrious Franklin in the office of preſident of the American Philoſophical Society; but towards the cloſe of his days he withdrew from public life, and ſpent his time in retirement. "There," ſays one of his eulogiſts, "we behold him the object of love, admiration, and reverence. In his intercourſes of friendſhip, ſincerity and ſimplicity went hand in hand. A ſtranger to the too common arrogance of high pretenſions, he met every man on the ground of friendly reciprocity. Feeling a ſuperior attachment to thoſe who propagated ſcience, he did not conceal the eſtimation in which he held them. He was among the firſt to welcome to America the perſecuted philoſopher of England (Prieſtley), and formed with him an intimacy which only required time to be cemented into a laſting friendſhip." After a very ſevere illneſs of a few days' continuance, he died on the 10th of July 1796, about the age of 64. He had the degree of L.L.D. conferred upon him. To the "Tranſactions" of the American Philoſophical Society he contributed ſeveral excellent papers, chiefly on aſtronomical ſubjects. Gentleman's Mag. Sept. 1796. Monthly Mag. Oct. 1796.—M.

RITTERA, in *Botany*, named by Schreber in honour of Dr. John James Ritter, a native of Berne in Switzerland, who practiſed as a phyſician, in Sileſia, during the middle of the 18th century, and who was the author of various tracts upon Natural Hiſtory. Schreb. 364.—It is now referred to Swartzia; ſee that article.

RITTERSHUYS, Conrad, in *Biography*, a learned juriſt and philologiſt, was born at Brunſwick in 1560. After having made a great progreſs in the learned languages, he went to Helmſtadt for the ſtudy of theology, but his inclination led him to prefer juriſprudence. He removed to Altdorff for the further purſuit of this ſtudy, and thence to Ingolſtadt. He took the degree of doctor of law at Baſil in 1591, and was nominated profeſſor in that ſcience at Altdorff, where he died in 1613. He was the author of "Jus Juſtinianeum, ſive Novellarum Methodica explicatio," 1615, 4to. His philological labours were notes on "Petronius" and "Phædrus;" commentaries on "Salvianus;" on "Oppian de Venatione et Piſcatione," with a Latin verſion; "Guntheri Ligurinus;" "Sacrarum Lectionum, Lib. viii."

Rittershuys, Nicholas, ſon of Conrad, born at Altdorff in 1597, was alſo a man of learning and a juriſt, and particularly applied to hiſtorical and genealogical enquiries. He ſtudied at Helmſtadt, and afterwards travelled into various countries of Europe. On his return he took a doctor's degree in 1634, and was appointed profeſſor of feudal law at Altdorff. He died in 1670. Nicholas edited ſeveral of his father's works, and in 1638 publiſhed an oration on "Hanno's Periplus." He was the author of a large folio, entitled "Genealogiæ Imperatorum, Regum, Ducum, Comitum, &c. ab Anno 1400 ad Annum 1664." Several of his letters are printed in the "Epiſtolæ celebrium Virorum," 1705.

RITUAL, Rituale, a church-book, directing the order and manner of the ceremonies to be obſerved in celebrating divine ſervice in a particular church, dioceſe, religious order, or the like.

The ancient heathens had, likewiſe, their rituals, or *rituales libri;* thoſe of the Etrurians were much famed. See Aruspici *Libri.*

Theſe books contained the rites and ceremonies to be obſerved in the building of a city, in the conſecrating of a temple or an altar, in ſacrificing and deifying, in dividing the curiæ, tribes, centuries, and, in general, in all their religious ceremonies.

There are ſeveral paſſages in Cato's books, De Re Ruſtica, which may give us ſome idea of the rituals of the ancients.

"The principal difference (ſays biſhop Stillingfleet, Orig. Brit. p. 287.) between the Roman and Gallic ritual of St. Germanus, which the Britons had adopted before the arrival of St. Auſtin, was in the *church muſic*, in which the Romans were thought to excel other weſtern churches ſo far, that the goodneſs of their muſic was the principal incitement to the introduction of their offices."

RITZEBUTTEL, in *Geography*, a town of the duchy of Bremen, on a ſmall river, which runs into the German ocean, between the mouths of the Elbe and the Weſer; 38 miles N. of Bremen. N. lat. 53° 52′. E. long. 8° 37′.

RITZENBUTTEL, a town of the duchy of Bremen.

Ritzenbuttel, or *Ritzbuttle*, is a ſmall town, containing about 200 houſes, half a mile from Cuxhaven, with a caſtle garriſoned by Hanoverians. The road for foot-paſſengers, from Ritzbuttle to Cuxhaven, is on a cauſeway, raiſed about eight feet from the carriage-road; but being made of clay, it is, in wet weather, extremely dirty and ſlippery. The road for carriages is very bad. The port of of Cuxhaven having only two or three ſmall hovels, and a wind-mill, the paſſengers by the packets reſide during their ſtay at Ritzbuttle.

RIVA, or RIFF, a town of the county of Tyrol, at the end of the Garda lake; 16 miles W.S.W. of Trent.—Alſo, a river of the Tyroleſe, which runs into lake Garda, near the town of the ſame name.—Alſo, a town of France, in the department of the Po, ſeated on an eminence, in the middle of a plain, which extends to the W. and S., and is nearly ſurrounded with water, over which are two bridges, one of wood, the other of ſtone. The adjacent hills are covered with vines and fruit-trees, and the plain produces abundance of grain; moſt of the houſes within the walls are furniſhed with gardens; two miles E. of Chieri.—Alſo, a town of Italy, in the bailiwick of Lugano; 8 miles S. of Lugano.—Alſo, a town of Italy, in the Valteline; 6 miles S. of Chiavenna.—Alſo, a town of Italy, in the department of the Mela; 14 miles N.N.W. of Breſcia.—Alſo, a town of the Ligurian republic; 6 miles N.N.E. of Savona.

RIVAGE, RIVAGIUM, a toll anciently paid to the king on ſome rivers, for the paſſage of boats or veſſels therein.

RIVAL, RIVALIS, a term of relation applied to two perſons who have the ſame pretenſion.

It is properly uſed for a competitor, in love; and figuratively, for an antagoniſt in any other purſuit. The intrigues of comedies and romances uſually turn on the jealouſies of rivals, who diſpute for the ſame miſtreſs.

The lawyers derive the word from the Latin *rivus*, *ſtream*, *quod ab eodem rivo aquam hauriant.*

Donatus ſuppoſes it to have been formed hence, that beaſts coming to drink at the ſame brook, or fountain, frequently quarrel.

Cælius ſays, that rivales were originally ſuch whoſe fields were parted by a brook or rivulet, the courſe of which being liable to be varied ſeveral ways, occaſioned frequent diſputes and law-ſuits.

RIVALTA, in *Geography*, a town of France, in the department of the Po, on the Sangon; 6 miles S.W. of Turin.—Alſo, a town of Italy, in the department of the Olona; 15 miles E. of Milan.

RIVANNA, a river of Virginia, which unites with the Fluvanna, to form James river, about two miles above Elk iſland. It is navigable for canoes and batteaux, to its interſection with the S.W. mountains, about 22 miles.

RIVAROLI *de Fuori*, a town of Italy, in the department of the Mincio; 20 miles S.W. of Mantua.

RIVAROLO, a town of France, in the department of the Po, on the Orco; 15 miles N. of Turin.

RIVAULT, DAVID, in *Biography*, a French man of letters and various writer, was born at Laval, in the province of Perche, about the year 1571. He was brought up in the family of the count de Laval, and for ſome time followed the military profeſſion, ſerving in Italy about the cloſe of the 16th century, and in Holland in the year 1602. During the following year, Henry IV. appointed him one of the gentlemen of his bed-chamber. In 1605 he accompanied the young count de Laval into Hungary, and entered into the ſervice of the emperor againſt the Turks. On his return to his native country, he devoted himſelf to literary and ſcientific ſtudies, in which he had before made conſiderable progreſs. In 1611 he was appointed ſub-preceptor to the young king Lewis XIII., and had a penſion of 3000 livres ſettled upon him. The office of principal preceptor becoming vacant during the next year, he received that appointment, and was honoured with the title of counſellor of ſtate. In 1614, the king conferred on him letters of nobility. He died at Tours, in 1616, about the age of 45. He is ſpoken of with high eſteem by ſeveral of the moſt celebrated writers of his time, particularly by Caſaubon, Scaliger, Voſſius, Erpenius, and Menage. His works conſiſt of "The States, or a Diſcourſe concerning the Privileges of the Prince, the Nobles, and the third Eſtate," &c.; "Elements of Gunnery," which is a curious and very ſcarce work; "Archimedis Opera quæ extant, Gr. et Lat. novis Demonſtrationibus illuſtrata;" &c. folio, and other pieces.

RIVE *de Gier*, in *Geography*, a town of France, in the department of the Loire, and chief place of a canton, in the diſtrict of St. Etienne; 4 miles N.E. of St. Etienne. The place contains 4263, and the canton 15,089 inhabitants, on a territory of 160 kiliometres, in 13 communes.

RIVEL *de les Semals*, a town of France, in the department of the Aube; 9 miles W.N.W. of Quillan.

RIVELLES, a town of Spain, in Catalonia; 12 miles N. of Cervera.

RIVELLO, a town of Naples, in the province of Baſilicata; 12 miles S.E. of Lauria.

RIVER, FLUVIUS, or *Flumen*, a ſtream or current of freſh water, flowing in a bed or channel, from a ſource or ſpring, into the ſea.

If the ſtream be not large enough to bear boats, or ſmall veſſels, loaden, it is properly called, in Engliſh, by the diminutive *rivulet*, or *brook;* by the Latins *rivus;* and by the French *rivière*, If it will only bear ſuch veſſels, the Latins call it *amnis.* If it be conſiderable enough to carry larger veſſels, it is called by the general name *river;* by the Latins *fluvius*, and *flumen;* and by the French *fleuve;* between all which the difference is only as to greater and leſs.

Some will have none to be properly rivers, except thoſe which bear the ſame name from their ſource to their mouth.

Others, none but thoſe which empty themſelves immediately into the ſea; and not into any other river.

Rivulets have their riſe, ſometimes from great rains, or great quantities of thawed ſnow; eſpecially in mountainous places; as in the long ridges of Africa, India, Sumatra, &c. But the generality of rivulets ariſe from ſprings.

Rivers themſelves all ariſe either from the confluence of ſeveral rivulets, or from lakes; nor is there any great river, ſuch as the Rhine, Elbe, &c. known to flow from a ſingle ſpring.

The Volga, *e. gr.* conſiſts of above two hundred rivulets, all flowing into it, before it reaches the Caſpian; and the Danube receives as many.

The Rhine and the Po receive each above a hundred others, great and ſmall; and the river of the Amazons receives into its large bed a prodigious number, ſome of which are five or ſix hundred leagues in length, and are of ſuch a depth and breadth as render them principal rivers.

Pliny, indeed, and Cardan, ſay, that the Nile receives none; but the later travellers into Abyſſinia aſſure us of the contrary.

The Rhine, Rhone, Danube, Boryſthenes, &c. ariſe originally from ſprings in the mountains; and the Nile, the Volga, the great river of St. Laurence, &c. from lakes.

It has been held by many, that all ſprings and rivers owe their origin to rains and dews; but there are ſome ſprings which cannot be accounted for on this principle, though others very well may. The intermitting ſprings, which flow

flow violently in rainy seasons, and are dry in summer, are probably owing to rains; but there are some springs which discharge more water annually than all that falls in rains and dews in the neighbouring country. The great perennial spring, at Willowbrig, in Staffordshire, is of this kind, and that of the Sorgne, in France, is much more eminently so; the river of that name being, according to Gassendus, navigable up to the very springs which are its source.

But if such springs as these discharge too great a quantity of water for the supply of rains and dews, how is it possible, that such small supplies of water as these can afford the constant currents of the larger rivers? The Volga alone, according to Ricciolus, pours forth as much water in a year's time into the Caspian sea, as would suffice to drown the surface of the whole earth. The river of St. Laurence, in America, pours forth nearly as much as this. If either of these rivers alone do, as has been affirmed, from calculations, discharge annually as much water as falls in the same time in rains and mists upon the surface of the whole earth; from whence are all the rest to be supplied, according to the system of their all being made by rains; and, particularly, where is left the supply for the Rio de la Plata, which Ricciolus affirms to be larger than the Nile, the Ganges, and the Euphrates, put together? its mouth being ninety miles wide, and running with that violence into the sea, that it makes it fresh for two hundred miles together. These, and the other rivers of the several parts of the globe, upon a very moderate calculation, discharge at least five hundred times as much water into the sea, as falls upon the whole surface of the earth, in rains, mists, dews, snows, &c. in a like space of time.

As it is evident, therefore, that these cannot be supplied by rains, so neither is it possible that the several hot springs and the salt springs can be supplied that way: the origin of springs also in places where there falls little or no rain, and where the conservatories must needs be too small to contain a supply, are great proofs that rain and mists are not the origin of springs, at least not in all places. The isles of Mago, Rotunda, and the Strophades, and the rock on which the Maiden Tower stands in the Thracian Bosphorus, cannot be supplied with, or retain a sufficiency of rain-water to supply constant springs, yet such are always found running there.

It cannot be otherwise but that there are subterranean communications between the sea and the sources of fountains, rivers, and the larger springs, by which these are supplied; and there are certainly charybdes which swallow the sea for these purposes; and when these happen to be stopped, the largest rivers have been dried up, and wholly ceased to run for a considerable time: this we have accounts in history has happened to the Thames, the Trent, and Medway, in England; the Elve, the Motala, and Gulfspang, in Sweden, and other rivers in other countries. If, on the other hand, these charybdes happen to be too open, fresh-water springs depending upon them will become salt. This we have instance of in history also; and even so old a writer as Pliny has said that this once happened in Caria near Neptune's Temple. (Plot. de Origine Fontium.) See EVAPORATION and SPRING.

RIVERS, *Phenomena and Variations of.* Rivers are found subject to great alterations, at different seasons of the year, day, &c. from frequent rains and melted snow. Thus in Peru and Chili many of the rivers are almost insensible in the night-time, and only flow by day, as being then augmented by the dissolution of the snow on the mountains Andes. Thus the Volga abounds in water in May and June, so as to cover the sand-banks, &c. which all the rest of the year lie bare, so as scarcely to allow a passage to the loaded ships. Thus also the Nile, Ganges, Indus, &c. are frequently so increased, as to overflow; and that either in the winter, from rain, or in the summer, from the melting of the snow. Some rivers bury themselves under ground in the middle of their course, and break out again in other places, like new rivers. Thus the Niger, which some cosmographers erroneously derive by a subterraneous channel from the Nile, because it swells at the same time with the Nile, without any other apparent cause—the Niger itself has been supposed by some to be hidden under the mountains of Nubia, and to rise again on the western side of those mountains; whereas, in reality, it is lost in lakes or sands. Thus, also, the Tigris is lost in the mountain Taurus, &c.

Aristotle, and the poets, mention several such rivers about Arcadia: Alpheus, a river of Arcadia, is particularly famed. This, being swallowed up in the ground, is supposed, by the Greek authors, to continue its progress under the earth, and under the bottom of the sea, into Sicily; where, breaking up near Syracuse, it forms the river Arethusa. The great reason of this opinion was, that, every fifth summer, the river Arethusa, in Sicily, cast up the dung of cattle about the time of the celebration of the Olympic games in Achaia, when the dung of victims was used to be cast into the Alpheus.

Some rivers empty themselves into the sea by one mouth, some by several. Thus, the Danube opens into the Euxine sea by seven mouths; the Nile by seven; and the Volga by at least seventy. The cause of this variety of mouths Varenius attributes principally to the banks of sand, &c. accumulated in them; which, gradually increasing, form islands, by which the channel is divided into several branches. Indeed, the ancients tell us, that the Nile formerly only emptied itself at one mouth, called the *ostium Canopicum;* and add, that the other six are adventitious, or artificial.

The channels of rivers, except such as were formed at the creation, Varenius endeavours to prove to be all artificial, and dug by men. His reasons are, that, when a new spring breaks forth, the water does not make itself a channel, but spreads over the adjacent land; so that the people have been necessitated to cut it a channel, to secure their grounds; and that a great number of channels of rivers are certainly known, from history, to have been dug by men, &c.

As to the question, whether those rivers which run into others, have made themselves that way by their own motion, or have been turned thither in canals cut by men? he takes the latter to be the more probable; and concludes the same of the arms, or branches, of rivers, and of the turns by which islands are formed in the Tanais, Volga, &c.

To the question, why we have no salt rivers, when there are so many salt springs? he answers, that it is because men, having no occasion for salt water, have not dug channels to conduct the water of salt springs; salt being procurable at less expence.

The water of most rivers carries with it particles of metals, minerals, sands, or oily and fat bodies, &c. Thus, some rivers bring sands intermixed with grains of gold; of which kind is, 1. A river in Japan. 2. Another in the island of Lequeo, near Javon. 3. A rivulet in Africa, called Arroe, breaking out of the foundation of the mountains of the moon, in which there are golden mines. 4. A river in Guinea, where the negroes separate the gold-dust from the sand, and sell it to the Europeans, who traffic thither for that very purpose. 5. In some rivulets near the city of Mexico, there are grains of gold taken up, especially

after

after rain; which is alſo to be underſtood of all the other rivers, none of which yield any thing conſiderable, except in rainy ſeaſons. 6. In Peru, Sumatra, Cuba, Hiſpaniola, and Guinea. Laſtly, there are ſeveral brooks in the countries about the Alps, eſpecially Tyrol, out of the ſediment of whoſe waters gold has been drawn, though there be no grains conſpicuous in them. Add to this, that the Rhine alſo, in many places, has afforded a golden mud.

As to rivers that bring grains or particles of ſilver, iron, copper, lead, &c. we find no mention of them in authors, though, doubtleſs, there are great numbers of each; and many of the medicinal effects of mineral waters are, doubtleſs, owing to particles of theſe kinds.

We muſt not here omit a water in Germany, which is ordinarily ſuppoſed to change iron into copper. The truth is, there is no real converſion of the metal; all that is done is, that the cuprine and vitriolic particles in the water corrode the iron; and, detaching parts of them by means of the motion of the water, coppery particles ſucceed in their room.

From this variety in the mixture of river-water reſult various qualities, different ſpecific gravities, different colours, &c.

Some rivers, at certain ſeaſons of the year, ſwell ſo as to overflow their banks, and drown the neighbouring lands. Of theſe the moſt eminent is the Nile, which riſes ſo as to cover all Egypt, except the hills. The inundation begins about the ſeventeenth day of June, and increaſes for the ſpace of forty days, and decreaſes for as many; during which period, the cities of Egypt, which are all built on hills, appear as ſo many iſlands.

To theſe inundations Egypt owes all its fertility; the heavens there affording no rain, or at leaſt none in any reſpect conſiderable. Hence, as the inundation is great or ſmall, Egypt, for that year, is fruitful or barren.

The ancient Greeks, &c. were much perplexed in aſſigning the cauſe of this inundation. From the modern Engliſh and Portugueſe traders into Congo, Angola, Monomotapa, &c. we learn, that the ſource of the Nile is in a large lake called Zaire, round which are the mountains of the moon, which being about 10° to the ſouth of the equator, inſtead of being covered with ſnow in their winter, have rain every day, at leaſt two hours before, and two hours after noon. So that their tops are always covered with clouds; and the rains are, at the proper ſeaſon, almoſt continual. Hence torrents are conſtantly deſcending from the mountains into the lake of Zaire; whence they flow into the channel of the Nile, and other rivers ariſing from the ſame lake; and hence the inundation of the Nile. See NILE and NILOMETER.

Mr. Bruce is the firſt perſon who, in his "Travels to Diſcover the Source of the Nile," has deſcribed, from his own obſervations, the ſpot in which he apprehends that the Nile ſprings.

Tracing one of the ſtreams, that run into the lake Tzana, to a ſwamp in the 11th degree of N. lat. he there remarks the head of the Nile, as our modern map-makers had actually done before he viſited this dreary region. Whether his guide deſerved credit, and whether he could juſtly infer that this rivulet was the Nile from the reſpect paid to it by the barbarous natives, it is not neceſſary particularly to enquire. The moſt important object in inveſtigating the ſource of the Nile is to account for its extraordinary inundations.

In doing this, Mr. Bruce has ſelected from the various opinions enumerated by Diodorus Siculus (l. i. c. 24.) that of Democritus of Abdera, and Agatharcides of Cnidus, which agrees in the main with that of Herodotus (l. ii. c. 8.) and has well explained the manner in which the ſun, continuing nearly ſtationary for ſome days in the tropic of Capricorn, rarefies the air, and collects a quantity of vapours from the Atlantic on the weſt, and the Indian ocean on the eaſt; and then, in its progreſs north towards the tropic of Cancer, draws theſe vapours after him. So that as he advances, the rainy ſeaſon begins upon his arrival at the zenith of every place, and the rains continue and increaſe after he has paſſed it in his progreſs northward.

In April many rivers join the Nile, and enable it to force its way through the ſtagnant lake Tzana, without mixing with it. In the beginning of May many other ſtreams pour themſelves into the ſame lake, and furniſh the Nile with an additional ſupply of water. In the beginning of June, the ſun having paſſed over Abyſſinia, the rivers are there full, and the time of the greateſt rains in this country is during the ſun's being almoſt ſtationary in the tropic of Cancer. Theſe rains are collected by the four great rivers of Abyſſinia, of which the Nile is one, which derives alſo a very copious ſupply from the White river, that riſes in a country of almoſt perpetual rain.

As the vapours meet with no mountains to interrupt their progreſs in the flat country that lies between Gerri and Syene, the tropical rains extend no farther north of the line than 16°.

When the ſun declines towards the equator, he reverſes the effects which he produced in his paſſage northward; and after his arrival at the line in the autumnal equinox, his influence ceaſes on the ſide of Abyſſinia, and extends itſelf to the ſouthern hemiſphere. Thus on the 25th of September, three days after the equinox, the Nile is generally found at Cairo to be at the higheſt, and then begins to decreaſe. Mr. Bruce explains the inundations that take place ſouth of the equator. The ancients were not unacquainted with this cauſe of the inundations of the Nile. The tropical rains falling to the extent of 16° on each ſide of the line gave riſe to the Nile and to its tributary ſtreams which flowed northward, through the kingdom of Sennar, &c. as well as to the Zebee, and many large rivers which flow ſouthward into Ethiopia, and according to the deſcent of the countries into the Indian or Atlantic ocean. Homer gives to the Nile the epithet διιπετης *qui cælitus deſcendit, a river produced and fed by rains*. See NILE.

The other rivers which have any notable ſtated inundations, are the Gambia, and the Niger, which overflow at the ſame time with the Nile, and loſe themſelves in ſands or lakes. (See NIGER.) Leo Africanus ſays, it begins on the 15th day of June, increaſes for forty days, and decreaſes as long. The Zaire, a river of Congo, is affected in the ſame manner with the Nile. (See ZAIRE.) The Rio de la Plata, in Braſil, as Maffeus obſerves, overflows at the ſame time with the Nile. (See *Rio de la* PLATA.) Of the ſame kind of rivers is the Ganges (which ſee); and the Indus, both which laſt overflow in June, July, and Auguſt; at which times the natives ſave great quantities of the water in ponds to ſerve them the reſt of the year; ſeveral rivers flowing out of the lake Chiamay into the bay of Bengal, which overflows in September, October, and November: theſe all bring a very great fertility with them to the ground; the river Macoa, in Camboïa; the river Parana, or Paranguaſa, which ſome will have to be the ſame with the Silver river; ſeveral rivers in Coromandel, a part of India, which overflow in the rainy months, from the great quantity of water iſſuing from the mountain Gatis; the Euphrates, which overflows Meſopotamia certain days in the year; and, laſtly, the river Sus, in Numidia.

The

The rivers moſt celebrated for their length, breadth, ſwiftneſs of current, &c. are, the Nile, which runs almoſt in a ſtraight courſe two thouſand five hundred and twenty geographical miles; the Niger, which runs two thouſand four hundred miles; the Ganges, two thouſand miles; the Burrampooter, the ſame diſtance; the Ob, ſixteen hundred miles; the Jenniſſee, in Aſia, about the ſame length with the Ob; the river Orellana, in America, ſixty miles broad at its mouth, and five thouſand miles long; the Rio de la Plata, about ninety miles broad at the mouth; the Omarannan, another river of Braſil; and the great river of St. Laurence, near two thouſand five hundred miles long. See the account of each river under its reſpective name.

Major Rennell, in his "Memoir," has eſtimated the proportional lengths of courſe of ſome of the moſt noted rivers in the world by the following numbers:

European Rivers.		
Thames		1
Rhine		$5\frac{1}{4}$
Danube		7
Volga		$9\frac{1}{2}$
Aſiatic Rivers.		
Indus	(probably)	$6\frac{1}{4}$
Euphrates		$8\frac{1}{2}$
Ganges		$9\frac{1}{2}$
Burrampooter		$9\frac{1}{2}$
Nou Kien, or Ava		$9\frac{1}{2}$
Jenniſſee		10
Oby		$10\frac{1}{2}$
Amoor		11
Lena		$11\frac{1}{2}$
Hoanho (of China)		$13\frac{1}{2}$
Kian Keu (of ditto)		$15\frac{1}{2}$
African River.		
Nile		$12\frac{1}{2}$
American Rivers.		
Miſſiſippi		8
Amazons		$15\frac{1}{2}$

By the ſtatute of Weſtm. 2. cap. 47, the king may grant commiſſions for perſons to take care of rivers, and the fiſhery in them; and the lord mayor of London is to have the conſervation in breaches and ground overflown as far as the water ebbs and flows in the river Thames. (4 Hen. VII. cap. 15.) Perſons annoying the river Thames, making ſhelves there, caſting dung in it, or taking away ſtakes, boards, timber-work, &c. of the banks, incur a forfeiture of 5*l*. by ſtat. 27 Hen. VIII. cap. 18. Commiſſioners were appointed to prevent exactions of the occupiers of locks, weirs, &c. upon the river Thames, weſtward from the city of London, to Cricklade, in the county of Wilts, and for aſcertaining the rates of water-carriages on the ſaid river, by ſtat. 6 & 7 W. III: and this ſtatute is revived, with authority from the commiſſioners to make orders and conſtitutions to be obſerved, under penalties, &c. by 3 Geo. II. cap. 11.

By ſtatutes 8 Geo. II. cap. 20, and 4 Geo. III. cap. 12, it is made felony, without benefit of clergy, maliciouſly to cut down any river or ſea-bank, by which lands may be deſtroyed, and to deſtroy ſluices or locks upon navigable rivers. See NUSANCE, and LARCENY.

RIVER, in *Phyſics*, denotes a ſtream of water running by its own gravity from the more elevated parts of the earth towards thoſe which are more depreſſed, in a natural bed or channel open above.

If this channel is artificial, it is called a canal; of which there are two kinds, *viz*. that whoſe channel is every where open without ſluices, called an artificial river, and that whoſe water is kept up or let off by means of ſluices, which is properly a canal.

RIVERS, *Hydraulic Theory of*.—The theory of moving waters is certainly one of great importance, and has therefore, for a long time, excited conſiderable intereſt, as well among practical engineers, as ſpeculative mathematicians; yet it muſt be acknowledged that it is but very lately any thing approaching to a well-founded theory has been eſtabliſhed. One of the firſt and moſt diſtinguiſhed of thoſe who attempted to reduce the motion and diſcharges of rivers to correct principles, was Guglielmini; and if his theory was falſe and hypothetical, yet he was the means of drawing the attention of philoſophers to theſe inquiries; and his deductions, though in many reſpects incorrect, are nevertheleſs entitled to a place in an article on this ſubject.

This author obſerves, that rivers have uſually their ſources in mountains or elevated lands, and that it is in their deſcent from theſe they acquire their velocity, or acceleration, which maintains their future current. In proportion as they advance farther, this velocity diminiſhes, on account of the continual friction of the water againſt the bottom and ſides of the channel, of the various obſtacles they meet with in their progreſs, and of their arriving, at length, in plains, where the deſcent is leſs; and their inclination to the horizon, of conſequence, greater. Thus the Reno, a river of Italy, which gave occaſion, in ſome meaſure, to theſe ſpeculations, is found, near its mouth, to have ſcarcely a deſcent of fifty-two ſeconds.

If the acquired velocity be quite ſpent, through the many obſtacles, ſo that the current becomes horizontal, nothing will then remain to propagate the motion, and continue the ſtream, but the depth, or the perpendicular preſſure of the water, which is always proportional to the depth. And happily for us, this reſource increaſes, as the occaſion for it increaſes; for, in proportion as the water loſes of the velocity acquired by the deſcent, it riſes and augments in depth.

It further appears, ſays he, from the laws of motion pertaining to bodies moved on inclined planes, that when water flows freely upon an inclined bed, it acquires a velocity, which is always as the ſquare root of the quantity or declivity of the bed. But in an horizontal bed, opened by ſluices or otherwiſe, at one or both ends, the water flows out by its gravity alone; and the flowing is quicker or ſlower in a direct ratio of the reſpective heights of the water, by reaſon of the weight of the ſuperior waters upon the inferior. Hence it follows, firſt, that as much as the declivity of the bed or channel of a river is greater, ſo much alſo will the velocity of the flowing waters be proportionably increaſed.

Secondly, as much as the water in an horizontal bed is deeper, ſo much will the velocity of the current be increaſed; and this velocity will diminiſh in proportion to the decreaſing depths of the water in the bed.

Thirdly, abſtracting from the reſiſtance cauſed by the bottom and ſides of the bed, as much nearer as the water is to the bottom, ſo much will its motion be accelerated; not only becauſe the inferior waters are more compreſſed by the ſuperior in proportion to their greater depth; but alſo becauſe the inferior ones have a greater declivity than the ſuperior, by reaſon of their greater depth in the bed, where

where they are more depreſſed with reſpect to the elevation of their common ſource or ſpring.

The upper parts of the water of a river, and thoſe at a diſtance from the banks, may continue to flow, from the ſingle cauſe, or principle of declivity, how ſmall ſoever it be; for, not being detained by any one obſtacle, the minuteſt difference of level will have its effect; but the lower parts, which roll along the bottom, will ſcarcely be ſenſible of ſo ſmall a declivity; and will only have what motion they receive from the preſſion of the ſuperincumbent waters.

The natural coheſion of the particles of water, and their implication, as it were, with one another, make the lower, which are moved by means of the depth, carry along with them the upper, which, in an horizontal channel, would have no motion at all: or, in a channel very little inclined, next to none; ſo that the lower, in this caſe, communicate to the upper a part of the motion they have received from the preſſure of it. Hence, from the preſſure, it frequently happens that the greateſt velocity of a river is about the middle of its depth, or that point, which is the fartheſt poſſible from the ſurface of the water, and from the bottom and ſides of the bed; ſuch middle parts having the advantage of being preſſed with half the depth of the river, and of being free, at the ſame time, from the friction of the bottom; whereas, on the contrary, the leaſt velocity of the water is at the bottom and ſides of the bed, becauſe there the reſiſtance reſulting from friction is the greateſt, which is communicated to the other parts of the ſection of the river, in an inverſe duplicate proportion of the diſtances from the bottom and ſides combined together.

To find whether the water of a river, almoſt horizontal, flows by means of the velocity acquired in its deſcent, or by the preſſure of its depth, ſet up an obſtacle perpendicular to it; if the water riſe and ſwell immediately againſt ſuch obſtacle, it runs in virtue of its fall; or, if it ſtop a little while firſt, in virtue of its preſſion.

Rivers, according to this author, almoſt always make their own beds. If the bottom have originally been a large declivity, the water, in conſequence of it, falling with a great deal of force, will have ſwept away the moſt elevated parts of the ſoil, and carrying them lower down, will gradually render the bottom horizontal; where the ſtream is ſwifteſt, there will the earth be moſt dug up; and, conſequently, there the greateſt cavity will be made.

The water having made its bed horizontal becomes ſo itſelf, and conſequently rakes with the leſs force againſt the bottom, till at length that force becomes only equal to the reſiſtance of the bottom. The bottom is now arrived at a ſtate of permanency, at leaſt for a conſiderable time; and the longer, according to the quality of the ſoil, clay and chalk reſiſting longer than ſand or mud.

On the other hand, the water is continually wearing away the brims of its channel, and this with the more force, as, by the direction of its ſtream, it impinges more perpendicularly againſt them. By this means it has a continual tendency to render them parallel to its own courſe; and when it has arrived as near that as poſſible, it ceaſes to have any effect that way. At the ſame time that it has thus rectified its edges, it has enlarged its own bed; that is, it has loſt of its depth, and conſequently of its force and preſſure: this it continues to do till there is an equilibrium between the force of the water and the reſiſtance of its banks, upon which they will remain without farther mutation. And it is evident, from experience, that theſe equilibriums are all real, inaſmuch as we find that rivers only dig and widen to a certain pitch.

The very reverſe of all theſe things happens on other occaſions. Rivers, whoſe waters are thick and muddy, raiſe their bed, by letting part of the heterogeneous matters contained in them fall to the bottom: they alſo contract their banks, by a continual appoſition of the ſame matter, in bruſhing over them. This matter, being thrown aſide far from the ſtream of water, might even ſerve, by reaſon of the obſcureneſs of the motion, to form new banks.

Now theſe oppoſite effects ſeem almoſt always to concur, and are differently combined, according to the circumſtances, whence it is very difficult to judge of the reſult; yet muſt this combination be known very accurately, before any meaſures can be taken about rivers, eſpecially as to the diverting of their courſes. The Lamona, which emptied itſelf into the Po, being turned another way, to make it diſcharge itſelf into the Adriatic, was ſo altered, and its force ſo far diminiſhed, after its waters were left to themſelves, that it raiſed its bed a great height, by continual depoſitions of mud, till it became much higher than the Po, in its utmoſt accretions, and needed very high banks, or dykes, to keep it from overflowing.

If various cauſes of reſiſtance to the motion of flowing waters did not exiſt, ſuch as the attraction and continual friction of the bottom and ſides, the inequalities in both, the windings and angles that occur in their courſe, and the diminution of their declivity the farther they recede from their ſprings, the velocities of their currents would be accelerated to twelve, fifteen, and, in ſome caſes, even to twenty times more than they are at preſent in the ſame rivers, by which they would become abſolutely unnavigable.

A little river may be received into a large one, without either augmenting its width or depth. This ſeeming paradox ariſes hence, that the addition of the little river may only go towards moving the waters, before at reſt near the banks of the large one, and thus augmenting the velocity of the ſtream, in the ſame proportion as it does that of the quantity of water. Thus the Venetian branch of the Po ſwallowed up the Ferrareſe branch, and that of Panaro, without any enlargement of its own dimenſions. And the ſame may be concluded proportionably of all other acceſſions to rivers, and, in the general, of all new augmentations of water.

A river offering to enter into another, either perpendicularly, or in an oppoſite direction, will be diverted by degrees from that direction, and obliged to make itſelf a new and more favourable bed towards the mouth.

The union of two rivers into one makes the whole flow the ſwifter, becauſe, in lieu of the friction of four ſhores, they have only two to ſurmount; and that the ſtream, being farther diſtant from the banks, goes on with the leſs interruption; beſides, that a greater quantity of water, moving with a greater velocity, digs deeper in the bed, and of courſe retrenches of its former width. Hence alſo it is that rivers, by being united, take up leſs ſpace on the ſurface of the earth, and are more advantageous to low grounds, which diſcharge their ſuperfluous moiſture into them, and have likewiſe leſs occaſion for dykes to prevent their overflowing.

Theſe advantages are ſo conſiderable, that S. Guglielmini thinks them worthy of nature's having had a view to them in her contriving to make the confluences of rivers ſo frequent as we find them.

Such were the views and deductions of this author, in which he has been followed by ſeveral mathematicians of the firſt eminence; but certainly without coming to any very accurate and eſtabliſhed principles, on which to found a computation of the quantity of water that would be diſcharged, in any new caſe that preſented itſelf for determination;

tion; or what ſlope, and what magnitude of current, was neceſſary for producing any required ſupply. Thus, a ſmall aqueduct, which was carried to Paris in the beginning of the laſt century, on a plan preſented to the academy, and, with ſome alteration, approved of by that learned body, was found, when completed, to yield very little more than half the quantity of water which they had computed. A ſimilar circumſtance happened at Edinburgh, when that city was ſupplied by water, under the direction of Deſaguliers; the quantity of water actually furniſhed being only about one-ſixth of the quantity which he had computed it would be, and but one-eleventh of what Maclaurin had eſtimated it at from the ſame plan.

Nothing can ſhew more clearly the inadequacy of the theory, as it exiſted at that time, than that the firſt mathematicians of their age, and we might almoſt add of any age, ſhould differ ſo widely from each other; the eſtimate of the one being but about one-half of the other, and the neareſt to the truth not agreeing with the actual ſupply by five parts out of ſix.

It required but a few inſtances of this kind to point out the neceſſity of a more preciſe and definite theory; and the ſubject was accordingly ſoon after undertaken by Michelotti at Turin, the abbé Boſſut at Paris, and by the chevalier du Buat; of whom the latter is generally admitted to have met with the moſt complete ſucceſs. Michelotti made a great number of experiments, both on the motion of water in pipes and in open canals. They were performed at the government expence, and nothing was ſpared to render them complete. A tower of fine maſonry was built, to ſerve as a veſſel from which the waters were to iſſue, through holes of various ſizes, and under various preſſures, from 5 feet to 22 feet. The water was received into baſons conſtructed of maſonry, and accurately lined with ſtucco, and of various forms and declivities. Theſe experiments on the expence of water through pipes are, of all that have yet been made, the moſt numerous and exact, and may be appealed to on every occaſion. Thoſe made on open canals are ſtill more numerous, and are no doubt equally accurate; but they have not been ſo contrived as to be ſo generally uſeful, being moſtly very unlike the important caſes which will occur in practice; and they ſeem to have been contrived chiefly with a view of overturning or eſtabliſhing certain received hydraulic principles of that time. The experiments of Boſſut are alſo very numerous, and of both kinds, *viz.* on pipes and canals; ſome particulars of which will be found under our article DISCHARGE *of Fluids*. But thoſe of the chevalier du Buat are the moſt concluſive, and his theory of rivers the moſt perfect of any with which we are yet acquainted. A few of the leading principles of this author's theory will be found in the ſubſequent part of this article.

It is certain that the motion of open ſtreams muſt, in ſome reſpects, reſemble that of bodies ſliding down inclined planes, perfectly poliſhed; and that they would accelerate continually, were they not obſtructed: but they are obſtructed, and frequently move uniformly. This can only ariſe from an equilibrium between the forces which promote their deſcent and thoſe which oppoſe it. Hence M. Buat aſſumes his leading propoſition, *viz.*

1. "When water flows uniformly in any channel or bed, the accelerating force, which obliges it to move, is equal to the ſum of all the reſiſtances which it meets with, whether ariſing from its own viſcidity, or from the friction of its bed."

From this propoſition, ingeniouſly combined with the reſult of his own and Boſſut's experiments, he then draws theſe fundamental propoſitions, *viz.*

2. "The motion of rivers depends entirely on the ſlope of their ſurfaces.

3. "Since the velocity of the water depends wholly upon the ſlope of the ſurface, or of the pipe through which it is conveyed, it follows that the ſame pipe will be ſuſceptible of different velocities, which it will preſerve uniform to any diſtance, according as it has different degrees of inclinations; and each inclination of a pipe, of given diameter, has a certain velocity peculiar to itſelf, which will be maintained uniform to any diſtance whatever. But this velocity changes continually, according to a certain function of its inclination for all degrees between its vertical and horizontal poſitions."

It is obvious that, conſidering the number of cauſes that may give riſe to inequalities in the motion of water, whether in pipes or canals, it would have been vain to attempt the determination of the function above-mentioned from theory only: the reſults of the ſeveral experiments were, therefore, examined with the moſt ſcrupulous attention, and penetrating ingenuity, and from which at length the author derived the following theorems, *viz.*

Let V be the velocity of the ſtream, meaſured by the inches it moves over in a ſecond; R a conſtant quantity, *viz.* the quotient obtained by dividing the area of the tranſverſe ſection of the ſtream, expreſſed in ſquare inches, by the boundary or periphery of that ſection, *minus* the breadth of the ſtream, expreſſed alſo in inches, *viz.* $R = \frac{wh}{b + 2h}$; where w is the mean width of the ſection, h the mean height or depth, and b the breadth at bottom.

The line R is called by du Buat the *radius*, and by Dr. Robiſon the *hydraulic mean depth*.

Laſtly, let S be the denominator of a fraction, which expreſſes the ſlope, the numerator being unity; that is, let it be the quotient obtained by dividing the length of the ſtream, ſuppoſing it extended in a ſtraight line, by the difference of level of its two extremities; or, which is nearly the ſame, let it be the co-tangent of the inclination or ſlope.

Then the general formula expreſſing the velocity V, ſuppoſed uniform, is,

$$V = \frac{307\sqrt{R - \frac{1}{10}}}{\sqrt{S} - \frac{1}{2}\text{h. log. }(S + \frac{16}{10})} - \tfrac{3}{10}\sqrt{R - \tfrac{1}{10}}, \text{ or}$$

$$V = \sqrt{R - \tfrac{1}{10}} \times \left(\frac{307}{\sqrt{S} - \frac{1}{2}\text{h. log. }(S + \frac{16}{10})} - \tfrac{3}{10}\right).$$

But when R and S are both very great, then,

$$V = \sqrt{R}\left(\frac{307}{\sqrt{S} - \frac{1}{2}\text{h. log. }S} - \tfrac{3}{10}\right) \text{ nearly.}$$

Hence it follows, that the ſlope remaining the ſame, the velocities are as R, or as the area of the ſection divided by its perimeter, *minus* the breadth of the river at the ſurface, *very nearly*; for they are as $\sqrt{R - \frac{1}{10}}$; and when the river is large, the $\sqrt{R}$ may be uſed without any ſenſible error.

Again, if R is ſo ſmall, that $\sqrt{R - \frac{1}{10}} = 0$, or $R = \frac{1}{10}$, the velocity will be nothing, which agrees very well with experiments; for in a cylindric tube $R = \frac{1}{2}$ the radius: the radius, therefore, is only two-tenths, ſo that the tube is nearly capillary, and the fluid will not flow through it.

The

The velocity may also become nothing, by the slope becoming so small, that

$$\frac{307}{\sqrt{S} - \frac{1}{2}\text{h. log.}\,(S + \frac{16}{10})} - \tfrac{3}{10} = 0;$$

but if $\frac{1}{S}$ is less than $\frac{1}{500000}$, or than $\frac{1}{10}$th of an inch to an English mile, the water will have sensible motion.

In a river, the greatest velocity is at the surface, and in the middle of the stream; from which it diminishes towards the bottom, and the sides, where it is the least. It has been found, from experiment, that if, from the square root of the velocity in the middle of the stream, expressed in inches *per* second, unity be subtracted, the square of the remainder is the velocity of the bottom.

Hence, if v be the velocity in the middle of the stream, the velocity of the bottom will be expressed by $(\sqrt{v} - 1)^2 = v - 2\sqrt{v} + 1$.

The mean velocity, or that with which, were the whole stream to move, the discharge would be the same as the real discharge, is equal to half the sum of the greatest and least velocities, as computed in the last proposition. Therefore, if v represents the greatest velocity, then will the mean velocity $= v - \sqrt{v} + \frac{1}{2}$.

Suppose that a river, having a rectangular bed, is increased by the junction of another river equal to itself, the declivity remaining the same; required the increase of depth and velocity. Let the breadth of the river $= b$, the depth before the junction d, and after it x; and, in like manner, v and v' the mean velocities before and after; then $\frac{b\,d}{b + 2\,d} = R$ *before*, and $\frac{b\,x}{b + 2\,x} = R'$ *after*, so $v = \frac{307\sqrt{R}}{\sqrt{S}}$, supposing the breadth of the river to be such, that we may reject the small quantity subtracted from R; and, in like manner, $v' = \frac{307\sqrt{R'}}{\sqrt{S}}$; then substituting for R and R′, we have

$$v = \frac{307}{\sqrt{S}} \times \sqrt{\frac{b\,d}{2\,d + b}}, \text{ and}$$

$$v' = \frac{307}{\sqrt{S}} \times \sqrt{\frac{b\,x}{b + 2\,x}}.$$

Multiplying these into the area of the sections $b\,d$, $b\,x$, we have the discharges, *viz.*

$$b\,d\,v = \frac{307}{\sqrt{S}} \times \frac{b\,d\sqrt{b\,d}}{\sqrt{(b + 2\,d)}}, \text{ and}$$

$$b\,x\,v' = \frac{307}{\sqrt{S}} \times \frac{b\,x\sqrt{b\,x}}{\sqrt{(b + 2\,x)}}.$$

And since the last of these is double the former, we obtain

$$\frac{b\,x\sqrt{b\,x}}{\sqrt{(b + 2\,x)}} = \frac{2\,b\,d\sqrt{b\,d}}{\sqrt{(b + 2\,d)}}, \text{ or } \frac{x^3}{b + 2\,x} = \frac{4\,d^3}{b + 2\,d},$$

$$\text{whence} \qquad x^3 - \left(\frac{8\,d^3}{b + 2\,d}\right)x = \frac{4\,b\,d^3}{b + 2\,d},$$

a cubic equation solvable by the formula of Cardan. As an example, let $b = 10$ feet, $d = 1$, then $x^3 - \frac{2}{3}x = \frac{10}{3}$, where $x = 1.4882$, which is the depth of the increased river. Hence we have $1.4882 \times v' = 2\,v$, and $1.4882 : 2 :: v : v'$; or v is to v' as 37 to 50 nearly.

When the water in a river receives a permanent increase, the depth and the velocity, as in the example above, are the first that are augmented. The increase of the velocity increases the action on the sides and bottom, in consequence of which the width is augmented, and sometimes also, but more rarely, the depth. The velocity is thus diminished, till the tenacity of the soil, or the hardness of the rock, affords a sufficient resistance to the force of the water; the bed of the river then changes only by insensible degrees, and, in the ordinary language of hydraulics, is said to be permanent, though, in strictness, this epithet is not applicable to the course of any river. For more on this subject, see Du Buat, "Principes d'Hydrauliques," in two vols. 8vo. Paris, 1806; Bossut's "Hydrodynamiques;" the article *River* in the "Encyclopedia Britannica;" and Playfair's "Outlines of Natural Philosophy."

The best and most simple method of measuring the velocity of the current of a river or canal, is the following. Take a cylindrical piece of dry, light wood, and of a length something less than the depth of the water in the river; round one end of it, let there be suspended as many small weights as may be necessary to keep up the cylinder in a perpendicular situation in the water, and in such a manner that the other end of it may just appear above the surface of the water. Fix to the centre of that end which appears above water, a small and straight rod, precisely in the direction of the cylinder's axis; to the end, that when the instrument is suspended in the water, the deviations of the rod from a perpendicularity to the surface of it, may indicate which end of the cylinder advances the fastest, by which may be discovered the different velocities of the water at different depths; for if the rod inclines forwards, according to the direction of the current, it is a proof that the surface of the water has the greatest velocity; but if it inclines back, it shews that the swiftest current is at the bottom; if it remains perpendicular, it is a sign that the velocities at the surface and bottom are equal.

This instrument being placed in the current of a river or canal, receives all the percussions of the water throughout the whole depth, and will have an equal velocity with that of the whole current *from the surface to the bottom* at the place where it is put in, and by that means may be found, both with ease and exactness, the mean velocity of that part of the river for any determinate distance and time.

But to obtain the mean velocity of the whole section of the river, the instrument must be put successively both in the middle and towards the sides, because the velocities at those places are often very different from each other. Having by this means found the *difference of time required for the currents to run over an equal space*; or, *the different distances run over in equal times*, *the mean proportional* of all these trials, which is found by dividing the common sum of them all by the number of trials, *will be the mean velocity of the river or canal.*

If it be required to find the velocity of the current only at the surface, or at the middle, or at the bottom, a sphere of wood, of such a weight as will remain suspended in equilibrium with the water, at the surface or depth which we want to measure, will be better for the purpose than a cylinder, because it is only affected by the water of that sole part of the current where it remains suspended.

It is very easy to guide both the cylinder and the globe in that part which we want to measure, by means of two threads of small cords, which two persons must hold and direct, one on each side the river; taking care at the same time neither to retard nor accelerate the motion of the instrument.

Having

Having the mean or medium velocity of a river, if we multiply this medium, the breadth, depth, and ſpace run over in a certain time, the product will give the quantity of water that flows down in that time. Dr. Halley, in order to eſtimate the quantity of water that flows into the Mediterranean ſea by means of rivers, makes a compariſon of the great rivers of Italy, &c. with that of the Thames. (Philoſ. Tranſact. Abridg. vol. ii. page 110.) He aſſumes the breadth of the Thames at Kingſton bridge to be 100 yards, its depth three yards, and velocity two miles *per* hour. He profeſſedly overrates the dimenſions, in order to allow more than a ſufficiency for the ſtreams received below Kingſton. This aſſumption gives the area of a tranſverſe ſection of the river = 300 ſquare yards, and the quantity of water flowing down = 20,300,000 tons in a day. This muſt be overrated by at leaſt, it is ſuppoſed, one-third. If the breadth be aſſumed 100 yards, the depth three, and velocity two miles *per* hour, it will then give two-thirds of the reſult above-mentioned; or it will amount to the ſame thing if we take one-eighth part from all the three data aſſumed by Dr. Halley, the reſult being two-thirds of that above; amounting in the year to 166,624,128,000 cubic feet, which is a little more than one-twenty-fifth part of all the rain and dew in England and Wales in a year, as above deduced. Mr. Dalton has eſtimated "that the water of the Thames is drawn from an extent of country of about 600 ſquare miles, or one-eighth of the area of the whole, nearly. The Severn, including the Wye, ſpreads over an equal or greater extent of country; and that collection of rivers which conſtitutes the Humber is ſuperior to either of the other two in this reſpect. As far as my own obſervation goes, the Severn and Wye muſt diſembogue as much or more water than the Thames; the Humber I have not ſeen collectedly, but have noticed moſt of the branches conſtituting it, and ſhould apprehend it cannot be inferior to the Thames: all other circumſtances being the ſame, the quantity of water carried down by any river ſhould be as the area of the ground from which the water is derived, and on this account the Humber ought to exceed the Thames.

"The Severn, which is partly derived from the mountainous country of Wales, is certainly the moſt rapid of the three rivers, and probably carries down the moſt water; as the Thames, however, is generally conſidered to take the lead, we will ſuppoſe, upon the whole, that theſe three rivers are equal in this reſpect.

"The counties of Kent, Suſſex, Hampſhire, Dorſetſhire, Devonſhire, Cornwall, and Somerſetſhire, from the Medway to the Lower Avon incluſively, in an extent of 11,000 ſquare miles, do not preſent us with many large rivers. From their number and magnitude, we cannot form a high eſtimate of their produce. The quantity of rain for thoſe counties is indeed near the average for the kingdom, as far as the preceding obſervations determine; but the milder temperature of their winters and greater heat of their ſprings and ſummers, will cauſe a greater evaporation than in ſome other parts: it is probable the rivers in theſe counties may amount, when taken together, to $1\frac{1}{2}$ times the magnitude of the Thames. The rivers that diſembogue their waters on the coaſt of Lincolnſhire, Norfolk, Suffolk, and Eſſex, from the Humber to the Thames, though drawn from a country of 7000 ſquare miles, manifeſtly fall far ſhort of the Thames. The two places in this diſtrict, for which we have accounts of the rain, Norwich and Upminſter, give a mean of only $22\frac{1}{2}$ inches annually. This, with the flatneſs of the country, which prevents the water from running off in ſome degree, makes the rivers much leſs than what might otherwiſe be expected from the extent of ground. There are but three or four of any conſequence. Probably all the rivers may amount to half the ſize of the Thames. There remains above 6000 ſquare miles in Wales, from the Wye to the Dee, incluſive of the laſt, and the northern counties of Lancaſter, Weſtmoreland, Cumberland, Northumberland, and Durham, with part of Cheſhire, and a ſmall part of Yorkſhire, from the Merſey round by the Tweed to the Tees, amounting to 7000 or 8000 ſquare miles, to be eſtimated.

"Theſe two diviſions, though not larger than ſome others, abound in rivers, many of which are conſiderable in magnitude and of great rapidity. The rains at an average, it is probable, are double what they are in the S.E. counties of the kingdom. The rivers in theſe two diſtricts cannot fairly be eſtimated, I think, at leſs than four times the Thames. It appears, then, that by this eſtimation, the water carried off by all the rivers in England and Wales, may amount to nine times that carried off by the Thames = 13 inches of rain. There remains ſtill ſixteen times the water of the Thames, or 23 inches of rain to account for, before we have diſpoſed of all the rain and dew."

This ingenious philoſopher concludes, from a detail of facts and reaſoning, that "the rain and dew of this country are equivalent to the quantity of water carried off by evaporation and by the rivers. And as nature acts upon general laws, we ought to infer, that it muſt be the caſe in every other country, till the contrary is proved.

"This concluſion being admitted, we are enabled to deduce a general theorem for the quantity of water carried down into the ſea by any river in any country (on the ſuppoſition that all rivers are ramified alike) provided we have certain data; theſe data are the length of the river, and the exceſs of the rain above the evaporation in the country from which the water of the river is drawn; alſo, it ſhould be known by obſervation, how much water ſome one given river carries down.

"For, from the principles of geometry, the area of country from which any river is ſupplied, will be as the ſquare of the length of the river; and the quantity of water carried off, will be in the compound ratio of the area of the country, and the exceſs of the rain and dew above the evaporation.

"Thus, let L = the length of any river, E = the exceſs of rain and dew above the evaporation, and Q = the quantity of water diſembogued in any given time by that river; l = the length of any other river, e = the exceſs, &c. and q = the quantity of water; then we ſhall have $q = \frac{Q\,l\,e}{L\,E}$.

"*E. gr.* Suppoſe the length of the Thames = 200 miles, and the exceſs = 5 inches, eſtimating the rain and dew at 30 inches, and evaporation at 25; and ſuppoſe the river Kent, in Weſtmoreland, to be 20 miles in length, and the exceſs 35 inches, the rain and dew being ſuppoſed 65, and evaporation 30 inches. Then,

$$\frac{20^2 \times 35 \times Q}{200^2 \times 5} = \frac{7\,Q}{100} = q,$$

or $Q = 14\frac{2}{7}\,q$; which reſult, I believe, will be found to accord nearly with the meaſurement of the two rivers on the principle before-mentioned." Mancheſter Memoirs, vol. v. pt. 2.

River, with regard to *Agriculture*, may be converted, in many ſituations, to various uſeful purpoſes, ſuch as thoſe of improving the meadow and other graſs-lands which lie below the ſources of them, by having their waters in particular ſeaſons turned over them. By proper attention in theſe

these refpects, vaft benefits might, in a variety of cafes, where it has never been even fo much as fufpected, be derived, and thereby immenfe favings in manure be made for the amelioration of the lefs favourably fituated lands. But befides this vaft fource of advantage, rivers may often be converted, with little trouble or expence, to other ufeful purpofes, fuch as the fupplying of live-ftock with water, the turning of different kinds of farming machinery, the conveying of cattle food, and manures of various defcriptions, as well as different forts of farm produce, and a great number of other ufes, which can only be difcovered by the particular circumftances of them, and thofe of their fituations. But though in thefe views they may be juftly confidered as of much advantage, in others they are often dangerous, troublefome, and highly detrimental to the farmer, as where they are much accuftomed to overflow their banks, injure the crops, fweep away the live-ftock, and carry down much of the lands on their borders. Where they are apt to prove hurtful by thus overflowing their banks, the beft modes of confining them in particular cafes have been pointed out in fpeaking of the nature of embankments and haugh-land. See EMBANKMENT, and HAUGH-*Land*.

There are, however, other cafes that deferve to be confidered in this place, fuch as the directing and altering the courfes of torrents coming from mountains, changing the courfes of rivers, fecuring the banks of rivers in vallies, and ftraightening the narrow, crooked windings of fmall rivers in the fame fituations, and other hollow parts of lands. By the firft of which much advantage may, in different circumftances, be procured, and great fecurity be attained for the valuable lands below. By the fecond, extenfive tracts of the moft valuable kinds of land may be obtained, while the whole is rendered more fafe and proper for the purpofes of pafturage or thofe of tillage. By the third, much ufeful land may be fecured, as well as much mifchief from the high floods be guarded againft. And as by the laft much ground is often loft, or rendered of but trifling value to the farmer, by proper means thefe inconveniencies may be obviated, and the land rendered of much greater utility. Befides thefe, the methods of fecuring the banks, in other inftances where they are liable to be carried away by large floods, may alfo prove a vaft benefit and improvement.

In the former of thefe cafes, the remedies are, in general, thofe of rendering their courfes more *free*, *open*, *ftraight*, and *regular*, by which they muft obvioufly fuffer lefs obftruction, and of courfe be lefs apt to overflow their banks, and prove injurious to the grounds below, or on the fides of them. It is, however, remarked, that this is a fort of work that ought to be maturely confidered in all cafes before it is attempted; but that in fuch upland fituations the bufinefs may often be performed with facility by fmall cuts made along the flat bafes of fuch elevations, while it is very different in thofe of ftraightening vale rivers, as much larger openings are requifite. Befides, fhallows for piers and ftops are moftly found there, while in thefe cafes they are in general wholly wanting. But in all cafes, and in every point of view, the bufinefs is evidently of the greateft intereft to the proprietors of land, as the deftruction produced in this way is not only often committed on the moft valuable forts of land, but is frequently the caufe of difputes between the neighbouring proprietors; this fort of work has, however, been little attended to, and is in common very imperfectly underftood. In many inftances a great deal may be effected by proper accommodation between the different proprietors, whofe interefts are affected.

But in undertaking works of this nature, there are different circumftances that require to be particularly confidered. The peculiar fcite or place of improvement fhould, Mr. Marfhall fays, be well ftudied, in order to fix upon the beft method of executing the work. And when this has been done, accurate plans and eftimates of the expence that may be incurred, as well as of the grofs profits that may refult from it, be made out with care. And it is advifed that, where the bufinefs is extenfive, and the perfon who has the management not perfectly acquainted with the nature of it, to contract with proper experienced labourers, or a refponfible undertaker, for the execution of the whole, binding the party who is to perform the work to uphold it for a certain number of years after it is finifhed. It is remarked, that for want of thefe precautions, fums of money are annually expended, and in great part thrown away, fo as to become, in fome inftances, a heavy tax upon eftates, and a ferious defalcation of timber. It does not follow, it is contended, that, becaufe a few fquare yards of land are annually carried away, an expenfive work fhould be erected, and upheld at ten times the value of the ground it will protect; nor that, becaufe one fide of a river is flightly injured, an over-fized work fhould be raifed to the greater injury of the oppofite banks. It will be found, it is obferved, that in ordinary cafes, oppofite proprietors have one and the fame intereft; and that fmall injuries may generally be remedied by fimple means, and at a fmall coft. What the writer is folicitous to inculcate is, that the remedy ought to be proportionate to the difeafe; and that it fhould be applied in fuch a manner as not to injure another: confequently, that it behoves a proprietor to fee that no one about him has an intereft in erecting expenfive and abortive works, or any profpect of advantage from the annoyance of his neighbour in any refpect from fuch works. It is added, that every perfon has an undoubted right to defend his property. It is often his duty, as well as his intereft, to do it. And that there are cafes on which even large fums of money may be prudently laid out, and ought to be expended in order to accomplifh the work; as by neglect great injury may be fuftained, which at firft might have been remedied at a very trifling coft.

Rivers, wherever they are properly fituated, fhould always be converted to the ufe of watering the grafs lands which lie below their levels. See WATERING *of Land*.

RIVER-*Banks*, *Securing of*, the means of guarding and protecting them from the encroachment and injury of the ftreams when in flood or otherwife. It is a work of much difficulty and labour in many cafes, and that requires the careful management of an experienced director. It is indeed remarked by the author of the Treatife on Landed Property, in fpeaking of the nature of this bufinefs, that fuppofing the uniform, and evenly-poifed, current of a reach or ftraight part of a river to be difturbed by the body of a large root of a tree, or any other matter, brought down and lodged by a flood, on this fide, which, in brooks and narrow rivers, is an ordinary caufe of mifchief, it is found that through this apparently trifling incident the current may be faid to lofe its balance. For, when the flood falls to the level of the obftruction, the water becomes confined in that part; its height, above the obftruction, is confequently increafed; and its current oppofite and below it not only accelerated, but gently turned from its direct courfe toward the oppofite bank of its natural channel; which, if it be of an earthy crumbling nature, becomes undermined: the land, or upper part of the bank, confequently fhoots down, and is carried away by fucceeding floods. And what tends to increafe the evil is, the circumftance of the channel, immediately below the obftruction, becoming occupied, even in minor floods, with comparatively ftagnant water. It is in confe-

quence

quence warped up with the fediment there depofited; and by this means an additional weight of water is thrown againft the oppofite bank; which, if the growing caufe of mifchief be not fpeedily removed, will in a fhort time be much torn away, and, in a courfe of years, a bend or bay be formed in the adjoining ground of the proprietor, nearly oppofite to the root or other body, with a correfponding bank of fand or gravel, united with and becoming part of the lands on this fide. But if the grounds, on this fide, are equally vulnerable as thofe of the oppofite neighbour, there is no caufe of exultation in the increafe of territory. For while the current is leaving the proprietor on this fide, perhaps a worthlefs fand-bank near the obftruction is, by a natural law of river-currents, fcooping out a bay below, and giving to his oppofite neighbour an increafing territory in that part. And thus a natural lofs of valuable land is incurred on each fide; and the evil (in this cafe) continually increafing; until the banks are fecurely defended, or the current is reftrained, and directed into its former channel. The remedies in this cafe are two; firft, to fheath the injured banks of the bays on both fides, with fuch materials as will refift the circuitous current, and let the river remain in its crooked ftate; and, fecondly, to erect a pier at the higher point of the bend on the oppofite fide of the river, to parry off the force of the current from the bank of it, and direct it forward; with the twofold intention of preventing further mifchief, and of bringing back the courfe of the river to its former ftate of ftraightnefs, as much as poffible.

It is likewife ftated, that the operation of guarding the immediate bank of a fharp river-bend againft a heavy current, meeting with great refiftance, is generally a work of much difficulty and expence, even where materials can be eafily procured; while that of diverting the current may frequently be accomplifhed at a comparatively fmall coft; and its effect be rendered infinitely more falutary and permanent. As it is evident that, if the accidental obftruction mentioned had been timely removed, no bad effect would have enfued, and the river would have continued its direct courfe. Or if, through neglect, it had been fuffered to remain awhile, until its mifchief was difcoverable, even then, if it had been moved from its ftation to the oppofite fide of the river, and placed in the part affected, this fmall counterpoife might have recovered the balance of the current, and directed it into its wonted channel. And in almoft any cafe, he thinks, by judicioufly placing, in a fimilar manner, an obftruction proportioned to the magnitude of the power to be counteracted, the like effect may be produced. As, for inftance, if, in the cafe propofed, the pier or river-guide above-mentioned were to be erected by the proprietor on the oppofite fide of the river, and to be inclined towards the ftream, or direct courfe of the river, in a degree proportioned to the ftrength of its current (a rapid current requiring lefs bias than a flow one), and of a fize in like proportion, not only the banks of the bay or bend would be defended, in a great degree, from the action of floods, but the fand-bed formed on this fide would be worn away, and its materials depofited in the bay on the other fide; which alfo being rendered ftagnant, comparatively, with the current of the river, would receive the depofits of foul waters in times of floods; and thus, in a twofold manner, be refilled and brought back toward its former ftate. And, further, that if, when the gravel bank on this fide is fufficiently removed, the proprietor on the fame fide were to erect a fimilar pier at the higher point of the bend on the fame fide, the fand or gravel bank on the other fide would, in like manner, be worn away, the bay on this fide be returned to its original proprietor, and the ftraight courfe of the river be regained; then the piers ought to be removed, whether they belong to one or two proprietors; the latter having generally a mutual intereft in directing the river, which feparates their properties, into a ftraight courfe, as much as can be done.

It is ftated, that in the conftruction of a river-guide for this purpofe, there are certan principles and particulars of practice to be obferved. It is fuggefted that its pofition fhould be fuch as to produce the required effect, with the leaft degree of refiftance. For the current of a river, as the waves of the fea, ought to be fubdued by ftratagem rather than by force. Refiftance ferves but to increafe their fury. A wave falling on a flat fhore, feems to die without a ftruggle; while one that is ftemmed by an abrupt rock ftrikes with tenfold force. And, in like manner, a rapid river will glide fmoothly along the fide of an even bank, though it may fomewhat deviate from the direct courfe; without perceptibly difturbing the current, or injuring the bank that directs it, even though merely of turf. But when a ftrong current meets with an abrupt projection, or a fharp bend in its channel, its fury is roufed. There, rock is fometimes barely fufficient to refift its force. On thefe principles it is, therefore, conceived, that in erecting a pier with this intention, it ought to be made to unite evenly with the natural bank of the river above it, and, where the required deviation from a ftraight line is confiderable, the face of the pier ought to pafs off from the natural bank with a fmooth hollow curve, that the force of the current may not be checked. But its outer or lower end fhould be ftraight, or nearly fo, and be directed, as a piece of ordnance, to the object it is intended to deftroy—to the obftruction it is intended to remove; and it may be obferved, that the nearer it approaches this, the greater will be the action of the current upon it, in times of flood; and the lefs liable the ftream will be, at low water, to turn back into its former channel. For, in cafes of this kind, the current of a flood, and that of low water, (if not better directed,) take different courfes, according to their heights and ftrengths. The one rufhes forward in the direction defired, the other, unable to furmount the obftruction, and flagging for want of ftrength at the point of the pier, doubles it; and falls back into the bay with an accelerated current; directed, perhaps, ftraight to the injured bank; and may thus increafe, perhaps, rather than prevent, the injury. But in order to remedy this evil effect, and to direct the current, at every height, into the fame channel, it will generally be found right, where it can be done, and at a reafonable expence, to cut a channel through the obftructing bank, large enough to admit the ftream at low water; depofiting the materials which are raifed in doing it at the point of the pier, and againft the foot of the injured bank: by thefe means not only preventing further injury to the lands on the oppofite fide, but greatly affifting the action of the flood-currents to force their way through the channel, and enlarge it; and, in a fhort time, lay open the required courfe. For although, by this procedure, the bay on that fide might not be fo readily and completely filled up, as it would by fuffering the current to throw back the obftruction, by degrees, in the manner above reprefented; yet the advantage of putting an immediate ftop to the ravages both of floods and of low water, might counterbalance that defect; even though the pier were thereby rendered neceffary to be kept up in perpetuity. The expence of the cut may generally be faved in the required *length* of the pier; whofe ufe, in this cafe, is, merely that of giving an eafy bend to the current; fo as to enable it to find its own way

to

to the channel prepared for it. And the *ſtrength* required, depends upon the weight of water, the force of the current, and the angle of deviation from the given direction of the current immediately above. If the required direction of the pier be nearly the ſame as that of the current above it, it has, it is contended, little more than the weight of water to ſuſtain. Whereas a jutment run out, abruptly, into the natural courſe of the current (as is commonly ſeen), has not only the weight, but the force, of the water to withſtand; and requires threefold, or tenfold, the ſtrength of ſtructure that is neceſſary in the other caſe. Another circumſtance to be particularly regarded in this ſort of buſineſs, is the height of the conductor. Where it is run out from the bank into the channel of the river, in rather a ſtraight manner, and if it be not raiſed high enough to prevent the waters of floods from making their way over it, its foundation may be endangered; eſpecially in a place where the general fall of the river is conſiderable. For an overfall of water, unleſs it have a firm baſis to act upon, naturally ſcoops out a pit at the foot of the fall; and undermines the precipice it tumbles over; ſeldom failing to let down ſuch as are conſtructed by art.

With reſpect to the means of obviating this effect, they are three, one of which is to raiſe the pier high enough to prevent the overfall; an expedient, however, which cannot always be practiſed with propriety. Another is to form the lower ſide, or back part of the pier, with a ſhelving or flatly inclining ſurface, to break or elude the fall. And the other, to prepare a convex floor behind the pier, for the waters to fall upon. This laſt has been found ſucceſsful in the writer's own practice. There is likewiſe another point that demands particular care in the operator, which is that of ſecuring the point or outer end of the pier, not only at the foundation, but in the ſuperſtructure. For although the main current cannot, if the pier is judiciouſly placed, exerciſe its ſtrength upon this part; yet, by reaſon of the weight of water there loſing its ſupport, and part of it, conſequently, ruſhing precipitately into the unguarded bay, the lower end of the pier is peculiarly expoſed to danger in that way. It is ſuppoſed ſcarcely neceſſary to add, that the *upper* end of the pier ought to be deeply inſerted in the firm bank of the river, to prevent the current from inſinuating itſelf behind the facing, or that the face of the pier ſhould be carried up with a ſufficient batter, to give it firmneſs; or that the *foundation* ought to be ſecurely laid, and to be kept ſeduloufly guarded in front, to prevent its being undermined by the current. Rough ſtones, thrown down looſe, and with a flat ſhelving ſurface, againſt the foot of the pier, are, in moſt caſes, the beſt guard, let its materials be of what ſort they may.

It is adviſed, that the materials for this uſe ſhould be ſuited to its occaſion, where a choice is to be had. If a low defence, only, is wanted, in a diſtrict where large rough ſtones are plentiful, a long pile of looſe ſtones, laid flatly ſloping againſt the bank of the river, or a flat ridge run out from it, may form a cheap and durable barrier. For ſhould they be diſturbed by an extraordinary flood, they may be readily replaced when the water ſubſides. Where a tall pier is required to direct a large and rapid river, in a place where ſtones and ſtrong cement may be procured at a moderate expence, maſonry may be eligible. But in expoſed ſituations, at leaſt, it ought to be guarded with timber, eſpecially at the top and the outer end (as the piers of ſea-ports, and the quays of navigable rivers, are guarded), to defend thoſe parts from injury by ice, timber, or other large floating bodies, driven againſt them in times of flood. And that where maſonry cannot be uſed, but at a great expence, a *caiſſoon*, formed with poſts and planks of adequate dimenſions, and filled with pebbles, gravel, or other indiſſoluble materials, to give ſtability to the fabric, may be found to laſt as long as its ſervices may be wanted; and, in ſome caſes, may be removed while its materials may yet be valuable.

But this, though the prevalent method, is merely palliative, and demands frequent repairs: it does not cure the evil, or bring back the loſt property to the owner who has a right to it. Nor is it in ſuch a caſe beneficial to a rival owner, for the current, as has been ſhewn, ſweeping circuitouſly along the banks of the bay, is thereby led to direct its force againſt the lands of the proprietor on this ſide, who cannot, under theſe circumſtances, defend them by the above means; but who muſt either ſecure them by a lengthened land-guard, or leave them at the mercy of a ſweeping current. It is therefore concluded, that, in a caſe of this kind, it is evidently the beſt intereſt of an oppoſite proprietor to ſuffer his ſand-bank, or gravel-bed, to be cut through, in the manner ſuggeſted, and that he ought to aſſiſt in the operation; as he will thereby not only get rid of the circuitous current, but, by the action of the floods, in the ſtraightened courſe, his bay will ſcarcely fail to be filled up with the ſcattered materials that may be removed.

There is another caſe in which this ſort of pier or river-guide may be made uſe of with ſucceſs; which is that where a ſtream of the above deſcription falls down a crooked valley, and neceſſarily takes, at certain points, a winding courſe.

In this caſe, where the quantity of water is conſiderable, its fall rapid, and eſpecially where it is conducted to the bend on the farther ſide down a ſtraight, unobſtructed reach, ſcarcely any thing but natural rock can reſiſt its force in that part. In ſuch ſituations it is not unuſual to ſee earth-banks ſcooped out and undermined, until a perpendicular cliff of twenty or thirty feet high be formed. But if a pier be erected at the upper part of the bend, with an eaſy curve from the natural courſe above, ſo as to *bend* the current without *breaking* it, and direct it into its natural channel, in the valley below, it will have nothing to contend with but the looſe gravel beds on the different ſides, which, if cut through, as in the former caſe, will preſently be torn away, and a principal part of their materials be depoſited in the bays on each ſide, but eſpecially in the latter, or that on this ſide: ſo that in this, as well as in that caſe, both ſides of the river may be benefited by the alteration which is thus produced. It is however ſtated, that there are caſes in which nothing but an immediate ſheath, or *land-guard* applied to the injured part, can be properly uſed to prevent further depredations. As, firſt, where the river is confined in the part where it is required to be bent, by rocks or otherwiſe, to an unaltered channel; as it frequently is in ſub-alpine ſituations. And, ſecondly, where a deep pool occurs in that part at low water, ſo as to render it difficult to get a proper foundation for a pier. It is obſerved that, in the former ſituation, ſtones are generally plentiful; and they require to be applied according to the circumſtances of the particular caſe. Where the foot of the injured bank is covered with a pool at low water, it is adviſed to ſhelve off the brink of the bank, and ſhoot down looſe ſtones from the top of it; ſuffering them to form their own ſlope in the action of falling, and by the operation of ſucceeding floods; continuing to pour them down until the bank be ſecured, at leaſt from minor floods; and then to

ſlope

ſlope back the upper part, to give freedom to floods of higher magnitude. But that where it is in the face of an impetuous torrent, and at ſome little diſtance from it, a gravel bed is thrown up, ſo as to lie dry during low water; yet where lands, behind, are liable to the ravages of floods, as is often the caſe, and eſpecially where ſtones are not plentiful, a more frugal arrangement of them may be made, by uſing them merely to caſe the expoſed bank, ſo as to prevent the currents of floods from laying eaſy hold of it, and tearing away the land. However, in this caſe much depends on the plan and conſtruction of a ſafeguard of this kind. It ought to be every way convex; ſo that the ſtrength of the current and the weight of the water may act upon it, as ſuperincumbent preſſure acts upon an arch. It ſhould bulge out, horizontally, towards the known current of floods, (without regard to the courſe of the ſtream at low water,) and the face of the wall ought to take the barrel form. A croſs ſection of the ſtone-work ſhould reſemble a ſemi-arch, or, in dangerous ſituations, it ought, it is conceived, to fall back flatter than the quadrant pitch. For, in general, the flatter it is made to lie, the more ſecure it will become; but the ſteeper it is carried up, the fewer materials, and the leſs labour, it will require. And in forming a work of this nature, the foundation ſhould be laid pretty deep, to guard againſt any accidental ſcoopings of the floods. The wall ought to be carried up dry, or without mortar, the ſtones being laid with their ends outwards, their inner ends pointing to the ſame centre, like thoſe of an arch, and to be backed with gravel or earth, rammed in firmly behind as the facing is carried up. The *coping*, or uppermoſt courſe of the ſtones, ſhould be ſecurely bound with thick tough ſods (eight or ten inches deep), whoſe ſurfaces, when beaten down, ought to lie even with that of the ſtone-work; and ſimilar ſods require to be laid, with a gentle riſing ſlope, until they unite ſmoothly with the natural turf of the land to be defended: ſo that the waters of floods, when they riſe above the ſtone-work, may have no abruptneſs to lay hold of, but may paſs away ſmoothly over the ſurface of the land, as they commonly do over ſmooth green-ſward, without injury. And, laſtly, that the ſtones are to be beaten forcibly into the bank with a rammer, a mallet, or a ſmall battering-ram adapted to the purpoſe; thus rendering the whole compact and firm to reſiſt the current. Where vacancies or fiſſures ſtill appear, long ſplinters of ſtone are to be driven in, as wedges, to increaſe the firmneſs, and prevent the current from tearing out an unguarded ſtone. It follows, in courſe, that the largeſt and longeſt of the ſtones ought to be uſed where the greateſt reſiſtance is known to be neceſſary, in order that the greater ſecurity may be attained. It is remarked that this ſort of defence, like that of every other ſpecies of the river kind, requires to be attended to from time to time, eſpecially after great floods. If the foundation be laid bare, it requires to be recovered with rough gravel, or with ſtones thrown looſely againſt it. If any of the facing ſtones be diſplaced, or looſened, they are to be replaced with others, or to be wedged in afreſh. Or if the turf which binds them at the top be diſturbed, the torn part ſhould be cut out ſquare, and be firmly and completely filled up with freſh turves. It is added, that this method of defence againſt rapid rivers originated in the ingenious writer's own experience and practice; and that, when compared with a wooden guard, it is cheap, ſightly, and durable.

It is noticed further, that there are caſes of other kinds, as thoſe which are found in the ſkirts or margins in the vallies of mountainous ſituations, through the plains of which the rivers are found winding with devious courſes, or tracing the margins at the feet of the containing heights. In ſome inſtances, they are confined in deep-ſunk channels, whoſe banks they ſeldom overflow; but, much oftener, their channels are ſunk a few feet only beneath the general ſurfaces of the lands they paſs through. Hence, in high floods, they may be ſaid to be let looſe over the plains, to ravage them at pleaſure. Their immediate banks, however, are generally the victims of their rage. Theſe they tear away, and ranſack off their better parts; ſubſtituting beds of ſtones and gravel, or perhaps their own channels, in the ſtead of what were, a few hours before, valuable lands. And that there are inſtances of mountain torrents, on ruſhing out of their confined channels into flat vale diſtricts, ravaging many acres during a ſingle flood. And to confine or direct theſe, is, it is obſerved, often a buſineſs of vaſt difficulty and trouble.

In theſe caſes, the beſt endeavour of the artiſt is generally, according to Mr. Marſhall, to give the river a direct or ſtraight-forward courſe, on its quitting its reſtraining channel, at its firſt entrance into the area of the plain; and, if no obſtruction lies in the way, to continue the ſtraight line to another retaining channel, at the lower end of the area to be improved. But that where the area is winding, or ſome obſtruction riſes within it, ſo that a ſtraight line cannot be drawn from the entrance to the outfall, an inſuperable difficulty may ſeem to fruſtrate this mode of improvement; as the current requires to be bent, not only after it has entered the plain, but after it has acquired an increaſe of velocity by moving in a ſtraight courſe. By actual practice and experience, he was led by another circumſtance belonging to it, to what may, perhaps, be conſidered as a principle, in conducting improvements of this nature. A ſtraight cut into the middle was deſirable: but the point of riſing-ground rendered it impracticable. Near the centre of the flat, a large inſulated fragment or iſlet of rock roſe ten or more feet above the level of the area; and at the lower end of it, near the natural outlet of the river, a bank of rock had formerly been waſhed by it. It was eaſy to perceive that the inſulated rock, which commanded both the extreme points of the area, might be employed in uniting them; and that, by the uſe of that rock the work might be rendered complete. For, by opening a ſtraight courſe to the rock in the middle, and another from thence to the bank of rock at the outlet, the current would be directed, in another ſtraight line, to the outlet, and the ſcite of improvement be entirely freed from its injurious effects. He remarks, that it is in few inſtances that prominent rocks, firm enough to reſiſt the current of an impetuous river, riſe in the areas of river-worn plains. But that, on the ſides of mountain vallies, rocks are common; and may, doubtleſs, in many inſtances, be employed to throw the river from ſide to ſide of a crooked valley, in ſtraight reaches; as rays of light may be reflected in continuation by well-placed mirrors. Even where natural rock is not preſent, either in the area, or on the ſides of ſuch a plain, or flat-baſed valley, riſing grounds may frequently be found within the former, and are never wanting on the ſides of the latter. And, againſt theſe, artificial butments, of ſufficient ſtrength, may not unfrequently be formed in alpine ſituations, where ſtones are generally plentiful, without any very great expence.

It is obſerved, in reſpect to the *altering* the *courſe* of a river or brook, that the difficulties and expence depend on the particular circumſtances belonging to it. In a ſimple caſe, in which one ſtraight cut only is required, the principal difficulty, and that which requires the beſt ſkill of the artiſt, lies in directing the current of the firſt flood out of the old into the new channel. But if a bend of the old channel, like

like that juſt noticed in the above caſe, can be made uſe of, this difficulty may be ſaid to vaniſh. The mouth of the new cut receives the current with a ſtraight courſe; conſequently, if it be made of ſufficient capacity, the river in a *flood* can have no propenſity left towards its old channel; and the looſe materials which riſe in forming the mouth of the new cut will generally be ſufficient to turn the ſtream at low water into it. But if a ſuitable bend cannot be approached by the new cut, a directing pier, like that in the above caſe, will be required to bend the flood-current, and give it a ſtraight-forward courſe into the new channel; a water-tight dam being formed between the point of the pier and the firm bank of the new channel, to prevent the water from regaining its former courſe or direction.

But in regard to the cutting of the new channel, it is merely a work of manual labour; being attended with no other difficulty than what may ariſe from the expence; which will depend on the ſize of the river, the nature of the ground to be cut through, and the value of labour in the given diſtrict. It is moſtly to be aſcertained with ſufficient accuracy, by previous calculations. And it is added that the required *ſize* of the *new cut* is ſmall compared with that of the old channel. For the currents of floods, by carrying off the earthy particles with which they come in contact, will ſoon enlarge it. It is nevertheleſs right to give ample room in the new channel, leſt the firſt flood ſhould prove high, and, by burſting its bounds, force its way back to its former courſe. Therefore, in order to give the required capacity to the new channel, and to allow for its widening, the materials which ariſe in making it ought to be formed into regular embankments on either ſide of it, and at ſufficient diſtances from its brink, to obtain the above purpoſes; and, moreover, to protect the adjacent lands from the injurious effects of unreſtrained floods. And it is further ſuggeſted, that a new river courſe requires to be carefully attended to, during a few years after it is opened, to ſee that its channel preſerves its ſtraightneſs, and that no breaches are made or threatened in its banks. And that, conſidering the uncertainty of extraordinary floods, it cannot be ſaid to be out of danger in leſs than three years. Of courſe, in contracts for theſe works, in theſe caſes they ſhould be upheld for that time, and then delivered up in the ſtate fixed upon in the agreement.

There are ſtill other caſes of rivers in lowland ſituations, where the currents of them are generally ſluggiſh, and their beds deep ſunk and narrow, with few ſhoals or firm baſes on which to found piers or bulwarks, and few ſtones with which to raiſe them; and even if erected, the ſluggiſhneſs of the current may render them ineffective. In theſe caſes the banks are ſteep, and often of the tendereſt earths, liable to the ſlighteſt attacks of agitated water, eſpecially near their feet, where they are naked of vegetable covering. Hence, it is from the frettings of the minor floods, or the waves of the dead water which occupies the channel of a river of this deſcription, that its banks are worn away; eſpecially at a bend which faces a length of reach, in which the waves have room to riſe. Theſe fretting againſt the foot of the bank undermine it. The face of the bank, in conſequence, ſhoots down; and the proſtrated ſoil is diſperſed by the next flood. It is conſequently obſerved, that the moſt eſſential work, in a caſe of this kind, is to guard the foot of the bank up to the level, and ſomewhat above the level of low water. And, this done, to ſlope back, ſmoothly, the upper part of the bank, to enable it the better to ſupport a vegetable covering, and withſtand the attacks of higher floods, as well as to render it leſs dangerous to paſturing ſtock, and enlarge their field of paſturage. And that when, with the increaſe of capacity, the channel is ſtill unable to contain the waters of great floods, lines of embankment may be raiſed on either ſide of it, with the ſoil removed in forming the ſlopes; and thus reſtrain them within due bounds. Likewiſe in particular parts, as at ſharp bends, when ordinary ſward, or paſturable turf, is not able to prevent the current, in this trying ſituation, from breaking up the ſoil, it ſhould be bound more ſecurely together by ſtronger rooted plants; of which the oſier is ſaid to be profitable to be planted upon the top of a rich river-bank; but it is altogether unfit to occupy its face for the purpoſe here required, though commonly uſed; as it tends to counteract one of the intentions propoſed in ſloping back the face of the bank; by filling up the ſpace thereby prepared for the waters of high floods to ſpread in; and thus increaſes the current at the foot of the bank. A much more eligible and effectual guard preſents itſelf, Mr. Marſhall ſays, in the furze, whoſe roots not only form a mat of ſtrong fibres in the ſoil, but bind it down to the ſubſtratum in a ſingular manner. Yet even the furze, if ſuffered to run up to its greateſt height, may fruſtrate the intention of propagating it. It ought, therefore, to be cut down from time to time as fuel; or to be kept cloſe mown, ſo as to form an invulnerable ſhield to the face of the ſlope. But it is obſerved that if we examine into nature's practice in guarding the ſoil of river-banks, we ſhall find it carried on with the beſt effect by the butter bur (*tuſſilago petaſites*).

But in theſe caſes of ſecuring the banks of rivers, Dr. Anderſon has long ſince given more full and ample directions. He remarks, that when a river runs in a bed of rich vegetable mould, the leaſt accident that may chance to direct the ſtream towards any particular part of the bank, cauſes it to ſweep away large tracts of fine ground, to the very great detriment of the proprietor, as well as the public; as this fine mould is uſually carried to the ſea, and the materials that the water leaves, to occupy the new bed that it thus forms for itſelf, is generally of a much worſe quality, conſiſting chiefly of ſtones, ſand, and gravel. And that where the whole force of the current is quite cloſe to the bank, and the materials neceſſary for fencing it are not to be there found, it may perhaps be impoſſible, or very difficult, totally to prevent this evil: but, for the moſt part, it admits of a cure, that can be obtained at a pretty moderate expence. For if you carefully obſerve the banks of rivers, you will readily remark that theſe ravages are always moſt conſiderable at thoſe places where the banks riſe perpendicularly to a pretty conſiderable height above the ordinary ſurface of the water, and never at thoſe places where the banks ſhelve down gradually towards the water's edge: for when the river is ſwelled to a great height by rains, and runs with a greater force and rapidity than uſual, it ſtrikes violently againſt theſe perpendicular banks that directly oppoſe its courſe; and as they are compoſed of earth, quite bare and uncovered, they are eaſily ſoftened by the water, and quickly waſhed away; ſo that the upper part of the bank, being thus undermined, falls by its own weight into the river, and is carried off in prodigious quantities. But when the river riſes to any conſiderable height, it generally glides along the ſurface of thoſe parts of the bank which ſhelve gradually downwards to the water's edge, which being defended by the matted roots of the graſs, with which it is covered, ſcarcely ſuſtains any damage at all, and is nearly the ſame after the water has retired within its banks, as before the inundation took place. He thinks that theſe are facts, which no one, who has beſtowed the leaſt attention to this ſubject, can fail to have obſerved; and that they clearly

clearly point out, that the firſt and moſt neceſſary ſtep towards a cure is to level down the edge of the bank that is next the water, ſo as to make it ſlope gradually down towards the river. And that where the bank is very high, and you have no other particular uſe for the earth that muſt be taken from it, the eaſieſt method of diſpoſing of it will be to throw it into the river. But in whatever manner you diſpoſe of the earth, the ſlope of the bank muſt be continued until the inner edge of it is as low as the ſurface of the water, at the drieſt time of the year, and be made to aſcend gradually upward from the water with an eaſy ſlope, till it comes to the level of the ground, or at leaſt riſes to ſuch a height as the water never exceeds. And the work ought to be performed as early in the ſummer as poſſible; and the ſlope ſhould be either immediately covered with turf, pared from the ſurface of ſome field that has a very ſtrong ſward upon it, taking care to lay their ends in ſuch a manner as to be in as little danger as poſſible of being waſhed away by any accidental flood that might happen, before they are grown together; or, if turf of this kind cannot be had, it ſhould be ſown very thick with the ſeeds of ſome ſmall mat-rooted graſs, that ſhould be kept in readineſs for that purpoſe, ſuch as the creeping meadow-graſs. If the ſtream has not been extremely rapid at the foot of the bank, ſome of the earth that was thrown into the water will be allowed to ſubſide to the bottom, and will there form a bed of looſe ſoft earth, which will be of very great uſe afterward in preventing the face of the bank under water from being waſhed away. But in order to ſecure this bulwark effectually for the future, the ſurface of this ſoft earth ought to be inſtantly ſtuck full of the roots of bog-reeds, flags, water-ſpiderwort, ruſhes, and other mat-rooted aquatic plants; which, if allowed to remain till they have once ſtruck root, will afterward form a barrier that nothing will ever be able to deſtroy. It is added, however, that if the ſtream be too rapid to admit of this, and the bank of ſoft earth much deeper than the ſurface of the water, it will be of great uſe to fill up the breaſt of the bank with ſmall looſe ſtones, with a little earth intermixed among them, careleſsly thrown in till they riſe near the ſurface of the water, which would moſt effectually ſecure it againſt any future encroachments, if the bank is ſloped away above. It is further ſtated, that in caſe it ſhould ſo happen that ſtones cannot be eaſily got for this purpoſe, the only recourſe is to dig the bank ſo low, as that at the undermoſt edge it may be always below the ſurface of the water, and carry it out in this way for a conſiderable diſtance; and then ſtick the whole ſurface, that is below the water, full of mat-rooted aquatic plants, ſtrewing it over, if poſſible, with a thin bed of ſmall gravel or ſand, as convenient, which will in a great meaſure, if not entirely, defend it from future encroachments. And this bank ought to continue to ſhelve downwards, even where it is below water; and thoſe aquatics that will grow in the greateſt depth of water be planted on the innermoſt bank, and the others behind them. The water-ſpiderwort will grow in four feet depth of water; and the roots of the common yellow-flowered water iris forms ſuch a ſtrong and compact covering, upon the ſurface of the ſoil on which it grows, as would defend that ſoil from being affected by the water almoſt as well as if it were a rock. It is likewiſe an advantage attending this plant, that it grows upon a firm bottom, and chiefly delights in running water. But where the ſtratum of ſoft earth is not ſo deep as to reach to the ſurface of the water, and lies upon a ſtratum of rock or hard gravel, there will be no occaſion for throwing in ſtones of any kind. But as it is difficult to unite the vegetable mould to any of theſe ſtrata, there will always be ſome danger of its ſeparating from them, in violent inundations; and if the water once gets an entry, the breach will not fail to grow larger and larger by every inundation. To prevent this inconvenience, it will be neceſſary, after you have ſloped the earth away till you reach the gravel or rock, to cover the place where the edge of the earth joins the inferior ſtratum with a good many ſmall ſtones, if they can be found, ſowing between them the ſeeds of any kind of plants that you think are moſt likely to thrive, which have ſtrong matted roots, with as ſmall and flexible tops as poſſible. But where the object is of great importance, it will be ſtill more effectually ſecured, if the face of the rock be dug entirely away for ſome diſtance backward, and the place which that rock originally occupied be then filled up with earth, and ſloped back in the ſame manner as if it had been an earthen bank, in which no rock was to be found. In all operations of this ſort, great care ſhould be taken that no ſtones ſhould be mixed with the mould; for every thing that makes an inequality on the ſurface, or a difference in the firmneſs of particular parts, is extremely pernicious. It is evident, that from the impoſſibility of ever making earth adhere firmly to ſtone of any kind, it muſt always be an improper practice to face the banks of a river to a certain height with ſtone, which is capped at top with earth; as it muſt always be liable to be removed. This method has been ſince found to anſwer perfectly in actual trials in ſuch caſes.

There is, the ſame author obſerves, another miſchief produced by the ſwelling of rivers, from the water overflowing the rich flat ground, that is frequently met with on the ſides of them, which ſometimes prevents them from being got laboured at the proper ſeaſon, ſometimes ſweeps off at once the whole crop, and ſometimes deſtroys it by covering the whole ſurface with ſtones and gravel, to the unſpeakable detriment of the poſſeſſors of ſuch ground. And as theſe lands, ſometimes termed *haughs*, are generally very rich and fertile, and ſometimes of great extent, the damage that is done by not getting them properly cultivated is very conſiderable. In reſpect to the mode of removing this ſort of inconvenience, it is remarked that theſe haughs are ſeldom of great extent, excepting on level tracks, where the water runs with no impetuous current; and, therefore, they may in general be preſerved by means of a ſloping bank, raiſed all along the ſide of the river, as far as the haugh extends, which, if formed by the ſame plan as thoſe deſcribed above, will eaſily confine the water within their boundaries, till it riſes ſo high as to overflow the top of the bank; ſo that if theſe are raiſed to a ſufficient height towards the back part, in ſuch a manner as to be capable of containing the whole of the water that at any time flows down the river, the fields on each ſide will be effectually ſecured. And that where the ſurface of the ground in the haugh is at any conſiderable height above the water in the river, the bank may perhaps be raiſed to the neceſſary height, by throwing the earth that is taken from the brink of the river to the other ſide of the bank, ſo as to form the new ſurface of the bank on that direction, inſtead of the old ſurface. But if the ſurface of the ground is level on the oppoſite ſide of the river, the earth that is taken from the triangle in the whole will not, in that caſe, be ſufficient to fill up the whole of the other triangle, and raiſe the bank to a proper height; to make up which deficiency, it will be neceſſary to dig a ditch at the back of the bank, throwing the earth into the higher part of the bank, and facing up the line with ſtones or turf, ſo as to make it become a fence to one ſide of the field that it preſerves from inundations. However, where the ſurface of the ground is extremely low, ſo as to be but little above the level of the water, then, inftead of raifing the bank on each fide to the proper height, it will be more advifeable to raife them only to the height of a particular line; as, in that cafe, it would be very difficult to find as much earth as would form both the banks, although there will be no difficulty in forming the fmaller one; and as the areas of the two are equal, thefe lower banks will contain an equal quantity of water within them, as the higher ones would have done; the greater width between them making up for their want of height. And it is conceived, that in this way it will be in the power of any man fo to proportion his banks to the circumftances in which he finds himfelf placed, as in the eafieft manner to accomplifh his defign: for if he has plenty of materials at hand, he may rear his banks to a greater height, and confine the river to a narrower courfe; and if he finds a deficiency in that refpect, he may make them of a fmaller height, and allow the river to fpread to a greater breadth. It is added, in concluding this account, that this method has been found to anfwer very well in actual practice; but that, in fome cafes, it was found that while the bank was new raifed, and before the furface was grown together, fome parts of that furface were broke a little, when the water rofe to a great height. In this cafe, the bank confifted entirely of loofe fand, which is the worft material it could be formed of; but this was eafily repaired, at a very fmall expence, when the water fubfided. If thefe fmall breaches, however, had been neglected, there is no doubt but the whole would quickly have been deftroyed. It was found that a few fmall ftones, laid upon the furface of the fward, near the edge of the water, proved in this cafe a very ufeful addition. In cafes where the fward is firm, this caution would have been unneceffary. Whoever attempts this mode of fencing, fhould take care to provide themfelves with a fufficient quantity of the feed of the plant, ufually called *fprots* in Scotland, to fow near the edges of the water; for thefe other kinds of graffes are fhelled, and without this precaution, the furface remains bare, and is therefore liable to be wafhed away with the water, during the time of floods.

There are other cafes in which attention is fometimes neceffary to rivers, which are in thofe of the vale kinds, which run in very ferpentine or crooked directions. In thefe cafes it is fometimes proper to ftraighten them, though it is but in few inftances, Mr. Marfhall thinks, that this can be done with propriety and advantage, in refpect to profit. And though the principles and management are the fame in the execution, there is much difference from the want of fuitable materials, &c.

The inftances in which the courfes of rivers that have their beds greatly funk below the general level of the furface of the lands, as five or fix yards, may be ftraightened in a profitable manner, are, it is obferved, where two reaches, or ftraight parts, run in a line with each other; but are feparated by a narrow neck of an extenfive tract.

In this cafe nothing more is required than that the earth which is taken out of the new cut, fhould be thrown into the ends of the old bed, by which the ftream, both at low water and in time of flood muft poffefs a ftraight unimpeded courfe. And by this means the proprietor on this fide not only obtains an acquifition of ground in the old river bed for different purpofes, but on his own fide of the river gains a length of ftraight ground for the plough or fcythe. But at the time this proprietor is thus benefited, the property on the other fide may be injured; as by fhortening the length, and that of ftraightening the direction of the river, the force of its ftream or current at the upper bend may be confiderably increafed, and the land there greatly endangered. Hence Mr. Marfhall thinks, that this obvious alteration fhould not be undertaken, except under the fanction of a commiffion of drainage, or till the proprietor below be indemnified for the injury that may be fuftained. It is fuggefted, that in the above inftance, half of the bed of the old river might be a fufficient indemnification. There is, however, a great variety of fmall ftreams and rivulets in the bottoms of fteep declivities, that have fuch winding and ferpentine courfes, that they might be ftraightened with not only profit, but vaft advantages to the lands on the different fides. In many fituations it is difgraceful to fee the deftruction and injury that is caufed by thefe little winding ftreams in the time of floods, and when they are in high water.

The proper protection and management of river-banks is unqueftionably a work of great intereft and importance in many inftances; as they are very liable to be extenfively deftroyed by the ftreams, and much lofs of valuable land to be thereby produced, as well as to be the caufe of frequent difputes and litigations between neighbouring landholders. Rivers for the moft part form the moft tedious, troublefome, and indifferent boundaries of any betwixt landed properties.

The fubject of guarding and fecuring their banks has hitherto been but little underftood, either in theory or practice, though it obvioufly requires equal, if not more attention, than any other rural practice, as being very ferious in its confequences, both as to the mifchiefs, and the ineffectual, though expenfive, modes of preventing them. The practical directions that have been given above fhould therefore be well confidered, as they may fave much labour and expence, when well applied; as well as prevent a variety of difputes, and the frequent lofs of much ufeful land. Plans of the methods of accomplifhing the work in different cafes, may be feen in the fecond volume of the Farmer's Dictionary.

Before undertakings of this nature are begun, proper plans and eftimates of expence and profits fhould conftantly, as has been feen, be prepared, and contracts, where poffible, entered into for their execution with perfons of experience, always binding them to uphold the works for a certain number of years afterwards; as by thefe means much money, timber, labour, and unneceffary trouble, will be faved, which would otherwife be thrown away, and the works be improperly managed. Befides, the means will be properly proportioned to the ends which are defigned, in all cafes. The intereft of oppofite proprietors will likewife often be fhewn to be one and the fame, which will greatly promote fuch works in different inftances. See EMBANKMENT.

RIVER *Guards*, terms applied to fuch piers, mounds, or other folid embankments, as are carried out for the purpofe of altering, directing, or confining, the courfes of rivers. They are diftinguifhed into common, and what are termed *dwarf* guards; the former being thofe employed for large rivers, and the latter, fuch as are made ufe of where the force of the currents are lefs violent and lefs heavy.

With regard to the fubftances that are moft commonly made ufe of in this intention, they are all forts of hard weighty materials, fuch as rough coarfe ftones of different kinds, large pebbles, heavy pieces of timber fecured by piles firmly driven into the ground, and fupported behind by coarfe gravel ftones, or other fimilar materials, the roots of trees with the earth about them, pofts firmly driven in with planks nailed to them, and well banked with ftrong fubftances, piles driven in and wattled with fods, being well banked with the fame fubftances. Befides thefe, various other materials are prefented to the attention of the workmen in different situations and circumstances where these sorts of guards are wanting.

River *Guide*, a strong work of the pier kind, carried out on them for the purpose of disposing their streams to take more suitable directions or courses for preventing their mischievous effects on the banks or lands on their sides. See River-*Banks, Securing*.

River *Weeds*, in *Farming*, are such sorts of plants as grow on the sides, and other parts, of rivers. When collected in large quantities, they are highly valuable for the purpose of manure. And in compost with other substances they have been found of much utility in the practice of several writers in the Transactions of the Bath society. And Mr. Crowe, of Lakenham, in Norfolk, according to Mr. Young's agricultural survey of that district, manures four acres annually for turnips, with the weeds of a river that runs by his farm; the plants are chiefly the philandrium aquaticum, and sium nodiflorum, the water hemlock and water parsnip. It is stated that he lays twenty loads of thirty bushels *per* acre, and ploughs in directly; which are as good on sand and mixed loam as the best dung; but not equal on stiff soils; and it is added, that Mr. Bloomfield, of Billingfold, has been in the habit of manuring his turnip lands with weeds fresh from the river, and ploughed in quickly; they have answered as well as yard muck.

But where these sorts of materials are made use of for the purpose of manure, the plants should be removed while in their most succulent green state, and be turned into the soil as quickly as possible afterwards. In the making of them up into composts, a great loss is probably sustained in the extrication and dissipation of the more fluid parts. And it is obvious, that as manure they must be the most useful when applied to the light friable descriptions of soils, as in these they run more rapidly into a state of putrefaction. It is probable they cannot be used with advantage on the stiff heavy soils in their green state. See Manure and Weeds.

River, *Fordable*, in *Military Language*, a river which may be passed without the assistance of any floating machines. In order to found the ford, and to ascertain the state of it, men on horseback are first ordered to cross. By that means you will be able to know whether any obstacles have been thrown in the way by the enemy; for nothing is more easily effected. The passage of a ford may be rendered impracticable by throwing whole trees in, by tables or platforms covered with nails, and by stakes. The two latter impediments are the most dangerous. But stakes are not easily fixed, and are consequently seldom used. When fords are embarrassed by them, it requires some time and trouble to clear the river; and it is equally difficult to get rid of the inconvenience that arises when wells have been sunk. Whenever there is reason to apprehend such obstacles, it is always best to reach the ford at dusk.

When the prince of Condé, in 1567, resolved to cross the river Seine, the Royalists, who were on the opposite side, endeavoured to prevent his passage by throwing quantities of madriers or thick planks that were nailed together, iron hoops and water-cats into the ford. The Huguenots or Protestants, however, were not diverted from their purpose. Aubigné, a French writer, says, that on that occasion they placed 400 arquebusiers upon the bank to protect the men that raked the ford.

This was certainly a singular method which was used to clear a ford, nor could it be done without much difficulty, and no inconsiderable share of danger. The chevalier Folard has proposed a much safer, and a much easier way, by means of grappling hooks, tied to long ropes, which might be thrown into the ford. Yet even in this case, observes the writer, the object could not be accomplished if the river were broad, unless the persons employed in the undertaking be under the cover of so heavy a discharge of ordnance and musquetry, that the enemy would not be able to interrupt them, even from an intrenched position on the opposite bank.

With respect to caltrops, the removal of them, when properly distributed at the bottom of a ford, must be attended with great difficulty; for they must render the passage absolutely impracticable, unless they were to sink very deep into the mud and sand, and thus become useless. The men that first enter are in this case the only persons incommoded, but the rest may follow without much hazard.

It sometimes happens, that the bottom of a stream or rivulet is firm and gravelly; when this occurs, the greatest precautions must be taken to escape the effects of caltrops, which would be extremely hurtful to any persons that might attempt to cross. In order to obviate their mischievous consequences, and to render them in a manner useless, a good stock of hurdles must be provided. The soldiers will hand these to one another, force them into the water, and then cover them with stones.

When one or two fords in a river are so situated, that several battalions cannot cross them upon one front, it is then highly prudent to throw a bridge over, either above or below the ford; for a swell may intervene and render it otherwise impassable; add to which, you have the advantage of getting a greater number of troops over at once.

In order to effect a passage for his army over the river Segre, Cæsar gave directions that ditches, thirty feet broad, should be dug in such parts of the banks as might, with ease, receive the water out of the stream, and render it fordable. Having accomplished this object, he found no difficulty in reaching Petréius, who, being in the daily fear of wanting provisions and forage for his men, was on the eve of quitting his position and marching forwards.

The passage of the Granicus by Alexander the Great, is likewise mentioned in history, as an instance of bold enterprise. But however celebrated that act may be in ancient records, we shall not be thought partial to the moderns when we state, that the passage of the river Holowitz by Ch. XII. of Sweden, was equally bold and well managed.

The passage of the Teglimenti by Bonaparte during his campaign in Italy, is the most celebrated of the present day.

River *Bay*, in *Geography*, a bay on the N.E. coast of Barbadoes; two miles N.W. of Cuckold's Point.

River's *Canal*, an inlet on the N.W. coast of North America, discovered by Capt. Vancouver in the year 1792. This canal extends from S. to N. about 16 miles, and terminates in N. lat. 51° 42′. E. long. 232° 22′.

River *of the West*, a river of North America, which runs into the Pacific ocean, N. lat. 43° 18′. W. long. 122° 30′.

River *Horse*, in *Zoology*. See Hippopotamus.

River *Navigations*, in *Hydrology*, denote those which are wholly or in a great part restricted to the ancient channel or bed of a river. See Canal.

River, *New*. See Canal and Company.

RIVERHEAD, in *Geography*, a township of New York, in Suffolk county, Long island; it was taken from the township of Southold, incorporated in 1792, and contains 1501 inhabitants.

RIVERIUS, Lazarus, in *Biography*, a distinguished physician of the 17th century, was born at Montpellier in the year 1589. He studied in his native university, but was very slow in his attainments, insomuch that he failed in his first

first examinations for his degree. This failure, however, occasioned him to redouble his exertions, and he gave sufficient proofs of his acquirements in the following spring, 1611, when he was admitted to the degree of doctor. His attachment to study became very great; and in 1622 he was appointed to the professorship of medicine in the university, an office which he continued to fill with great honour during the remainder of his life. He died in the year 1655. Riverius published "The Institutes of Medicine," in five books, in Latin, of which there are many editions, and which must be deemed a very respectable work for the time. But his principal work, and that which has gained him considerable reputation, is a course of medicine, entitled "Praxis Medica." The first publication of this work consisted of a mere practical treatise, without any pathological discussion, as a sort of text-book, used in his lectures. But finding that many editions of it were printed in France and Holland, he enlarged and improved it, and it was printed in this state at Paris in 1640, and a great number of editions have subsequently appeared, as well as translations into French and English. It treats of most of the diseases to which the body is subject, in seventeen books, in a clear style; but in many places he appears to have borrowed copiously from Sennertus. He published also a work, entitled "Observationes Medicæ et Curationes insignes," which has been frequently reprinted, and is not now without its value. These works have been collected, and published together, under the title of "Opera Medica Universa." Eloy observes, that a friar, Bernardin Christin, who had been a pupil of Riverius, compiled some secrets of chemistry, which he published with the name of Riverius; and although it has been clearly proved that he was not the author of these papers, yet they have been frequently printed, in the collections of his works, and separately, under the title of "Arcana Riverii." Eloy Dict. Hist. de la Med.

RIVERS, Cape, in *Geography*, the N.W. point of the island of Celebes. N. lat. 1° 25'. E. long. 120° 30'.

RIVES, a town of France, in the department of the Isere, and chief place of a canton, in the district of St. Marcellin; 14 miles N.W. of Grenoble. The place contains 1530, and the canton 12,019 inhabitants, on a territory of 115 kiliometres, in 12 communes.

RIVESALTES, a town of France, in the department of the Eastern Pyrenées, and chief place of a canton, in the district of Perpignan; six miles N.N.W. of Perpignan. The place contains 1986, and the canton 10,036 inhabitants, on a territory of 422½ kiliometres, in 14 communes.

RIVET de la Grange, Anthony, in *Biography*, a French Benedictine monk, was born at Confolens, a small town belonging to the diocese of Poictiers, in the year 1683. Afterwards he was sent to study philosophy under the Jacobins, or Dominican monks at Poictiers, where he gave the greatest satisfaction by his application and proficiency. At the age of 21, he became a noviciate in the abbey of Marmoutier, and took the vows in the year 1705. After completing his courses of philosophy and divinity, he was transferred to the abbey of St. Florence, at Saumur, where his order was establishing a kind of academy, consisting of such members as were most distinguished by their talents and literature, for the purpose of studying the scriptures in their original languages, the councils, the fathers, and the historians of the church, without being shackled by the trammels of the schools. He undertook to write "A Literary History of France," the plan of which he had already conceived. However, before he became wholly occupied on this work, he gave to the public, through the medium of the Dutch press, another favourite production, entitled "The Necrology of Port-Royal in the Fields, &c. containing historical Eulogies; with the Epitaphs of the Founders and Benefactors of that Monastery, &c." 1723, 4to., preceded by an historical preface. In the year 1733 he published the first volume of his work under the title of "The Literary History of France; treating of the Origin and Progress, of the Decline and the Revival, of Learning among the Gauls and among the French; of their respective Taste and Genius for Literature in each Age; of their ancient Schools, and the Establishment of Universities in France; of the principal Colleges; of the Academies of Sciences and Belles-Lettres, &c." in 4to. This was followed, at different periods, by other volumes, till the author had printed the ninth, which includes the first years of the twelfth century, when he died, towards the beginning of 1749, in the 66th year of his age. This work was afterwards extended to twelve volumes. It has been compared, and not undeservedly, with the "Memoirs" of the learned Tillemont, for accuracy of citation, and depth of research, and it will be found to furnish the reader with much interesting matter, not only on the subjects mentioned in the title, but also relating to the lives of the learned men who flourished in the ages of which it treats.

Rivet, in the *Manege*, is the extremity of the nail that rests or leans upon the horn when you shoe a horse.

Rivets, in *Agriculture*, a term sometimes applied to a sort of bearded wheat. See Wheat.

In Essex, throughout all the district of the Roodings, this sort of wheat is found very general, and to yield much better crops on these heavy lands, than any common sort; but on the more light soils the Kentish red is superior.

RIVIERA, or Palese, in *Geography*, a town of Italy; five miles N. of Bellinzona.

Riviera *di Levante*, a name given to that part of Genoa which extends from the city of Genoa, included in it, to Etruria.

Riviera *di Ponente*, that part of the Genoese territory which extends westward from the city of Genoa to France.

Riviera, *La*, a town of France, in the department of the Doubs; 10 miles S. of Ornans.

RIVIERE, Grande. See Grand *River*.

Riviere *Pelote*, a town on the S. coast of the island of Martinico.

Riviere *Salée*, a town on the S. coast of the island of Martinico.

Riviere *Mahaut*, *La*, a town of the island of Guadaloupe, situated in a bay to which it gives name. N. lat. 16° 27'. W. long. 61° 46'.

Riviere *de Theyrargues*, a town of France, in the department of the Gard; 14 miles N.N.W. of Uzés.

Riviere *de Thibouville*, a town of France, in the department of the Eure, 18 miles N.W. of Eure.

RIVINA, in *Botany*, was so named by Plumier, in honour of the great German systematic botanist; see Rivinus. Linnæus at first called the genus *Rivinia*, which would have been more correct, but he did not persist in the amendment, nor has it prevailed.—Linn. Gen. 63. Schreb. 87. Willd. Sp. Pl. v. 1. 694. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 273. Juss. 84. Plum. Gen. 47. t. 39. Lamarck Illustr. t. 81. Gærtn. t. 77.—Class and order, *Tetrandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Atriplices*, Juss. See Piercea.

Gen. Ch. *Cal.* Perianth inferior, coloured, permanent; of four obovate, obtuse leaves. *Cor.* none, except the calyx be so called. *Stam.* Filaments four or eight, shorter than the calyx, approaching each other in pairs, permanent;

nent; anthers ſmall. *Piſt.* Germen ſuperior, large, roundiſh; ſtyle very ſhort: ſtigma ſimple, obtuſe. *Peric.* Berry globoſe, ſtanding on the reflexed calyx, (which is hardened and become green,) of one cell, and crowned with a little incurved point. *Seed* ſolitary, roundiſh, lenticular, rough.

Eſſ. Ch. Calyx coloured, in four deep ſegments, permanent. Corolla none. Berry with one lenticular ſeed.

Obſ. The error of Linnæus in ſubſequently terming *corolla*, what he had, with indubitable propriety, called *calyx*, is difficult to be accounted for. He is followed by Willdenow, who has miſled Dryander and Aiton. The natural order of the plant, as ſettled by Linnæus himſelf, determines the queſtion without appeal.

1. R. *humilis*. Downy Rivina, Linn. Sp. Pl. 177. Willd. n. 1. Ait. n. 1. (Amaranthus baccifer, circææ foliis; Comm. Hort. v. 1. 127. t. 66.)—Stamens four. Leaves downy.—Native of the Weſt Indies. Common in our ſtoves for above a century paſt, flowering at moſt parts of the year, and always decorated with drooping cluſters of little berries, of a peculiarly bright ſcarlet, which make the chief beauty of the plant. The *ſtem* is buſhy, ſhrubby, three or four feet high. *Leaves* alternate, ſtalked, ovate, acute, entire, thin, flaccid, light green, downy, about three inches long. *Cluſters* from the forks of the branches, ſolitary, downy, of many ſmall, greeniſh-white, drooping *flowers*.

2. R. *lævis*. Smooth Rivina. Linn. Mant. 41. Willd. n. 2. Ait. n. 2.—Stamens four. Leaves ovate, pointed, even, ſmooth. Stem round.—Native of the Weſt Indies. Flowers in the ſtove, moſt part of the year. Cultivated by Miller in 1733. *Aiton.* Like the foregoing, but ſmooth. Margins of the *leaves* purpliſh. *Flowers* reddiſh at the outſide.

3. R. *braſilienſis*. Wave-leaved Rivina. Nocca in Uſteri Annal. faſc. 6. 63. Willd. n. 3. Ait. n. 3.—"Stamens four. Leaves ovate, undulated and rugged. Stem furrowed."—Native of Brazil. Introduced at Kew by ſir Joſeph Banks, in 1790. It bloſſoms in the ſtove in June and July. *Stem* ſhrubby. *Leaves* ovate, or heart-ſhaped, wavy, ſmooth. *Flowers* white or reddiſh. *Berry* round, of a ſhining red.

4. R. *octandra*. Climbing Rivina. Linn. Sp. Pl. 177. Willd. n. 4. Ait. n. 4. (R. dodecandra; Jacq. Obſ. faſc. 1. 6. t. 2. R. ſarmentoſa, &c.; Browne Jam. 149. t. 23. f. 2.)—Stamens eight or twelve. Leaves elliptic-oblong, ſmooth.—Native of the Weſt Indies. Cultivated by Miller, before 1752. It flowers in the ſtove in May and June. *Aiton.* The *ſtem* is deſcribed by Jacquin as very tall, though ſlender, throwing out long ſlender ſhoots, amongſt other ſhrubs and buſhes. *Leaves* entire, acute at each end. *Calyx* white, turning to a purpliſh-red. *Berry* dark purple, the ſize of a pea, eagerly devoured by birds. *Jacquin.*

R. *paniculata*, Linn. Syſt. Nat. ed. 10. v. 2. 899, though retained as ſuch by Murray, in Syſt. Veg. ed. 14. 165, is no other than *Salvadora perſica*, as cited in Linn. Sp. Pl. 178. This being removed from *Rivina*, the character of "ſimple cluſters" for the remaining ſpecies, being common to all, becomes ſuperfluous.

Rivina, in *Gardening*, contains plants of the ſhrubby evergreen kind, of which the ſpecies cultivated are; the downy rivina (R. humilis); the ſmooth rivina (R. lævis); and the climbing rivina (R. octandra).

Method of Culture.—All theſe plants may be increaſed by ſeeds procured from the places where they are natives, ſowing them, as ſoon as they are obtained, in pots filled with freſh light earth, plunging them in a hot-bed when in ſummer, but in the tan-bed of the ſtove, in the autumn or winter. The earth ſhould be well moiſtened during the ſummer ſeaſon, but very ſparingly in the winter. They ſhould be carefully preſerved in theſe ſituations till the ſeeds vegetate, which is often a great length of time, of courſe the pots ſhould not be diſturbed. When the plants have attained about two inches in growth, they may be removed into ſeparate ſmall pots, filled with light loamy mould, plunging them into a hot-bed, ſhading them till freſh rooted.

They afterwards require the management of other ſtove exotic plants.

They may likewiſe ſometimes be raiſed by layers and cuttings, aſſiſted by the heat of the bark hot-bed.

After theſe plants have been preſerved in the ſtove of the hot-houſe till they have attained a good growth and ſtrength, they are capable of being preſerved in moderate warmth in winter, and in the warmeſt part of ſummer in the open air, in a warm ſheltered place.

They afford variety among other potted evergreen ſtove plants.

RIVINI Foramen, in *Anatomy*, a ſuppoſed opening in the membrana tympani of the ear. See Ear.

RIVINUS, Augustus Quirinus, in *Biography*, an eminent phyſician, but much better known as a botaniſt, formed, with Ray and Tournefort, the triumvirate of ſyſtematical teachers, who, in the latter part of the 17th century, and the beginning of the 18th, divided the homage of the ſtudents of botany between them. Their importance aroſe from the neceſſity, which nobody could overlook, of a methodical arrangement of plants; but even the memory of their labours has now almoſt paſſed away, becauſe thoſe labours proved, all nearly alike, inſufficient for the deſired purpoſe. The ſervices they have rendered to practical ſcience ſtill indeed remain; and the laurels which ſpring from that ſoil are unfading. Of theſe Rivinus may claim a ſhare, though by no means an equal portion, with his Engliſh, or his French, contemporary. He endeavoured in vain to bring his German ſquadrons, with any great force, into the botanical field; while the pupils of Ray, as well as of Tournefort, poured forth in abundance; and by their own proficiency diſplayed the merits of their reſpective leaders.

Rivinus was the ſon of a learned phyſician and critic, Andrew Bachmann, whoſe name, according to the faſhion of the time amongſt literary people, being tranſlated into Latin, became *Rivinus*. The ſubject of our memoir was born at Leipſic in 1652. He graduated at the age of twenty-four, and fifteen years afterwards obtained the profeſſorſhips of Phyſiology and of Botany in his native univerſity. He became a foreign member of the Royal Society of London, and was aſſociated with many other learned bodies, filling his different appointments with honour to himſelf, till his death in 1723, at the age of ſeventy-one. His publications ſhew him in the light of an elegant ſcholar and a gentleman; and if he betrayed a little impatience in his controverſies with Ray, and ſomewhat of diſdainful ſeverity towards Dillenius, who, when a young man, had attacked him; the latter fault, at leaſt, may be pardoned, in one who had attained ſo conſiderable a rank in ſcience, and who perhaps had ſagacity enough to feel that Dillenius had no ſyſtematical talents at all commenſurate with his own. Having propoſed to himſelf three great objects; a commodious claſſification of plants; a compendious nomenclature; and an univerſal delineation of ſpecies, as far as they came under his own obſervation, he might perhaps not be very patient of contradiction from thoſe whom he thought more able to hinder than to aſſiſt him. The ſame apology may be made for many philoſophers, who unjuſtly incur the charge of petulance, or of pride.

The

The botanical fyftem of Rivinus is founded on the moft elegant and attractive, if not the moft folid and important, parts of plants. His claffes are marked by the number, the regularity, or irregularity, of the petals. He could not proceed far in this path without perceiving that he made moft unnatural, and, as Haller juftly terms them, paradoxical, combinations. He therefore afferted, and doubtlefs believed, the inutility and impracticability of a really natural claffification. This principle brought him to one right conclufion, which even the philofophical Ray did not attain, or was afraid to admit, that the old primary diftribution of vegetables into trees, fhrubs, and herbs, is unfcientific and erroneous.

Rivinus publifhed, at his own expence, in 1690, his fplendid illuftration of the firft clafs of his fyftem, comprifing fuch plants as have a monopetalous irregular flower. Thefe are the ringent flowers of Linnæus, accompanied by the *Scitamineæ*, and even by *Arum*. This part confifts of one hundred and twenty-five plates; but though each plate often contains more than one plant, the intelligent reader will perceive how imperfect the catalogue of fpecies muft be. A learned *Introductio generalis in rem herbariam* is prefixed; and this introductory part was, at different times, republifhed in a fmaller form. The fecond part of the fumptuous work of which we are fpeaking, came forth in 1691. This confifts of one hundred and twenty-one plates, of plants with four irregular petals; into which clafs, by means of fome contrivance, and many grains of allowance, are admitted all the papilionaceous tribe, the cruciform genus *Iberis*, the *Euphorbia*, and a few things befides. The genus laft named is referred rather arbitrarily to this clafs, merely becaufe its ftalked pendulous germen muft be turned to one fide, and therefore, in the author's opinion, the flower is rendered irregular. In 1699 the third part, containing flowers with five irregular petals, was given to the world. Even more liberty is taken in the affemblage of genera here than in the former clafs. The natural order of *umbelliferæ* is admitted entire; very juftly indeed as to practical or philofophical propriety; but with great laxity of artificial principle, many of the plants having regular or equal petals. Next to thefe follow *Tropæolum;* the irregular *Gerania* (which now conftitute the genera of *Pelargonium* and *Erodium*); fome leguminous plants not papilionaceous; *Viola; Aefculus; Delphinium; Aconitum; Dictamnus;* and the whole concludes with *Pyrola*, whofe flight and partial irregularity of flower has gained it admittance here. This third part of the work of Rivinus confifts of one hundred and thirty-nine plates. A fourth part, the *hexapetalæ irregulares*, confifting of the *Orchideæ*, was finifhed, but not publifhed, before the author's death; nor indeed have any more than a very few copies of this ever got abroad into the world, fo that it conftitutes one of the greateft bibliothecal rarities. With refpect to utility or beauty, thofe who are poffeffed of the tranfcendent engravings of this favourite tribe in Haller's Hiftory of Swifs Plants, may difpenfe with the figures of Rivinus. The author had prepared feveral fupplementary plates to his work, which never came forth, and of which perhaps the only fpecimens are to be feen in fir Jofeph Banks's fine copy of the whole work, except two duplicate plates beftowed by his bounty on the writer of this article. There is every reafon to believe that the copy in queftion belonged to the author himfelf, or to his fon, as may be gathered from its manufcript additions and corrections. A complete copy, of even the three firft parts of Rivinus's book is, indeed, difficult to be met with; for feveral of the plates having from time to time received additions of feed-veffels, or of entire plants; the earlier impreffions of fuch plates are confequently imperfect. The beft copies are required, by faftidious collectors, to have every plate with and without the additions. Haller truly remarks, that the author evidently derived his materials chiefly from garden plants, and having fyftem in view, was more folicitous to exhibit flowers than roots, or the lower part of the herbage; a great defect as to the *Orchideæ* and *Umbellatæ*. We ought, at the fame time, to recollect, that the tribes he has felected are among the moft interefting, attractive, or difficult, that could have been wifhed. His fcheme of nomenclature deferves high commendation as fuch, though it proves totally inadequate to the author's purpofe, which was to comprehend, in a fingle word accompanying the generic name, the effential character or idea of each particular fpecies.

As a medical writer, Rivinus has the merit of faithful obfervation and defcription, in his treatife *de Pefte Lipfienfi*, publifhed in 1680. He wrote alfo on Dyfpepfia, on Intermittent Fevers, and various other fubjects. He did not fcruple to attack whatever practice or opinion he found ever fo ftrongly eftablifhed on the bafis of prejudice and ignorance. In this refpect his *Cenfura Medicamentorum officinalium* ranks very high. His commendable aim, in this work, was to clear the Materia Medica of its various difgraceful incumbrances; fo many of which originated in error, impofition, or fuperftition. His attempts have been followed up by various men of ability and authority; and it is to the united labour and good fenfe of fuch, that the world is indebted for the purified and improved ftate of our modern Pharmacopeias.

Though not a great practical anatomift, or diffector, Rivinus is faid to have difcovered a new falivary duct. He left a fon, John Auguftus Rivinus, who fucceeded him as profeffor, and under whofe prefidency was publifhed a differtation, in 1723, on Medicinal Earths. This gentleman died in 1725, aged thirty-three, having furvived his father but two years. His premature death feems to have prevented the publication of the fourth part of his father's great botanical work, at leaft for fome time. Haller fays, Ludwig afterwards edited the plates of the *Orchideæ*, without any letter prefs; but this publication has never come under our infpection. Rivini Opera. Hall. Bibl. Bot. Aikin's Gen. Biogr. Dryand. Bibl. Banks.

RIVISONDOLI, in *Geography*, a town of Naples, in Abruzzo Citra; 9 miles S.E. of Sulmona.

RIULI, a town of Naples, in Calabria Citra; 16 miles N.N.E. of Caffano.

RIVOGLIOMENTO, Ital. in *Mufic*, changing the place of the parts of a compofition. It is placing the treble or other upper part in the tenor or bafe, and *vice verfâ.* This frequently happens in double counterpoint, when the treble ferves for the bafe, or the bafe for the treble; and in fuch a manner, as that the harmony, though different, fhall remain equally correct and pleafing as in the firft arrangement of the parts.

RIVOLGIMENTO, Ital. inverfion.

RIVOLI, in *Geography*, a town of France, in the department of the Po, fituated at the declivity of a hill on the road from France into Italy by the Cottian Alps, in a fertile country and climate more falubrious, as it is faid, than that of Turin. It contains three parifh churches and three monafteries. The king of Sardinia had a palace here. The inhabitants are fuppofed to be about 800; 6 miles W. of Turin.—Alfo, a town of Italy, in the Veronefe; 12 miles N.W. of Verona.

RIVOLTA, a town of Italy, in the department of the Mincio; 4 miles W. of Mantua.—Alfo, a town of of Italy, in the department of the Adda; 2 miles S. of Crema.

RIVOLTA *Secca*, a town of Italy, in the department of the Adda; 10 miles W. of Crema.

RIVOLTARE, Ital. in *Music*, to reverfe; whence

RIVOLTATO, reverfed. See ROVERSCIO.

RIVOLTELLA, in *Geography*, a town of Italy; 17 miles E. of Brefcia.

RIUT, a Ruffian fettlement on the W. coaft of America. N. lat. 65° 25′. E. long. 209° 36′.

RIVULARIA, in *Botany*, fo called by Dr. Roth from its growing generally in rivulets, is a cryptogamic genus, feparated, by that able botanift, from *Ulva* and *Conferva*: to each of which genera fome or other of its fpecies had been, by preceding writers, referred.—Roth Catal. v. 1. 212. Sims and Konig's Ann. of Bot. v. 1. 247. Smith Engl. Bot. v. 25. 1797.—Clafs and order, *Cryptogamia Algæ*. Nat. Ord. *Algæ fubmerfæ*.

Eff. Ch. Frond gelatinous, firm, deftitute of an external cuticle. Fructification among jointed filaments, lodged in the fubftance of the frond.

Roth defcribes eleven fpecies of this genus, in his Beyträge, v. 1. 239, tranflated in Ann. of Bot. above cited. He there alfo adopts a genus from Micheli, by the name of *Linckia*, whofe character is as follows. Frond gelatinous, pellucid, enclofed in a membranous pellucid integument, and ftuffed with granules of fructification, difpofed in curved beaded lines. Of this he defines four fpecies.

Of his *Rivulariæ*; *elegans*, n. 5, Engl. Bot. t. 1797, and *tuberculofa*, n. 11, Engl. Bot. t. 2366, are acknowledged natives of Britain; as are two of his *Linckiæ; pruniformis*, n. 2, which is *Ulva pruniformis* of Linnæus, and of Engl. Bot. t. 968; and *Noftoc*, n. 3, which is *Tremella Noftoc* of Linnæus, and of Engl. Bot. t. 461. The *pruniformis* juft mentioned, is in the index to Engl. Bot. referred to *Rivularia;* how juftly we dare not pofitively fay. In the fame work the following fpecies are added to thofe of Roth. Refpecting the marine ones, there may poffibly be fome difference of opinion as to their genus; but they can fcarcely be referred to any other at prefent eftablifhed.

R. *Opuntia*. Indian-fig Rivularia. Engl. Bot. t. 1868. (Fucus Opuntia; Gooden. and Woodw. Tr. of Linn. Soc. v. 3. 219. Tremella marina cæfpitofa, fegmentis tenuibus; Dill. Mufc. 50. t. 10. f. 9.)—Compreffed, branched, red, jointed; joints elliptical, confluent. Internal filaments repeatedly forked; their ultimate joints fhortened, filled with feeds.—Found on rocks, on the Britifh coaft, forming fmall, creeping, purplifh tufts, between high and low-water marks. The *fronds* are entangled, much branched, compreffed, of a fpongy texture, but not hollow, compofed of elliptical joints. Thefe, when cut tranfverfely, prove full of innumerable forked, beaded filaments, whofe joints, near the furface of the *frond*, are fhorteft, and full of red grains, prefumed to be *feeds*. We do not pretend that this fpecies anfwers well to the character of a *Rivularia*. It will probably hereafter conftitute a new genus, along with feveral more, now difperfed in *Fucus*, *Conferva* or *Ulva*, but whofe fructification and economy are not fufficiently known, for any decifive meafure to be taken concerning them. Among them perhaps is *Fucus Wigghii*, Engl. Bot. t. 1165; for we are not yet perfuaded of its being a real *Rivularia;* nor have we examined it minutely ourfelves.

R. *vermiculata*. Worm-fhaped Rivularia. Engl. Bot. t. 1818.—Cylindrical, much branched, brown; branches fcattered, fubdivided, crooked. Internal filaments compound and divaricated; their ultimate branches cluftered, beaded, thickened upwards. Fruit obovate, feffile at the bafe of the beaded branches.—Found on the coafts of Ireland and the fouth of England, in fummer. A very curious fubmarine plant, four or five inches high, olive brown, much and irregularly branched, folid, gelatinous, invefted with a pale flimy mafs, of minute, jointed, branched fibres, fome of which are darker, and beaded, and accompanied by a dark, oval, folitary *feed* at their bafe.

R. *verticillata*. Whorled Pink Rivularia. Engl. Bot. t. 2466. (Ulva verticillata; With. v. 4. 127.)—Cylindrical, much branched, very gelatinous, pale pink; branches alternate; the ultimate ones very numerous, of equal thicknefs. Internal filaments whorled, repeatedly forked. Fruit obovate, lateral.—Found on the fea beach of Ireland and Suffex, in fummer. Highly gelatinous and tender, of a delicate flefh-colour. Its generic characters nearly accord with the laft.

R. *incraffata*. Thick Green Rivularia. (Ulva incraffata; Hudf. 572. Engl. Bot. t. 967. Tremella paluftris gelatinofa, damæ cornuum facie; Dill. Mufc. 51. t. 10. f. 10.)—Compreffed, much branched, gelatinous, finuated and toothed, green; thickened at the margin. External filaments loofely tufted, forked, with pale pellucid tips.—Grows on moffes, in pools of frefh water. Whole plant gelatinous and flippery, of a grafs green. It feems very near *R. Cornu damæ* of Roth, if not the fame.

R. *tuberiformis*. Potatoe Rivularia. Engl. Bot. t. 1956.—Irregularly globofe, inflated, pale brown; white within. Seeds vertically difpofed in rows at the fummits of the filaments.—Grows on rocks and fubmarine plants, on the fouth coaft of England. When floating it looks like a group of young potatoes. Each plant is hollow, confifting of a thick tender coat. The outfide is not, as in the laft, covered with pellucid filaments, beyond the feed-bearing part.

R. *atra*. Small Black Rivularia. Roth Catal. v. 3. 340. Engl. Bot. t. 1798.—Hemifpherical, folitary, feffile, hard, black. Internal filaments ftraight, compact, branched, concentric, green; their joints cylindrical.—This is found on mud, or on wooden piles, in falt marfhes, or about the mouths of rivers; confifting of black granules the fize of muftard-feed. Thefe, when highly magnified, and cut perpendicularly, are found to confift of concentric rows, of more or lefs pale, green, denfe filaments.

R. *calcarea*. Calcareous Rivularia. Engl. Bot. t. 1799.—Hemifpherical, feffile, cluftered, hard, green. Internal filaments ftraight, compact, entangled, fimple, with fcarcely any appearance of joints.—This is found in the beds of rivers, and mountain torrents, in Ireland, Wales, &c. in maffes, either feparate, the fize of a large pea, or aggregate and confluent. Their colour a glaucous green; their fubftance firm, of fimple parallel fibres, or tubes, all conglutinated, as it were, with calcareous earth.

R. *echinulata*. Little Hedgehog Rivularia. (Conferva echinulata; Engl. Bot. t. 1378.)—Floating, glaucous, globofe, muricated with the points of its concentric, fimple, jointed, fhort filaments.—Found by the Rev. H. Davies, in a lake, in Anglefea, covering the furface in June and July, with a floating mafs of little feparate prickly globules, each the fize of a pin's head.

RIVULET, a diminutive of river.

RIXAS, in *Geography*, a mine-town of Brazil, in the government of Goyas; 80 miles N. of Villa Boa.

RIXDOLLAR, in *Commerce*, a money of account and filver coin in Holland, Germany, Denmark, and Sweden. In Holland, a rixdollar is worth $2\frac{1}{2}$ gilders, 50 ftivers, or 800 pennings. A pound Flemifh is equal to 6 gilders, or $2\frac{2}{5}$ rixdollars, and is divided into 20 fhillings, 120 ftivers, or 240 pence Flemifh, called alfo groots: hence a rixdollar is equal to 8*s*. 4*d*. Flemiſh, and a gilder = 3*s*. 4*d*. Flemiſh. A gold gilder, with which accounts are kept in the corn trade, is worth 28 ſtivers. At Copenhagen accounts are kept in rykſdalers or rixdollars of 6 marks, or 96 ſhillings Daniſh. In the duchies of Holſtein and Sleſwig accounts are kept in rixdollars of 3 marks, or 48 ſhillings Lubs, and at Elſineur on the Sound, accounts are kept in rixdollars of 4 orts, or 96 ſkillings Daniſh. The baſe rixdollar (ſletdaler), which is an imaginary coin, is reckoned at 4 marks, or 64 ſkillings Daniſh. A mark is divided into 16 ſkillings or ſhillings; and a ſkilling into 2 fyrkes, 3 wittens, or 12 pfenings Daniſh. The Daniſh denominations of marks and ſhillings bear only half the value of the ſame denominations in Lubs or Hamburgh money: thus, 2 marks Daniſh are worth 1 mark Hamburgh, &c. In ſilver, ſpecie rixdollars, which paſs for 7 marks 6 ſkillings Daniſh currency, are commonly reckoned at 6 marks 12 ſkillings crown money, at the toll on the Sound. There is alſo the new Holſtein currency, coined ſince the year 1788, conſiſting of ſpecie rixdollars, at 48 ſhillings ſpecie, or 60 ſhillings Holſtein currency; and pieces of 32, 16, 8, 4 and 2 ſhillings ſpecie, or 40, 20, 10, 5 and $2\frac{1}{2}$ ſhillings Holſtein currency. In this money, the Cologne mark of fine ſilver is coined into $9\frac{1}{4}$ rixdollars ſpecie, or $11\frac{9}{16}$ rixdollars currency.

Any perſon, whether a native or a foreigner, may open an account at the bank of Copenhagen, on paying 4 rixdollars a year for each folio, and whenever he wiſhes to have his account ſettled. Beſides, this bank charges a commiſſion of 1 *per* 1000 for all the money inſcribed or transferred in the books. Bank notes are iſſued of the value of 80, 40, 20, 8, and 4 rixdollars ſpecie; or 100, 50, 25, 10, and 5 rixdollars currency. Theſe are current through the Daniſh dominions, and they are to be paid off on demand at the bank.

By a royal edict of 1776, ſettling the rate of coinage, $9\frac{1}{2}$ rixdollars ſpecie are to contain a mark of fine ſilver; each piece weighing 537.69 eſchen, Cologne weight, or 447.9 Engliſh grains, and being 14 lods or $\frac{14}{16}$ths fine; ſo that it contains 391.9 Engliſh grains of fine ſilver. The rixdollar Daniſh currency, in current ducats or 12 markpieces, is equivalent to 28.48 German aſes, or $21\frac{1}{8}$ Engliſh grains of fine gold; and the ſame rixdollar, in ſilver currency, contains 429 aſes, or 318 grains of fine ſilver. The rixdollar in crowns may be valued at 467 aſes, or $346\frac{3}{8}$ grains of fine ſilver. Thus the proportion of gold to ſilver is as $15\frac{9}{189}$ to 1. One hundred rixdollars Hamburgh banco anſwer to $113\frac{1}{8}$ rixdollars in crowns, or $123\frac{1}{13}$ rixdollars Daniſh currency: the latter may be conſidered at par with Hamburgh currency. The rixdollar currency is = 3*s*. $8\frac{1}{2}$*d*. ſterling; and the rixdollar in crowns = 4*s*. $0\frac{1}{2}$*d*. ſterling; or a ſingle crown piece = 16*d*. ſterling; a current ducat = 7*s*. $5\frac{1}{2}$*d*. ſterling; and 1*l*. ſterling = 5 rixdollars 2 marks 6 ſkillings currency, or 4 rixdollars 5 marks 12 ſkillings crown money.

The moſt common way of keeping accounts in Germany is in rixdollars of 90 creutzers, or in guldens or florins of 60 creutzers; the rixdollar of account, or (as it is generally called) rixdollar current, is reckoned at $1\frac{1}{2}$ florin, and the rixdollar ſpecie or effective at 2 florins, or 120 creutzers. In Pruſſia, Saxony, Hanover, Brunſwick, and Luneburg, accounts are kept in rixdollars of 24 good groſchen, each good groſche being divided into 12 pfenings; or in rixdollars of 36 marien groſchen, each marien groſche being divided into 8 pfenings. At Hamburgh, Altona, Lubeck, Holſtein, and Mecklenburg, accounts are kept in marks of 16 ſhillings lubs, each ſhilling being divided into 12 pfenings; and the rixdollar reckoned at 3 marks. Each independent ſtate or city of Germany has its own coins, moſt of which may be referred to, or compared with, the following, *viz.*; in gold, the ducat, the piſtole, and the gold florin or gulden; and in ſilver, the rixdollar ſpecie, and its ſubdiviſions. The piſtoles are all reckoned at 5 rixdollars current. The gold florins, chiefly current in countries on the banks of the Rhine, paſs generally for 2 rixdollars current, and are to contain $18\frac{1}{3}$ carats of fine gold, $3\frac{2}{3}$ carats of fine ſilver, and $1\frac{5}{6}$ carat of copper: 72 gold florins are to weigh a Cologne mark. Since the eſtabliſhment of the convention in 1763, the Cologne mark of fine ſilver is valued at $13\frac{1}{3}$ rixdollars of account, or 10 rixdollars effective, or 20 florins. In ſmall payments, the Cologne mark of fine ſilver being reckoned at 16 rixdollars of account, or 24 florins, each of the coins is rated 20 *per cent.* higher than its value in convention money; the ſpecie rixdollar paſſes for $2\frac{2}{5}$ florins, the convention florin for $1\frac{1}{5}$ florin, and the copfſtuck for 24 creutzers. According to the Leipſic rate of coinage, the Cologne mark of fine ſilver was valued at 12 rixdollars of account, 9 effective rixdollars, or 18 florins; 8 ſpecie rixdollars were to weigh a Cologne mark of ſilver, 14 loths 4 grains fine: in the ſmalleſt coins, ſuch as double and ſingle marien groſchen, the mark of fine ſilver was coined at the rate of $12\frac{2}{3}$ rixdollars. Theſe coins are known by the name of "conſtitution coins:" 100 rixdollars, coined after the Liepſic rate, are worth $111\frac{1}{3}$ convention rixdollars. The fineneſs of gold is valued all over Germany by dividing the mark fine into 24 carats, and the carat into 12 grains; the fineneſs of ſilver, by dividing the mark fine into 16 loths, and the loth into 18 grains. At Hamburgh, the reichſthaller, or rixdollar, is 3 marks, 48 ſhillings, or 576 pfenings; the rixdollar of exchange is 2 marks, 32 ſhillings, or 384 pfenings. The ſilver coins of this city are rixdollars reckoned at 3 marks ſpecie, which commonly paſs for $\frac{1}{2}$ *per cent.* better than banco, or for 3 marks 12 ſhillings 5 pence Hamburgh currency. All ſorts of ſpecie rixdollars, when they are full banco weight, are reckoned at 3 marks, with about $\frac{1}{2}$ *per cent.* premium againſt banco, or at 4 marks light money, with about 33 *per cent.* diſcount below banco. But the value of a common ſpecie rixdollar, in current money, is 3 marks 12 ſhillings, and the halves and quarters in proportion.

Accounts are kept in Sweden in rikſdaler of 48 ſkilling, the ſkilling being ſubdivided into 12 runſtycken or ore. By the regulations of 1777, the ſpecie rikſdaler was to paſs for the ſame value that 6 ſilver dahler, or 18 kopper dahler, formerly did; and there were coined whole rikſdaler, and pieces of $\frac{2}{3}$ds, $\frac{1}{3}$d, $\frac{1}{6}$th, $\frac{1}{12}$th, and $\frac{1}{24}$th of a rikſdaler. According to the mint regulations, the Swediſh ſpecie rikſdaler ſhould weigh 609 Swediſh aſs, or $451\frac{2}{3}$ Engliſh grains, and contains 535 aſs, or $396\frac{1}{3}$ grains of fine ſilver; it is therefore worth 4*s*. $7\frac{1}{2}$*d*. ſterling, and the ſkilling $1\frac{1}{6}$*d*. nearly. For the value of rixdollars, current in various places, according to the mint price of ſilver in England, ſee MONEY.

The rixdollar (conſtitution) of the Auſtrian dominions has on it the head of the reigning emperor, with name and titles, thus: CAR. VI. D. G. R. I. S. A. G. HI. H. BOH. REX; that is, *Carolus ſextus, Dei gratia, Romanus imperator ſemper auguſtus, Germaniæ, Hieroſolymæ, Hungariæ, Bohemiæ rex* (Charles VI. by the grace of God, emperor of Rome, ever auguſt, king of Germany, Jeruſalem, Hungary, and Bohemia); reverſe, a two-headed eagle crowned, bearing on his breaſt the arms of Auſtria, and in his talons a ſword and ſceptre; legend, ARCHID. AUST. D. BU. M. MOR. COM. TY. (archduke of Auſtria, duke of Burgundy, marquis of Moravia, count of Tyrol), with the date; and on the edge of the piece, CONSTANTER CONTINET ORBEM, (he guides the globe ſteadily).

The

The rixdollar (convention) has the head of the reigning sovereign, with name and title, thus: M. THERESIA, D. GR. IMP. GE. HU. BO. REG. (Maria Theresa, by the grace of God, empress of Germany, queen of Hungary and Bohemia); reverse, as on the rixdollar constitution; the legend on the edge of the piece of Francis I. is, PRO DEO ET IMPERIO (for God and the empire). On that of Maria Theresa, JUSTITIA ET CLEMENTIA (justice and clemency). On that of Joseph II., VIRTUTE ET EXEMPLO (by virtue and example).

The rixdollar of Hungary has the head, name, titles, and legend, on the edge as above; reverse, the Virgin and Child, and the letters K. B.; legend, S. MARIA, MATER DEI, PATRONA HUNG. (Holy Mary, mother of God, patron of Hungary).

The florin, or half rixdollar, bears the same impressions as the rixdollar; as also the half florin.

The copfstuck, or copstick, (the 20 creutzer piece,) bears the same impressions as the rixdollar, except that there is no legend round the edge, and it is marked 20 on the reverse; the half copfstuck is marked 10.

The rixdollar of Baden has the head of the reigning prince, with name and title, thus: CAROLUS FRID. MARCHIO BAD. ET H. (Charles Frederick, marquis of Baden, &c.); reverse, arms of Baden; legend, AD NORMAM CONVENTIONIS (according to the rule of the convention); and at the bottom, the date, and X EINE F MARCK (10 pieces to a mark fine).

The thaler or rixdollar of Basil has the griffin, arms, and legend, as on the patagon; reverse, a wreath of laurels, inclosing the value, I THALER; legend, MONETA REIPUB. BASILEENSIS (money of the republic of Basil). The half piece is marked $\frac{1}{2}$ THALER; and the third is marked $\frac{1}{3}$.

The rixdollar of Bavaria has the head of the reigning prince, with name and titles, as in the gold coins; reverse, arms of Bavaria, and the date; and on other pieces, the Virgin and Child, with the legend, PATRONA BAVARIÆ (patroness of Bavaria); but the new rixdollar coined in 1800, bears the arms of Bavaria, and the legend, PRO DEO ET POPULO.

The rixdollar of Brunswick (old) has the head, name, and title of the reigning prince, as in the gold coins; reverse, the horse and legend as on the Carl d'or; but at the bottom there are X EINE FEINE MARCK CONVENTION M. (ten pieces to a mark fine, convention money).

The rixdollar of 1795 has on one side the words I SPECIES THALER, and the date; legend, X EINE FEINE MARCK, &c. as above; reverse, arms of Brunswick, with the name and title of the reigning prince.

The rixdollar of Cologne has the head of the reigning emperor of Germany, with his name and titles; reverse, arms of the city; legend, MONETA NOVA LIB. ET IMP. CIVIT. COLON.; that is, *Moneta nova liberæ et imperialis civitatis Coloniensis* (new coin of the free and imperial city of Cologne); and on some rixdollars, MON. NOVA LIB. REIPUB. COLONIENSIS (new coin of the free republic of Cologne).

In Denmark the rykSdaler (old), coined for Norway, has the head of the reigning king, with name and title, thus: FRIDERICUS V. D. G. REX DAN. NOR. V. G. or D. G. DAN. NORV. VAND. GOTH. REX (Frederick V. by the grace of God, king of Denmark, Norway, the Vandals, and the Goths); reverse, a lion and battle-axe, with 6 M. (6 marks), and the following legend in the Norwegian language, in two concentric circles, MOD TROFKAB DAPPERHED. OGH VAD DER GIVER ÆRE DEN HEELEN VERDENBAND BLANT NORSKE KLIPPER LAERE, which is thus translated: spirit, loyalty, valour, and whatever is honourable, let the whole world learn among the rocks of Norway. On the same coin, of a later date, the legend is TROE JOVE MOD OGH VAD DAN KONGENS GUNST KAND VINDE, MENS NORGE KLIPPE HAR MAN SKAL HOS NORDMAND FINDE; that is, true lion's heart and whatever can win a Danish monarch's love, whilst Norway has rocks, shall be found among Norwegians.

The rykSdaler of 1777 has the king's cypher and a crown; legend, D. G. DAN. NOR. VAND. GOTH. REX, as before; reverse, arms of Denmark; legend, GLORIA EX AMORE PATRIÆ (glory from the love of our country), and the date.

The rykSdaler of 1795 has the head, name, and titles of the reigning king; reverse, arms of Denmark; legend, I RIGSDALER SPECIE, with the date.

The rykSdaler of Holstein has the head, name, and title, as above; reverse, arms of Denmark, and I SP.; legend, 60 SCHILLING. SCHLESW. HOLST. COURANT (60 schillings Sleswig and Holstein currency), with the date. The pieces of $\frac{2}{3}$ds and $\frac{1}{3}$d are marked $\frac{2}{3}$ SP. and $\frac{1}{3}$ SP., and the number of schillings is also expressed: SP. means specie.

The rixdollar of Francfort has varied much in the impressions: most of them bear an eagle; but the reverses and legends are very different in coins of different dates; they may be easily distinguished by the word FRANCKFURT or FRANCOFURT, which is to be found on some part of the piece, as also the words AD NORMAN CONVENTIONIS (according to the rate of convention money), and X E. F. MARK, or X EINE FEINE MARK (10 to a mark of fine silver): these last words, within a circle or wreath, form the reverse of the more modern pieces; and coins of 1796 bear likewise the following German legend, AUS DEN GEFŒSEN DER KIRCHEN UND BURGER (out of the plate of the churches, and of the citizens); and on the other side, DER STADT FRANCKFURT (of the city of Francfort).

The rixdollar specie or banco of Hamburgh has on the front the arms of Hamburgh; legend, MONETA NOVA HAMBURGENSIS (new coin of Hamburgh), and at the bottom, 48 SCHIL. SPEC.; reverse, a two-headed eagle crowned, with the name of the reigning emperor of Germany, thus: JOSEPHUS II. D. G. ROM. IMP. SEMP. AUGUST. (Joseph II. emperor of Rome, ever august).

The rixdollar of Hanover has the arms of the reigning king, with his name and title; reverse, a horse running over rough ground; legend, NEC ASPERA TERRENT (neither do rough places deter him), and the date. Some rixdollars bear a figure of St. Andrew on the cross; legend, the king's German titles.

The rixdollar convention of Hesse has the head of the reigning prince, with name and titles, thus: WILHELMUS IX. D. G. HASS. LANDG. HAN. COM. (William IX. by the grace of God, landgrave of Hesse, count of Hanau); reverse, arms of Hesse Cassel; legend, X ST. EINE FEINE MARCK (10 pieces to a mark fine), and at the bottom the word JUSTIRT (adjusted or verified). In pieces of more modern date, 1796, &c. this last word is not to be found, but under the above legend the words BIBERER SILBER (silver of the mine of Biber); and in some pieces of 1770, the words EX VISCERIBUS FODINÆ BIEBER (from the bowels of the mine of Biber). The half and quarter rixdollars are marked XX ST, &c. and 40 ST, &c. and under the coat of arms $\frac{2}{3}$ or $\frac{1}{3}$.

The thaler or rixdollar of account has the head, name, and title, as above; reverse, a star with a lion in the centre, and the words VIRTUTE ET FIDELITATE, as before; or the arms of Hesse; the legend, in both cases, is EIN THALER (one thaler): and on the half piece, EIN HALBER THALER.

The rixdollar or 3 markpiece of Lubec has a two-headed eagle crowned, with 48 on its breast; legend, MON. NOV. IMP. CIVITAT. LUBECÆ (new coin of the imperial city of Lubec); reverfe, arms of the city; legend, 48 SCHILLING COURANT GELDT ANNO, &c. (48 fchillings currency; the year, &c.)

The rixdollar (fine) of Manheim has the head of the reigning prince, with name and title, thus: CAR. THE. C. P. S. R. I. A. T. & EL.; that is, *Carolus Theodorus, comes palatinus, fancti Romani imperii archi thefaurarius et elector* (Charles Theodore, count palatine, high fteward and elector of the holy Roman empire); reverfe, arms of the prince; legend, EX VISCERIBUS FODINÆ WILDBERG (from the bowels of the mine of Wildberg), and FEIN SILB. (fine filver) at the bottom.

The piece of $\frac{2}{3}$ bears the fame impreffions as the rixdollar, except that it is marked ($\frac{2}{3}$) under the arms. Some pieces of an ancient date bear no head but $\frac{2}{3}$ in large figures, and under this, FEIN SILBER; legend, DEUS SERVET METALLI FODINAS MONTENSES (may God preferve the mines of Wildberg); the names and titles are on the reverfe, round the arms.

The rixdollar (convention) has the head, name, and titles, as above; reverfe, arms of the prince; legend, AD NORMAM CONVENTIONIS (according to the rule of the convention); or 10 EINE FEINE MARCK (10 to a fine mark).

N. B. The coins of Manheim and the Palatinate now bear the fame impreffions as thofe of Bavaria, both countries being united under one fovereign.

The rixdollar of Mentz has the head of the reigning prince, with name and titles, thus: FRID. CAR. JOS. D. G. A. EP. MOG. S. R. I. P. G. A. C. ET EL. E. W.; that is, *Fredericus Carolus Jofeph Dei gratia archiepifcopus Moguntiæ, fancti Romani imperii pro Germania archi cancellarius et elector, epifcopus Wormenfis* (Frederick Charles Jofeph, archbifhop of Mentz, high chancellor for Germany and elector of the holy Roman empire, bifhop of Worms); but the pieces of 1796, &c. have their legend in German, thus: FRIED. CAR. JOS. ERZB. U. KURF. Z. MAINZ. B. Z. W.; that is, *Erzbifchoff und Kurfurft zu Mainz Bifchoff zu Worms* (archbifhop and elector of Mentz, bifhop of Worms); reverfe, arms of the bifhop; legend, ZEHEN EINE FEINE MARCK (ten to a mark fine).

The rixdollar (conftitution) of Nuremberg has the head of the reigning emperor, with name and title, thus: CAROLUS VI. D. G. ROM. IMP. SEMP. AUG. (Charles VI. by the grace of God, emperor of Rome, ever auguft); reverfe, a view of the city, with an eagle flying over it; legend, AUGUSTO DOMINO TUTA ET SECURA PARENTE EST (it is fafe and fecure under its auguft lord and father), and at the bottom, NORIMBERGA.

The rixdollar (convention) varies in the impreffions, fome bearing the head, name, and title of the reigning emperor, as above; and others a view of the city, with a fun over it; reverfe, a two-headed eagle crowned, bearing the arms of the city on its breaft; or a fingle-headed eagle carrying two efcutcheons in his talons. The pieces are marked with the letter N, or the word NURNBERG, or the legend, MONETA NOVA REIPUBL. NORIMBERGENSIS (new coin of the republic of Nuremberg); and the words, X EINE FEINE MARCK (ten to a mark fine), are alfo to be found in fome part of the piece.

The rixdollar of Pruffia (coined before 1791) has the head of the reigning king, with name and title, thus: FRIDERICUS BORUSSORUM REX (Frederick king of Pruffia); reverfe, an eagle and military trophies; legend, EIN REICHS THALER (one rixdollar). The half rixdollar bears the fame impreffions; and its value is marked thus, 2 EINE R. THALER (two to a rixdollar).

The rixdollar current (coined fince 1791) has the head of the reigning king, and the legend in German, as before; reverfe, arms of Pruffia, with EIN THALER at the bottom; but the rixdollar convention money bears the legend, ZEHN EINE FEINE MARCK (ten to a mark fine).

The florin of Silefia has the fame impreffions as on the rixdollar of 1791; but on the reverfe it is marked XXI EINE FEINE MARK.

The rixdollar of Anfpach and Bareuth has the head of the reigning prince, with name and title, thus: ALEXANDER D. G. MARCH. BRAND. (Alexander, by the grace of God, marquis or margrave of Brandenburg); reverfe, arms of Anfpach, &c. with ZEHEN EINE FEINE MARK (ten to a mark fine); but thofe of modern date, 1790, &c. bear the impreffions of the Pruffian coins, Anfpach having been at that period ceded to Pruffia.

The rixdollar of Ratifbon has the head, name, and title of the reigning emperor, as on the coins of Hamburgh and Nuremberg; reverfe, a view of the city; legend, MONETA REIP. RATISPON (coin of the republic of Ratifbon), and at the bottom, X ST. EINE F. C. M.; that is, *X ftuck eine feine Collnifch marck* (ten pieces to a mark fine, Cologne weight). The half and quarter rixdollars are marked 20 ST. EINE F. C. M. and 40 ST. EINE F. C. M.

The rixdollar of Saltzburg, and its divifions, has the head of the reigning prince, with name and titles, thus: HIERONYMUS D. G. A. & P. S. A. S. L. N. G. PRIM.; that is, *Hieronymus Dei gratia archiepifcopus et princeps Salifburgenfis, Germaniæ primas* (Jerome, by the grace of God, archbifhop and prince of Saltzburg, primate of Germany); reverfe, arms of the reigning prince, without a legend; and the copfftuck or 20 creutzer piece differs only in being marked (20) on the reverfe.

The rixdollar (convention) of Saxony has the head of the reigning prince, with name and titles, thus: FRID. AUGUST. D. G. DUX SAX. ELECTOR (Frederick Auguftus, duke and elector of Saxony); reverfe, arms of Saxony, with the infcription, X EINE FEINE MARCK (ten to a mark fine).

The florin or piece of $\frac{2}{3}$ bears the fame impreffions as the rixdollar; but the infcription on the reverfe is XX EINE FEINE MARCK, and it is marked $\frac{2}{3}$ at the bottom; the half florin is marked XL EINE, &c. and $\frac{1}{3}$ at the bottom; and the quarter florin is marked LXXX or ACHZIG EINE, &c. and $\frac{1}{6}$.

The rixdollar of Saxe Gotha has the head, name, and title, of the reigning prince, thus: ERNESTUS D. G. GOTHAN. SAXONUM DUX (Erneft, by the grace of God, duke of Saxe Gotha); reverfe, arms of Saxe Gotha, with X EINE FEINE MARCK, as above.

The rixdollar of Sweden of 1752 has the head of the reigning king, with name and title in Latin, thus: GUSTAVUS III. D. G. REX SUECIÆ (Guftavus III. by the grace of God, king of Sweden); reverfe, arms of Sweden; legend, SALUS PUBLICA SALUS MEA (the public fafety is my fafety); and on the edge, MANIBUS NE LÆDAR AVARIS (that I may not be hurt by rapacious hands). The half rixdollar bears the fame impreffions.

The rixdollar of 1779 has the head, name, and title, as before; reverfe, arms of Sweden, with I RD.; legend, FADERNES LANDET (the land of our fathers). The divifions of the rixdollar bear the fame impreffions, but have their value marked on them, thus: $\frac{2}{3}$ RD., $\frac{1}{3}$ RD., $\frac{1}{6}$ RD. The rixdollar, and other pieces coined fince 1795, have the legends on both fides in the Swedifh language. The infcription

tion on the edge of the piece is MANIBUS, &c. as on the old rixdollar.

The rixdollar of Friburg, and its divifions, have the arms of the canton; legend, RESPUBLICA FRIBURGENS (republic of Friburg); reverfe, a crofs formed by eight F's, and four crowns; legend, AUXILIUM NOSTR. DEUS (God is our help). The quarter rixdollar has, on a fquare in the centre of the crofs, the number 56; and the inferior divifions are marked 28, 14, and 7.

The rixdollar of Treves has the head of the reigning prince, with name and titles, thus; CLEM. WENC. D. G. A. EP. TREV. S. R. I. A. C. ET EL.; that is, *Clemens Wenceflaus Dei gratia archi epifcopus Trevirenfis fancti Romani imperii archi cancellarius et elector* (Clement Wenceflas, by the grace of God, archbifhop of Treves, arch chancellor and elector of the holy Roman empire); reverfe, arms of the prince; legend, EPISC. AUG. APP. COAD. ELEC. (bifhop of Augfburg, and other titles), befides the words, IO EINE MARC F. or IO EINE FEINE MARK (ten to a mark fine).

The rixdollar of Wirtemburg has the head of the reigning prince, with name and title, thus: CAROL. ALEX. D. G. DUX WUR. ET T. (Charles Alexander, by the grace of God, duke of Wurtemburg, &c.); reverfe, arms of Wurtemburg; legend, PROVIDE ET CONSTANTER (providently and conftantly), befides the words, IO EINE FEINE MARK (ten to a mark fine).

The rixdollar of Wurtzburg (coined before 1795) has the head of the reigning prince, with name and titles, thus: FRANC. LUD. D. G. EP. BAM. ET WIR. S. R. I. P. F. O. DUX; that is, *Francifcus Ludovicus Dei gratia epifcopus Bambergii et Wirtfburgii, fancti Romani imperii princeps, Francorum Orientalium dux* (Francis Louis, by the grace of God, bifhop of Bamburg and Wurtzburg, prince of the holy Roman empire, duke of Eaft Franconia); reverfe, arms of the bifhop, legend, IO EIN FEINE MARCK (ten to a mark fine). But the rixdollar of 1795, &c. bears on the front the head of the bifhop, with names and titles as above; and on the reverfe only the words, IO EINE FEINE MARCK, encircled by two fprigs of laurel; and above it the legend, PRO PATRIA (for the country). See Kelly's Cambift, vols. i. and ii.

RIXI, in *Geography*, a town of Hindooftan, in Bahar; 23 miles S. of Palamow.

RIXOUSE, LA, a town of France, in the department of the Jura; fix miles N. of St. Cloude.

RIXTOWN, a town of the duchy of Holftein; feven miles S.W. of Lutkenberg.

RIZAH, a town of Afiatic Turkey, in the government of Trebifond, near the Black fea; 45 miles E.N.E. of Trebifond. N. lat. 48° 9′. E. long. 40° 20′.

RIZEA, in *Ancient Geography*, a town of Afia, in that part of the Colchide, which lay to the left of the Phafis. Procopius fays, that it was fituated on the frontiers of the empire, and that it was very populous.

RIZIUM, in *Botany*, a name given by the ancients to a peculiar kind of red root brought from Syria, and ufed by the Grecian women to paint their cheeks red.

The Latin writers, who have mentioned this, have called it *radicula;* and Pliny, who has more than once mentioned it, calls it *herba lanaria*, or *radix lanaria*. This, however, is a very great error, confounding it with the *ftruthium* of the Greeks. It is probable, that the rizium was no other than the anchufa, or alkanet root, which grows very plentifully in the countries from whence the Greeks had their rizium, and which will anfwer all the purpofes for which they ufed it.

RIZOA, fo named by Cavanilles, Ic. v. 6. 56. t. 578, after Salvator Rizo, a botanical artift employed by Mutis, is a genus of the *Didynamia Gymnofpermia*, whofe diftinctive characters are fcarcely fufficiently marked, for us, without a fpecimen, to decide concerning it.

The fpecies is *R. ovatifolia*, an herbaceous plant of Chili, flowering there in February. *Corolla* pale rofe coloured.

RIZSKOI, in *Geography*, a province of Ruffia, formerly Livonia, fo called from Riga, its capital; bounded on the N. by Revelfkoi, on the E. by the government of Peterfburg and Pfkov, on the S.E. by Polotzkoi, on the S. by Semigallia, and on the W. by the gulf of Riga; about 160 miles long, and 100 broad. N. lat. 56° 30′ to 59° 15′. E. long. 24° to 27° 34′.

RIZZIO, DAVID, in *Biography*, born at Turin, but brought up in France, was a good mufician, and fung agreeably. His father was a dancing-mafter. The count de Merezzo took him to Scotland, when he went thither ambaffador from Savoy. Rizzio charmed the queen by his talents, which were not confined to mufic, and there were rumours that fhe favoured him too much. Henry Stuart Darnley, the queen's hufband, had him arrefted in the mufic room of this princefs. But it is faid, in fome accounts, that he was actually at fupper with her majefty and the countefs of Argyle in her cabinet. Some fay that he was maffacred in her prefence; others affert, that the duke of Rothfay dragged him out of the room and murdered him at the door. There is no doubt but that the queen made ufelefs efforts to fave his life; (but to fave the life of a cat, a dog, or a fquirrel, common humanity would naturally have done as much). However, it is added, that fhe revenged his death afterwards on feveral of his affaffins. Laborde.

We wifhed to know what foreigners fay of this tranfaction, as party concerning Mary, queen of Scotland, ran fo high at the time, and it ftill runs, that there is no great credit to be given to either fide.

His inftrument feems to have been the lute, the general favourite at that time all over Europe.

At Turin, fome years ago, among many other mufical enquiries, David Rizzio was not forgotten. Imagining, as he was a native of that city, and his father a mufician as well as a dancing-mafter there, if we could find any mufic compofed by either of them or by their Italian contemporaries, it might determine the long difputed queftion, whether David Rizzio was author of the Scots Melodies afcribed to him. The refult of this enquiry is related in the article JAMES I. king of Scotland; which fee.

Sir John Melvil, in his Memoirs, tells us that "the queen had three valets of her chamber, who fung in three parts, and wanted a bafe to fing the fourth part; therefore, telling her majefty of this man, Rizzio, as one fit to make the fourth in concert, he was drawn in fometimes to fing with the reft." This was about the year 1564.

He quickly crept into the queen's favour; and her French fecretary happening at that time to return to his own country, he (Rizzio) was preferred by her majefty to that office. He began to make a figure at court, and to appear as a man of weight and confequence. Nor was he careful to abate that envy which always attends fuch an extraordinary and rapid change of fortune. On the contrary, he feems to have done every thing to increafe it; yet it was not his exorbitant power alone which exafperated the Scots; they confidered him as a dangerous enemy to the Proteftant religion, and held for this purpofe a conftant correfpondence with the court of Rome. His

prevalence,

prevalence, however, was very ſhort lived; for, in 1566, certain nobles, with lord Darnly at their head, conſpired againſt him, and diſpatched him in the queen's preſence with fifty-ſix wounds. Biog. Dict. vol. xi. p. 94.

RIZZUTO, Cape, in *Geography*, a cape on the coaſt of Calabria. N. lat. 38° 57′. E. long. 17° 25′.

ROA, a town of Spain, in Old Caſtile, on the Duero; 25 miles N. of Segovia.

ROACH, in *Ichthyology*, the Engliſh name of a well-known fiſh, called by the generality of authors the *rutilus* and *rubiculus*, by ſome the *rubellio*. It is a ſpecies of the cyprinus according to the new ſyſtem of Artedi, and the cyprinus rutilus of Linnæus. It has been deemed, though without much reaſon, remarkable for its livelineſs and vivacity; whence the proverb, *ſound as a roach*.

In ſome parts of the world this fiſh will only live in ſtanding waters; with us it equally thrives in ponds and in deep ſtill rivers, and is remarkable for its numerous progeny; a pond being much ſooner ſtocked with this than with any other fiſh.

Roach *Fiſhing*. See Fishing.

Roach-*Leech*, in *Sail-making*, the maſt-leech of ſails cut with a curve, or roach.

ROACHING *of Alum*, one of the laſt proceſſes uſed in the alum making, and is what renders it fit for the market.

After the alum liquor has been left four days in the cooler, and is ſufficiently ſhot, they drain it out; and taking out the alum, they waſh it in a ciſtern of alum water ſo ſtrong, that it can ſcarcely take up any more of that ſalt, but only cleanſes it of its accidental foulneſſes. After this waſhing the alum is put into large pans, and a quantity of water added to it. It is ſet over the fire to melt in this water and boil a little; then it is ſcooped into a great caſk, where it is ſuffered to ſtand about ten days; and it is then fit for the market under the name of *roach alum*, or *roached alum*; the liquor let out of the cooler is boiled up again, and ſhoots more alum. See Alum.

ROAD, Via, an open way or paſſage, forming a commodious communication between one place and another.

The Romans, of all people, took the moſt pains in their roads; the labour and expence they were at to render them ſpacious, ſtraight, ſmooth, and agreeable, to the very extremities of their empire, are incredible.

Uſually, they ſtrengthened the ground by ramming it, laying it with flints, pebbles, or ſand; ſometimes by a lining of maſonry, rubbiſh, bricks, potſhreds, &c. bound together with mortar.

F. Meneſtrier obſerves, that in ſome places in the Lyonnois he has found huge cluſters of flints cemented with lime, reaching ten or twelve feet deep, and making a maſs as hard and compact as marble itſelf; and which, after reſiſting the injuries of time for ſixteen hundred years, is ſtill ſcarcely penetrable by all the force of hammers, mattocks, &c. and yet the flints it conſiſts of are not bigger than eggs.

Sometimes they even paved their roads, regularly, with large ſquare free-ſtones; ſuch are the Appian and Flaminian ways, &c.

The roads paved of very hard ſtones, they uſually called *viæ ferreæ*, either becauſe they reſembled iron, or becauſe they reſiſted the iron of the horſes feet, chariots, &c.

Roads are either *natural* or *artificial*, *terreſtrial* or *aquatic*, *public* or *private*.

Road, *Natural*, is that which has been frequented for a long ſucceſſion of time, and ſubſiſts with little expence by reaſon of its diſpoſition, &c.

Road, *Artificial*, is that made by labour of the hand, either of earth or maſonry; and in the making of which, ſeveral difficulties were to be ſurmounted; ſuch are moſt of thoſe along the banks of rivers, and through marſhes, lakes, &c.

Roads, *Terreſtrial* or *Land*, are not only thoſe made upon the ground, but alſo thoſe formed of earth heaped up in manner of a bank, and ſuſtained by ſpurs, buttreſſes, and counterforts.

Road, *Aquatic*, is a road made in the waters, whether current, as thoſe of rivers, &c. or ſtagnant, as banks and cauſeways, or over moraſſes, &c.

Under this denomination are alſo comprehended navigable rivers, and artificial canals. See Canal.

Road, *Public*, or *grand road*, is any common road, whether ſtraight or acroſs, military or royal, &c. *Private* road is that made for the convenience of ſome particular houſe, &c. See Highway.

Roads, *Military*, ſo called among the Romans, were grand roads appointed for the marching of their armies into the provinces of the empire, for the aſſiſtance of their allies, &c.

The principal of theſe roads, in England, are Watling-ſtreet, Ikenild-ſtreet, Foſs-way, and Erminage-ſtreet. See Way.

Roads, *Double*, among the Romans, were roads for carriages, having two pavements or cauſeways, the one for thoſe going one way; the other for thoſe returning the other, to prevent claſhing, ſtopping, and confuſion.

Theſe two ways were ſeparated from each other by a bank raiſed in the middle, paved with bricks, for the convenience of foot people, with borders and mounting ſtones from ſpace to ſpace, and military columns to mark the diſtance. Such was the road from Rome to Oſtia, called *Via Portuenſis*.

Road, *Subterraneous*, is that dug in a rock with a chiſſel, and left vaulted. Such is that of Puzzuoli, near Naples, which is near half a league long; and is fifteen feet broad, and as many high.

Strabo ſays, it was made by one Cocceius, a relation probably of Nerva; but it has ſince been widened by Alphonſus, king of Arragon and Naples, and made ſtraight by the viceroys. There is another of the ſame kind in the ſame kingdom, between Baiæ and Cumæ, called the Grotto of Virgil, becauſe mentioned by that poet in the ſixth book of his Æneid.

Road, in *Rural Economy*, a track or way conſtructed with ſome ſort of hard materials for the purpoſe of travelling upon, with carriages, horſes, and other animals. Roads are of different kinds, as public and private, or parochial. The firſt ſort may be ſubdivided into toll and free-roads, and the latter into lanes or bye-roads: there are likewiſe other ſorts of roads, as carriage and horſe tracks, &c. It has been remarked by a writer, in the firſt volume of "Communications to the Board of Agriculture," that the conveniencies and beneficial conſequences which reſult from a free and eaſy communication between different parts of a county and diſtrict are ſo various, and the advantages of them ſo generally and extenſively felt by every deſcription of individuals, from the higheſt to the loweſt; that no labour or expence ſhould be ſpared in providing them; as, without ſuch ready means of intercourſe, all ſorts of internal commerce and improvement are either much embarraſſed, or wholly at a ſtand. And it is, indeed, well added, that roads and canals, or navigable rivers, may juſtly be conſidered as the veins and arteries through which all improvements flow. To internal commerce and agriculture,

culture, they are as the veins and arteries to the human body. Through thefe the blood circulates in every direction, and thus keeps alive the animal fyftem; but, if this circulation is by any means checked or obftructed, even in the remoteft part, that part foon becomes ufelefs, and finks into decay, and in fome degree is felt throughout the whole body. So it is with refpect to the commercial and agricultural fyftems. Without a free and uninterrupted intercourfe, it is impoffible they can exift, or at leaft produce, to the community at large, fo many important benefits as they otherwife might have done. How many, for example, are the places, in almoft every country, that might be rendered doubly valuable, if the accefs were practicable and eafy. How immenfe the quantities of the fineft timber, perhaps growing in inacceffible woods, which, on that account alone, are loft to fociety. How many the valuable ftrata of the richeft metals and minerals, which, from the fame caufe, lie buried and undifturbed in the bowels of the earth; and how many thoufands of acres of the moft fertile foil, that might be improved and cultivated to the higheft degree of perfection, and thus very largely contribute to increafe the food and the comforts of man, were the ingrefs and egrefs rendered practicable and free. And the value of a farm, confequently the riches, perhaps the ftrength of a country, greatly depend on an eafy and uninterrupted communication by good roads.

And the able author of the "Wealth of Nations" has well fuggefted, that good roads, canals, and navigable rivers, by diminifhing the expence of carriage, put the remote parts of the country more nearly upon a level with thofe in the neighbourhood of the town. They are, upon that account, the greateft of all improvements. They encourage the cultivation of the remote, which muft always be the moft extenfive circle of the country. Though they introduce fome rival commodities into the old markets, they open many new markets to its produce. It is even further obferved, that the Romans were fo fenfible of this, that we are told, the firft writer fays, they did not think it beneath the dignity of the commonwealth to attend to the conveniencies from good roads. That great and wife people, it is faid, carried on, at an immenfe expence, roads, whofe remains are to this day the admiration of the curious, from the centre of the empire to many of the remoter provinces. The readier march of their armies was, perhaps, he thinks, their firft motive; but the eafier intercourfe of the feveral parts of the great empire was another, which they had too much prudence and too much wifdom to overlook. We are alfo told by Diodorus, Strabo, and other hiftorians, he fays, that the famous Semiramis, being fo fully convinced of the importance of an eafy and general intercourfe, applied herfelf to render the roads practicable throughout the whole extent of her empire.

Mr. Donaldfon alfo ftates, that, in an agricultural view, the benefits derived from good roads are incalculable. Before the eftablifhment of turnpike roads in England, many parts of that kingdom, like the highlands of Scotland, were fcarcely acceffible. Coal, manure, grain, &c. as is ftill the cafe in many parts of Cornwall, were carried on horfes' backs. Where waggons were ufed, feven or eight horfes were neceffary to draw about two tons, and feldom were able to proceed above twenty miles in a day. Now, where turnpikes are eftablifhed, or other means ufed for keeping the roads in a proper ftate of repair, the fame number of horfes will draw at leaft five tons, and travel nearly double the diftance, with much more eafe. How abfurd, then, continues he, for any perfon to fcruple the payment of an inconfiderable toll, when the faving is fo great and fo evident; where the tear and wear in one cafe are not one-twentieth part of what they are in the other!

It is likewife contended by Mr. Beatfon, in refpect to the turnpike laws in this country, that they are liable to many exceptions; for although immenfe fums of money are annually levied for the purpofe of making and repairing the highways, yet, either from bad management, from party influence, or from the chicanery and ignorance of furveyors and contractors, the roads in many places are not only laid out in the moft abfurd direction, but are fo badly conftructed, and kept in fo wretched a ftate of repair, that they are almoft impaffable. It is furprifing that in fo enlightened a country, and where the turnpike laws have fo much engaged the attention of many very ingenious men, thofe laws fhould ftill remain fo very defective; more efpecially as there is hardly a country gentleman who attends a turnpike meeting, but confiders himfelf completely mafter of the whole bufinefs and management, as well as of the making of roads; at leaft, if we may judge from the violent difputations and bickerings that frequently happen at thefe meetings, where a propofed new line of road, or perhaps the repair of an old one, will fometimes be contefted with as great keennefs and vehemence, as if the parties were contending whether Great Britain fhall be a monarchy or a republic. And it is contended, that it too often happens party influence rules the proceedings at fuch meetings, and that thofe who are entrufted with the management of this bufinefs, delegate their powers, and truft the infpection and whole management and direction of the roads to fome ignorant or pretended furveyor; who, almoft to a certainty, will impofe upon them, efpecially if he is empowered to fettle with contractors; and thus the bufinefs of the public, in one of its moft important concerns, is either altogether neglected, or terminated according to the convenience of the ftrongeft party, without any regard to the interefts of the community at large. In fupport of this affertion, he has only to refer to many parts of the principal thoroughfares in Britain. In fome, it will be obferved, the roads are directed in the moft irregular zigzag manner, through a level part of the country, where they ought evidently to have gone ftraight forward. In other places, the traveller and the public, and the poor overloaded horfe, are obliged to fubmit to all the inconvenience, the labour, and the fatigue of afcending and defcending the fteepeft hills, when they might have gone, with the greateft eafe and comfort, on a level road, by proper attention in the firft making and laying them out. He is, however, far from thinking it would either be juft or proper to force a road unneceffarily through any part of a gentleman's property without his confent, unlefs for very powerful reafons indeed.

If to avoid a deep afcent, or to fhorten the diftance confiderably, and that there is no other way to do fo, in that cafe there fhould be no hefitation; but if the advantages to the public are not very material, and that another line can be adopted, nearly as good, which will do lefs injury to an individual, the latter line fhould unqueftionably be preferred in all fuch cafes of laying out roads.

It fhould be a general maxim, he thinks, that private confiderations ought, in all cafes, to give way to public convenience and advantage. Society, fays he, is formed for the mutual and general benefit of the whole, and it would be a very unjuft meafure to incommode the whole, merely for the convenience, or perhaps to gratify the whim or caprice of an individual. However, the property of an individual ought by no means to be taken to ferve the

public,

public, without allowing him, not only the full value, but more than the value proportioned to the inconvenience or injury he may ſuſtain by the meaſure.

But he contends, farther, that while the preſent turnpike laws remain in force, and the common mode is practiſed of chooſing ſurveyors annually, or by rotation, without the ſmalleſt regard to abilities or experience, it cannot be expected the public convenience will be ſo much attended to as it ought to be; neither is it to be expected, that the generality of ſurveyors, ſo choſen, can know the proper directions to give in making or repairing roads, nor the proper manner of making eſtimates, ſo as either to conclude an agreement with an artful contractor, or to form a correct judgment of ſuch propoſals as may be made. From theſe diſadvantages, it is inconceivable the loſs that may be occaſioned, or the miſchief that may be done by an ignorant and inexperienced ſurveyor. For he is decidedly of opinion that a ſurveyor of roads ſhould be a man of conſiderable abilities, and of the ſtricteſt honour and integrity. A man not apt to be ſwayed by party influence, or by private or perſonal conſiderations; for if he once allows himſelf to be led away or biaſſed by thoſe, or to act in any manner inconſiſtent with the public intereſts, he is unfit for that office. He ought not to be a man, who has all his life-time been confined to the narrow limits of a ſingle diſtrict or county, or who has ſuddenly, or by a ſlender recommendation, been brought forward as a perſon qualified for ſo arduous an undertaking. He ought to have ſeen, in various places, the different ſyſtems adopted in the management and conſtruction of roads, and to have made it a particular object of his attention, the judging of the beſt and moſt advantageous practices, under the particular circumſtances of different caſes. And beſides theſe, there is another probable reaſon why, under the preſent ſyſtem, the public roads cannot be ſo impartially managed and conducted as they ought to be, in the unlimited power given to country gentlemen over the roads in the county or diſtrict in which they live. Many of thoſe gentlemen, for their benevolence and liberality, are truly deſerving of every praiſe that can be beſtowed upon them; but, however honourable and reſpectable they may be, and however deſirous to promote the public good, it would be doing an injuſtice to human nature to ſuppoſe they can view, with impartial eyes, the fine plantations, the beautiful incloſures, and other improvements, they have made on their eſtates. We may as well imagine, that a doting mother can coolly and deliberately ſee an inciſion made in the ſkin of her darling child, however much it may be benefited by the operation, as that a country gentleman can with indifference behold a turnpike road carried through an incloſure, which he himſelf has been at the pains and the expence of adorning. He adds, that ſo ſituated, it is natural to believe this gentleman would wiſh that road to go in any other direction, even though it ſhould not be quite ſo convenient to the public. He will not only uſe his own perſuaſion and endeavours to point out arguments againſt its coming that way, but he will even endeavour to prevail on his friends to exert themſelves alſo, and thus a party is often formed in oppoſition to the public intereſt; and if he is a man of opulence and power, and generally reſpected, it is more than probable his influence will prevail in this buſineſs.

It conſequently appears to him neceſſary, in order to obviate theſe abuſes and inconveniencies, that there ſhould be a controlling power over the meaſures propoſed by country gentlemen reſpecting turnpike roads: for to allow thoſe gentlemen to decide ultimately on the laying out a new road through their own lands, or even on the diſtribution of the money to be expended in repairing old roads, is, in fact, making them judges in their own cauſe. In ſhort, it is an object ſo truly important to the intereſts of the community at large, and of the kingdom in general, to procure the moſt eaſy, ſafe, and expeditious, and the leaſt expenſive intercourſe with every part, by means of the beſt roads, that it is a meaſure, he preſumes, highly deſerving the attention of the legiſlature; and which, from the great extent of buſineſs, would probably require a board, with proper ſurveyors appointed by it, for the purpoſe. If ſome plan of this nature were adopted, we ſhould then hear no more of thoſe numerous complaints that are ſo often made reſpecting the abuſes committed in the management of turnpike roads, and of the money levied at the toll-bars, at many of which, it is ſaid, by the author of the "Wealth of Nations," the money levied is more than double of what is neceſſary for executing, in the completeſt manner, the work which is often executed in a very ſlovenly manner, and ſometimes not executed at all.

But in reſpect to the improvement of both the public and private roads, the following hints have been thrown out in the able Agricultural Survey of Shropſhire. In lieu of ſurveyors in each pariſh (who are generally choſen in turn, and conſequently have neither time nor experience ſufficient to act properly, and are generally not inclined to exert themſelves by enforcing the duty, &c.), the writer would propoſe for the magiſtrates to have power to appoint a proper ſurveyor with a ſalary, who ſhould act under their direction, and be amenable to them for his conduct; ſuch ſurveyor to undertake the arrangement of a certain diſtrict (ſay ten miles ſquare), whoſe duty it ſhould be to employ deputies, to call in and ſee the ſtatute duty done under his direction: by this means the forming of the roads, which is the firſt principle, would be done in the moſt approved method, and the ſtatute duty regularly called out. There may be an inſpector, an inhabitant in each pariſh, appointed, and choſen yearly, whoſe intereſt it would be, as well as his duty, to act as a check upon the general ſurveyor and his deputy: this office, being eaſy, might be filled by one of the moſt liberal perſons in the pariſh. He apprehends that an arrangement of this ſort would very ſoon inſure good private roads. And ſomething like the following would, he thinks, procure good turnpike roads alſo; namely, the truſtees of all the turnpike roads throughout England, to be obliged to erect weighing engines at all their gates or bars, at which tolls are received, on or before the 24th day of June next, the expence of ſuch erections to be repaid to them, by their being empowered to add to their preſent reſpective tolls any ſum to be paid by ſuch carriage to be weighed, not exceeding ſo much as has been heretofore paid within one year laſt for the tolls; ſuch ſums to be paid, until all expence of erecting the ſaid engines ſhall be fully repaid. The account of ſuch repayment to be made out and ſettled by the clerks and gate-keepers belonging to the reſpective roads, and to be atteſted upon oath before two juſtices of the peace. And from and after the ſaid 24th day of June next, it may be lawful for all carriages to be drawn with any number of horſes along any turnpike road. But to prevent the injuries done to roads, by the great burdens too frequently drawn along them, it ſhould be enacted, that from and after the ſaid 24th day of June, it ſhould be lawful for all truſtees appointed by any act or acts of parliament, for the repair of any turnpike road, or any five or more of them, and they ſhould be required at a public meeting, to be held

for

for that purpose on or before the 24th day of April next, to order to be erected at all the gates and bars which they have erected, or shall erect, for the receiving of tolls, or upon any part of the road within their respective jurisdictions, and at such a distance from any turnpike, bar, or toll-gate, as they shall think requisite and expedient to order and cause to be erected, a crane, machine, or engine, proper for the weighing of carts, waggons, or carriages conveying any goods or merchandize whatever; and by a writing signed by them, or any five or more of them, to order all and every such carriage or carriages which shall pass loaded through any such gate or bar, to be weighed, together with the loading thereof; and for them, or any five or more of them, or for any person or persons empowered by any five or more of them, to receive and take, over and above the tolls already granted, or hereafter to be granted, the sum of 10*s.* for every hundred weight, 112lbs. to the hundred, which every waggon or cart hereafter described, together with the loading thereof, shall weigh over and above the weights hereafter allowed to them respectively; that is to say, to every waggon or four-wheel carriage, having the fellies or rollers of the wheels of the breadth of sixteen inches, eight tons in summer, and seven in winter: to every waggon or wain, having the axle-trees thereof of such different lengths, that the distance from wheel to wheel of the nearer pair of the said wheels be not more than four feet two inches, to be measured at the ground, and that the distance from wheel to wheel of the other pair thereof be such, that the fore and hind wheels of such waggons and wains shall roll only one single surface or path of sixteen inches wide at the least, on each side of the said waggons or wains, and having the fellies thereof of the breadth of nine inches from side to side at the bottom or sole thereof, six tons ten cwt. in summer, and six tons in winter: to every waggon or four-wheel carriage, having the sole or bottom of the fellies of the wheels of the breadth of nine inches, six tons in summer, and five tons ten cwt. in winter: to every cart, having the fellies of the same dimensions, three tons in summer, and two tons fifteen cwt. in winter: to every waggon, having the sole or bottom of the fellies of the wheels of the breadth of six inches, four tons five cwt. in summer, and three tons fifteen cwt. in winter: and to every such waggon, so constructed as to roll, and actually rolling a surface of eleven inches by the wheels thereof, five tons ten cwt. in summer, and five tons in winter: to every cart having the fellies of the same dimensions, two tons twelve cwt. in summer, and two tons seven cwt. in winter: to every waggon, having the sole or bottom of the fellies of the wheels of less breadth than six inches, three tons fifteen cwt. in summer, and three tons twelve cwt. in winter: and to every cart, having the fellies of the same dimensions, one ton fifteen cwt. in summer, and one ton to twelve cwt. in winter. And if such trustees as aforesaid shall neglect to erect such engine at their respective gates by the said 24th day of June, then it shall and may be lawful for any mortgagee or mortgagees of the said gate or gates to erect such engine or engines, and to take upon them the same power as the said trustees were by the act invested with, and under the same regulations, on or before the 29th day of September next; and if the said trustees and mortgagees shall neglect to erect such engine or engines by the respective times hereinbefore stipulated for erecting the same, then it shall and may be lawful for all horses, carts, and other carriages, from and after the said 29th day of September next, to go through and pass along such road or roads, without any obstruction or payment for tolls whatsoever, until such trustees or mortgagees shall erect such weighing engine or engines as aforesaid, and occasion the same to be regularly used; any thing contained within the respective acts for turnpike roads to the contrary notwithstanding.

And it is usefully remarked, in respect to the effects of these regulations, that, first, the weighing engines will sufficiently prevent carriages of all sorts being overloaded, which will be a preservation of the road, whereas, the restraint upon the number of horses does not answer the purpose; for a short and overpowered team does more damage to the roads, than a greater number of horses, which draw easy, and consequently pass along much quicker. That disagreeable restraint will be thereby made unnecessary, which empowers and encourages some poor indolent wretches to wander about the country with their ready printed notices, to catch a prey, which, when got, is lavished away in drunkenness, debauchery, and disorder; and if they fail in their lawful attempt, which is often the case, and perhaps distressed to the greatest degree, being despised by persons of all denominations, pursue poaching and fowl-stealing, which lead to greater acts of thievery, of which there are many instances; for all the convictions are grounded upon the poor wretches as above described, being by the law allowed to be credible witnesses, who obtain the reward to the amount of 5*l.* or more, when the team-owner's servant or servants are all deemed prejudiced; so that, as the act now stands, no one is safe from these convictions.

Besides, the occupiers of farms in general, particularly those upon the middling-sized ones, find themselves, it is said, very much oppressed and injured by the law now subsisting for regulating the turnpike roads, by their being restrained from drawing more than four horses in waggons, the fellies of the wheels thereof being under six inches broad. Were farmers permitted to draw any number of horses, it would be of great public utility in lowering the price of those animals, which is now enormously high; the farmer would find it his interest, as formerly, to keep breeding mares, which, with the colts they breed, may be made useful great part of the year, provided they may be worked easy. The law, as it now stands, acts nearly as a prohibition to farmers breeding horses; for a breeding mare, or a colt under five years old, is not fit to draw one of four in a waggon, with no more than sixty bushels of barley or wheat, which is the common load of the Shropshire or Staffordshire farmers, neither of which bring more than two tons, which is considerably under the weight the present act allows to be drawn on the turnpike roads in winter. Before the said turnpike laws were in force, the farmer's team, to draw his sixty bushels of wheat or barley, consisted of six in number, two of which at least were mares, either in foal or sucklers, two colts, one of them two, the other three years old, which were never oppressed or hurt by their work; consequently a succession came on, and the owner had one or two good sound colts to sell off every year to the harness or draft, as they best suited. Good waggon horses were then bought at from 10*l.* to 15*l.* each, which are now, by their scarcity, from 25*l.* to 35*l.*; and those for the coach, that is, the light active half-blood horses, are from 40*l.* to 60*l.*

And another evil occasioned by this law is, that such farmers are obliged to keep horses of the largest size, which consume the produce of much land, by eating a large quantity of corn, when the smaller horses, working easy, seldom eat any. It is conceived by the same writer, that upon this principle, a law for regulating roads may be enacted, so as to answer every good design of the present, and at the ſame time relieve thoſe individuals who are exceedingly injured, and alſo be of general utility.

It is likewiſe remarked in regard to private roads, that they are by no means properly attended to; and which may be attributed to the general highway act being ſo eaſy of evaſion, that every farmer is able to avoid doing ſtatute duty, or at leaſt next to none. Nothing is more valuable than *time*, eſpecially to a man of buſineſs; and a farmer who executes the office of ſurveyor of the highway, *impartially and effectually*, will find he muſt neglect no ſmall part of his own buſineſs; and after all he might, perhaps, have been as little out of pocket had he done the whole work with his own team and labourers. It is ſtated, that there is no trick, evaſion, or idleneſs, that ſhall be deemed too mean to avoid working on the road; ſometimes the worſt horſes are ſent, at others a broken cart, and a boy, or an old man paſt labour, to fill; they are ſometimes ſent an hour or two too late in the morning, or they leave off much ſooner than the proper time, unleſs the ſurveyor watch the whole day. It is true, that redreſs may be had by application to a magiſtrate; but then how often cauſes of complaint occur; and how many days muſt be loſt to bring each home to the offender; who, *from cuſtom*, thinks he is doing no harm; beſides the conſtant breach of good neighbourhood that muſt be occaſioned by theſe petty litigations. It is ſuggeſted that a remedy might eaſily be had in the following manner. Aboliſh all perſonal ſervice upon the highways. Let ſurveyors be appointed, as at preſent, who ſhould have power, under the authority of two magiſtrates, to raiſe, by rate, certain ſums that may be neceſſary for the repair of the roads within the reſpective pariſhes and townſhips, and to account for the ſame at going out of office at the year's end. The farmer, who acts as ſurveyor, might then be able to repair the highways when moſt convenient to himſelf, and when he could give attention to them without any interruption or impediment, whereas at preſent ſome duty is given up, or nearly ſo, from the difficulties ariſing in collecting it. On the ſame principles, the author of the Preſent State of Huſbandry in Great Britain contends, that an act of parliament ſhould be introduced, for the purpoſe of reſcinding the ancient laws reſpecting ſtatute labour; which have in every inſtance been found ineffectual, and to eſtabliſh other general rules and regulations more likely to anſwer the purpoſe in the new improved ſtate of the country. He adds, that the exiſting acts of parliament reſpecting the making and repairing roads, where the juſtices of the peace cannot commute the ſtatute labour, are not ſufficient for the purpoſe of raiſing a fund ſufficient for keeping the roads in repair. Where the juſtices of peace have it in their power to aſſeſs the inhabitants in a ſum of money in lieu of the ſtatute labour, it is in general not the want of means, but the miſapplication of that means, or negligence in the general management, that is the cauſe why the pariſh roads are almoſt every where a diſgrace to the country. The imperfect and indifferent modes of executing the ſtatute work, as ſtated above, render it neceſſary, it is ſuppoſed, that thoſe ſtatutes enforcing the performance of this neceſſary duty ſhould therefore be aboliſhed; and in every county the juſtices of the peace ought to be inveſted with the power to aſſeſs the inhabitants of the diſtrict by ſome equitable *ratio*, whereby they would pay only in proportion to the benefit they received. Were this generally done, as is the caſe in ſeveral parts of Scotland, the counties divided into diſtricts of ſuch ſize, that the proprietors could conveniently meet as occaſion required; the money ariſing from the commutation act collected by one perſon, who ſhould be allowed a certain *per centage* on the ſum collected, be continued during good behaviour, and be reſponſible for his conduct to the gentlemen of the diſtrict; the money ſo collected be afterwards expended under the direction of theſe gentlemen, and the whole be ſubject to the review of the quarter-ſeſſions; the pariſh roads would, it is ſuppoſed, ſoon be materially improved. If to theſe regulations a power were added to mortgage the ſum ariſing from the commutation of the ſtatute labour for ſuch a number of years, and to ſuch an extent, as was found neceſſary to put the uſeful private roads in a perfect ſtate of repair, they might, it is ſuppoſed, in a few years, be made the reverſe of what they are at preſent. The laſt meaſure would be found the moſt effectual of any that could be adopted, and is probably the only one that can be reſorted to for the purpoſe of effecting an immediate and general improvement.

It has likewiſe been remarked by the author of the "Landed Property of England," in reſpect to the improvement of farm-lands by theſe means, that the art of planning, forming, and repairing roads, is a ſubject with which, for various reaſons, every manager of a large eſtate ought to be familiarly converſant. It is not enough for him to know the theory, or general principles, of the art. It is neceſſary that he ſhould ſtudy it practically in the particular diſtrict in which he is placed; and with the given materials that it happens to afford; as by theſe means he can only be capable of executing the buſineſs with the greateſt poſſible advantage. In this buſineſs a moſt material point, whether in the *laying* out of *new* roads, or *improving* ſuch as have been long eſtabliſhed, is that of giving them all the advantage in direction and other circumſtances that the peculiarity of their nature and ſituation admit of. It has been ſtated by the above writer, that moſt of all the old roads of the kingdom (the remains of the Roman ways excepted) owe their preſent lines to fortuitous circumſtances. Many of them were, no doubt, he thinks, originally foot-paths; ſome of them, perhaps, the tracks of the aboriginal inhabitants, the patriarchal ſavages, who lived by hunting; or of the paſtoral tribes, who travelled with their flocks and herds from paſture to paſture, as herbage and browze invited; or of the firſt ſettlers, between biding places which may not now exiſt. And that theſe incidental foot-tracks, eſpecially when they led through woods, became, as the condition of ſociety advanced, the moſt convenient horſe-paths; as we not unfrequently find at the preſent day. Conſequently, that in this ſtate of ſociety, before wheel-carriages were in uſe, many of the lands of the kingdom were appropriated, by which circumſtance thoſe fortuitous lines of roads became fixed and unalterable; there being no other legal lines left for carriage roads, than thoſe incidental horſe-ways, or ſmall tracks. He ſuppoſes, that in this account of the probable origin of roads, we have, at leaſt in part, the cauſe of the crookedneſs, as well as the ſteepneſs, of carriage roads, between the places which are now inhabited: for true it is, that the traveller is not unfrequently led down one ſteep to make an angle, and aſcend another; while the hang of the hill would conduct him nearly on a level, and by a more direct line. But, admitting that a cluſter of habitations heretofore ſtood at the angle, the ſeeming abſurdity ceaſes. He adds, that formerly, it is probable, the zigzag direction of roads, between towns and villages, was much more obſervable than at preſent. In more modern times, and ſince the legiſlature wiſely interfered with reſpect to appropriated lands, many improvements of lines have been made. And, by the general laws which have more recently been paſſed, magiſtrates are inveſted with authority to alter eſtabliſhed lines. So that now, the expence of alteration may be ſaid to be the only obſtacle, in ordinary caſes, to the perfection of the lines of roads in this country. And which is, of courſe, a circumſtance that has had much effect in improving the convenience of travelling.

And it is ſuggeſted, in reſpect to the direction of roads, that the moſt perfect line is that which is ſtraight and level. But this is to be drawn in a country only which is perfectly flat, and where no obſtructions lie in the way :—joint circumſtances that rarely happen. Where the face of the country, between two points or places to be connected by a road, is nearly but not quite level, by reaſon of gentle ſwells that riſe between them, a ſtraight line may be perfect ;—may be the moſt eligible under theſe circumſtances. But where the intervening country is broken into hill and dale, or if one ridge of hill only intervenes, a ſtraight line of carriage road is ſeldom compatible with perfection. And that in this caſe, which is nearly general, the beſt ſkill of the ſurveyor lies in tracing the midway between the ſtraight and the level line. Here the level line of perfection, for agricultural purpoſes, is to be calculated, by the *time* and *exertion* jointly conſidered, which are required to convey a given burden with a given power of draft from ſtation to ſtation. On great public roads, where *expedition* is a principal object, time alone may be taken as a good criterion. It is likewiſe added, that the moſt regular method of finding out the true line of road, between two ſtations, where a blank is given,—where there is no other obſtruction than what the ſurface of the ground to be got over preſents,—is to aſcertain and mark, at proper diſtances, the *ſtraight line ;* which is the only certain guide to the ſurveyor. And that where the ſtraight line is found to be ineligible, each mark becomes a rallying point, in ſearching on either ſide of it for a better. If two lines of equal facility, and nearly of equal diſtance from the ſtraight lines, preſent themſelves, accurate meaſurements are to determine the choice. If one of the two beſt lines, which the intervening country affords, is found to be eaſier, the other ſhorter, the aſcent and the diſtance are to be jointly conſidered, the exertion and the time required are likewiſe to be duly weighed. Further, alſo, the nature of the ground, the ſource of materials and, generally, the comparative *expence* of forming the road by two doubtful lines, as well as their comparative *expoſure*, are to be taken into conſideration. A long line of road, acroſs a broken country, ſhould not be haſtily drawn or determined upon by the directors of this ſort of buſineſs.

But in regard to the moſt difficult and troubleſome part of this ſort of work,—the neceſſary management in the aſcent of hills,—it is obſerved that, whether in laying out a freſh line, or in altering an eſtabliſhed one, modern road ſurveyors, like many other reformers, have run from one extreme to another. To do away the abſurdity of going up one ſteep and down another, to aſcend a third in order to reach the required elevation (a common occurrence on fortuitous roads), they have ingeniouſly, but very injudiciouſly, given an uniform riſe from the bottom to the top of the aſcent. In the theory of mechanics, and where mechanic powers only were to be uſed, a regularly inclining plane would be perfectly proper, in a caſe of this kind. Where the requiſite power is to be applied by rational beings, the ſame principle, though not altogether perfect, may be allowed ; but when the moving power is neither purely mechanical, nor in a ſufficient degree rational, but an irregular compound of theſe two qualities, the nature and habits of this power require, he thinks, to be conſulted. It is, he conceives, one of many inſtances, which ſhew the impropriety of applying purely mechanical principles, in agriculture and rural concerns, in which they are to be combined, not only with the power but the will of the animals. No man who has been accuſtomed to drive a road team, or in the habit of ſeeing one driven in a hilly country, and who properly regards what he ſees, would lay out a long line of aſcent without one or more breaks, or convenient reſting-places ; in which the animals of draft may relax at their eaſe, and ſet off again without difficulty. He, however, obſerves, theory will readily ſuggeſt that, by a dragſtaff, or pall, a carriage may be ſecurely ſtopped on the ſteepeſt aſcent. But practice well knows the danger of checking the efforts of beaſts of draft while they are ſtruggling againſt the collar. For if they poſſeſs any habits, or even the ſeeds of reſtiveneſs, nothing is, he contends, more likely to encourage, or produce it, than ſuffering them to ſtop under the difficulties of draft. Beſides, thoſe which are true to their work, well knowing the extraordinary difficulty to be overcome, in putting a carriage at reſt into motion in ſuch a ſituation, ſtop under a degree of anxiety ; while the more ſpirited and irritable ſtand on the rack, and tremble at the apprehenſion of the painful effort they have to make. But let them ſee an end, or a reſpite, of their endeavours, and they will ſtruggle with willingneſs. A reſt, after the difficulty is ſurmounted, comes as a reward for their exertions. But where the natural ſurface of the ground is well ſtudied in any given caſe, there will ſeldom, he ſuppoſes, be much difficulty in aſſigning the places proper for reſts ; ſo as to make the road not only eaſier for carriages of burden, but ſafer and more pleaſant to travellers, as well as more ſightly : beſides being better to be kept in repair, than an uniform deſcent ; by reaſon of the flatter ſtages being checks to the ſurface water, and convenient places to get rid of it, without injury to the face of the road. But where ſuch breaks do not occur, the line of aſcent ſhould be uniform ; or as nearly ſo as the natural ſurface, or immoveable obſtructions of the acclivity to be ſurmounted, will allow in the particular caſe.

Likewiſe in the ſetting out of theſe lines, the common level is to be ſet by an obſervation from the bottom to the top of the aſcent (theſe points having been previouſly determined on, by the given circumſtances of the general line of the road), or from ſtation to ſtation where a clear view cannot be had between the extremities ; and the degree of aſcent, thus aſcertained, is to be marked with a pencil upon the inſtrument that is made uſe of for the purpoſe. And by this mark it is adviſed to trace a rough line along the face of the hill ; in order to determine, with ſufficient truth, reſpecting the proper breaks, or reſting-places, that may be required ; endeavouring to fix upon ſuch natural breaks in the ſlope as are ſituated in, or ſufficiently near, the general line of aſcent. And that when this has been done, to aſcertain, by ſimilar obſervations, the exact angle of elevation, or degree of ſteepneſs of each riſe, or length of aſcent between the breaks, &c. by theſe means procuring an unerring guide, in marking out and forming the baſe or bed of the road ; without the riſk of incurring unneceſſary labour and expence in doing the work twice over to bring it to the truth, or a ſtate of ſuitable exactneſs.

But it is well remarked by Mr. Marſhall, that the beſt ſervices of the road ſurveyor lie in avoiding, not in ſurmounting hills. And that in a long line of road, between places of nearly equal elevation, this may often be done. There are inſtances of the moſt public roads going over the tops of hills, where lines of equal length might be traced along their baſes ; and the difficulty and danger of aſcending and deſcending the ſteeps be avoided by ſuch means.

Very much attention has lately been beſtowed on this department

partment of the road-maker's bufinefs, efpecially in the more northern parts of the kingdom; but much is ftill left to be accomplifhed, efpecially in the weftern diftricts of the fouthern parts of the ifland, where an attachment ftill remains to the original lines or directions.

And it is fuggefted by Mr. Beatfon in the paper above alluded to, that the bufinefs of laying out the lines of roads may, in fact, be reduced to three fimple principles; thofe of fixing upon the *fhorteft*, the *moft level*, and the *cheapeft* directions, for which, though apparently very eafy of execution, from the frequent occurrence of circumftances that render it neceffary to deviate from them, the knowledge and experience of the furveyor are found requifite. The firft requifite from its being a ftraight line, is often neceffary to be departed from in order to avoid the removal of expenfive obftacles, fuch as hills, rocks, water, and moraffes. The fecond is of vaft importance, and fhould invariably be adhered to, if poffible, even though the other two fhould, in a certain degree, be given up; for it is infinitely better to go a confiderable way about to obtain a level road, than to go ftraight forward and be obliged to take an afcent; but it may, in fome cafes, be preferable to afcend a gentle rife, in order to obtain a good hard bottom, and a road eafily made, than to go on a level through a fwamp, or piece of water, which would require a much greater quantity of materials, be much more difficult to keep in repair, and occafion a great deal more expence. It is not the moft hilly line to appearance that is always to be rejected as being the leaft level; for the fteeper and fhorter fome hills are, it will be the eafier to obtain a level road in that direction, by cutting down the fummits, and laying the materials taken from them in the vallies or hollow parts, which, in many inftances, may be done with great facility. And the third, or the leaft expenfive line, is alfo frequently given up, in order to obtain one or both of the other two. It is therefore concluded, that much depends on the fkill and ability of the furveyor, who, before he finally determines on a line of road, ought to make himfelf perfectly mafter of every part of the intermediate and adjacent country; nor fhould he rafhly determine at once, but fhould examine repeatedly, over and over again, whether no other line would be better than that he firft thought of.

And with refpect to the parts or divifions of which a public road fhould confift, it is obvious that they fhould vary in fome meafure, according to the nature of the traffic or bufinefs which is carried on upon them, the fituation in which they are placed, and the particular circumftances of the different cafes. It is, however, contended by the author of the "Landed Property of England," that the plan and formation of all *public* roads fhould be the fame; every public lane, or other fcite of a public road, he conceives, ought, where the width and other circumftances will permit, to be divided into three travellable lines, namely: 1. A middle road of hard materials, for carriages and horfes, in winter and wet feafons: 2. A foft road, formed with the natural materials of the fcite, to be ufed in dry weather, to fave the unneceffary wear of the hard road, and to favour the feet of travelling animals; as well as for the fafety, eafe, and pleafantnefs of travelling in the fummer feafon: and 3. A commodious path, for the ufe of foot paffengers, at all feafons. But in thefe cafes, he thinks, modern practice has fimplified too much. Inftead of thefe three requifites of a public road, we generally find a parliamentary or turnpike road (away from the environs of great towns), confifting, fimply, of one uniform broadway of hard materials; upon which horfes ftumble, and carriages jolt, the year round: while travellers on foot are feen wading to their ankles in mud, or in duft, according to the ftate of the wind and weather. His notion of what the nature of a public road ought to be, is, that within the fences of a lane or road there fhould be a raifed foot-path, a convex hard road, a foft fummer road, and channels to carry off the water collected by the carriage roads; the foot-path being cut acrofs, in proper places, to permit the water, which falls on that fide of the middle road, to pafs off freely into the ditch at that fide, as well as to prevent horfemen from riding along the path; the oppofite hedge-bank being perforated, to let off, into the other drain on the contrary fide, the waters which may collect on that fide of the lane or road.

And in regard to *private* roads it is contended, that where they are much ufed, as in fuch as lead from a village or other place to a public road, they fhould have a double carriage path, fo that carriages may any where pafs each other. But that for fuch as lead merely to a farm-houfe or a hamlet, a fingle line fufficiently wide to let a fingle or faddle horfe pafs a carriage with occafional dilations for carriages to pafs in, are only in general requifite.

Form of Roads.—Further, in regard to the moft appropriate form of roads, there has been a great difference of opinion among the perfons engaged in this fort of work, fome contending in favour of the *convex* form, while others are inclined to think the *concave* fhape preferrable in many cafes; and ftill others, that they fhould be either made perfectly flat from one fide to the other, with inclined planes longitudinally, or be *wholly flat* in every direction. But experience fully fhews, that fome degree of the convex form is neceffary in almoft every cafe, in order that the wetnefs and moifture may be difcharged with greater facility, and of courfe the roads be preferved in a more dry ftate. And in fpeaking of this form of road, Mr. Beatfon obferves, that the rife in the middle is more or lefs according to the fancy or whim of the makers, but in general it is a great deal too much. This form is adopted on the idea, that whatever wet falls upon the road will run off towards the fides into drains made there for the purpofe of receiving it. If the roads were a perfect fmooth hard furface, this theory would, no doubt, he thinks, hold good; but in practice it is found not to be the cafe, for the wheels of carriages occafion fo many ruts, and fuch a roughnefs on the furface of the roads in general, that little or no water can run towards the fide-drains, however convex the road may be. It confequently lodges in thofe ruts, and every fucceeding carriage, he thinks, the more eafily makes them deeper, and works the water and materials together in fuch a manner, as very foon to render the road extremely difagreeable. This frequently happens, he afferts, even on roads that have been made moft incommodioufly convex, for the very purpofe of keeping them dry; confequently, the convexity of a road has not the defired effect of preventing water lodging upon the furface. Befides, it is, he conceives, extremely inconvenient for all wheel carriages, and deftructive to the road itfelf, by making the loading reft unequally upon the wheels, unlefs when going on the very middle of the road, for the loweft wheel will always bear the greateft part of the burden, and therefore will injure the road the more in proportion. If a cart or any carriage with two wheels is loaded, we will fuppofe, with two tons weight; when that cart is upon a level from fide to fide, the load is equally divided, and each wheel fuftains the weight of one ton; but if that cart is going on the fide of a convex road, there will perhaps be the weight of a ton and a half upon one wheel, and only half a ton upon the other, confequently the lower wheel, in this cafe, will do the road as much injury, as if the cart were loaded with

with three tons upon a level, inftead of two upon fuch a declivity. The proportion of weight upon each wheel, according to the declivity, will depend on the nature of the loading of the cart, for the higher the centre of gravity of the load is, the greater will that weight be on the lower wheel on the fame declivity; and therefore a cart loaded with hay, ftraw, or wool, or any other bulky commodity, will be more injurious to a convex road, unlefs when on the middle of it, than the fame cart loaded with the fame weight of ftone, lead, or iron, or any other weighty commodity which lies low in a cart: and nothing can be more injurious on fuch roads, than a ftage-coach loaded with outfide paffengers. But the deftructive confequences of allowing carriages to heel much on any fort of road are even vifible, though in a fmall degree, he fuppofes, from the effect produced by a wheel going over a ftone, or any hard fubftance lying in one of the tracks or ruts, in which cafe there will foon be a deep hole formed by the wheel in the other track, directly oppofite to that ftone or fubftance which raifed the other wheel. Every precaution ought, therefore, to be ufed to prevent carriages heeling to one fide on any part of a road. And he fuggefts, that the inconvenience, and in many cafes the danger, of going on either fide of a convex road, makes all waggoners, carters, coachmen, &c. keep always on the middle, by which, on fuch roads, there is feldom any other part ufed by wheel carriages, however wide the road may be; confequently, by the carriages being always confined to the fame track, that part of the road foon gets out of repair, and requires a conftant outlay of money to keep it in proper order or condition for being travelled upon. It is alfo added, that the method of forming and making the convex roads, in the firft inftance, appears to him very abfurd. He fuppofes, that before any hard materials are laid on, the road is generally formed in fomewhat a hollow manner, rounded below, in which there are drains, or ditches, on each fide: alfo the footways or horfe roads when made high enough. Thefe are alfo fometimes called the fummer roads, on account, he fuppofes, of that being the only feafon they can in general be travelled upon. The road forms a convex line, about ten or twelve inches lower at the fides of it than the footway and fummer road. After being thus formed and prepared, the hard materials, moftly confifting of broken ftones, are laid on, which, it is fuppofed, will fill up that fpace which is the hollow in a convex line, and when finifhed, the whole furface, from one fide to the other, forms one convexity; the footways or horfe roads being made a continuation of the fame curve. And this is ftill with the idea, that all the water that falls on the road will run into the drains on each fide. But let any perfon, in wet weather, take a view of a road thus formed, and he will find, that, in general, however great the convexity may be, the water will ftand in every rut and every impreffion made upon it, efpecially if the road has been long travelled upon; that the ftones on the furface are pulverized by heavy wheel carriages, and the wet earth from below worked up among them. Alfo where the road is but newly made or repaired, and the materials are fufficiently porous to let through the water, it will then lodge on the convex furface, in every impreffion of a ftone or other uneven part, particularly at the fides, where it is dammed again by the footways, and thus the bed or foundation of the road is kept conftantly moift, and of courfe it will very foon go out of repair. By this continual moifture the ftones fink down into the foft earth, of which the bed of the road is compofed, and this earth works up through the harder materials, and occafions all that dirtinefs generally on the furface of roads in wet weather, although, perhaps, ten or twelve inches in thicknefs of thofe hard materials had been at firft laid over it. Sometimes, indeed, there are under-drains made through the footway, from the fide parts, at every ten or fifteen yards diftance, to convey the water into the ditches; but even this is not found to anfwer the purpofe intended, for the intermediate fpaces foon become fo impervious, that the water does not pafs through them to enter thefe drains, the wet earth being converted into a fort of puddle, refembling what is ufed, in aquatic works, for the purpofe of preventing the moifture from penetrating through, and confequently it lodges in all the ruts and hollows on the furface, without paffing off fo quickly as fhould always be the cafe in fuch inftances.

Befides this there is another manner of forming thefe convex roads advifed in the Bedfordfhire Agricultural Report, in which it is propofed to leave a hollow or vacuum, as it is called, in the middle, to depofit the hard materials in. The only difference that appears to be between this and the method defcribed above, is, that inftead of the bottom of this hollow being made convex, it is made flat, and alfo deeper. It is thought that this method is liable to the fame objection as the former, perhaps even in a ftronger degree; befides, it would require a much greater thicknefs of hard materials, which are very expenfive, and thofe materials would be deepeft or thickeft in the middle of the road, where the wheels of carriages hardly ever go, confequently that part is not fo liable to be cut up as the tracks in which wheels moft generally run, and produce their greateft effects. Mr. Marfhall feems, however, to think more favourably of this form of road, efpecially for wet weather, affuming it as a found pofition, that roads, in general, which are intended to be travelled in wet feafons, fhould be *convex* or *fhelving*, not flat or concave. It remains to determine the proper degree of convexity of the hard line of road; from the margin of which the dry-weather line ought to fhelve gently to the foot of the hedge-bank; fo that carriages may pafs freely, and fafely, from one line to the other; and in order that the rain-water which falls on that fide of the lane may find its way, eafily, into the channel prepared for it, which is, he conceives, for a wet-weather road, to be regulated by a variety of circumftances: as, firft, by the materials of which it is to be formed: foft materials are moft liable to be worn into ruts and hollows, and require to be laid up with a quicker defcent for rain water, than hard materials, which require lefs elevation or rotundity of furface; and leaft of all a firm even pavement. Secondly, that a convex road in the face of a fteep is to be laid up higher, with a given material, than one on more level ground, on which rain-water has no other tendency than to the fides; whereas in the face of a fteep, it it may have an equal or greater tendency along the line of road; and is liable to be caught by the flighteft impreffions of wheels; and thus to wear channels, as may too often be feen, from the top to the bottom of the hill. Even where the furface of the road is perfectly fmooth, it may have twice the diftance to run, before it reach the outer margin, that it has on a level. And thirdly, that the degree of convexity is to be determined, in part, by the width of the road; the materials and defcent being equal. A wide road requires to be formed with greater fideway defcent than a narrower one; which more readily frees itfelf from rain-water, inafmuch as the diftance is fhorter from the crown to the outfkirts of the road in fuch inftances.

But that the freeing of a road from rain-water is not the only object to be kept in view, with regard to its convexity: the eafe and fafety of carriages, and particularly thofe of burden, whofe loads, being of light materials, are laid up high, require to be confulted. A carriage moves moft freely, and with the leaft exertion of draft, when the load lies

lies evenly upon the wheels on either fide. In proportion as the weight is thrown on one fide or the other, the refiftance is increafed; efpecially on the road which is liable to impreffion. Hence the inconvenience of a highly convex road in the face of a fteep; and hence the utility of breaks in long afcents, or fuch roads as are formed in hilly fituations.

In fact, he conceives it evident in refpect to convexity, that every part of a road fhould be equally and duly convex, —fhould be equally fafe and eafy for carriages of every defcription; otherwife it becomes partially worn; the more level parts only are ufed; the fteeper being in a degree ufelefs. Hence a road of even and due convexity is not only eafy and fafe, but may be formed of a narrower width, than one whofe fteep fides are neither eafy nor fafe to be travelled; and whofe crown, only, is in ufe for paffing upon. And on meafuring different paffages of roads which appeared to lie in the moft defirable form, and taking their convexity, or the elevation of the crown or middle of the road above the bafe line, he has found that roads of twenty feet in width rife about ten inches: namely, one inch in every foot, on either fide. And he is of opinion that this refult may be taken as a general guide in forming roads: this middle degree of convexity being liable to be altered according to the width of the road, the nature of the materials, and other circumftances which have been ftated already.

And concerning the fecond or concave form of roads, Mr. Beatfon thinks that it is quite the reverfe of the common form, being loweft in the middle, where other roads are generally made higheft. By differing fo widely from the common practice, and the general opinion of road makers, one would at firft be almoft inclined to fuppofe, that fo fingular a practice in forming roads could only proceed from a defire or propenfity to differ from the reft of mankind: but when we are told that the late celebrated and ingenious Mr. Bakewell was an advocate for this form; that the road by his farm of Difhly, and that through Mefham, in the fame county, are both upon this principle, and in much better order than the roads found about them; likewife that the road through Bredon, made under the direction of Mr. Wilkes, is of the fame form, and is faid to be better now than ever remembered before, and kept in order at much lefs expence:—when we confider thefe well authenticated facts, fupported by fuch refpectable evidence, we naturally conclude that the reafons for adopting this uncommon form of road, are founded on fomething more fubftantial than mere whim and caprice; and confequently deferve to be more fully inveftigated. This writer ftates, that he has not been able to learn the manner of forming thefe kinds of roads before the hard materials are laid on, but, when completed, he underftands the form is fomething fimilar to that of a paved ftreet, with a drain for the water in the middle. The whole width of the road is divided into three equal parts, or nearly fo. The fides are made quite flat. The middle divifion has a gradual but fmall defcent, or concavity, from each fide to the middle part, which is the middle of the road. This concavity has alfo a fmall defcent lengthways, made on purpofe, if not declining naturally, fufficient to carry off the water to proper outlets. In the middle divifion the beft and hardeft materials are laid. The direction of Mr. Wilkes, as ftated in an ingenious paper, in the firft volume of Communications to the Board of Agriculture, is, that when the fall is one foot in 150 or 200 feet forward, the fall from the fides towards the middle ought to be 15 inches in 20 feet. When one foot in 100 to 150, to be 12 inches. One foot in 30 or lefs, to be even the whole breadth. Where the width of a road is 60 feet, one foot of fall to each 40 feet in length of the road. Twenty feet from the fides towards the middle, to have nine inches of fall.

The inner 20 feet to be flat.

And Mr. Bakewell's idea, he is informed, was, that water, where it can conveniently be applied, fhould frequently be let run upon this concave part, in order to wafh it quite clean; for it is always obferved, where a fmall ftream of water comes upon a road, that part, if the bottom is good, is generally firmeft, and hardly ever gives way. To have a command of water, therefore, to flood the road at pleafure, he thought would be of great advantage in keeping it in order. And the other ufeful properties attending a road of this form are the following: There are three parts of it on which wheel carriages may go, without heeling to either fide; on the fide divifions, and alfo on the middle divifion, when the horfes walk in the loweft part. This is certainly a material advantage, being much more eafy for the horfes and lefs injurious to the road. By carriages ufing indifcriminately thefe three tracks, all parts of the road will wear more equally and for a greater length of time; whereas in the convex roads, there being only one part, namely, the middle, on which carriages can go without heeling, that part only is moft generally ufed, and confequently fooneft gets out of repair, which is a great inconvenience in fuch roads.

With refpect to flat roads floping longitudinally, the advocates for them obferve with good reafon, that by being flat or level from fide to fide, the preffure of wheel carriages will be more equal, the friction lefs, and all parts of the road may be travelled on with the fame facility; confequently it will wear more equally, be eafier kept in repair, and require fewer materials for keeping it up. But notwithftanding fuch advantages are deferving of attention, it muft feem to thofe unaccuftomed to fuch a form of road, a difficult matter to keep it fufficiently dry, or free from the ftagnation of water upon it. But from its having been obferved that the ruts made by the wheels of carriages prevent the water running to the fides of convex roads, it is propofed that roads of this form fhould have in every level part gentle flopes, fufficient for water to run along, which, fuppofing them to be one foot in fifty, would hardly be perceptible. On thefe flopes, or inclined planes, the ruts made by the wheels of carriages would promote the water running off, by forming fo many little channels or conductors for it to run into the lower part of thefe flopes, from whence it muft be properly conveyed away. By this plan fuch roads will be much more eafily kept dry than the common roads ufually are or can be from the nature of their conftruction.

And farther, in regard to the wholly flat form of roads, the reafons given for them are nearly the fame as ftated in fupport of the laft, only that as there are few parts of a country fo perfectly level, for any confiderable diftance, that water will not run either one way or another, it is confequently unneceffary to be at the expence and trouble of forming thofe flopes or inclined planes recommended in the preceding form; but that proper outlets fhould always be kept clear at every hollow part, and if the road fhould in any place be quite level, a fhallow crofs drain, that will occafion no impediment to carriages at every 50 or 60 yards diftance, or nearer, will keep the road fufficiently dry.

And it is from thefe ftatements concluded by Mr. Beatfon, that the main objects fought after are, 1. To keep the road always as free from moifture as poffible: and 2. To conftruct it in fuch a manner, as to render the draft or communication eafieft, at the leaft expence. In thefe are

 compre-

comprehended all the requisites necessary to form a complete road. To attain them in the best manner is therefore the important point. Four different methods have been stated, each of which has its supporters. The arguments in favour of each have also been shortly mentioned, which will shew that their main object is the same, unless perhaps the idea of watering the concave road may be considered a deviation from one part of the general rule; but as that is proposed to be done only to wash the road occasionally, in case it becomes dirty or slushy, it cannot therefore be considered in that light in any respect whatever. But from these modes of constructing roads being in some measure unsatisfactory, he is induced to offer a new theory on the subject, which is founded on the knowledge of the stratified nature of the earth. It is however only given as theory, having never, he believes, been subjected to the test of actual practice. It is observed, that every person who has paid the least attention to the structure and formation of the different strata of the earth, must have seen that some of these strata are of so close a texture as to be impenetrable to moisture; others again are so porous, that water will easily run through them in any direction, till it meets with some obstacle, or finds a vent. Of the first sort some are less dense, and of the latter some less porous than others, consequently as they partake more or less of these qualities, the water or moisture will the more or less quickly penetrate through them. But in order to shew this more clearly, and apply the principle to the construction of roads, he supposes the section of a hill or eminence composed of a number of strata. If the upper stratum or surface soil is of a porous nature, it is evident that any water which falls upon it, will penetrate through to the stratum below, where, if it cannot go farther, it will glide along the surface till it finds a vent at the bottom of the hill; if the second stratum is hollow, and continues on towards any depression in it, the water will lodge in that hollow, and form a sort of pool or bog, as is sometimes observed on the tops of hills; but if in this hollow place there is a communication with the porous stratum, no water will lodge there, but it will penetrate through and glide along the upper part of the dense stratum below, till it finds a vent on the side or at the bottom of the hill, as before. And by the above it will also appear, that if the uppermost stratum is of a close texture or clay, any water falling upon it will not only lodge in the large hollow, but in the smaller ones, and in all the other irregularities or concavities that may happen to be upon the surface. Hence, also, it is evident that in order to keep dry the surface of any such piece of ground, it matters not of what shape or form that surface is, or whether it is convex or flat, provided there is a communication with some under stratum, sufficiently porous to carry off the water below; but it is of some consequence the form of the upper part of that stratum upon which the water is to run, for the smoother it is, the water will of course the more easily flow away, and be discharged from it.

It is easy, it is supposed, to apply these principles in the forming of roads in the following way: when a new road is to be formed, let it be done in the first instance nearly in the usual manner, with such materials as are on the spot, and the nearer the quality of these approaches to *clay*, so much the better. Instead, however, of forming it convex, as is generally done, let the lines on either side from the middle be quite straight, and meet in an angle or ridge at that part or the middle of the road, having a slope from thence to each side, of about an inch in a foot. There are to be made small drains for the more easily conducting away the water that may be collected at those places. The road, being thus formed, must be allowed to harden and settle for some time before any other materials are laid on, great care being taken, while in that state, to let no carriages or cattle upon it, and it should be rolled with a long wooden roller, that will reach at once from each of the sides to the middle. This roller should be loaded with a box of stones to make it sufficiently heavy, and that it may be the more portable when that box is taken off; and it may be so contrived, that by changing the horses from one side to the other, there will be no occasion to turn the roller, in order to make it roll the same space over again. Being rolled in this manner, will consolidate the materials composing the ridge of road, and prepare it for receiving those to come afterwards, for it is a most absurd practice to lay hard materials in the common way upon this first form or basis of a road, before it is sufficiently firm to bear them. When thus formed and properly settled, the next step to be taken is to imitate the works of nature in dry soils as nearly as possible, by forming a stratum penetrable by water, composed either of sand or sandy gravel, or any other substance easiest to be got, that is sufficiently porous to admit water to pass through it. This stratum should be laid quite level, and extending from one side of the road to the other, filling up the small drains also on the sides. Over this are to be laid the best materials that can be got for completing the road, consisting either of stones broken very small, or of the best gravel. This coat of hard materials need not exceed above six or seven inches in thickness, which being much less than is commonly used, will be a considerable saving; and it may even still be less, if the directions hereafter given are strictly attended to. If this covering consists of broken stones, they should afterwards be laid over with sand or fine gravel, when easily procured, so as to fill up all the cavities betwixt them. The sand or rubbish from a freestone quarry is excellent for this purpose, providing there is no mixture of earth in it, which should be carefully guarded against in every step taken after the road is first formed. These finishing materials being properly laid on and smoothed with a rake, the whole should now, before any carriages or horses are admitted upon it, be well rolled with a heavy iron roller, divided in three parts for the purpose, the two hind divisions of the roller being large, the front or middle division smaller, to the framing of which the shafts are fixed, and so contrived, that it turns in the manner of the fore-wheels of a waggon; there is a box for holding stones to increase the weight when necessary; but in adding this weight, it must be observed to lay about two-thirds of it over the two large parts, and only one-third over the other, otherwise the pressure will not be equal. Iron rollers are sometimes made in three parts, as above, but being all in a line, and close together, they are apt to be choaked by gravel and small stones, which cannot happen in the construction here recommended. It is contended, that if such a roller were generally used upon roads, especially when newly made, it would save a great deal of expence in repairing them; for it cannot be expected that any new road will immediately bear wheel-carriages, or continue long in repair, when composed entirely of loose materials, without the smallest pains being taken to consolidate them together. Frequent and heavy rolling would therefore produce the most beneficial effects, and would tend very much to keep the road free from deep ruts and holes; besides, there is nothing could contribute more effectually to promote and preserve firmness and solidity, two qualities without which it is impossible any road can, with propriety, be called a good one, or have the necessary degree of solidity and firmness.

The advantages that would result from this mode of construction ftruction would be various: by being level on the furface, every part of it is equally commodious for carriages, confequently it will all be equally travelled upon, and the deep ruts fo frequent in other roads, will almoft entirely be prevented. It will therefore be much eafier kept in repair, and, if properly managed at firft, will be made at lefs expence than the common roads, efpecially in a fandy foil, or where fand or gravel is eafily procured. The draft will be much eafier on fuch a road. And one very important advantage is, by having an under-ftratum through which the water can penetrate, and the cavities among the harder materials being filled with the fame porous fubftance, no water can ever lodge on the furface, nor can it ever become fo dirty as other roads are in wet weather; all the water that falls on the furface, unlefs perhaps in very heavy rains, being conducted away underneath and in every part. And it may be added, that from the fmall drains on each fide of the road, crofs-drains fhould be carried through the fences, provided the level of the ground will admit of it, at the diftance of every ten or fifteen yards. Thefe crofs-drains may be made of wood, with about an inch bore, or of ftone, if preferred.

It would be of great advantage to this fort of road, as well as to every other road where the ground is inclofed on each fide, that the fences fhould be funk towards the fields, and the water be conducted through to thefe funk fences, inftead of the common method of leaving large open ditches and drains on each fide of the road. It muft alfo be particularly attended to, that on all floping roads on a declivity, where the water is apt in heavy rains to run upon the furface, or at the fides, that it ought never to be allowed to run in the fame direction more than ten or fifteen yards, but at that diftance to be conducted away to a fide into the main drains. It will then do little or no harm, as it can never increafe beyond a very weak ftream; but if it is allowed to run one hundred or two hundred yards, it will probably be increafed to fuch a fize before it reaches the bottom, that it will wafh away a great deal of the materials, and may befides very much injure the road or fences on each fide of it, which would be highly difadvantageous in many refpects. Befides, it is fuggefted, that a road formed on this plan need not be quite fo wide as roads in general are made, for the whole furface of it will be in ufe from one fide to the other, and therefore from twenty to twenty-four feet wide is quite fufficient, unlefs near populous towns or extenfive works, where great numbers of carts or waggons are employed. And in the interior parts of the country, twenty feet in width will anfwer every purpofe required. He has obferved in feveral places, where the roads have not been above eighteen or twenty feet wide, and properly made from fide to fide, that they were in much better condition than the neighbouring roads, from thirty to forty or fifty feet wide. On thefe wide roads, formed in the ufual way, there is feldom more than eight or ten feet in the middle of them generally made ufe of; the remainder one on each fide being occupied by heaps of ftones, fcrapings, and other rubbifh, which, although they may partly be of ufe fometimes in repairing the roads, ought on no pretence to be allowed at all times, or at any time, to lie there; fuch rubbifh being not only difgraceful on the fides of a public highway, but even dangerous, particularly in the dark, for either carriages or horfes; befides having various other difadvantages arifing from the growth of weeds, and the diffemination of their feeds.

But in refpect to the moft proper and beft form of the roadway of narrow lanes, as thofe leading from village to village, in reclufe fituations; where bridle roads, or packways, have been fo far opened as to admit carriages; or though the whole width of the lane may not be more than eight or ten feet, it is remarked by the author of the treatife on "Landed Property," that on fuch a narrow fpace, a whole barrel, or convex road, cannot eafily be kept up. If raifed, it prefently wears into a middle track, and two wheel-ruts, with foul drains on either fide of them; and becomes, in wet weather, a dirty trough, which is unfit for either carriages or horfes, and in which a foot paffenger has not where to fet his foot. But that provided fuch a lane be thrown into a fhelving form, refembling half a barrelled or convex road, a greater width of travellable road for carriages and horfes will be obtained; ruts will not be fo liable to be formed; the whole of the water of rains will be thrown on one fide; while the other will afford a comfortable walking path at all feafons. And this, it is added, is now no longer merely a probable, but a tried improvement. Lanes, ten, twelve, or more feet wide, have been ftrikingly improved by it. And it is further fuggefted, that when water, in a wet feafon, is apt to ooze out of the banks on the upper fide of the lane, a narrow channel is to be cut, to prevent its overflowing the road: or, in forming the bed of the road, the inclination may in fome cafes be reverfed; fo as to throw the drain on that fide of the lane from whence the fpring water iffues: thus the fame drain will ferve for the fpring and the rain-waters. And it is added, in regard to this femi-convex form of road, that it is applicable, not only to narrow lanes, but to the fides of hills; where the road, as it generally ought, is conducted fidelong, not directly, up the flope. By this form of the road, the whole of the water which falls upon it will be got rid of, without inconveniency or expence. And the bed of the road, for this purpofe, may be made narrower than for a full convex road; a circumftance which, in fome cafes, may become a faving of much expence. The upper fide of a road in this form being nearly level, and firm to the foot of the fteep, would be chofen by afcending carriages; while the lower fide would acquire a loofenefs of furface, and be ufed by laden carriages going downward; and while a raifed foot-path, on the lower margin, would be a fecure guard, and a relief to the apprehenfions of timorous travellers.

But in relation to the width of public roads where a blank is given, it fhould be regulated, Mr. Marfhall fays, by their publicity, as it is compound folly to make a road wider than its ufe demands. He fuppofes that there are few roads, even near populous towns, that require a greater width than about thirty-three feet. But every public road, under common circumftances, fhould have a line which is travelable at any feafon, and of ample width to permit two carriages to pafs each other with freedom and fafety. This ample width let us fet down as one ftatute pole. In deep clayey diftricts, where hard materials are difficult to be procured, a fingle road, of half a pole in breadth, with dilations at proper diftances, to let carriages pafs each other, may, in many reclufe fituations, be advifable. This regards the breadth of the winter road, for carriages and animals of burden. But that the width of a public *lane* requires a more enlarged view. On the plan offered, it is to contain, not only a wet-weather road, for carriages and horfes; but a fummer road, and driftway; as well as a foot-path, which may be ufed in any feafon. He obferves, that in many parts of the greateft public roads acrofs the kingdom, the lane is not more than twenty feet wide. But this being filled with hard materials, from hedge-bank to hedge-bank, carriages alone feldom find any inconveniency in thefe narrow parts. But where carriages, and large droves of cattle or fheep meet in them, ftoppages are unavoidable, and great inconvenience is of courfe fuftained.

And

And it is thought, that the width of the *driftway* ought, like that of the hard materials, to be guided by the publicity of the given road. In a great public road, it ſhould certainly be wide enough to let two carriages paſs each other, or one pole in width. But in one of leſs publicity, or where the exiſting lane will not admit of that width, a ſingle carriage path may ſuffice; as this being a continuance of the width of the hard road, no difficulty in paſſing can be experienced, it is ſuppoſed, from it.

But the width of the *foot-path* and the ditch may vary from half a pole to ten feet.

It is therefore concluded, that on theſe premiſes, the width of the lane of a great public road, near a populous trading place, ought to be fifty-nine feet and a half; and that of a common market-road, thirty-three feet. And theſe widths, without any previous intention, come out nearly the ſame as thoſe directed by act of parliament, for the lanes of turnpike roads and highways. A great error in the act, however, is, that the lanes of all turnpike roads, ſhall be ſixty feet wide: thus incurring a ſerious waſte of land; and creating great nuiſances; which green lanes ever are to the occupiers of adjoining lands. He from this ſuggeſts, that where exiſting lanes are wider than all the deſired conveniencies require, ſlips ſhould be ſold off their ſides, and be laid to cottages, or to the adjoining incloſures; having receſſes here and there, in which to lodge materials. It has long appeared to his mind an evident poſition, that every part of a public lane ſhould be uſed; and conſequently that no part of it ought to be a nurſery for weeds, or an unprofitable common paſture for ſtarving ſtock. Still he remarks, that a wide lane has its advantages; eſpecially in a low cloſe ſituation. It gives freer admiſſion to the ſun and air than a narrow lane, and the road dries more quickly. And further, that by permitting a more forcible current of wind, the pulverized materials, or dirt of the road is, in dry ſeaſons, carried off in the ſtate of duſt; leaving the uſeful materials undiſturbed. And it is highly proper to place the principal line of road in the midway of the lane, that it may be the moſt effectually expoſed to the agency of the ſun and wind.

Mr. Beatſon even ſuſpects, that, in the whole kingdom, thouſands of acres of fertile lands are loſt to the public, merely by making the roads ſo much wider than there is any neceſſity for. In the vicinity of large towns, they ſhould have an ample width, as 30 or 40 feet; or, in ſome caſes, conſiderably more, as near the metropolis. But the practice of making them 40 or 50 feet wide, as is ſometimes the caſe, through a thinly inhabited part of the country, or near the moſt pitiful villages, where even 20 feet would be ſufficient, is, he contends, a mere waſte of ground for no purpoſe, and occaſions a very great additional expence in making ſuch roads, which certainly might be avoided. Suppoſing the medium neceſſary width of road to be 7 yards, or 21 feet, and that the medium width now made is 11 yards, or 33 feet; this is, upon that ſuppoſition, 4 yards wider than is neceſſary; which, in every mile, is a loſs of 1 acre 1 rood and 2 perches: and ſuppoſing there are 5000 miles of ſuch roads in the whole kingdom, there is a loſs of more than 6300 acres, which, if eſtimated the ſame as the improved value of the waſte lands, at 27*s. per* acre, and at 30 years' purchaſe, would produce 255,150*l.*; a ſum which, if laid out in improving the roads, and making eaſy communications through different parts of the kingdom, would be of the greateſt public advantage. And it is evident, that where they have the width ſtated as neceſſary by the firſt of the above writers, the loſs ſuſtained in this way muſt be ſtill greatly more conſiderable.

Mr. Marſhall thinks, that in the operation of forming roads of the public kind, the firſt buſineſs of the road-ſurveyor is to examine the lane, or other ſcite of the intended road, in every part, to aſcertain whether offenſive waters lodge beneath it, and whether quickſands or land-ſprings break out in a wet ſeaſon, in which this examination is requiſite to be made. If defects of this kind be found, effectual ſubdrains are to be run up to them from the ditches or ſide-drains of the lane, or other ſcite. And that the next operation is to adjuſt the ſurface of the ſcite; to ſtrike off the protuberances, and fill up the hollow parts; and thus, in ordinary caſes, to mould it to the firſt proper form, or according to ſome of the other forms that have been mentioned; the foot-path and the higher ſide of the ſoft road being raiſed with the earth which is required to be taken off the bed of the hard road, whoſe baſe or foundation ought to be formed with peculiar care. Every part is required to be firm and ſound; dry earth or hard materials being rammed into every hollow and yielding part. It is ſuggeſted that the firſt form is adapted to firm binding materials; to ſuch as acquire, by wear, a repellent ſurface, and ſhoot off the waters that fall upon it; not to thoſe which are looſe and incoheſive, yielding to preſſure, abſorbing rain-waters, and conveying them down to the baſe or bed of the road. Theſe require a flat or a convex bed, free from obſtructions on either ſide, ſo that the abſorbed waters may effect their eſcape at the baſe. And that on this firm and level bed the largeſt of the hard materials are to be laid; next, thoſe which are more finely and evenly broken; and, laſtly, a covering of ſtill finer materials: to aſſiſt the roller in giving ſufficient firmneſs to the ſurface, and to render it immediately capable of being travelled upon.

But in regard to the proper materials for conſtructing roads with, Mr. Marſhall thinks that although every diſtrict may be ſaid to have its own material, and often without choice or alternative, yet there may be inſtances in which uſeful materials are overlooked or diſregarded. And that in ſome parts, particularly in Lancaſhire, large paving ſtones are in common uſe; ſome of the more public roads being rough pavements, reſembling the ſtreets of ill-paved towns. But that in the northern, and ſome of the midland provinces, broken quarry ſtones are the ordinary road material; and that, taking the kingdom at large, they are the moſt common material. But in the ſouthern and weſtern counties, flints and other hard field ſtones, gathered off ley grounds, are in common uſe; and in the neighbourhood of the metropolis, and in other parts of the kingdom, ſharp flinty gravel is a favourite and valuable material. In many parts of England, ſmooth, water-worn, pebbly gravel, collected on the ſea-beach, and in river beds, is uſed; and if the pebbles are of a hard texture, and be properly broken, to make them bind, or unite firmly together, a good road may be made of this material. In ſome caſes, ſand and ſilt, or fine ſea-ſand, have been employed with ſucceſs.

It is likewiſe added, that the artificial materials of roads, which he has met with, in quantity, are the droſs and cinders of iron and copper works; and burnt clay, (burnt as bricks in heaps,) which in a clayey diſtrict, deſtitute of other materials, and where fuel is cheap, may be found a valuable ſubſtance for the purpoſe. It is ſuggeſted by Mr. Beatſon, that in a ſandy ſoil the roads may be made on the new conſtruction, he has already recommended, with the greateſt eaſe. In ſuch a ſoil, there will be nothing more to do than to level the ſurface properly, fill up all the hollow parts, roll it well with the long wooden roller, and lay on the materials intended to finiſh it with, in the manner directed,

rected, and then roll it with the heavy roller, as has been advifed above.

But in cafes where the foil confifts entirely of a deep loofe fand, the beft and eafieft way to make a lafting road is, to form it to the width intended for the hard materials, and then to let a channel be dug at leaft 18 inches in depth, and about the fame width; let thefe be again filled, and firmly built up with ftrong turf or clay, or any other folid fubftance that will prevent the materials to be laid on the road from fpreading to either fide; openings being left at every 10 or 15 yards, to let the water that falls on the middle part of the road more eafily through. Where the form of the ground requires making up, a little wall of the fame nature, inftead of digging a channel, may be built on each fide, nearly as high as the furface of the road is intended to be. Thefe will prevent the hard materials laid on from fpreading, which is the principal caufe of roads made in fuch foils giving way in fo fhort a time; and thefe materials will not be fo liable to fink into the fand, if it is properly rolled before they are laid on, as well as at different periods after it is finifhed. And if there be a fence on each fide of the road, and materials can be fpared to cover it from fide to fide, there will be the lefs occafion for the little walls; as thefe are only intended to keep the hard materials within the bounds prefcribed, in cafe it is not judged proper to lay them the whole breadth of the road. Where, however, thofe walls are thought requifite, the fpaces, by being covered with a little gravel or freeftone-fand, will make very good foot-ways or horfe-roads; but in a road finifhed in this way, there will be no occafion for horfe-roads diftinct from the main road, as the whole, if kept in proper order, will, he fuppofes, be fufficiently fmooth and fafe for horfes, or even foot paffengers, to go upon at any time. In fpeaking of the making of roads through a clayey foil, it is remarked that thofe formed in fuch diftricts are in common the moft unpleafant of any, chiefly on account of proper precautions not being taken to prevent the water lodging on the furface; fometimes, perhaps, owing to a want of proper materials, fuch as ftones or gravel: but he has often feen the very worft of clay roads, even where no fuch excufe could be given. And that it feems hardly ever to have occurred to thofe who had the direction of fuch roads, that fand, properly applied, would in a great meafure remedy all the defects complained of; and there are few parts of a country where fand of fome fort, or freeftone-rock, or fandy gravel, may not be obtained by fome means. In certain fituations it may, no doubt, be more expenfive and difficult to procure fuch materials than in others; but thefe are local advantages, which road-makers muft lay their account with. But the exceffive inconvenience of bad roads, the expence occafioned by the tear and wear of wheel-carriages and harnefs, the rifk of diflocating the limbs of horfes, together with many other difadvantages, ought to ftimulate all concerned to exert their utmoft endeavours to make roads good, and eafily paffable, be the difficulties what they may, that ftand in the way of them.

It is hinted, that in fuch places as where no hard materials can be got, if the road were formed nearly in the fame manner as that firft noticed, the evils complained of might probably foon be remedied. The clay fhould be excavated, fo as to form a ridge in the bottom of the excavation. There fhould be fmall openings or drains at every 10 or 15 yards, or at every hollow place, to conduct away the moifture into the main drains. If this excavation is then filled with fand, or any other porous matter eafieft to be got, and finifhed as formerly directed, there is no doubt but the road would foon become as good as could be wifhed for. Something fimilar to this he has known put in practice by a very ingenious gentleman in Chefhire, on whofe eftate, being a ftrong clay foil, the roads were fo exceffively bad as hardly to be paffable. He dug away the furface of the road to the depth of 12 or 14 inches, and having the command of plenty of fand, he filled up the excavation therewith, and covered the whole with gravel; by which means he has now made, fo far as completed in this manner, as pleafant a road as one could wifh to travel on. He is not certain if he left the bottom of the excavation with a ridge in the middle, as here directed; but he is clear this would be an advantage, as well as the outlets at certain diftances, to let away the water.

And in conftructing roads through boggy or moraffy foils, it is advifed, after proper fteps have been taken, to drain off as much of the water as poffible, by deep ditches or drains withinfide the fences, if inclofed, or intended to be inclofed, on each fide. Thefe drains fhould be caft at leaft a twelvemonth before any thing elfe is done towards making the road; for if the place is very boggy, it will be found to fubfide confiderably after the water is drained away; and fome parts will fubfide more than others, in proportion to the depth of the moffy foil, and to the quantity of water lodged there. Thofe parts will, therefore, be the better feen the fecond feafon than the firft. All hollows or irregularities fhould then be filled up and levelled, either by taking from the heights and filling up the hollows, or by fome other proper materials neareft at hand. In either cafe, the furface fods fhould, with a pufh-plough or paring fpade, be carefully pared off the heights to be lowered, and alfo off the hollows to be filled up. Thefe fods fhould be laid afide, till thofe places are brought to their proper level, and fhould then be laid on again. This will make the whole furface of an uniform toughnefs, which would not be the cafe where the fods are not laid on in this way. After this has been done, the breadth of the intended part for receiving the hard materials fhould be marked off; then let that part be covered with fand, or fuch porous fubftance, as before recommended, to the thicknefs of at leaft 10 or 12 inches. Then roll this, and finifh it as already directed; and there is no doubt but a road made in this manner may be as good through a mofs as in any other fituation. This he fpeaks of from experience, having feen the moft pleafant roads made in this manner, through moffes formerly thought impaffable. When the mofs is too foft to admit horfes upon it, the fandy ftratum may be rolled by men, the weight of the roller being regulated by the ftone box, according to their ftrength. Sometimes the rolling is altogether omitted; but it is much better to roll, when practicable. It is added, that there are other methods of making roads through moffes; as by laying a foundation of broom, furze, or heath, and then the hard materials above them. But fand is greatly preferable, where it can eafily be got, and when the track of the road is properly drained, as it always ought to be, before any thing is laid upon it with a view of making a road. Thefe principles and directions are, it is faid, equally applicable on all other forts of foil, with trifling variations, according to the peculiar circumftances of the cafes.

And it is fuppofed, that in the above cafes the roads were formed where the fcite or track was nearly level from one fide to the other; but there are other fituations, fuch as when cut or formed on the fides of hills, where fome other precautions become neceffary to be attended to. In thefe cafes it is obferved, that in making them it frequently happens that the excavation affords a fufficient quantity of materials for the purpofe; and the part cut out

of

of the solid very rarely requires any covering laid upon it. This, however, depends on the nature of the soil. If the whole breadth of the road is formed from the solid, and that is sufficiently hard, no extraneous materials will be necessary; but if the soil is a compound of clay, or of a soft nature, the above rules and regulations must be had recourse to. And that where the parts are made up from the excavation, they ought to be formed considerably higher at first than the other parts, as they will naturally subside for some time afterwards, and the hard materials should not be laid on till they have sufficient time for that purpose, which may be greatly expedited by rolling; and it should be observed, that it is much better to be obliged to lower those parts to their proper level before the materials are laid on, than to be under the necessity of making up any of them at the time. And further, that where the hill is of a considerable height above the road, a good deal of water will sometimes come down. In this case it is in general better to intercept that water at some little distance from the side of the road, than to allow it to run down the face of the bank. If allowed to run down this face, it will very soon moulder it away, especially in frosty weather, and will always choak up any drain that may be made, whether covered or open; for if covered, the earth that moulders down will in a short time become so close, that water will not get through it to the drain before it runs off upon the road; and if open, it would be extremely difficult and troublesome to keep it clear. In this case, by intercepting it about four or six feet from the brink, and conducting it away to the most convenient outlet, it would be much easier to keep the road dry. If the face of the bank be irregular, the water may still be conducted away, by making the drain recede from the brink at such places, and keeping the course always at a proper level, or it might, he supposes, be let off at every hollow place by small recesses faced up with stone, or by wooden spouts sunk upright in the bank at every such hollow; to conduct the water from the upper drain to a cross covered drain below the road, by which it may be carried away at the lower side, without any injury being done to the road. And it is advised, that in the forming and making of these, as well as all other roads, the preventing of any water running on them, except what falls from the clouds, should carefully be attended to. Where this cannot easily be done, and where it is necessary to allow a stream to run along the side of a road, the drains or ditches which, as before observed, should be withinside the fences, should be made of a proper size accordingly, as the small drains filled with sand or gravel, as already recommended, are only meant for such roads as can have no extra water coming upon them in this way.

But in respect to *private* roads, the nature and manner of laying them out has been already noticed. And in respect to the method of forming them, Mr. Marshall says, it is the same where strong cohesive binding materials are made use of, whether in a lane, or across open ground. The mode he advises is to form a receptacle for such hard materials, twelve or more inches deep; either by digging to this depth beneath the natural surface, and carrying off the excavated soil; or to half the depth, disposing of the soil raised in the operation on each side of the receptacle; so as to elevate the general surface of the road above that of the adjacent ground. And in this receptacle deposit the materials; leaving the surface either in a convex or a semi-convex form, as the turn of the surface of the ground to be travelled over may direct: the margin or margins of the road, at which the rain-water is to be collected, being left a few inches beneath the adjoining sward. But that in forming roads of every description with sand, loose gravel, or other incohesive absorbent materials, which imbibe the rain-waters that fall on them, a receptacle of that kind is altogether improper. Such materials ought to be laid on a level or an elevated surface; and a shallow drain to be open on either side, for the absorbent waters to filter into; thus preventing a surcharge, and freeing the surface entirely from collected moisture, which would be highly injurious to it. And it is here added, that the surface of a road which is formed of well-broken stones, binding gravel, or other firmly cohesive materials, and which is much used, presently becomes repellent of the water which falls upon it; no matter as to the basis on which they are deposited; provided it is sound and firm enough to support them. And that where the situation is low and the land of a moist retentive nature, a deep drain on one or on each side may be proper to give due firmness and stability to the base. Such drain, however, is not to be sunk close along the margin of the hard materials, to deter horsemen and carriage-drivers from coming near it, but a few feet distant from it; so that every inch of the hard road may be used with equal pleasure and safety, and a commodious driving and walking path be formed between the road and the drain; proper channels being cut across it, in order that it may be kept properly dry. And further that in a dry situation, as across a gravelly or stony height, little more is frequently required than to remove the surface mould, and lay bare the rock or the bed of gravel beneath it; and then to give the indurate base a round or a shelving form, as the lying of the ground may require. In this way a travellable road may be made, and kept up at one-tenth of the expence incurred by the ordinary practice in this case; which is to gather up the surface soil into a ridge, and on this soft spongy bed to lay coat after coat of some hard materials, fetched perhaps from a distance! at much expence for the purpose.

But in addition to the above sorts of roads there are still others, which require some art to form and keep them up in particular situations; these have the denomination of carriage and horse-tracks, and are described under these different heads.

Methods of Repairing Roads.—It is noticed by the author of the "Landed Property of England," that this is a business that incurs a heavy expence on landed property, and of course requires the peculiar attention of the proprietors and managers of land. And in the paper mentioned above it is observed, that where the funds of the parish will admit, which would generally be a saving, that proper persons should be appointed in them, or have the charge of a certain extent of road to see where any part is giving way or getting out of order, and to direct their immediate repairs. Also to take care that no water stands in the hollows or ruts upon them. And, that the summer season is the best not only for making, but for repairing roads, nor ought they on any account to be touched in winter, unless to give a temporary aid to some sudden breach that is perhaps almost impassable, or to let off any standing water. Yet nothing is more common than to see a number of labourers employed on the highways in winter, when the days are short, and but a few hours labour can be obtained of them. Indeed so little attention is there often paid to repairing the highways, that sometimes old infirm people are employed for the purpose, as if repairing roads were a sort of trifling bye job, merely for the employment of paupers, or lame, miserable objects, who can get no other means of subsistence. And Mr.

Marſhall thinks, that in this ſort of work, the beſt ſervice of the ſurveyor is to keep their ſurfaces ſmooth and even; ſo that rain-water may find a free and ready paſſage to its proper drain. Ruts and hollow parts are to be filled up, level, or even with the general ſurface, as often as they are formed, and perfectly free from water. This attention is more eſpecially requiſite to a new made road, whoſe bed and foundation are not yet fully confirmed. But in every caſe, and at all times, a ſolicitous regard is due to this moſt important, yet moſt neglected part of road ſurveying. Much expence of materials and labour may thereby be ſaved, and the great end of road-making be fully obtained: namely, that of rendering the road in all ſeaſons eaſy, ſafe, and pleaſant to the traveller, as well as eaſy in the conveyance of all ſorts of articles. Beſides, he conceives, that in this operation, as well as that of making new roads, very much depends on breaking the materials *evenly*. For, by doing this, the wear of the road becomes regular. Where the heads of large ſtones riſe above the general ſurface, they become obſtacles to carriages, and ſtumbling blocks to horſes; beſide their tending, by the jolting motion which they give to carriages, to indent the ſurface on either ſide of them, and thus to increaſe the roughneſs, and haſten the decay of the road. It is added, that by the law of gravitation and the action of wheel-carriages, a pit or hollow place in the ſurface of a road is made deeper every time the wheel of a carriage paſſes through it. The periphery of the wheel acts as a chiſſel, and in falling into the hollow receives an impetus or acquired force in addition to the actual weight it is loaded with; and, in addition to this, an undue proportion of the general load is, by placing it out of its upright poſture, taken from the upper and thrown upon the lower wheel. Likewiſe hard protuberances, beſide being dangerous or diſagreeable to travellers, whether on horſeback or in carriages, are injurious to a road, as being the cauſes of pits and hollow places in its ſurface. Every hard protuberance, as the point of a ſtone ſtanding above the general ſurface of the road, or a large ſtone lying looſe upon it, is productive of four impreſſions: namely, two, by throwing additional weight upon the oppoſite wheels (going both ways), and two more by the impetus or acquired force of the wheels (paſſing both ways) in falling on the ſurface of the road. He therefore conſiders it to be the firſt duty of the ſurveyor, not only to fill up the ruts and hollows, from time to time, but to pick out or to cruſh with a heavy hammer the ſtones, whoſe tops riſe above the general ſurface; as well as to gather off thoſe which lie looſe upon the road; the latter being an operation that is readily performed, yet frequently neglected, and in ſome places to a ſhameful degree, eſpecially in the northern parts of the iſland.

And in reſpect to the ſizes moſt proper for road-ſtones it requires much latitude. Not only the intended uſe of the road, but the nature of the material is to be conſidered. A road for broad-wheeled carriages of burden, only, may be made of larger ſtones than one for narrow wheels. And hard ſtones require to be broken ſmaller than thoſe which more readily wear down, and form a travellable ſurface. For when once the ſurface of the materials becomes united and cemented together, and its rock-like texture eſtabliſhed, the ſtones that are cruſhed, and the ſmaller fragments which are ſplintered on, in wear, ſerve, he ſuppoſes, to incruſt and bind together the ſtratum of ſtones which lie next, in ſucceſſion, beneath: eſpecially if proper attention be paid to the irregularities of wear, and to bring back the ſurface, wherever it is requiſite, to its original evenneſs of convexity where that form is adopted:—ſo that it may, in every part, act as an arch, and may be able to reſiſt, with the greateſt firmneſs, the weight with which it may be impreſſed. It is, however, to be obſerved, that, in forming and repairing roads with ſtones of ſize, a conſiderable ſhare of the expence ariſes from the labour of reducing the materials; and, in conſequence, the ſmaller they are broken the greater becomes the expence. This, on ordinary occaſions, is a ſerious conſideration. Hence, in conſtructing and repairing common roads, it is adviſable, inſtead of reducing the ſurface ſtones to ſmall fragments with the hammer at a great coſt, to cover them with materials that are already reduced; as the rubbiſh of ſtone quarries, ſoft ſtones, or gravel, or the ſcrapings of the road to be repaired. Such cementing materials being waſhed and worked down by rains, and the action of carriages, and the feet of travelling animals, among the ſurface ſtones, aſſiſt much in binding and fixing them in a firm cruſt; and in making the road immediately paſſable by horſes and light carriages; moſt particularly if the whole be compreſſed, and united together with a heavy roller (ſuitable to the purpoſe), repeatedly paſſed over the ſurface of it. And another good method of ſaving expence in this way, where materials are readily procured, is that of placing the coarſe unbroken ſtones or other hard materials in the bottom part or bed of the road, covering them over with gravel, or other ſorts of materials that are of a ſmall kind. However, where the hard materials are broken down ſmall and evenly the roads are found to wear the beſt.

The proper materials for repairing roads are in a great meaſure the ſame as thoſe which are uſed for the making of them in the firſt inſtance. The writer of the Agricultural Report of Middleſex thinks the rounded ſtony materials of the nature of flint, found in gravel pits and river bottoms, are in every reſpect more fit for roads than any other flinty matters. The materials for the ſupport of great public roads ſhould, it is ſuppoſed, be ſelected from among ſuch ſtony ſubſtances as are tough as well as hard; for this purpoſe, hornblende is believed to be particularly ſuitable, to which may be added whinſtone, baſalts, iron-ore, and all ſuch ſtones as contain iron, as well as the ſlag, or the refuſe of furnaces. The comparative weight which ſtones of ſimilar ſize and figure can ſupport without being broken, is, it is imagined, the criterion by which to try them for this uſe.

Mr. Beatſon thinks, that if the above directions were ſtrictly attended to, and every appearance of a breach or defect in a road at once repaired, the ſame materials, when diſplaced, would very often, if properly relaid, and fit for the purpoſe, repair the part beginning to fail; whereas, if neglected for ſome time, and allowed to get much out of repair, it will probably require a conſiderable additional quantity of materials, and thereby occaſion a great deal of expence that might have been ſaved. He alſo ſuggeſts, that during the time of hard froſt, it may be very proper to drive materials, and lay them down for the purpoſe of being at hand to repair the roads when the ſeaſon permits, but ſuch a time is the moſt improper of any for applying thoſe materials. And that in laying them down it is a very general practice to place them in ſmall heaps along the ſides of the road, and even encroaching ſometimes very much upon the ſpace allotted for travelling on. This ought on no account to be allowed (unleſs thoſe materials are to be immediately uſed), for reaſons ſo obvious, it is unneceſſary to mention them. It would be much better to have receſſes at certain convenient places, for the purpoſe of laying the materials in till wanted; by which means the inconveniencies attending the common way would be totally avoided;

avoided; and travellers might then, without interruption, uſe any part of the road they found beſt; and beſides, there would then be leſs occaſion for making the roads ſo wide as they are generally made, which would undoubtedly ſave a great deal of money in keeping them in repair, or proper condition.

It is ſtated, that rolling of roads with a heavy roller, as directed above, would be a very beneficial practice in keeping them in good repair, eſpecially if the hard materials, that are worked out of place by the wheels of carriages, are raked in again previous to the roller paſſing over them. This would be an eaſy and expeditious operation, and if taken in proper time, would, in many caſes, be all that is neceſſary to put the road in repair. It is, however, an implement that is very ſeldom made uſe of for this purpoſe by the overlookers of roads.

And the uſe of machinery has probably been hitherto too little attended to in the execution of this ſort of work; but from the increaſing price of hand-labour, it certainly at preſent demands the ſerious notice of the managers of this ſort of buſineſs. For dragging over roads, when much out of repair, in order to replace the ſtones or gravel diſturbed by wheel-carriages, a ſort of harrow has been invented by Mr. Harriott of Great Stanbridge, in Eſſex, for which he received a premium from the Society for the Encouragement of Arts, &c. and of which he gives the following account. "Being appointed ſurveyor of the roads at Michaelmas, 1786, and finding them very bad, I provided a ſufficient quantity of ſtones and gravel againſt the next ſummer, to cover the roads pretty thick; but when ſo done, I found the heavy loads of chalk, gravel, and corn, ſoon turned the ſtones out, and made almoſt as deep a rut or rake as ever. Stubbing the quarters in I found an endleſs job, as well as a great expence; I, therefore, contrived the road-harrow, and by the help of which I have, during the laſt ſummer, at a very trifling expence to the pariſh (after the ruts were again filled up with ſtones), kept the roads in extraordinary good condition. A man, a boy, and two horſes will do three miles in length in one day, completely harrowing down the quarters, and drawing the ſtones together, which, by means of the mould-boards, are dropped into the ruts, far better than a man can ſtub them in. Now, if a man was employed to ſtub, he could not do it for leſs than a penny *per* rod, of ſixteen feet and a half, (the moſt common is three halfpence, or two-pence *per* rod, if they ſtub the outſide as well as the inſide quarter,) which would amount to one pound ſix ſhillings and eight-pence for one mile in length, conſequently to four pounds for three miles, which the road-harrow will do in one day; and for which I charge the pariſh for man, boy, and horſes, only eight ſhillings." And it is further ſtated by him, that it does the work better, as well as cheaper; that ſeveral other pariſhes are uſing them, and he thinks the uſe of them will ſoon become general, eſpecially where roads are mended with gravel. The head of the harrow is three feet long, from outſide to outſide of the bars. The bars four inches ſquare, and the length of them five feet. The mould-boards extend eleven inches farther, which is neceſſary to draw the ſtones (which the teeth of the harrow work up to the top) nearer the middle of the road. The mould-boards are four feet two inches long, ten inches deep, and two inches thick; they are ſhod with a bar of iron, and lined about ſix inches high with an iron plate. The teeth (which ſhould be ſteeled at the points) are one foot in length, from the under ſide of the bars to their points; they are one inch and a quarter ſquare, and are fixed with ſtrong nuts and ſcrews, with collars both on the under and upper ſide of the bars. The bars are made to go lengthwiſe inſtead of acroſs, to prevent them from ſplitting. The harrow is drawn by two horſes abreaſt, a boy leads the outſide horſe on the outer quarter, the other horſe goes on the horſe-path, the man ſteadying the harrow by the handles. Of courſe they take one inſide, and one outſide quarter as they go, and the other two quarters as they come back. And as this harrow is certified, by ſeveral people in the pariſh where it is uſed, to do more work with one man, a boy, and two horſes, in one day, and in a much better manner than could be effected by twenty men in the ſame time in the uſual way, it muſt certainly produce a prodigious ſaving both of time and money, and having been found to anſwer the purpoſe ſo extremely well, renders it worthy of attention by thoſe engaged in this kind of work.

Mr. Beatſon ſuggeſts, that after the uſe of this harrow, the heavy roller, noticed already, would have a very good effect, or there might be a roller of a lighter conſtruction faſtened behind the harrow, to roll at the ſame time; although the heavy roller would certainly make the beſt work. And likewiſe that other implements, nearly on the ſame principle, have been conſtructed, particularly one of which he was ſhewn a model by a gentleman near Cheſter. Its ſhape is in form of an iſoſceles triangle, which is laid upon the road, and drawn by ſhafts at the baſe. The two ſides, by meeting in an angle oppoſite the baſe, are ſuppoſed to draw the looſe materials towards the middle of the road. It has two ſmall wheels near the baſe or front, and one at the angle in the rear, with different contrivances for fixing the whole frame higher or lower as required.

It is alſo ſuggeſted that a machine for the more eaſily breaking ſtones to repair roads in the common way would be of very great uſe, as at preſent this is a tedious and laborious taſk. Under the article Machine, a very ingenious contrivance for removing the mud and dirt from roads has been deſcribed. But, although ſeveral contrivances have at different times been propoſed for facilitating the repair of roads, and leſſening the expence, yet that expence, Mr. Beatſon ſays, is no doubt very great, eſpecially in thoſe places where many heavy-loaded carriages are continually paſſing. The ruts made by the wheels ſoon become ſo deep, and the materials of the road are thereby ſo much torn up, that it is almoſt an impoſſibility, however hard the materials, to keep the road for any conſiderable time in proper condition, or ſtate of repair. It is, therefore, ſuggeſted, that theſe effects ſhould be attempted to be remedied by ſome means or other, as by a ſort of roller ſo fixed as to prevent the wheels from ſinking ſo as to form ruts.

It is evident that the principles and directions which have been given apply equally to private or parochial roads, which in general are in a worſe condition, from their being commonly worſe managed. The cauſes of their being in bad condition ſhould be attended to and removed, as much as poſſible, in the manner already ſuggeſted, as it is evident that they muſt have a great effect in promoting improvements in agriculture, by leſſening the expence of labour, and facilitating the means of conveyance of different articles. The effects of ſome ſorts of wheels have been more deſtructive to roads than others, and of courſe acts of parliament have been formed with the view of affording proper regulations in this reſpect. See Wheel and Waggon.

In ſpeaking of the draft from friction on the roads, Mr. Middleton, after conſidering what happens on thoſe made with gravel, and on iron railways, concludes, that, on gravelled roads, friction is not more than one-fifth part of the entire draft; the other four-fifths being occaſioned by the

the obſtacles of duſt, ſludge, looſe ſand and gravel. Hence it follows, he thinks, that by removing theſe obſtructing cauſes, and keeping the roads conſtantly clean and hard, the draft would be ſo much leſſened, as to render the preſent number of labouring horſes unneceſſary. It is ſuggeſted, that many of theſe inconveniencies may be got rid of; and the roads be in the way of getting more dry, clean, and hard, by removing the offending matter while in the ſtate of duſt, when it occupies the leaſt poſſible ſpace, and is in the moſt favourable condition for being taken away. A ſmall portion of duſt, it is ſaid, when drenched with rain, becomes a large quantity of ſludge, in which ſtate it requires much labour to clear it away; on which account it is very advantageous to get quit of it before rain falls. This is, it is ſuppoſed, beſt effected by means of buſh-harrows wrought every windy day. But ſome might be taken away after being ſcraped together by ſuitable machinery for the purpoſe.

It is intimated, that the time ſeems to be approaching, when iron muſt be made to contribute largely towards the public roads. It is thought that iron rails, or bars, may be laid along the preſent turnpike roads, in ſuch a manner as to afford the moſt convenient track for all heavily laden carriages; and that this may be done without any material inconvenience to thoſe of lighter weight and ſwifter ſpeed. The great original expence of making ſuch roads will, it is ſuppoſed, be ſufficiently counterbalanced by their much longer duration, and the trouble fully compenſated by the ſuperior pleaſure of travelling over them.

On the whole, it is ſuppoſed, that the keeping of roads in the moſt perfect repair is an object of high importance; for that until canals, or inland navigation, became general, the ſupply of the markets, and the price of every article, will be in proportion to the ſtate of the roads over which they have to paſs in their way to towns. Bad roads, it is ſaid, require a greater number of horſes to draw any given weight along them, than would be neceſſary for the conveyance of the ſame weight over good ones; which extra draft muſt be paid for by increaſing the price of the article to the conſumer. The ſame number of horſes which, along *bad roads*, could only bring a ſcanty ſupply of the produce of the country from a ſmall diſtance, can, on *good roads*, convey a more abundant ſupply, and from greater diſtances: which is calculated to lower the price of the neceſſaries of life in the metropolis and other large towns, rather than *advance* them in the diſtant counties, and have a happy tendency towards *equalizing* the prices between the towns and the country.

And the author of the paper already noticed, thinks it a matter of great conſequence to have proper regard to the nature of the fences on the ſides of roads, as on theſe the goodneſs of them, and the expence of upholding them, very much depend. Where the form of the ground and ſituation will admit of it, the ſunk fence from the road, that is, with the deepeſt part towards the field, is by far the beſt. A fence of this ſort, in the form of a ditch or drain, may be made of any depth without the leaſt danger or inconvenience, which is not the caſe when open to the road; and the deeper it is made, the better effect it will have in keeping dry the foundation of the road, if properly conſtructed; nor will the road require to be ſo wide as uſual, at the ſame time there will be fully more room to travel on; for if the fences are of this kind, the whole width of the road may with ſafety be occupied, but when open to the road a conſiderable ſpace is loſt, by the fear or danger of approaching too near them. And the fences on the ſides may either be of ſtone, ſod, or a hedge or paling; but ought not to be more than eighteen inches, or two feet above the level of the road (except a paling), and the top of them, if broad enough, may, in ſome places, be made to ſerve as a foot-path. Neverthelefs, the fence towards the field may be ſix feet in height, or as high as the purpoſe of it requires. The road will thus receive the whole benefit of the ſun, which is very eſſential towards keeping it dry, as well as the depth of the drains or ditches withinſide the field, to which there muſt be proper openings at certain diſtances, as before recommended; and in winter, after heavy falls of ſnow, there will be little chance of a road fenced in this manner ever being blocked up, for it will be obſerved, when a ſtorm of ſnow is attended with a high wind, that the drifted ſnow lodges chiefly about the fences, or where it meets with an obſtacle to occaſion an *eddy;* for where high fences are on the ſides of roads, they are almoſt to a certainty in ſuch caſes blocked up, to the great inconvenience of the whole neighbouring country or diſtrict in which it happens. The planting of trees on the ſides of roads ſhould always be avoided as much as poſſible; but where rows of them are to be put in, it ſhould never be done at leſs than ten or twelve feet diſtance from the fences, and not leſs than forty or fifty feet from each other, being conſtantly ſo ſituated as not to produce much ſhade on the road in the middle of the day.

Road, in *Ornamental Gardening*, that ſort of carriage-way which is peculiar to reſidences of the country kind. They are of many different ſorts, according to the nature, circumſtances, and ſituations of the different places. But when properly laid out and formed, they have moſtly one of the effects of building, at leaſt, in a partial manner, which is that of giving force and ſpirit to ſcenes of verdure and cultivation. They ſhould be laid out according to the nature of the ſituations; their directions and widths being provided by their conveniences, propriety, and utility. The methods of making and repairing of them are much the ſame as thoſe employed for other kinds of roads; but in the finiſhing, their ſurfaces ſhould be laid over with a finer and better coloured material of the gravel or ſome other ſort, and they ſhould be kept more perfectly rolled down and level; as the colours of ſuch ſurface materials and the margins of ſuch roads are principally what concerns picturesque effect, or that which is to be produced by them. In ſituations where the ſcene is avowedly of the artificial kind, the margins of them, according to the author of the work on "Country Reſidences," ſhould be parallel to each other, and correctly defined; as in that part of an approach-road, which comes within the parapet or fence which incloſes the manſion, or in thoſe roads which are within the bounds of the other more adorned parts of the ground. But in ſituations where the roads are not in theſe ſcenes, but are either in pictureſque or natural pleaſure-grounds, paſture-fields, parks, foreſts, dingles, or other ſimilar places, the edges ſhould be irregular, and more or leſs rough or ſmooth, blending or ragged, as is ſeen to take place in roads or tracks through ſimilar ſcenery in wild nature. The excellent effects and ſuperior advantages which reſult from the adoption of theſe principles in the formation and conſtruction of roads of this nature, may often, it is ſaid, be ſeen in thoſe parts of much frequented approach-roads of reſidences, which are not thought proper or neceſſary to be ſubjected to the operation of the paring-iron, and the formal trimming of the gardener. And indeed, that one of the moſt ſtriking deformities in pictureſque ſcenery, is that of the formal, ſtiff, and harſh edges of made roads, as they highly diſguſt the ſpectator, and prevent the true effect which ſhould be produced.

All roads of this ſort ſhould, therefore, be laid out, and formed

formed in fuch a manner as to harmonife as perfectly as poffible with the nature, circumftances, fituations, and fcenery of the particular places in which they are to be had recourfe to. See WALK.

ROAD, *Approach*, that variety of this fort of road which is peculiar to refidences, manfions, or houfes of the country kind, and which leads or conducts to their principal or other entrances. In their manner of being laid out, they fhould in their directions neither be too affectedly graceful, have too much waving in their appearance, be too much befet and intercepted with trees; or be too vulgarly formed in the rectilineal and direct manner, or be too abrupt in their nature. There is a certain kind of dignity, propriety, and fitnefs requifite in them, which is not eafily defcribed, but which, in given fituations and circumftances, readily prefents itfelf to the mind of the defigner; and in confequence of the whole of the operations, both of conceiving and defigning them, being fo fimple, they are, for the moft part, marked out upon the ground with great facility,—eafily improved upon, and, in their execution, the work is merely that of road-making.

The accompanying circumftances which appertain to roads of this nature have been already pointed out in fpeaking of them in general, and they ought to be well attended to, as much of their beauty and effect arife from them.

The only proper approach-roads to caftles, Mr. Loudon fays, have been fuppofed thofe of the avenue kind, but that there feems no reafon in nature for fuch a rule; and the arguments drawn from antiquity are wholly infufficient to juftify their conftant introduction in fuch cafes. However, wherever they exift with good effect, they fhould, it is faid, be carefully preferved; and even, in fome fituations, avenue roads to manfions, ftraight private roads through monotonous cultivated countries, or public roads paffing along eminencies, may be created and formed with great advantage and effect, as is the cafe in many places. Roads of this kind fhould always be fo contrived as to afford the beft effect, and to produce the greateft harmony, which the places are capable of admitting.

ROAD, *Drive*, another defcription of road belongingto refidences of the rural fort, which is chiefly defigned to fhew and difplay the beauties of the places, or of the furrounding country, or of both at the fame time. They are principally had recourfe to in refidences of the more extenfive and elegant kind, being moftly contrived without any great difficulty. The main circumftance to be attended to in this bufinefs, is that of only fhewing one fort of rural character at one time, but to difplay the whole, in fucceffion, as much as poffible. They are commonly formed, as to the road part, without much labour or trouble, being often fimply made by levelling, and the materials upon the fpot; they may, however, be conftructed in the fame manner as the other roads in fuch fituations.

The leading, or ftriking characters of the fpot, are here to be particularly regarded.

ROAD-*Gage*, a contrivance for the purpofe of breaking road ftones, or other hard materials, by. A ring, or an oval, of iron, of the proper fize for the intended ufe, with a fhort handle fixed to it, will anfwer this intention very well. Thefe gages are of great ufe in breaking ftones by the load, or in other ways, before they are laid upon roads; and fhould always be known to the workmen previous to their undertaking the bufinefs. See ROAD *Stones*.

ROAD-*Harrow*, an implement of the harrow kind, contrived for the purpofe of forcing in the fides of the ruts. One reprefented in the Effex Agricultural Survey levels the ruts and combs very expeditioufly. It was invented by Mr. Pattefon, and cofts 5*l*. See ROADS.

ROAD-*Horfe*, fuch a one as is employed in the teams on the road, and which in general performs the moft laborious work. Under this defcription comes the greater part of all the horfes in conftant ufe, as it includes carriage horfes of every kind, roadfters, and hacks. Road-horfes of every denomination are, from their conftant hard work, entitled to a proportionable degree of care and attention with the beft horfes in the kingdom; and fhould undergo the ufeful part of ftable management, that fo much contributes to the prefervation of health in horfes of a fuperior defcription. Thofe which have inceffant labour, or which travel poft, muft be fupplied with at leaft from one to two pecks of corn a day. Large and ftrong carriage horfes, in perpetual work, require confiderably more, or they will become apt to lofe flefh by frequent perfpiration. Thefe rules, however, offer only a kind of general ftandard.

ROAD-*Materials*, all fuch fubftances as are employed, or made ufe of, in the making and repairing of roads; as thofe of ftony matters of different kinds and qualities, various forts of gravel, fand, and a variety of other articles. They fhould, in every cafe, be reduced as much as poffible to the fame fizes, as the regular wear of roads depends very much upon it. See ROAD.

ROAD-*Pick*, an ufeful implement of this kind with three points. It has much refemblance to the common pick-axe, only differing from it in having the flat edge-like end of that tool occupied by three ftrong tines, about fix inches in length, and ftanding about fix inches in width from the outfide to the outfide of them. It thus forms a fort of fmall trident, which is borne on the fhank of the implement, and ftands about fix or eight inches from the focket and handle.

It is a very convenient tool in ftriking off the protuberances, and filling in the ruts of hard roads; as well as to level aud adjuft the furface with, in forming and repairing ftone roads. The fingle end is likewife capable of being employed for letting off water from fhallow ruts, or hollow places, as well as for many other ufes of the common pick. See PICK.

ROAD-*Plough*, an inftrument of the plough kind, invented and made by the late Mr. Brand, an ingenious blackfmith, in the county of Effex, at Lawford, near Maningtree. It is formed all of iron, and reprefented in the Agricultural Survey of that diftrict. Its length is that of a common plough, with two fmall wheels, one before and the other behind; and the coulter part is ftrongly fecured.

ROAD-*Roller*, a heavy kind of iron roller, formed in three feparate parts, ufed for rolling down the loofe materials on roads. It is drawn by a horfe or horfes in fhafts, fomewhat as in the common roller. See ROADS.

ROAD *Scraping Machine*, a contrivance made for the purpofe of cleanfing roads from dirt, &c. Thefe machines are conftructed in feveral different ways, by different makers; but a very ufeful one may be feen under the head *Machine*; which fee. See alfo ROAD.

ROAD-*Stones*, all kinds of ftones, whether of the field, quarry, or other forts, that are employed in the forming and mending of roads. For fome ufes of this nature, the ftones fhould be confiderably reduced, even in conftructing or repairing ordinary roads. Mr. Marfhall has fuggefted, that by dropping road-ftones through circular gages of different fizes, it will be found that, for repairing fmall breaches, thofe which pafs freely through a ring, $2\frac{1}{2}$ inches in diameter, may be confidered as of a middle fize; and that

that for new forming or fresh covering the surface of a road, none ought to exceed 4 inches; $3\frac{1}{2}$ inches being, for these purposes, the middle size: that 2 inches and 4 inches may, as a matter of general information, be set down as the extremities of size of road-stones of a middle quality, for the above purposes. See ROAD-*Gage*.

ROAD-*Surveyor*, a person who has the care and management of a road, whether in the making or repairing of it. All such persons as are employed in this way should be well acquainted with the nature of laying out, forming, and keeping them in order. Each of the different methods, which are in common practice, ought to be well understood, as well as those had recourse to in particular districts or places. And, besides, he should be well informed with regard to every thing of a local nature that has any relation to them, and be a man of exertion and ingenuity.

ROAD-*Team*, any sort of team that is employed on the road, whether in carts, waggons, or other kinds of carriages. All teams of this nature should in general be well kept. See TEAM.

ROAD-*Work*, all such kind of work as is done upon the road, either by the labour of men or animals. It is also sometimes applied to the business of making and repairing of roads.

ROAD, in *Navigation*, denotes a place of anchorage at some distance from shore, and sheltered from the winds, where vessels usually moor to wait for a wind or tide proper to carry them into harbour, or to set sail.

When the bottom is clear of rocks, and the hold firm, and the place well covered from the wind, the road is said to be good. An open road is one which has but little land on any side.

The roads within his majesty's dominions are free to all merchant vessels, either of his subjects or allies. Captains and masters of ships who are forced by storms, &c. to cut their cables, and leave their anchors in the roads, are obliged to fix up marks or buoys, on pain of forfeiture of their anchors, &c.

The masters of ships, coming to moor in a road, must cast anchor at such a distance as that the cables, &c. may not mix, on pain of answering the damages. When there are several vessels in the same road, the outermost to the seaward is obliged to keep a light in his lantern in the night-time, to apprise vessels coming in from sea. See PORT.

ROAD *Aqueduct*, is an arch under a canal, through which a road passes.

ROAD *Bridge*, a bridge over a canal for the use of a road, instead of private use. See OCCUPATION *Bridges*.

ROAD, *Cock*. See COCKROAD.

ROAD-*Goose*, in *Zoology*, the name of a small species of wild goose. See *Anser* under DUCK.

ROADER, a vessel riding at anchor in a road, bay, or river.

ROADING, a term used on the Fen rivers, for cutting off the weeds at their bottom.

ROADING, in *Agriculture*, a provincial term used to signify the striving of teams for the lead on the roads. It was formerly much in use in Norfolk, but is at present nearly laid aside, probably from the danger that attended it.

ROADSTER, among *Horses*, a term frequently applied to such as are used for the purpose of riding.

ROAITHA, or ROUAITHA, in *Geography*, a town of Arabia, in Yemen; 56 miles S. of Medina.

ROAK, a provincial word, signifying a mist or fog.

ROAN, in *Geography*, a small island in the North sea, near the north of Scotland. N. lat. 58° 35′. W. long. 4° 11′.

ROAN, in the *Manege*. A roan horse is one of a bay, sorrel, or black colour, with grey or white spots interspersed very thick. When this party-coloured coat is accompanied with a black head and black extremities, he is called a roan with a black-a-moor's head; and if the same mixture is predominant upon a deep sorrel, it is called claret-roan.

ROANCARRICK ROCKS, in *Geography*, rocks in Bantry bay, on the S. coast of Ireland; 3 miles N.E. of Beat island.

ROANE, a county of America, in the district of East Tennessee, containing 5581 inhabitants.

ROANE-*Tree*, in *Botany*. See SERVICE-*Tree*.

ROANNE, in *Geography*, a town of France, and principal place of a district, in the department of the Loire, which here becomes navigable, and renders it a convenient staple for all goods conveyed from Lyons to Paris, Orleans, Nantes, &c. The place contains 6992, and the canton 14,790 inhabitants, on a territory of 225 kiliometres, in 13 communes. N. lat. 46° 2′. E. long. 4° 10′.

ROANOKE, an island in the Atlantic, on the coast of North Carolina, at the entrance into Albemarle sound, with a town of the same name. The north point of the island is about 7 miles W. of Roanoke inlet. N. lat. 35° 50′. W. long. 76°.—Also, a long and rapid river, formed by two principal branches, *viz.* Staunton, which rises in Virginia, and Dan, which rises in North Carolina. It empties itself into Albemarle sound, about N. lat. 35° 58′. W. long. 76° 56′. This river is navigable for sea-vessels nearly 30 miles; but for boats of 30 or 40 tons, to the falls. Above the falls, boats of 5 tons ascend about 200 miles. The planters on the banks of this river are supposed to be the wealthiest in North Carolina.

ROANOKE, *Little*, a river which discharges itself into the Staunton, about 15 miles above the junction of the Dan and Staunton.

ROANOKE *Inlet*, a channel on the coast of North Carolina, which leads into Albemarle sound. N. lat. 35° 56′. W. long. 76° 14′.

ROANPOUR, a town of Bengal; 17 miles S.S.E. of Mauldah.

ROARAGUR, a town of Hindoostan, in Visiapour; 22 miles N. of Sottarah.

ROARING BULL *Island*, an island in the North Atlantic ocean, near the east coast of Nova Scotia. N. lat. 45° 17′. W. long. 60° 44′.

ROARING *River*, a river of America, in the state of Tennessee, which runs N.W. into Cumberland river, 12 miles S.W. of the mouth of Obas river.

ROARING *Water Bay*, a bay on the S. coast of Ireland, in which is a number of small islands; 6 miles S.W. of Skibbereen. N. lat. 51° 28′. W. long. 9° 22′.

ROARING *Water*, a river of Ireland, which runs into the fore-mentioned bay, 5 miles W.S.W. of Skibbereen.

ROASCHIA, a town of France, in the department of the Stura; 8 miles S.W. of Coni.

ROASTING, in *Metallurgy* and *Chemical Manufacture*, is a process by which the volatile parts of metals and minerals are separated by the application of heat. The minerals are generally mixed with the fuel, and fired in heaps exposed to the open air. When the volatile substance is driven off with difficulty, the reverberatory furnace is sometimes employed.

This process is frequently, though improperly, called *calcining*, since the latter is confined to the oxydation of metals.

metals. In expelling the volatile parts from lime-ſtone and gypſum, the proceſs is termed *burning*, and in the latter ſometimes *boiling*. The term roaſting is principally confined to iron, and other ores abounding with ſulphur and arſenic.

The iron ores of this country are roaſted for the purpoſe of expelling ſulphur, water, and carbonic acid. The former would probably injure the quality of the iron in ſmelting; the latter would contribute to an expenditure of the heat of the furnace. The proceſs is conducted in the open air, by piling the iron-ſtone and ſmall coal in alternate ſtrata, allowing the maſs to burn till the coal is conſumed. The iron-ſtone, by this means, becomes of a red colour, and loſes much of its weight. In ſome iron-works the proceſs is performed in kilns, ſimilar to thoſe employed for burning lime-ſtone.

The ore from which zinc is obtained is generally blende, which is the ſulphuret of that metal. It is expoſed to the ſtrong heat of a reverberatory furnace, by which the ſulphur is expelled, and the metal oxydated.

When the metals or their oxyds are themſelves volatile, and are combined with ſulphur, roaſting is not practicable: recourſe muſt then be had to ſome other agent, which will combine with the ſulphur, and ſeparate the metal itſelf. Such is the caſe with *cinnabar* and *arſenic*. See the reſpective metals.

ROASTING, in *Domeſtic Economy*. When that change by heat which animal food undergoes to render it fit for digeſtion is brought about by a temperature capable of partially changing the ſurface, the proceſs has been termed roaſting; a ſimilar change in vegetable food, ſuch as bread, puddings, and pies, being termed baking. The moſt ancient method of roaſting, which is ſtill the general practice, is by turning the meat before the fire; and it is ſtill ſuppoſed, without any good reaſon, that meat cannot have its proper flavour when roaſted in any other way. It is true that *roaſters* or *ovens* of the common conſtruction are apt to give the meat a diſagreeable flavour, ariſing from the empyreumatic oil which is formed by the decompoſition of the fat, expoſed to the bottom of the oven. This evil has been completely remedied in two ways, firſt by providing againſt the evil of allowing the fat to burn, and ſecondly by carrying off by a ſtrong current of heated air the empyreumatic vapours.

The roaſter uſed in the Derby Infirmary, and in many private houſes in the neighbourhood, is not on any account objectionable, but it is particularly valuable in an economical point of view. This is principally effected by caſting the heat entirely upon the object of roaſting, inſtead of ſending three-fourths of the heat up a capacious chimney, and expending the greateſt part of the remainder upon the cook, and the walls and furniture of the kitchen.

The roaſter above alluded to is made of ſheet iron, of the ſtrength of about one pound to the ſquare foot: its form is that of a parallelepipedon, about twenty-five inches high, twenty-two long, and eighteen in breadth. The fire is put under it; but one courſe of bricks is placed immediately over the fire, and above this a cavity of five inches deep between the brick roof and the oven bottom. The flame of the fire paſſes a little to the right and left, and riſes perpendicularly up the ſides of the roaſter, freely communicating with the top of the ſame. By this means the flame and hot vapour will be the hotteſt at the top of the oven, becauſe of its greater levity, and its not being allowed to eſcape at this point, according to the common practice. After the hot vapour has beſtowed its heat on the ſuperior part, it now deſcends and enters on each ſide the cavity under the oven, from whence it paſſes up the back of the ſame, which back forms one ſide of the ſmoke chimney. This arrangement is ſufficient for diſtributing all the diſpoſable heat equally on every ſide of the roaſter. We ſhall next point out the contrivance for diſpoſing of the ſmell above alluded to. The door of the oven is caſed with wood, a piece of thick paper, ſteeped in a ſolution of alum, and ſmeared with clay, being placed between the wood and the iron, to prevent the wood from being charred. The door extends below the bottom of the oven about three inches. This, when the door is open, expoſes a plate three inches deep, and the width of the oven, and which conſtitutes the front of the cavity under the oven. At one ſide of this plate is a hole at the entrance of the tube, which extends to the other end of the cavity, where it is bent, and returns on the other ſide of the cavity, and opens into another cavity formed by a double plate, which conſtitutes the iron part of the door. The firſt entrance of this tube correſponds with an opening at the bottom of the door, ſo that when the door is ſhut, cold air can enter the tube. In its paſſage it becomes heated, and then enters the oven at the top, from the cavity in the door. It now paſſes over the meat, and eſcapes through a tube in the back plate, which extends ſo high as to reach above the ſmoke damper. By this means the roaſter is conſtantly cleared of any diſagreeable vapour, by a force equal to the draft of the chimney.

A ſliding rake is made, ſo as to fit the top and ſides of the oven, that the whole ſurface becomes perfectly ſcraped by one motion.

ROATO, in *Geography*, a town of France, in the department of the Tanaro; ten miles N.W. of Aſti.

ROB, in *Pharmacy*, the inſpiſſated juice of any ſubſtance, uſually boiled up to the conſiſtence of honey.

There are robs made of quinces, ſloes, cherries, mulberries, elderberries, barberries, gooſeberries, and other fruits, for various diſeaſes. The juice of grapes, thus prepared, is more particularly called rob, or *ſapa ſimplex*; this is almoſt of the conſiſtence of honey.

When only one-third of the humidity is boiled away, it is called *defrutum*; and when only boiled to the conſiſtence of a ſoft electuary, a *reſin*.

The word *rob* is pure Arabic; and ſignifies originally a juice dried in the ſun, or over the fire, that it may keep the longer without damage.

Sometimes it alſo denotes a compoſition of ſome juice made up with honey or ſugar, in which ſenſe it is confounded with loche or lohoc.

The rob is a form now much out of uſe, though there are ſeveral directed in the college diſpenſatory; as robs of black cherries, of ſloes, of quinces, of elder, &c.

It is poſſible that great improvements might be made, by introducing the uſe of this form among the malt-diſtillers. The great inconvenience attending that art being, that the malt being of a large bulk, in proportion to its ſaccharine part, and requiring a larger proportion of water to extract that ſaccharine part, many large veſſels, ſuch as maſh-tubs, coolers, fermenting backs, &c. are neceſſary; and the neceſſary labour on the ſubject is increaſed, and the commodity rendered dearer. The remedy of this ſhould ſeem the introducing a new art ſubſervient to that of the malt-diſtiller, and confining itſelf to the boiling down of malt-wort to a rob, ſo as to ſupply the malt-ſtiller with his ſubject, in the ſame manner as the fine-ſtillers are ſupplied with treacle from the ſugar-baker. By this means the buſineſs of the malt-ſtiller would be reduced to a great degree of ſimplicity, and the ſpirit produced would be alſo much finer than at preſent, becauſe the ſubject would come tolerably refined to his hands, and purged of its groſs, mealy, and huſky matter, which

which yields a diſagreeable oil in diſtillation, and is alſo apt to burn to the ſtill, and ſpoil the ſpirit. It is poſſible that a ſpirit purer and finer than that from treacle might this way be procured from malt, prudently managed. Shaw's Lect. p. 219.

ROBALI, in *Geography*, a town of Abyſſinia; 75 miles S. of Miné.

ROBALO, in *Ichthyology*, a name by which ſome have called the *camuri*.

ROBARES, in *Geography*, rocks near the S. coaſt of Ireland; three miles S.E. of Gally Head. N. lat. 51° 31′. W. long. 8° 50′.

ROBASOME, a town of France, in the government of the Po; eight miles N.N.W. of Turin.

ROBBEN, or Seal, *Iſland*, an iſland on the coaſt of Africa, near the Cape of Good Hope, at the entrance into Falſe bay, about ſix miles in circumference. It ſerves as a place of exile for criminals ſent from the Cape or the Indies, who are compelled to labour, and are guarded by twenty-four ſoldiers under the command of a ſerjeant. No women are permitted to live upon the iſland. Within this iſland and the continent there is excellent anchorage, where ſhips driven out by the S.E. winds, which blow from September to the end of April, the ſeaſon when all ſhips bound for the Cape reſort to Table Bay, uſually bring up. Here, too, ſhips intending to come into Table Bay uſually wait the abatement of the S.E. wind, if it ſhould happen to be too ſtrong for their working up againſt it. This iſland is too ſmall, and at too great a diſtance, to afford the leaſt ſhelter to Table Bay in the N.W. winds that blow in the winter months. S. lat. 33° 40′. E. long. 18° 20′.

ROBBERY, Robberia, or *Roberia*, in *Law*, a felonious and forcible taking away another man's goods or money, from his perſon, preſence, or eſtate, by putting him in fear, &c. 1 Hawk. P. C. 95.

A mere attempt to rob was held to be felony, ſo late as Henry the Fourth's time (1 Hal. P. C. 532.); and afterwards it was only a miſdemeanor, and puniſhable with fine and impriſonment, till the ſtat. 7 Geo. II. cap. 21. which makes it a felony, tranſportable for ſeven years, unlawfully and maliciouſly to aſſault another, with any offenſive weapon or inſtrument, or by menaces, or by other forcible or violent manner, to demand any money or goods, with a felonious intent to rob. If the thief, having once taken a purſe, returns it, ſtill it is a robbery. The previous putting in fear is the criterion that diſtinguiſhes robbery from other larcenies; and yet this putting in fear does not imply any great degree of terror or affright in the party robbed; it is ſufficient that ſo much force, or threatening by word or geſture, be uſed, as might create an apprehenſion of danger, or oblige a man to part with his property without or againſt his conſent. (Foſt. 128.) Thus, if a man be knocked down without previous warning, and ſtripped of his property while ſenſeleſs, though ſtrictly he cannot be ſaid to be *put in fear*, yet this is undoubtedly a robbery; or, if a perſon with a ſword drawn beg an alms, and I give it him through miſtruſt and apprehenſion of violence, this is a felonious robbery. 1 Hawk. P. C. 96.

This is ſometimes alſo called *violent theft*, and its puniſhment, be the value of the thing taken ever ſo ſmall, is death.

This ſpecies of larceny is debarred of the benefit of clergy by 23 Hen. VIII. cap. 1. and other ſubſequent ſtatutes; not indeed in general, but only when committed in or near the king's highway. A robbery, therefore, in a diſtant field or foot-path, was not puniſhed with death (1 Hal. P. C. 535.), but was open to the benefit of clergy, till the ſtat. 3 & 4 W. & M. cap. 9. which takes away clergy from robbery whereſoever committed.

The word is ſaid to have taken its riſe hence, that anciently robbers only took away the *robes* or clothes from travellers. Though lord Coke, in the third of his Inſtitutes, takes the name to have had its riſe from Robin Hood, who lived under Richard I. in the borders of England and Scotland, by robbery, burning houſes, rape, and ſpoil. Hence, alſo,

Robbers-men, or *roberds-men*, mentioned in ſeveral ſtatutes for great thieves.

ROBBING. See House-*Robbing*.

ROBBINS, or Robands, *i. e. rope-bands*, in a *Ship*, ſmall lines, or braided cordage, which make the upper edges of the great ſails faſt to their reſpective yards, being reeved into eyelet-holes in the head of the ſail under the head-rope for that purpoſe. They are generally of a ſufficient length to paſs two or three times about the ſaid yard. The word is, *make faſt the robbins;* for at ſea they do not ſay, *tie*, but *make faſt*.

ROBE, Roba. See Gown.

Robes, *Maſter of the*, is an officer of the houſehold, with an appointment of 500*l.* a-year, who has the ordering of all his majeſty's robes. See Master *of the Wardrobe.*

He has ſeveral officers under him, as a clerk of the robes, a yeoman, three grooms, a page, a bruſher, furrier, ſempſtreſs, laundreſs, ſtarcher, and ſtanding wardrobe-keepers at St. James's, Windſor caſtle, Hampton-court, &c. There is alſo in the eſtabliſhment of his majeſty's houſehold a miſtreſs of the robes, with an appointment of 500*l.* a-year, and two keepers of the robes. See Wardrobe.

Robes *to Minſtrels*. Innumerable bands of tumblers, buffoons, rope-dancers, muſicians, players on inſtruments, and actors, were formerly retained in the courts of princes, who, by their gambols, farces, ſports, and ſongs, diverted the company. Theſe were called in Tuſcany *Giullare* and *Giocolari*, and, by thoſe who mentioned them in Latin, *Joculares* and *Joculatores*. Theſe fabricators of amuſement never departed without being well rewarded. But what appears the moſt extraordinary and different from our preſent cuſtoms is, that the coſtly and gorgeous robes, which it was uſual for princes to receive from other great perſonages who viſited their courts at feaſts, or upon their marriage, as marks of their friendſhip and reſpect, were beſtowed on theſe people. Benvenuto Aliprando, an old ruſtic poet, in his Chronicle, deſcribes a marriage at the great court of Mantua, in the year 1340, while under the dominion of the Gonzaga family. "At that time," ſays he, "the different princes and nobles of Italy, whoſe names he mentions, preſented the Gonzaghi with a variety of rich and precious veſtments, which were called *robe*, robes, and which were afterwards given to muſicians and buffoons," as the old poet informs us in the following lines:

> "Tutte le robe ſopra nominate,
> Furon in tutto trent' otto e trecento,
> A buffoni e ſonatori donate."

> "And all theſe coſtly robes of ſtates,
> In all three hundred thirty-eight,
> To fidlers and buffoons were given."

The family of Gonzaga, in return, reciprocally exerciſed munificence towards the nobles who viſited them, as the ſame old poet informs us in the following rude verſes:

> "Otto giorno la corte ſi durare
> Torni eri, gioſtri, bagordi facia,

Bellar,

Bellar, cantar', e fonar facean fare,
Quattro cento fonator fi dicia
Con buffoni alla corte fi trovoe.
Roba e danar donar lor fi facia.
Ciafcun molto contento fi chiamoe, &c."

" Eight days thefe fports were held, where valiant knights
In tilts and tournaments their prowefs fhow,
And minftrels, full four hundred, crown the rites,
While dance and fong teach ev'ry heart to glow.
To thefe and each buffoon who here was found,
Or gold was given, or robes of coftly fort;
And all, fo well their fpritely arts were crown'd,
Depart contented from the fplendid court."

With what magnificence the princes of the houfe of Vifconti fupported their court at Milan, during the fame century, is frequently defcribed by Corio the hiftorian; but he particularly excites our wonder by his account of the folemn pomp with which the nuptials of Lionel, duke of Clarence, fon of Edward III. king of England, was celebrated in 1368, with Violante, the daughter of Galeazzo Vifconti, duke of Milan. This event is circumftantially related by feveral other ancient hiftorians of Italy; and Aliprando of Mantua tells us, that Lionel gave five hundred fuperb dreffes to the minftrels, muficians, and buffoons, who were then affembled at Milan; that Galeazzo prefented them with many more; and Bernabo, his brother, rewarded them munificently with money on the occafion.

The fplendid robes and gorgeous attire of bards and minftrels at all times are upon record. The flowing veft of Orpheus, in the triple capacity of prieft, legiflator, and mufician, is fpecified by Virgil; Arion is related by Herodotus to have leaped into the fea, in the rich veftments he ufually wore in public; Suidas fpeaks of the faffron robe and Milefian flippers worn by Antigenides; and the performers in the tragic chorus, which ufed to be furnifhed at the expence of fome wealthy citizen of Athens, wore alfo a fplendid and coftly uniform.

In France the *Jongleurs*, and in Provence the *Troubadours*, or minftrels, during the middle ages, had frequent prefents of coftly robes from their patrons. In the "Fabliau Conte," or Tale of the red Rofe, a female complains to a *vavaffor*, or yeoman, of his having taken from her a robe, to give to the minftrels.

" Bien doit eftre vavaffor vis,
Qu'il vuet devenir meneftrier;
Miez voudroi que fuffiez rez, (rafé)
Sans aigue (eau) la tefte & le coul,
Que ia n'y remanfift chevoul,
S'apartient à ces jongleours,
Et à ces autres chanteours,
Qu'ils ayent de ces chevaliers,
Les robes, car c'eft lor meftiers."
Fabliau de la Rofe vermeille.

" I would not own the wretch for kin,
Who wou'd the minftrel trade purfue,
He'd better *dry* fhave head and chin,
And, with the hair, cut off the fkin,
Than herd with fuch a worthlefs crew.
Let fplendid knights with ufual pride,
On fidlers lavifh fuch rewards,
But 'tis to meaner fools denied
To ftrip themfelves for vagrant bards."

The cuftom of prefenting muficians with fuperb and expenfive dreffes during the 14th century, in the manner already related, feems to have travelled into England, and to have continued here till after the eftablifhment of the king's band of four-and-twenty performers; part of their prefent falary being ftill paid at the wardrobe office, as an equivalent for the annual drefs with which they ufed to be furnifhed at his majefty's expence. To this we may add, that the *waits*, or muficians who attend on the mayor and aldermen, in moft of our incorporate cities and towns, are furnifhed with fplendid cloaks.

ROBE, in *Geography*, a river of Ireland, which, rifing in the eaftern part of the county of Mayo, flows weftward by the town of Ballinrobe; a few miles weft of which it difcharges itfelf into Lough Mafk.

ROBEC, a river of France, which runs into the Seine, a little below Rouen.

ROBEK, a river of France, which runs into the Meufe, near Stevenfwaert.—Alfo, a river of France, formed by the union of the Clarence and the Nevee, which, after a fhort courfe, runs into the Lys, 2 miles E. of St. Venant.

ROBEK, or *Robeque*, a town of France, in the department of the Straits of Calais; 3 miles S. of St. Venant.

ROBEL, a town of the duchy of Mecklenburg; 9 miles S. of Wehrau. N. lat. 53° 10'. E. long. 12° 45'.

ROBER, a river of France, which runs into the Mofelle, at Treves.

ROBERDSMEN. See ROBBERY.

ROBERGIA, in *Botany*, received that appellation from Profeffor Schreber, in memory of Laurence Roberg, profeffor of phyfic in the univerfity of Upfal, who was born in 1664, and died in 1742. His moft curious, though very compendious and fuperficial publication, entitled *Grundvahl til Plantekjænningen*, is an anonymous introduction to botany, on Tournefort's plan, of 20 duodecimo pages, with as many rude wooden cuts of flowers, to illuftrate the principal claffes. Of the fifteen various inaugural differtations, publifhed under the prefidency of Roberg, only two are botanical; one being that of John Olaus Rudbeck, on the *Sceptrum Carolinum* (fee RUDBECK); and the other by Lofsberg on the Generation of Plants.—Schreb. Gen. 309. Willd. Sp. Pl. v. 1. 752. Mart. Mill. Dict. v. 4. (Rourea; Aubl. Guian. v. 1. 467. Juff. 369.)—Clafs and order, *Decandria Pentagynia*. Nat. Ord. *Terebintaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, in five deep, roundifh, concave fegments, permanent. *Cor.* of five roundifh petals, the length of the calyx. *Stam.* Filaments ten, inferted into the receptacle, the length of the corolla; anthers roundifh. *Pift.* Germen fuperior, roundifh, villous; ftyles five, capillary; ftigmas rather thick, furrowed. *Peric.* Drupa ovate, moft convex on one fide, flightly hollowed out at the other. *Seed.* Nut the fhape of the drupa, of one cell, with a bivalve fhell.

Eff. Ch. Calyx in five deep fegments. Petals five. Drupa fuperior, of one cell. Nut with a bivalve fhell, and fingle kernel.

1. R. *frutefcens.* Willd. n. 1. (Rourea frutefcens; Aubl. Guian. v. 1. 467. t. 187.)—Native of woods in Guiana, belonging to the parifh of Aroura, flowering in Auguft. The *ftem* is fhrubby, fupporting itfelf by branching over the neighbouring trees. *Leaves* alternate, pinnate, of three or four pair, with an odd one, of ftalked, elliptical, pointed, entire leaflets, from an inch and a half to three inches long; fmooth above; downy and whitifh beneath. *Flowers* in axillary, branched panicles, white, with a fcent fweeter than that of lilac. *Fruit* black, with a greenifh kernel.

ROBERT, in *Biography*, emperor of Germany, furnamed the *Short*, born in 1352, was count palatine at the time of the depofition of Wenceflaus; and Frederic, duke of Brunfwick, who was firft elected by the German princes to fupply the vacancy, having been affaffinated, Robert was chofen in his ftead in 1400. Wenceflaus had fold the dukedom of Milan to John Galeazzo, who had withdrawn his ftate from the fovereignty of the empire, and by force of arms had annexed to it feveral neighbouring towns and diftricts. Robert, therefore, invited by the pope and Florentines, led an army into Italy, and entered the duchy of Milan; but he was fo much harafled, as to be obliged to march back to Germany, without having effected any thing. On his return he was involved in fome petty wars with princes and ftates, who difputed his authority; and a confederation was formed againft him, which fubfifted during the whole of his reign. The moft inveterate of his opponents was the elector of Mentz, who began to build a caftle at Hochft, in defiance of him. Robert affembled troops to reduce him to obedience; but having advanced to Oppenheim, was feized with a fever, which proved fatal to him in 1410, at the age of 58. He was a prince of more prudence than enterprize, but poffeffed qualities which would have rendered his reign happy in lefs turbulent times. He was juft, clement, and pious, an enlightened politician, and a lover of learning, as he manifefted by founding the univerfity of Heidelberg.

ROBERT, king of France, fon of Hugh Capet, was affociated by his father to the crown in 988, and fucceeded him in 997, being then in his 27th year, and highly efteemed for his qualities both of body and mind. He had married Bertha, daughter of Conrad, king of Burgundy, and widow of Eudes, count of Blois. As he was diftantly related to his queen, and had alfo ftood god-father to one of her children by her former hufband, his marriage was confidered as invalid by Gregory V.; the parties were commanded to quit each other, and to fubmit to feven years' penance, on pain of excommunication. The king refufing to comply with this mandate, the fentence was iffued againft him, and the greater part of his own bifhops joined in it. The effects of this excommunication are a ftriking example of the fuperftition of the age. The lords of his court broke off all intercourfe with him, and the fervants, who remained to wait upon him, fhewed their horror of his fituation by throwing to the dogs all the relics of food touched by the king or queen, and burning the veffels they had ufed. It was even reported that the queen was delivered of a monfter. At length the king gave way, and parting with Bertha, by whom he had no iffue, efpoufed Conftance, daughter of the count of Arles, a beautiful woman, but violent and capricious, who difquieted all the remainder of his life.

The death of the duke of Burgundy, the king's uncle, without lawful heirs, in 1002, caufed that rich inheritance to fall to the crown of France; and after a war carried on for fome years with another claimant, Robert obtained poffeffion of the country, with which he invefted his fecond fon, Henry. The termination of this war gave much fatisfaction to the king, who was more inclined to the arts of peace than to military exploits; and he occupied himfelf in cares for the regulation of his court and houfehold, and the cultivation of letters and religion among his people. He built and repaired many magnificent religious edifices, and merited the title of the devout. By the perfuafion of the queen, he affociated his eldeft fon, Hugh, in the government, in his 18th year. This prince, difgufted with the haughtinefs and avarice of his mother, withdrew from court, and was guilty of fome diforders; but by the mild treatment of his father, he was brought back to his duty. In 1022, Robert difplayed his attachment to orthodoxy, by caufing a council to affemble at Orleans, for the purpofe of inquiring into a herefy introduced from Italy, which had been embraced even by fome diftinguifhed ecclefiaftics. Several of the culprits were burnt alive, in the prefence of the king and queen; the latter of whom manifefted the fury of her zeal, by thrufting out an eye of one who had been her confeffor, as he was led to execution. On the death of the emperor Henry II., in 1024, an Italian party offered the imperial crown and kingdom of Italy to Robert, or his fon; but the king had too much wifdom to involve himfelf in a war on fuch a project. In 1026 he loft his eldeft fon Hugh; on which event, he affociated in the crown his next fon, Henry, notwithftanding the oppofition of Conftance, who preferred her fon Robert. He died at Melun, in 1030, or 1031, about the age of 60, after a reign of 33 years. This prince was extremely beloved by his fubjects, on account of his mildnefs, juftice, and piety.

Robert was contemporary with Guido d'Arezzo. He was a great mufician, and a good poet: he wrote feveral hymns for the church, and fet them to mufic. They have been preferved among the ecclefiaftical chants, and are ftill the moft agreeable in its fervice. Conftance, his fecond wife, preffed him to write a hymn in her praife; and he made her believe that the hymn "Conftantia Martyrum" had been written for her, and fhe was fatisfied.

Trithemius writes, that Robert made a pilgrimage to Rome, and depofited on the altar himfelf, at St. Peter's, his hymns, in the prefence of the pope.

One of his beft hymns is "Veni, Sancte Spiritus." To him is likewife afcribed "Chorus Novæ Jerufalem;" the "Profe on the Afcenfion;" "Rex omnipotens Die odierna;" "Sancti Spiritûs adfit nobis Gratiâ." Laborde.

ROBERT I., king of Scotland, of the family of Bruce, memorable as the reftorer of the independence of his country, was grandfon of that Robert Bruce who was the unfuccefsful competitor with John Baliol for the crown of Scotland. But the death of his father, who left him heir to his eftates and pretenfions, with that of John Baliol, whofe fon was a captive with the Englifh, infpired him with high defigns both for himfelf and his country, which was then in a ftate of fubjection to Edward; and having left the Englifh court, to which, it is faid, his purpofes had been betrayed, he arrived in Scotland about the clofe of 1305, with the refolution of declaring himfelf. The Scottifh writers mention Comyn as the perfon who had given information againft him; but whether this were the fact, or fome other caufe of quarrel rofe between them, it is certain that at an interview at Dumfries, in February 1306, Bruce with his dagger ftabbed Comyn, who was afterwards difpatched by one of his affociates. This deed of violence could be juftified only by greater daring; and Bruce immediately proceeded to feize the caftle of Dumfries, to confine the Englifh judges affembled there, to affert his claim to the crown, and to fummon all the friends of his family to his affiftance. He was foon at the head of a body of troops, with which he penetrated as far as Perth, the Englifh every where flying before him; and in March he was folemnly crowned at Scone, in prefence of fome bifhops and nobles, and a great number of gentlemen. The king of England, highly enraged at the news of thefe events, ordered all the forces of the northern counties to enter Scotland, and join the family of Comyn, in order to take vengeance on the rebel, as he was termed. The earl of Pembroke marched to Perth, where he furprifed and defeated Bruce's troops at Methven, in June, their leader himfelf efcaping with difficulty. The broken remnant of his army was again routed by lord Lorn, the

the nephew of Comyn; and Bruce, difmiffing his few followers, was conftrained to take refuge in an unfrequented ifle of the Hebrides.

Neither friends nor foes were acquainted with the fate of Bruce, when he fuddenly appeared at his eftate of Carrick, at the head of a fmall but refolute band, with which he furprifed an Englifh lord, who had obtained a grant of that property; but on the approach of a detachment from the Englifh army, he retreated to the Highlands. In the mean time, Edward was preparing for an expedition into Scotland with a force which was to reduce it to entire fubmiffion. He was foon after delivered from the moft formidable of his foes, by the death of Edward I. near Carlifle, as he was juft upon the point of entering Scotland with a great army. His fon, Edward II., though he obeyed his father's dying injunction of marching into Scotland, yet purfued the war with no vigour, and foon returned to England to join his favourite Gavefton. Robert, who had reduced the weftern counties, left them in charge of his gallant friend, fir James Douglas, and proceeded againft his enemies in the north. He afterwards made himfelf mafter of Invernefs, and the northern diftricts; and at length, having taken the caftle of Forfar and the town of Perth, he brought the whole of Scotland, except a few fortreffes, to acknowledge his authority. In the beginning of 1314, there remained in Scotland only the caftles of Stirling, Dunbar, and Berwick, in the hands of the Englifh. Edward had now, after the death of Gavefton, reconciled himfelf with his difcontented barons; and it was refolved that he fhould make an attempt to recover Scotland, with fuch a force as might overcome all refiftance. At the head of the greateft army that had ever entered that country from England, he moved from Berwick in June 1314, and marched for Stirling, to relieve its caftle, then befieged by Robert in perfon. The Scotch army, much inferior in number to the Englifh, but compofed of veteran troops, awaited the approach of the enemy on the banks of the rivulet of Bannock, in the road to Stirling. In a fkirmifh of cavalry preceding the engagement, Robert difplayed his ftrength and prowefs by cleaving down to the chin, with his battle-axe, an oppofite commander, of the family of Bohun. This was an omen of the fuccefs of the great battle of Bannockburn, in which, through the able difpofition and conduct of Robert, the Scotch obtained the moft decifive victory over the Englifh that their annals boaft, and eftablifhed the independence of their country. Edward himfelf narrowly efcaped; and the number of noble prifoners was fuch as to enable Robert to recover, by exchange, his wife, daughter, and fifter, with feveral men of rank, who had been the captives of Edward I. The king of Scotland followed up his fuccefs by an invafion of England, in which he ravaged the northern counties without oppofition. He now thought himfelf ftrong enough to give the Englifh government moleftation in another quarter; and in 1315 he fent his brother, Edward, over with a body of troops to the north of Ireland, to affift the natives in freeing themfelves from the dominion of England. Robert himfelf followed with a large reinforcement in 1316, but was compelled by famine to return; and his brother, after experiencing a variety of fortune, was defeated and flain in an engagement with the Englifh near Dundalk.

The depofition and death of Edward II., in 1327, gave occafion to a breach of the truce on the part of the king of Scotland, who feems not to have confidered himfelf as bound to the new government. In reality, however, he was tempted by the difordered ftate of England to renew hoftilities, for which he had been fome time preparing. Young Edward III. was not a prince to fuffer an infult without refiftance and retaliation; and learning that the Scotch under Douglas and Murray, were making dreadful ravages in Northumberland, he affembled a powerful army, and went in fearch of them. They, however, eluded all his attempts to bring them to action, and retired to their own country. Edward difmiffed his army, and in the fame year a peace was agreed upon between the two nations, by an article of which the king of England renounced all claim to fuperiority over the kings or kingdom of Scotland; and thus the great object of Robert's reign, the independence of his country, was finally eftablifhed. At the fame time, his only fon David, then five years of age, was contracted to Joan, Edward's fifter. Robert was now nearly worn out with the cares and fatigues of his active life; and in 1329, at his caftle of Cardrofs, he expired, in the 54th year of his age and the 24th of his reign, leaving a name memorable in the annals of his country, which he refcued by his courage and wifdom from a foreign yoke, and reftored to its rank among nations. Hume. Henry. Univ. Hift.

Robert, king of Naples, fon of Charles II., by the fifter of Ladiflaus, king of Hungary, born in 1279, was duke of Calabria at the time of his father's death, in 1309. The fucceffion was difputed between him and the fon of his elder brother, Carobert, king of Hungary; but the college of cardinals (Naples being then confidered as a fief of the holy fee) decided in Robert's favour. He was crowned at Avignon, and, in gratitude to the pope, exerted himfelf to oppofe the Ghibelline or imperial party in Italy. At this time the crown of Sicily was in poffeffion of Frederic III. of Arragon, who, for his defence againft the king of Naples, formed an alliance with the emperor. Robert was ambitious to extend his dominion, and almoft the whole of his reign was fpent in fruitlefs attempts to conquer the ifland of Sicily. He alfo, during his contefts with the Imperialifts, aggrandized himfelf in Lombardy, and for fome time he held the fovereignty of great part of Romagna, Florence, Lucca, Ferrara, Genoa, and feveral other places in Piedmont. He was the moft potent prince in Italy of his age; but it is lefs on account of his political and military fucceffes that he deferves commemoration, than becaufe he was the greateft royal proficient in fcience and letters, and the moft munificent patron of them, in the century in which he lived. Many of the early writers give their teftimony to his merits in this refpect; and Petrarch, in particular, in feveral parts of his writings, is profufe in his praife. Robert, however, is faid, when a child, to have been fo flow of comprehenfion, that it was with the greateft difficulty he could be taught the elements of grammar; and it was not till his preceptor had interefted him in Æfop's Fables, that he exhibited any fondnefs for learning. The private character of the king was highly amiable, and the only fault with which he is taxed was a difpofition to avarice, that grew upon him with his years. He had the misfortune of lofing his only fon, Charles, at the age of 31, on which occafion he exclaimed that the crown was fallen from his head. He died in January 1343, in the 64th year of his age, and 34th of his reign.

Robert, Claude, a French ecclefiaftic and chronologift of fome celebrity, was born at Cheflay, a village between Bar-fur-Seine and Tonnerre, on the borders of Burgundy, in the year 1564. From fome feminary in the province juft mentioned, he went to purfue his academical ftudies at Paris, where he obtained an exhibition in the college of Cambray. As foon as he had been admitted to the degree of licentiate in canon law, he accompanied his pupil into Burgundy, where, in 1590, he was prefented to a canonry of the Chapel-au-Riche at Dijon. Afterwards he travelled with his pupil through

through France, Flanders, Germany, and Italy. At Rome he was introduced to persons of the greatest distinction, and received several marks of esteem from the cardinals Bellarmine and Baronius. It was in this city that he first conceived the plan of his "Gallia Christiana." He was afterwards nominated bishop of Chalons-sur-Saone; upon which event this prelate conferred a canonry of his cathedral upon his preceptor, and made him his archdeacon and grand vicar. The bishop was desirous of expressing his regard for our author, by collating him to other benefices; but M. Robert constantly refused any additional preferment. He discharged the duties of his appointments with the strictest fidelity, and died in the episcopal palace at Chalons in 1637, when about 73 years of age. The most considerable of his production is entitled "Gallia Christiana," &c. published at Paris in 1626, in folio, with an appendix, preface, and chronological tables of the popes and anti-popes, the Eastern and Western emperors, the kings of France and England, the councils of France, the indictions, &c. He left behind him materials for a second edition of this work, which were made use of by M. St. Marthe, whose new collections increased the work to three volumes folio. It was afterwards extended by the Benedictines to twelve volumes folio.

Robert de Vaugondy, a French geographer, was born at Paris in the year 1688. Little is known of his private history, but he became geographer to the king, and died at Paris in 1766. His works are "An Introduction to Sanson's Geography," 1743; "An Abridgment of the different Systems of the World," 1745; "Sacred Geography," 1746; "A Treatise on the Use of the Globes;" "A Portable Atlas;" and above all "Atlas Universel," published in 1756, consisting of 108 maps, upon a large scale, engraved with neatness and accuracy. He had a son, who for some time was the assiduous companion of his labours, and who assisted him in the "Atlas Universel," to which work is prefixed an historical preface, in six chapters, treating of the origin, progress, and present state of geography.

Robert de Brienne, harper to Edward I. previous to his ascending the throne. The harp for many ages seems to have been the favourite instrument of the inhabitants of this island, whether under British, Saxon, Danish, or Norman kings. Many disgraceful circumstances are blazoned of the poor minstrels; it is therefore but just to relate those that redounded to their honour, and the Chronicle of Walter Heming furnishes an incident that well deserves to be recorded.

Edward I., according to this historian, about the year 1271, a short time before he ascended the throne, took his harper with him to the Holy Land; and this musician must have been a close and constant attendant on his master, for when Edward was wounded with a poisoned knife at Ptolemais, the harper, *citharœda suus*, hearing the struggle, rushed into the royal apartment, and killed the assassin. This signal service from his bard did not, however, incline the monarch, afterwards, to spare his brethren in Wales. See Grey's Ode, "Ruin seize thee, ruthless king!"

Robert, *Herb*, in *Botany*. See Geranium.

Robert *Bay*, in *Geography*, a bay on the E. coast of Newfoundland.

Robert *Bay*. See Cul *de Sac Robert*.

Roberts's *Island*, a small island on the Florida stream. N. lat. 24° 42′. W. long. 81° 33′.

Roberts's *Islands*, a cluster of small islands in the Pacific ocean, the largest being eight miles long and from two to three wide, four others being very small; discovered in the year 1792 by lieutenant Herget, commander of the Dædalus store-ship. S. lat. 7° 53′. E. long. 219° 50′.

ROBERTI, John, in *Biography*, a celebrated professor of divinity among the Jesuits, was born in the year 1569. He commenced his academical studies at Liege, and continued them at Cologne, where, when he was twenty-two years of age, he entered into the society of Jesus. His proficiency in various branches of learning is highly commended, particularly in the belles-lettres, the several departments of theological learning, and ecclesiastical history. He was made professor of divinity, and created doctor of that faculty, at Mentz, discharging the duties of his post with great reputation, during a long succession of years, in that city, at Doway, at Treves, and at Wurzburg. He died at Namur in 1651, in the 82d year of his age. He was author of many works on theological subjects, of which the most important, and that which proves how deeply he was versed in scripture criticism, was entitled "Mysticæ Ezekielis Quadrigæ, hoc est, Evangelia Historiarum et Temporum Serie vinculata Gr. et Lat."

ROBERTON, in *Geography*, a township of Washington county, Pennsylvania, containing 899 inhabitants.

ROBERTSON, William, in *Biography*, was born at Dublin in 1705, and received his grammar-learning under Dr. Francis Hutcheson, afterwards the celebrated professor of moral philosophy in the university of Glasgow. In the year 1722 young Robertson removed to that university, where he continued till the year 1725, when he was admitted to the degree of M. A. During this year there was a dispute between Mr. Sterling, the principal of the university, and the students, about the right of choosing the rector, in which Mr. Robertson took an active part, being selected by his fellow students to read their protest against the person, and his authority, who had been chosen rector in opposition to their wishes. Thus distinguished, he excited against himself the indignation of the principal, Mr. Sterling, and his rector, and was the only one of more than fourscore petitioners against whom they instituted proceedings. He was cited before the faculty, and after a trial which lasted several days a sentence of expulsion was pronounced. Mr. Robertson was satisfied of the justice of his cause, and presented a memorial on the subject to the duke of Argyle, through whose influence an appeal was made to the king, who appointed a commission to visit the university of Glasgow, with full powers to examine into and rectify all existing abuses. As a result of this enquiry, the right of electing their rector was restored to the students: the visitors on this occasion also, among whom was the earl of Hay, called the principal to a severe account for the public money which he had embezzled, and ascertained the right of the university to send two gentlemen, upon handsome exhibitions, to Baliol college in Oxford: they moreover annulled the expulsion of Mr. Robertson, and ordered that measure particularly to be recorded in the proceedings of the commission; declared the election of the rector, who had been named by the principal, to be void; and assembled the students, who immediately chose the son of lord Ross to be their rector.

While the visitors were exercising their powers, Mr. Robertson remained at London, and on the return of lord Hay he introduced Mr. Robertson to Dr. Hoadly, the bishop of Winchester, who made him known to Dr. Wake, archbishop of Canterbury; and he was entertained with much civility by both these prelates. He had, from a thorough conviction of its importance, devoted himself to the clerical profession; but at present being too young to be admitted into orders, he employed himself, while in London, in visiting public libraries, attending lectures, and improving himself himfelf as opportunity offered. As foon as he was old enough to receive ordination, he was nominated by Dr. Hoadly to the cure of Tallow, in the county of Carlow. Here he continued till he was of age for prieft's orders, to which he was admitted on the 10th of November 1729, and on the next day he was prefented by lord Carteret, then lord lieutenant of Ireland, to the rectory of Ravilly, in the county of Carlow, and to another rectory in the county of Wicklow. In 1728 he married Elizabeth, the daughter of major William Baxter, by whom he had twenty-one children.

Mr. Robertfon firft appeared as an author about the year 1738, by a pamphlet entitled "A Scheme for utterly abolifhing the prefent heavy and vexatious Tax of Tythes:" the object of this work was to pay the clergy and impropriators a tax upon land in lieu of tythes, and it excited fo much attention, that feveral editions of it were called for in a fhort fpace of time. In 1739 Mr. Robertfon received from lord Cathcart a deputation to be his chaplain; and in the year 1743 he obtained leave from his diocefan to nominate a curate at Ravilly, and to refide fome time in Dublin for the education of his children. Immediately on his fettlement in this city he was invited to the cure of St. Luke's parifh, which he retained about five years, when he returned to Ravilly. While in that city he formed a fcheme, jointly with Mr. Kane Percival, to raife a fund for the fupport of the widows and children of clergymen within the diocefe of Dublin, which has fince produced very happy effects. In 1758 he met with a fevere affliction in the death of his wife, to whom he was moft tenderly attached, but he fuftained the lofs with exemplary refignation to the will of God. Soon after this he found a new patron in Dr. Richard Robinfon, who had been tranflated from the fee of Killala to that of Ferns, and who prefented to Mr. Robertfon the firft benefice which became vacant in his lordfhip's prefentation. Before, however, he could be collated to it, he, for the firft time, had the "Free and Candid Difquifitions relating to the Church of England, &c." put into his hands; and, by the perufal, he was led to entertain fuch doubts refpecting fome points to which he would be required to declare his affent, as made him defer his attendance on the bifhop. At length he received a letter from his lordfhip, calling upon him to come immediately for inftitution. Upon this he wrote a very affecting letter to the prelate, in which he returned the moft grateful thanks for his kindnefs, but faid he could no longer confcientioufly comply with the terms required by law to qualify him for fuch preferment. "In debating this matter with myfelf," fays he, "befides the arguments directly to the purpofe, feveral ftrong collateral confiderations came in upon the pofitive fide of the queftion. The ftraightnefs of my circumftances preffed me clofe; a numerous family, quite unprovided for, pleaded with the moft pathetic and moving eloquence. And the infirmities and wants of age now coming faft upon me were urged feelingly. But one fingle confideration prevailed over all thefe—that the Creator and Governor of the univerfe, whom it is my firft duty to worfhip and adore, being the God of truth, it muft be difagreeable to him to profefs, fubfcribe, or declare, in any matter relating to his worfhip and fervice, what is not believed ftrictly and fimply to be true."

Mr. Robertfon, though he refufed to fubfcribe for the fake of preferment, did not feel it neceffary to quit the church, and continued to perform the duties of parifh prieft; but from this time he omitted the reading of the Athanafian creed, and fome other parts of the public fervice which appeared to him to countenance unfcriptural tenets. Finding, however, that this mode of conduct gave offence to fome perfons, he refigned his benefices in 1764, and in 1766 he publifhed, by way of apology to his friends for what he had done, his learned and ingenious little work, entitled "An Attempt to explain the Words Reafon, Subftance, Perfon, Creeds, Orthodox, &c." to which he fubjoined the letter written to his bifhop, of which an extract has been given above. He now came to London, where he met with a very cordial and liberal reception from many excellent men, who generoufly contributed to his fupport. In the following year he prefented a copy of his "Attempt, &c." to the univerfity of Glafgow, and, in return, received a moft obliging letter, accompanied with the diploma of D.D. In 1768 he was nominated to the mafterfhip of the free grammar-fchool at Wolverhampton, in Staffordfhire, by the company of Merchant Taylors; which, though honourable to the patrons, was not lucrative to the doctor, the falary being only 70*l.* *per ann.*, and this was, for fome years, diminifhed by a penfion of 40*l.* to a fuperannuated predeceffor. Dr. Robertfon was, however, fatisfied, and through the kindnefs of his friends was prevented from wanting what was neceffary to his fupport. At one time he received from an unknown hand a prefent of 500*l.*, and from various perfons ftated affiftance was fent him. In 1772 he was chofen one of the committee of the fociety of clergymen, &c. employed to draw up, and prefent to the houfe of commons, a petition praying for relief from the obligation of fubfcription to the 39 articles. In the courfe of a few years he had the misfortune to lofe all his children one after another; and he himfelf died in May 1783, in the 79th year of his age. Dr. Robertfon was poffeffed of great learning and an excellent judgment; he had a fine imagination, and a temper regulated by the mild and amiable fpirit of Chrift; and in his addrefs and manners he was at all times eafy and cheerful. When he quitted the church he was probably of the Arian fchool, but in the latter years of his life he became a firm believer in the fimple humanity of Chrift. He was mentioned by Mr. Lindfey, a few months before his death, as "the aged and venerable father of Unitarian nonconformity of our own days;" and in another work the fame writer fays, "the example of an excellent perfon now living at Wolverhampton, Dr. Robertfon, has been a fecret reproach to me ever fince I heard of it." See Lindfey's Apology for refigning the Vicarage of Catterick, his Hiftorical View of the Unitarian Doctrine, and Dr. Difney's Communications to the Gent. Mag. 1783.

Robertson, William, D. D., a celebrated hiftorian, was born in 1721, at Borthwick, in Mid Lothian, of which parifh his father was then minifter. He received the early part of his education at Dalkeith, under Mr. Leflie, a mafter of high repute. In 1733 he entered upon his academical ftudies at Edinburgh. After the completion of his courfe, he obtained a licence to preach in 1741, and in 1743 he was prefented, by the earl of Hopetoun, to the living of Gladfmuir, in Eaft Lothian. On this living, which was not more than 100*l.* *per ann.*, he contrived to educate his fix fifters and a brother, who, about this time, were left orphans by the death of both their parents. Here alfo he difplayed his zealous attachment to the caufe of liberty, by his efforts, in the year of the rebellion, in favour of the houfe of Brunfwick, which he carried fo far as to quit, for a feafon, his parochial charge, and join the volunteers of Edinburgh. He became, in a fhort time, diftinguifhed for his eloquence and good tafte as a preacher; and, in 1755, a fermon which he delivered before the Society for propagating Chriftian Knowledge, and which was the only compofition of that kind that he ever publifhed, raifed him very high as a pulpit orator. It paffed through five editions, and was tranflated

tranflated into the German language. He had, fome years previoufly to this, begun to take a part in the debates of the general affembly of the church of Scotland, and, as he poffeffed great talents for bufinefs, as well as the powers of a public fpeaker, he acquired an afcendancy in that body which, during a long period, gave him the lead in the ecclefiaftical politics of the country. In 1754 a "Select Society" had been eftablifhed in Edinburgh, among the firft members of which are found many names that, in procefs of time, became highly diftinguifhed in literature and public life. Among the number of thefe was that of Robertfon, who was moft affiduous in his attendance, and obtained from it an increafe of reputation. In the mean time he was deeply engaged in the ftudies neceffary for completing the plan of an hiftorical work which he had formed foon after his firft fettlement as a minifter, and having taken a journey to London for the purpofe of making arrangements for the publication, his "Hiftory of Scotland during the Reigns of Queen Mary, and King James VI." made its appearance in the year 1759, in two vols. 4to. He had, previoufly to this, as appears by the title-page of the volume, obtained the degree of D. D. It was received by the public with general approbation and applaufe. The celebrated Hume, fo far from betraying jealoufy or envy at the appearance of a competitor for the hiftoric palm, took the warmeft intereft in the fuccefs of the work.

The Hiftory of Scotland appears to have been the moft popular of the author's works, and it had paffed through fourteen editions during the life of the author. It had, in every refpect, a favourable influence on his fortune, fince the fame which he acquired by the publication was probably the caufe of his rapid promotion. He had removed to Edinburgh, in confequence of a prefentation to one of the churches of that city, while it was in the prefs; in the fame year he was nominated chaplain of Stirling-caftle; in 1761 he was appointed one of the king's chaplains in ordinary in Scotland, and in the following year he was elected principal of the univerfity of Edinburgh. Two years after this he was appointed to the poft of hiftoriographer royal of Scotland, with the falary of 200*l.* *per ann.*, fo that, at this period, he was the beft beneficed clergyman of his church. He was, moreover, the acknowledged head of the party which held the chief fway in a national church; and the period from his becoming principal of the univerfity of Edinburgh, to his retreat from public life, was commonly denominated "Dr. Robertfon's adminiftration."

In the midft of the numerous avocations which his feveral offices created, he proceeded to collect materials for his "Hiftory of the Reign of the Emperor Charles V.," which he publifhed in 1769, in three quarto volumes. This work was, like the former, received with high approbation; it increafed his reputation both on account of the greater maturity of ftyle to which he had attained, and of the more profound and varied refearch which the weight and copioufnefs of the theme led him to difplay. The introductory volume contained a view of the progrefs of fociety in Europe from the fubverfion of the Roman empire to the beginning of the fixteenth century, which was particularly admired, as prefenting a mafterly furvey of the gradations by which the focial inftitutions of antiquity have paffed, through the barbarifm of the dark ages, into all that characterizes the ftate of modern Europe. So highly pleafed was Catharine, the emprefs of Ruffia, with the Hiftory of Charles V., that fhe conveyed her acknowledgments to the author in a prefent of a rich fnuff-box fet with diamonds.

In the year 1777, Dr. Robertfon publifhed his "Hiftory of America," in two vols. 4to., which, from the new views of man and nature that it prefents, and the magnificence and variety of its fcenery, is perhaps the moft entertaining of his productions. Either gratitude for the communications obtained from the Spanifh court, or candour carried far beyond the bounds of moderation, led him to extenuate the cruelties that had been committed by that nation in their conquefts in the new world, to a degree that brought upon him cenfure. The work proved fo acceptable to the Spanifh nation, that the author was unanimoufly elected a member of the Royal Academy of Madrid. In 1791 Dr. Robertfon publifhed "An Hiftorical Difquifition concerning the Knowledge which the Ancients had of India, and the Progrefs of Trade with that Country, prior to the Difcovery of the Cape of Good Hope." After this, Dr. Robertfon's health began to decline, and in June 1793 he died at the age of 72. As an hiftorian his ftyle is pure, fweet, dignified without ftiffnefs, fingularly perfpicuous, and often eloquent; the arrangement of his materials is fkilful and luminous, his mode of narration is diftinct, and his defcriptions highly graphical; and he difplays a fagacity in the developement of caufes and effects, and in his judgment of public characters and tranfactions, which is very remarkable in one who was brought up in retirement. "If," fays one of his biographers, "there is lefs glow and ardour in his expreffions of moral and political feelings, than fome writers in a free country have manifefted; there is, on the other hand, all the candour and impartiality which belongs to a cool temper, when enlightened by knowledge and directed by principle." To his private and focial virtues the moft liberal teftimony has been given, even by thofe who were his opponents in church politics. See Dr. Dugald Stewart's Life of Principal Robertfon.

Robertson, Joseph, was born at Knipe, in Weftmoreland, in 1726, and educated at Appleby fchool, from which place, in 1746, he went to Queen's college, Oxford, where he took his degree of M. A., and, on entering holy orders, he was prefented to the vicarage of Hertford, in Hampfhire. In 1764 he became an author, by contributing largely to the Critical Review, an occupation in which he continued more than 20 years. In 1770 he was prefented to the rectory of Sutton, in Effex, and in 1779 to the vicarage of Horncaftle, in Lincolnfhire. In 1782 he publifhed what he entitled "An Introduction to Polite Literature," a very fmall volume, and which cannot certainly deferve fo high founding a title. It has been reprinted feveral times. It is a fort of fpelling-book or primer, with good rules for pronunciation. The author was, however, fo tenacious of his property, that he attacked, with much feverity, the late Dr. Paley, for copying a part of it without acknowledgment, into a little piece intended for the ufe of Sunday fchools. Dr. Paley's reply and defence is that of a gentleman and fcholar, and muft be quite fatisfactory to the candid reader. Mr. Robertfon's next piece, "An Effay on Punctuation," was publifhed in 1785; it is a work of confiderable merit, and has gone through feveral editions. In 1788 appeared his "Differtation on the Parian Chronicle." Mr. Robertfon publifhed, in 1795, a new "Tranflation of Telemachus;" and in 1798 "An Effay on the Education of Young Ladies," which was followed by an "Effay on the Nature of Englifh Verfe." He died in 1802. See Gent. Mag. vol. lxii. Monthly Mag. Meadley's Memoirs of Dr. Paley.

Robertson's *County*, in *Geography*, a county of America, in the diftrict of Weft Tenneffee, bordering N. on Kentucky, and containing 7270 inhabitants. It is watered by Cumberland and Red rivers.

ROBERVAL, Giles Personne de, in *Biography*, an excellent

excellent mathematician of the 17th century, was born at Roberval, a feignory belonging to his family, in the diocefe of Beauvais, in the year 1602. In the courfe of his education he difcovered a ftrong inclination towards the ftudy of the mathematics, with which he made himfelf very converfant. When he was 30 years of age he obtained the profefforfhip of mathematics in the college of Gervais, at Paris; and afterwards he contefted, with other candidates, the fucceffion to the vacant chair of Ramus, which he gained by the fuperiority of his powers in difputation. He fucceeded Morin as mathematical profeffor at the college-royal, the duties of which office he performed with high reputation fo long as he lived. He was chofen a member of the Royal Academy of Sciences in 1666, and communicated to that body fome curious experiments on the Torricellian vacuum, which he made in the years 1647 and 1648. He invented two new kinds of balances, one of which was adapted to the weighing of air. Roberval died in 1675, at the age of 73. His chief works are "A Treatife on Mechanics," inferted in Merfenne's "Univerfal Harmony." A treatife "On the Mundane Syftem," written in Latin, attributed to Ariftarchus of Samos, but generally believed to be his own production. Befides thefe he contributed feveral papers to the Memoirs of the Academy of Sciences: fuch as "Experiments concerning the Preffure of the Air;" "Obfervations on the Compofition of Motion, and on the Tangents of Curve Lines;" "The Geometrical Refolution of Plane and Cubic Equations;" "A Treatife on Indivifibles;" at the end of which he has explained a new method for the transformation of figures, to which Torricelli gave the name of "Robervallian Lines."

ROBERVALLIAN Lines, a name given to certain lines, ufed for the transformation of figures: thus called from their inventor M. de Roberval.

Thefe lines bound fpaces infinitely extended in length, which are neverthelefs equal to other fpaces terminated on all fides.

The abbot Gallois, in the Memoirs of the Royal Academy, anno 1693, obferves, that the method of transforming figures, explained at the latter end of M. de Roberval's Treatife of Indivifibles, is the fame with that fince publifhed by Mr. James Gregory, in his Univerfal Geometry, and afterwards by Barrow, in his Lectiones Geometricæ; and that, by a letter of Torricelli, it appears that Roberval was the inventor of this manner of transforming figures, by means of certain lines, which Torricelli therefore called *Robervallian lines.*

He adds, that it is highly probable, that J. Gregory firft learned the method in the journey he made to Padua in 1668; the method itfelf having been known in Italy from the year 1646, though the book was not publifhed till the year 1692.

This account Dr. David Gregory has endeavoured to refute, in vindication of his brother. His anfwer is inferted in the Phil. Tranf. an. 1694, and the abbot has rejoined in the French Memoirs of the Academy.

ROBESON, in *Geography*, a county of North Carolina, in Fayette diftrict, bounded S. by the ftate of South Carolina. It contains 7528 inhabitants. The chief town is Lamberton.—Alfo, a townfhip of Lancafter county, Pennfylvania; containing 1807 inhabitants.

ROBESPIERRE, Maximiliam Isidore, in *Biography*, was born at Arras in 1759. His father, a barrifter, having ruined himfelf by his prodigality, left France before the revolution, eftablifhed a fchool at Cologne, where, however, he did not remain long, and he went from thence into England, and afterwards to America. Deferted by his father, and his mother dying when he was only nine years old, he was taken under the patronage of the bifhop of Arras, M. de Conzie, who caufed him to be fent to the college of Louis le Grand, where he was taken on the foundation. From a very early age he was noticed for his love of independence; he was however timid, and in his temper gloomy and unfociable. He was extremely affiduous in his ftudies, and gave hopes of talent, that were not realized in after-life. In 1775, when Lewis XVI. made his entry into Paris, he was chofen by his fellow ftudents to prefent to that prince the homage of their gratitude. Becoming a barrifter in the council of Artois, he obtained a place in the academy of Arras. In the year 1789 he took an active part in all the revolutionary meetings, and was appointed a deputy from the province of Artois to the States-General. He manifefted but little talent as an orator or legiflator, but attached himfelf to Neckar, and then to Mirabeau, during the heights of their popularity; but when they became lefs careffed by the people, Robefpierre was the firft to notice the difference, and deferted them for fome other leader. The firft time that he made himfelf at all remarked in the conftituent affembly, was on the 20th of July 1789, when he oppofed the fcheme of martial law; and from that period, fays his biographer, "he endeavoured to legitimatize infurrection." By courting the people, and difplaying a determined hoftility to the royal prerogatives, he laid the foundation for future influence in the democratic party; and it has been confidered a very remarkable circumftance, in connection with his future conduct, that the moft frequent topic of his declamation was the injuftice of capital punifhment in any cafe.

After the diffolution of the conftituent affembly, followed by the election of the legiflative body, the members of which being all new, Robefpierre's chief theatre of action was the Jacobin club, at which he was the principal fpeaker. He alfo publifhed a weekly paper, entitled "Le Defenfeur de la Conftitution." He now took a decided part with the republicans, though it does not appear that he was an actor in the infurrection of the 10th of Auguft, or in the prifon-maffacres of September. In the new affembly, which met in September 1792, he was returned a member for the city of Paris, and he foon became the head of the party called the Mountain, which was oppofed to the followers of Briffot, who then poffeffed the minifterial power. He was now charged with the defire of making himfelf dictator, but his party in the fenate was too powerful for his accufer to carry the point, and the affembly paffed a decree to print and circulate the fpeech which he made in juftification of himfelf. By this he became ftill more popular, and his fubfequent exertions to bring the unfortunate king to trial, augmented his influence with the democratic part of the nation. Soon after the execution of Lewis, Robefpierre, affifted by Danton and Marat, gained a moft decided fupremacy in the national convention, and the period commenced which has been emphatically, but juftly, denominated the reign of terror. The Briffotines, to the number of twenty-one, were accufed, condemned, and guillotined. After them followed the queen, the duke of Orleans, and other members of the royal family. The fcaffold daily ftreamed with the blood of nobles, priefts, and all who by character and condition could be fufpected of being attached to the ancient government. In fome of the provinces, maffacres were perpetrated againft whole orders of men, without diftinction: the levelling principle was extended to all fuperiority of fcience and talent, and it feemed Robefpierre's object to bring back an age of barbarifm. At length his own confederates, Danton, Defmoulins, Fabre d'Eglantine, and others, were brought to the block.

block. In the midst of all these horrors he exhibited a festival, in which the existence of the Supreme Being was solemnly recognised; and as the restorer of religion, he appointed days for public worship.

The reign of terror was now become too intolerable to be endured. No man was safe from a tyrant whose bloody disposition seemed to grow with the acts of cruelty which it generated, and who had established such a system of domestic treachery, as destroyed the confidence of society, and subjected every individual to accusation. He lost his popularity, and a decree of the convention was passed against him: in the act of arresting him two pistols were fired, by which he was wounded in the head and the under-jaw. He endured in silence the pain of his wounds, and the upbraidings of his foes, and was carried to the same dungeon which he had made to many the passage to death. On the next day, after being taken, with his accomplices, before the revolutionary tribunal, he was led, July 28, 1794, to execution, amidst the acclamations and curses of thousands of spectators. Such was the well-merited end of Robespierre, in the 36th year of his age. Although a concurrence of circumstances enabled him to act a considerable part in the revolution, he was not one of the superior figures in point of abilities and force of character. Natural reserve, cunning, habitual dissimulation, and a total want of feeling, carried him through difficulties which might have overwhelmed a greater man; but as he never made a friend, and was unsupported by native courage, he sunk under the first serious opposition. He was regarded as incorruptible, and never accumulated money: nevertheless, he always took care to open the path of honour and wealth to his own creatures, and especially to his rivals, in order that he might have an additional method of ruining them. Upon the whole, he has left a name more the object of horror and detestation, than that of any other among the personages of the same awful drama.—Ann. Register. Lives of Remarkable Characters, who have distinguished themselves in the French Revolution. Biog. Anec. of the Founders of the Fr. Rev.

ROBIA HERBA, in *Botany*, a name given by Paulus Ægineta, and many others, to a plant used in dyeing.

The near resemblance of the name to the word *rubia*, has made many conclude that it was the *rubia*, or madder, which they have meant by it; but they have taken care in their writings to distinguish it from that plant, and it is plainly the *genistella tinctoria*, or dyer's weed, that they meant by the *robia herba*. They say it was used to dye yellow, and that it was also a custom to stain the hair with it.

These are the properties recorded of the *cymene* and *æcomenium* of the Greeks, and the *lutum*, or *lutea herba*, of the Latins, which were names of the *genistella tinctoria*. Pliny says, that the *lutum* had leaves like flax, and flowers like broom, which is exactly the case with the *genistella tinctoria*, but by no means agrees with the glastum or woad.

ROBIESSOU, in *Geography*, a town of Austrian Poland; 22 miles S. of Chelm.

ROBIGALIA, or RUBIGALIA, in *Antiquity*. See RUBIGALIA.

ROBILLANTE, in *Geography*, a town of France, in the department of the Stura; six miles S. of Coni.

ROBIN, or, as it is more usually called, *Robin red-breast*, *Rubecula*, in *Ornithology*. See RED-*breast*.

ROBIN, *Ragged*, in *Botany*. See CAMPION.

ROBIN, *Wake*. See WAKE *Robin*.

ROBINAL, in *Geography*, a town of Mexico, in the province of Vera Paz; containing 800 inhabitants; 40 miles S.S.W. of Vera Paz.

ROBIN-HOOD's BAY, a bay on the E. coast of Newfoundland, frequented by small vessels.

ROBINIA, in *Botany*, commemorates John Robin, botanist to Henry IV. and Louis XIII. of France, who published a catalogue of his own garden, which has gone through several editions. He also supplied descriptions to Vallet's figures. A popular French author, who calls himself M. de Vigneul-Marville, but whose real name was d'Argonne, in his *Melanges*, stigmatizes Robin for his greedy and selfish love of flowers, the more curious kinds of which he would rather destroy, than communicate to his friends. In allusion to this, and to a report of his being an eunuch, he was addressed in a bitter Latin satire, as by nature an enemy to all propagation. De Theis, nevertheless, speaks of Vespasian Robin as his son. They published conjointly a botanical *Enchiridion*, or manual, and one of them introduced into the French gardens, from American seeds, that species of *Robinia* called *Psedo-acacia* by Tournefort, who under that name founded the present genus.—Linn. Gen. 378. Schreb. 501. Willd. Sp. Pl. v. 3. 1131. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 4. 323. Pursh v. 2. 487. Juss. 358. Lamarck Illustr. t. 606. Gærtn. t. 145. (Pseudoacacia; Tourn. t. 417. Caragana; Lamarck Dict. v. 1. 615. Illustr. t. 607. Juss. 358.)—Class and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminosæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, small, bell-shaped, four-cleft; the three lower teeth narrowest; the upper one twice as broad, with a broad shallow sinus; all of equal length. *Cor.* papilionaceous. Standard roundish, large, spreading, obtuse. Wings oblong-ovate, distinct, each with a very short blunt appendage. Keel nearly semiorbicular, compressed, obtuse, the length of the wings. *Stam.* Filaments diadelphous, one simple, the other nine combined, ascending towards the extremity; anthers roundish. *Pist.* Germen cylindrical, oblong; style thread shaped, bent upwards; stigma terminal. *Peric.* Legume large, long, gibbous, compressed. *Seeds* few, kidney-shaped.

Eff. Ch. Calyx four-cleft; the upper segment divided. Standard roundish, reflexed. Stamens in two distinct sets. Legume elongated, gibbous, of one cell, with many seeds.

Obs. Jussieu and Lamarck distinguish their genus *Caragana*, by its smooth abrupt stigma, and a somewhat cylindrical inflated legume. The former adds, that the leaves are abruptly pinnate, without the terminal leaflet seen in *Robinia*. Yet Lamarck's plates do not confirm all these distinctions. Linnæus describes the stigma as downy, and yet in his Syst. Veg. ranges *Robinia* among genera which want that character. In fact the style, rather than the stigma, is downy.

1. R. *Pseudoacacia*. Common Acacia, or Robinia. Linn. Sp. Pl. 1043. Willd. n. 1. Ait. n. 1. Pursh n. 1. "Schmidt Arb. t. 32." (Pseudoacacia; Duham. Arb. v. 2. 188. n. 1. t. 42.)—Partial stalks single-flowered. Leaves pinnate, with an odd leaflet. Stipulas spinous. Legumes smooth, compressed.—Native of dry fertile ridges, on the mountains of North America, from Canada to Carolina, flowering in May and June. *Pursh.* Cultivated here, by the elder Tradescant, before 1640. *Parkinson.* This is a large and handsome *tree*, of quick growth, beautiful in *foliage*, and highly ornamental, when laden in summer with bunches of white sweet-scented *flowers*, resembling those of the *laburnum* in size and position. The branches are liable to be shivered off by our autumnal storms. Mr. Pursh says, "the wood is almost incorruptible, and particularly calculated for posts of gates and fences." The *leaves* are deciduous

deciduous, a ſpan long, of a peculiarly pleaſant light green, conſiſting of many elliptical, oppoſite or alternate, ſtalked leaflets. The ſhort awl-ſhaped *ſtipulas* become rigid ſpines. *Legumes* pale, wavy, compreſſed, two or three inches long.

2. R. *viſcoſa.* Clammy Robinia. Willd. n. 2. Ait. n. 2. Purſh n. 2. Venten. Jard. de Cels, t. 4. (R. glutinoſa; Curt. Mag. t. 560. R. Pſeudoacaciæ var. Sm. in Abbot's Inſ. of Georgia, v. 1. 37. t. 19.)—Partial ſtalks ſingle-flowered. Leaves pinnate, with an odd leaflet. Branches and legumes clothed with viſcid glands.—Native of the banks of rivers in South Carolina, eſpecially the Savannah, flowering in June and July; and ſaid to have been introduced into our gardens, where it is quite hardy, by Mr. R. Whitley, in 1797. This ſpecies not being known to us when Abbot's Inſects of Georgia were publiſhed, was, in that work, miſtaken for a red-flowered variety of the foregoing. The whole *tree* is of a ſmaller ſize than that ſpecies, and diſtinguiſhed by its dark red viſcid *branches*. The *flowers* are variegated with pink and white. *Stipulas* forming ſtraighter ſpines. The creeping *roots* are ſaid, by Mr. Purſh, to be troubleſome in ſmall plantations. Hence, however, our gardeners propagate the tree the more eaſily by cuttings of the root, inſtead of grafting this ſpecies on the more brittle *Pſeudoacacia.*

3. R. *violacea.* Violet Robinia. Linn. Sp. Pl. 1044. Willd. n. 3. Ait. n. 3. Jacq. Amer. 210. t. 177. f. 49. —Partial ſtalks two-flowered. Calyx but ſlightly toothed. Leaves pinnate, with an odd leaflet. Branches without thorns.—Found by Jacquin in buſhy places about Carthagena in South America, flowering in July and Auguſt. Miller cultivated this plant, but it is now unknown in our ſtoves. Jacquin deſcribes it about twelve feet high, erect, with ſhining *leaves,* whoſe *leaflets* are about ſix pair, ſtalked, ovate, obtuſe, emarginate, two inches long. *Cluſters* axillary, half a foot in length; their partial ſtalks ſhort, numerous, each bearing two *flowers,* which reſemble our ſweet violet in ſcent as well as colour.

4. R. *ſtriata.* Striated-leaved Robinia. Willd. n. 4.—"Partial ſtalks ſingle-flowered. Leaves pinnate, with an odd leaflet; downy beneath. Branches without thorns." —Gathered by Bredemeyer, on open ſunny hills in the Caraccas. A large *ſhrub,* with pale, unarmed, warty *branches. Leaves* half a foot long, compoſed of from fifteen to twenty-five oblong, pointed *leaflets,* each an inch in length, ſtriated with veins; ſhining above; covered with cloſe-preſſed hairs beneath. *Stipulas* lanceolate, deciduous. *Cluſters* ſimple, ſhorter than the leaves, downy, as well as the *calyx. Bracteas* awl-ſhaped, very ſhort. *Corolla* yellow, *Willdenow.*

5. R. *hiſpida.* Hairy Robinia, or Roſe Acacia. Linn. Mant. 101; excluding the reference to Jacquin. Willd. n. 5. Ait. n. 4. Purſh n. 3. Curt. Mag. t. 311. (R. foliis impari-pinnatis; foliolis ovatis, ramis pedunculiſque hiſpidis; Mill. Ic. 163. t. 244. Pſeudoacacia hiſpida, floribus roſeis; Cateſb. Carol. v. 3. 20. t. 20.)—Branches, calyx, and flower-ſtalks hiſpid. Thorns none. Leaves pinnate, with an odd leaflet. Partial ſtalks ſingle-flowered.—Native of mountains in Virginia and Carolina. Hardy with us, flowering from May to September, being a very ornamental *ſhrub,* on account of its large pink copious *bloſſoms,* enhanced, like a moſs roſe, by the brown briſtly covering of the *ſtalks* and *calyx.* Purſh notices a taller and leſs hiſpid variety.

6. R. *ſepium.* Hedge Robinia. Willd. n. 6. Jacq. Amer. 221. t. 179. f. 101. Swartz Ind. Occ. v. 3. 1258. —Partial ſtalks moſtly two-flowered. Leaves pinnate, with an odd leaflet, pointed. Thorns none.—Native of the banks of rivers, in the receſſes of mountains of the Weſt Indies, flowering about March and April. A *tree* twenty or thirty feet high, with long, lax, ſpreading *branches.* The *leaflets* differ from thoſe of *violacea,* n. 3, in being pointed, not emarginate. *Cluſters* rather drooping, of numerous purple *flowers;* their *ſtalks* ſmooth.

7. R. *ſquamata.* Scaly-branched Robinia. Willd. n. 7. "Vahl Symb. v. 3. 88. t. 69."—Partial ſtalks ſingle-flowered. Leaves pinnate, with an odd leaflet, ſpinous-pointed. Stipulas ſpinous.—Native of the iſland of St. Thomas. *Branches* round, ſmooth, leafy towards the ends, ſcaly below the leaves; bearing ſmaller ones ſcarcely an inch long, clothed with four rows of imbricated, ovate, pointed ſcales. *Leaflets* about nine pair, oval or roundiſh, ſmooth and ſhining on both ſides, the midrib of each extended into a terminal ſpine. *Stipulas* permanent, hardening into thorns. *Cluſters* axillary, downy, of four or five diſtant *flowers. Bracteas* ſmall, linear. *Calyx* ſmooth, with lanceolate ſegments. *Legume* compreſſed, linear, occaſionally contracted here and there, as if jointed.

8. R. *uliginoſa.* Swamp Robinia. Willd. n. 8.—"Partial ſtalks three-flowered. Leaves ternate, oblong, pointed. Branches twining, without thorns."—Native of the Eaſt Indies; communicated to Willdenow by Dr. Roxburgh. The *branches* are deſcribed as round and ſmooth. *Leaflets* an inch and half long, pointed, ſmooth. *Cluſters* from the old branches, three inches in length. *Flowers* apparently white.

9. R. *ſcandens.* Climbing Robinia. Willd. n. 9. (R. Nicou; Aubl. Guian. v. 2. 771. t. 308.)—Partial ſtalks ſingle-flowered. Leaves pinnate, with an odd leaflet, oval, pointed, ſmooth. Branches twining, without thorns.—Native of the woods of Guiana, flowering in June. A twining *ſhrub,* of lofty growth, crowning the neighbouring trees with its leafy *branches,* and purple *bloſſoms.* The *leaflets* are uſually ſeven, each about four inches long. *Flowers* in axillary cluſters. *Legume* compreſſed, thick-edged, ſmooth, meaſuring about two inches. The natives of Guiana beat the water with freſh cut twigs of this ſhrub, by which means the fiſh are intoxicated, and floating inſenſible near the ſurface, are eaſily caught.

10. R. *tomentoſa.* Downy Robinia. Willd. n. 10. (R. Panacoco; Aubl. Guian. v. 2. 768. t. 307.)—Partial ſtalks ſingle-flowered. Leaves pinnate, with an odd leaflet, elliptical, pointed, coriaceous; ſomewhat downy beneath: their common ſtalk rough. Stem arboreous, without thorns. —Found by Aublet in the woods of Cayenne and Guiana, being one of the largeſt trees of thoſe countries. The *trunk* is 60 feet or upwards in height, and uſually a yard in diameter; its baſe ſubdivided above ground, ſo as to form cavities ſix or eight feet wide, affording ſhelter to wild beaſts. The head conſiſts of ſtrong and widely extended *branches,* which when young are clothed, like the main ſtalks of the *leaves,* with red or ruſty down. The *leaflets* are from eleven to fourteen, various in ſize, from three to eight inches long, veiny and wrinkled; ſmooth above; more or leſs hairy or downy beneath. *Stipulas* deciduous. *Cluſters* at the ends of the branches. *Flowers* reddiſh. *Legume* two inches long, half-lanceolate. The bark of the *tree,* when wounded, diſtils a copious reſinous balſam. The *wood* is almoſt incorruptible, Aublet having obſerved poſts, partly in the ground, which were quite ſound, though ſaid to be above 60 years old.

11. R. *florida.* Flowery Robinia. Willd. n. 11. "Vahl. Symb. v. 3. 89. t. 70."—Stalks ſimple, ſingle-flowered. Leaves abruptly pinnate, ſmooth; their common

 ſtalks

ſtalks unarmed. Stipulas lanceolate, permanent, flexible. Calyx nearly entire.—Native of the Weſt Indies. A very beautiful *ſhrub*, entirely covered with large purpliſh *flowers*, four or five from each bud, on ſimple capillary *ſtalks*, before the leaves appear. *Branches* round, ſmooth, dotted, purpliſh-grey. *Lower leaves* from the flowering buds of the preceding year, uſually two or three together, the length of the finger; *upper ones* on the young branches ſolitary, alternate, half as long again; leaflets ſtalked, oppoſite, oblong, ſmooth, veiny, pointed, the uppermoſt rather ſmalleſt: common footſtalk without any terminal ſpine. *Stipulas* lanceolate, ſmall, thin, flexible, permanent. *Calyx* cup-ſhaped, nearly entire, finely downy. *Corolla* large; its claws the length of the calyx. *Germen* ſmooth. *Vahl.*

12. R. *polyantha*. Many-flowered Robinia. Swartz Ind. Occ. v. 3. 1260.—Stalks ſimple, ſingle-flowered. Leaves abruptly pinnate; hoary beneath; their common ſtalks unarmed. Stipulas awl-ſhaped, cloſe-preſſed, permanent. Calyx with linear teeth.—Native of thickets on the mountains of Hiſpaniola. A *ſhrub*, about ſix feet high, erect, with copious *branches*, deſtitute of dots; greyiſh and downy when young. *Flowers* pale purple, three or four from each bud, appearing moſtly before the leaves, as in the laſt, from which this ſpecies chiefly differs in the ſmaller ſize of every part, and in the teeth of its *calyx*, which are nearly, if not entirely, wanting in *R. florida*. *Swartz.*

13. R. *Caragana*. Caragana Robinia, or Siberian Pea-tree. Linn. Sp. Pl. 1044. Willd. n. 12. Ait. n. 5. "Schmidt Arb. t. 33." (R. Altagana; Pall. Roſſ. v. 1. p. 1. 68. t. 42, the middle figure only.)—Stalks ſimple, ſingle-flowered, many together. Leaves abruptly pinnate, of about four pair of elliptical leaflets; their common ſtalks unarmed. Stipulas thorny. Legume cylindrical.—Native of Siberia. Cultivated by Miller in 1752. Hardy in our gardens, flowering in April and May. The *ſtem* forms a buſhy *ſhrub*, producing from each bud numerous large yellow *flowers*, on long ſimple ſtalks, accompanied by ſeveral abruptly pinnated, nearly ſmooth, *leaves*, which become alternate on the protruding *branches*. The *leaflets* are moſtly alternate, elliptical or obovate, hardly an inch long. The *ſtipulas* change into ſtraight awl-ſhaped thorns.

14. R. *Altagana*. Sand Robinia. Willd. n. 13. Ait. n. 6. L'Herit. Stirp. 159. t. 76. Pall. Roſſ. v. 1. p. 1. 69, the ſmall variety, t. 42, the lateral figures.—Stalks ſimple, ſingle-flowered, ſolitary. Leaves abruptly pinnate, of about eight pair of obovate, or inverſely heart-ſhaped, leaflets; their common ſtalks unarmed. Stipulas thorny. Legume compreſſed.—Native of ſandy ground in Siberia. Introduced into England by Mr. Bell, in 1789. Differs from the laſt, of which Pallas made it a variety, in its more humble ſize, emarginate, numerous, and hoary *leaflets*; ſolitary *flowers*; and eſpecially its compreſſed *legume*. Theſe two ſpecies, ſo nearly akin, prove the ſuppoſed generic diſtinction of the cylindrical and compreſſed *legumes*, aſſerted by Lamarck to be of no avail, in a natural point of view, for the purpoſe of dividing *Robinia* into two genera.

15. R. *jubata*. Bearded Robinia. Willd. n. 14. Ait. n. 7. "Pall. in Nov. Act. Petrop. v. 10. 370. t. 6."—Stalks ſimple, ſingle-flowered. Leaves abruptly pinnate, of numerous pairs of lanceolate, downy leaflets; their common ſtalks thread-ſhaped, ſpinous, permanent, reflexed. Branches villous.—Found near lake Baical in Siberia, from whence it was imported by Mr. Buſh, in 1796. This is a ſmall *ſhrub*, ſcarcely two feet high, with villous *branches*, aſſuming a very peculiar aſpect in conſequence of its numerous, reflexed, permanent, hardened and ſpinous *common footſtalks*. The *leaflets* are narrow. *Flowers* purpliſh. *Legumes* cylindrical, hard, reddiſh-brown.

16. R. *tragacanthoides*. Tragacanthine Robinia. Willd. n. 15. "Pall. in Nov. Act. Petrop. v. 10. 371. t. 7."—Stalks ſimple, ſingle-flowered. Leaves abruptly pinnate, of two pair of oblong-lanceolate, ſilky leaflets; their common ſtalks ſpinous and permanent, as well as the ſtipulas. Legume downy, ſomewhat compreſſed.—Native of granite rocks in Siberia, beyond lake Baical. A ſmall *ſhrub*, very much branched. *Branches* downy, armed with ſtrong, recurved, ſtipulaceous *ſpines*. *Leaflets* ſmall, tapering at each end, tipped with terminal, ſolitary thorns. *Flowers* yellow. *Legume* cylindrical, ſlightly compreſſed. *Willd.*

17. R. *ſpinoſa*. Thorny Robinia. Linn. Mant. 269. Willd. n. 16. Ait. n. 8. "Schmidt Arb. t. 36." (R. ferox; Pall. Roſſ. v. 1. p. 1. 70. t. 44.)—Stalks ſingle-flowered, very ſhort. Leaves abruptly pinnate, of about three pair of wedge-ſhaped ſmooth leaflets; their common ſtalks ſpinous and permanent, as well as the ſtipulas. Legume cylindrical. Native of moiſt gravelly vallies, as well as of dry ſandy hills, in Siberia. Hardy in our gardens, flowering in April and May. Pallas reports, that it is frequent about Pekin in China, where, being fixed with clay on the tops of walls, it ſerves to keep off intruders. The long ſtrong *thorns*, formed by the hardened *footſtalks*, render the buſhes of this ſpecies excellent for hedges. The *ſtems* are as tall as a man, much branched. *Leaflets* oblong-wedge-ſhaped, hardly an inch in length. *Flowers* yellow, axillary, either ſolitary or two or three together, each on a ſimple *ſtalk* not half the length of its *calyx*.

18. R. *Halodendron*. Salt-tree Robinia. Pall. It. v. 2. append. 741. t. W. Roſſ. v. 1. p. 1. 72. t. 46. Linn. Suppl. 330. Willd. n. 17. Ait. n. 9. Curt. Mag. t. 1016.—Stalks three-flowered. Leaves abruptly pinnate, of two pair of ſilky leaflets; their common ſtalks ſpinous and permanent. Legume inflated.—Found by Pallas, in dry ſalt fields, about the river Irtis, in Siberia. The late Dr. Pitcairn is mentioned as having firſt imported it in 1779. This *ſhrub* is hardy with us, but ſeldom bloſſoms, which is much to be regretted on account of its beauty. Its thorny habit nearly accords with the foregoing; but the *leaflets* are fewer, larger, and ſilky, of a glaucous hue. *Corolla* of a delicate roſe-colour. *Legume* ovate, inflated, an inch long, ſcarcely leſs different from the *Caragana* tribe, than from the original *Robinia*; yet no perſon who attends to natural genera could think of ſeparating this plant from the laſt.

19. R. *Chamlagu*. Shining Robinia. L'Herit. Stirp. 161. t. 77. Willd. n. 18. Ait. n. 10.—Stalks ſingle-flowered. Leaves abruptly pinnate, of two pair of obovate ſmooth leaflets; their common ſtalks ſpinous. Stipulas awl-ſhaped, ſpinous, permanent. Branches decumbent.—Suppoſed to be a native of China. It has long been cultivated in the French gardens, and was ſent to Kew, in 1773, by Monſ. Richard. The ſhrub is hardy, flowering in May and June. The *ſtem*, at firſt erect, throws out long decumbent *branches*. *Leaves* green, ſmooth and ſhining; each leaflet tipped with a ſmall briſtly point. *Flowers* large, on long, ſolitary, ſimple *ſtalks*, pendulous, yellow; the diſk of their *ſtandard* at firſt green, afterwards deep red. The young *legume* is cylindrical, but we have never ſeen it full-grown. The *footſtalks*, though ſpinous, are leſs hard and permanent than in many of the other ſpecies.

20. R. *fruteſcens*. Buſh Robinia. Linn. Sp. Pl. 1044. Willd. n. 19. Ait. n. 11. Pall. Roſſ. v. 1. p. 1. 69. t. 43.—Stalks ſingle-flowered. Leaves of four, obovate, ſmooth, briſtle-pointed, equal-ſtalked leaflets. Branches aſcending.—Native of hills in the temperate parts of Siberia. Cultivated

vated by Miller in 1752; flowering in the fpring. The *ftem* is branched, bufhy, and erect, various in height, from two to eight or nine feet. *Leaves* different from all the foregoing, confifting of four, nearly equal, obovate *leaflets*, each on its own fhort partial ftalk, at the fummit of a rigid, fpinous-tipped, *common footftalk*, not a quarter the length of the leaflets. *Stipulas* lanceolate, oblique, combined with the common footftalk, and at length hardened with it into a three-branched divaricated fpine. *Flowers* yellow, their fimple folitary ftalks longer than the leaves. The *foliage* varies greatly in luxuriance, according to circumftances. The *legume* is cylindrical.

21. R. *pygmæa*. Dwarf Robinia. Linn. Sp. Pl. 1044. Willd. n. 20. Ait. n. 12. Pall. Roff. v. 1. p. 1. 71. t. 45. (Afphalatus frutefcens minor anguftifolius, cortice aureo; Amm. Ruth. 204. t. 35.)—Stalks fingle-flowered. Leaves of four linear-lanceolate, fpinous-pointed, nearly feffile leaflets.—Native of rocky hills in many parts of Siberia. Cultivated by Miller in 1751; flowering in the fpring. This has much affinity to the laft, but the narrow *leaflets* and their fpinous points, as well as the more evident and pungent thorns of their fhort *common footftalk* and *ftipulas*, readily diftinguifh it. The *flowers* are yellow. *Leaves* often more or lefs filky or hairy.

R. *mitis*, Linn. Sp. Pl. 1044, is referred by Willdenow to *Dalbergia*, under the name of *arborea*; Sp. Pl. v. 3. 901. Ait. H. Kew. v. 4. 248. This is *Pongamia glabra*, Venten. Malmaif. t. 28; an Eaft Indian tree, of lofty growth, which has not yet bloffomed in our ftoves. Ventenat faw its flowers at the garden of Malmaifon. The *calyx* is purple; *petals* white. *Legume* ovate, pointed, thick and woody.

We are not acquainted with *R. amara* and *flava* of Loureiro, Cochinch. 455, 456, nor dare we adopt them without examination.

Robinia, in *Gardening*, comprifes plants of the hardy, deciduous, tree and fhrub forts, with tender kinds for the ftove. The fpecies cultivated are moftly thefe: the falfe or common acacia (R. pfeudo-acacia); the rofe acacia, or robinia (R. hifpida); the Siberian abrupt-leaved robinia (R. caragana); the fhrubby robinia (R. frutefcens); the dwarf robinia (R. pygmæa); the thorny robinia (R. fpinofa); the afh-leaved robinia (R. violacea); and the fmooth Indian robinia (R. mitis).

The firft fort grows very faft whilft young, fo that in a few years from feed, the plants rife to eight or ten feet high, and it is not uncommon to fee fhoots of this tree fix or eight feet long in one fummer; the branches are armed with ftrong crooked thorns. But there is a variety which has no thorns on the branches, but which is eafily known at firft fight by its peculiar appearance. And the echinated, or prickly-podded American falfe acacia, in which the pods are much fhorter, and clofely befet with fhort prickles, but in other refpects agrees with the common fort.

The fixth fpecies, on account of the length and toughnefs of the branches, and its large ftout thorns, is admirably adapted to form impenetrable hedges, and is fufficiently hardy to bear our climate.

Method of Culture.—The firft fix hardy forts are all capable of being raifed from feeds, cuttings, layers, and fuckers; but the feed method is faid to afford the beft plants.

The feeds fhould be fown about the end of March or beginning of the following month, on a bed of light mould, being covered to the depth of about half an inch. In the firft fort and varieties the plants moftly appear in the courfe of fix or eight weeks; but in the other kinds often not till the next fpring. They fhould be well weeded and watered, and when fufficiently ftrong, be fet out in the fpring or autumn in nurfery-rows, for two or three years, in order to remain, to have proper growth for final planting out. The cuttings fhould be made from the young fhoots, and be planted out in the beginning of autumn, in a fhady border, where the foil is mellow. They are moftly well rooted in the courfe of a twelvemonth, when they may be removed into nurfery-rows as above. The layers fhould be made from the young wood, being laid down in the autumn, when, in the courfe of the year, they moftly become well rooted, and may be taken off and planted out in nurfery-rows, as the feedling plants. And the fuckers, which are produced in plenty from the two firft forts, may be removed in the early autumn or fpring, and be planted out in nurfery-rows or in beds, to be afterwards removed into them.

The two laft, or tender forts, may likewife be raifed from feeds and cuttings, but they muft be fown and planted in pots filled with good mould, to have the affiftance of a hot-bed in the ftove, by being plunged in it. When the plants have attained a little growth, they fhould be fhaken out of the pots, and planted feparately in fmall pots, filled with the fame fort of earth, plunging them in the tan-bed, affording due fhade till well rooted, managing them afterwards as other tender ftove plants. And as the plants are moft tender while young, they fhould therefore be kept in the ftove tan-bed till they have acquired ftrength, when they may be preferved in the dry ftove, with a temperate heat in winter, and be expofed in the open air in fummer, in a warm fheltered fituation, when the weather is fine.

It may be noticed that the hardy forts have a fine effect in the border clumps and other parts of pleafure-grounds, and the tender kinds afford variety in the ftove-collections.

ROBINS, Benjamin, in *Biography*, a celebrated mathematician, was born at the city of Bath in the year 1707. His parents were in very low circumftances, and utterly unable to give their fon much education. His genius, however, ftrongly urged him to the purfuit of knowledge: he became his own inftructor, and made an early and furprifing progrefs in various branches of literature and fcience, particularly in the mathematics. He came to London under the patronage of Dr. Pemberton; and at the age of 20, he gave a demonftration of the laft propofition of Newton's Treatife on Quadratures, which was fo ably performed, that it was thought deferving a place in the Philofophical Tranfactions for the year 1727; and towards the clofe of the fame year he was admitted a member of the Royal Society. In the courfe of the following year he embraced an opportunity of offering to the public a fpecimen of his acquaintance with natural philofophy. The Royal Academy of Sciences at Paris, among their prize queftions in 1724 and 1726, had afked for a demonftration of the laws of motion in bodies impinging on one another. On this occafion, John Bernouilli appeared in the lift of candidates, but did not obtain the reward. He felt himfelf aggrieved, and appealed to the learned world, by publifhing his demonftration in 1727. In the following year, Mr. Robins publifhed a confutation of Bernouilli's performance, which was allowed to be unanfwerable. Mr. Robins, about this time, began to take pupils, profeffing to teach the mathematics only; yet he frequently affifted them with inftruction and advice on other fubjects, for which he was well qualified, by the rich ftores of knowledge with which his mind was furnifhed. After fome time he abandoned the laborious bufinefs of education, and devoted his attention to fubjects which required more exercife. Among other things, he made many experiments in gunnery, from a belief that the resistance of the air had a much greater effect on swift flying projectiles than was generally supposed. He likewise directed his attention to the mechanic arts, such as the construction of mills, the building of bridges, draining of fens, rendering rivers navigable, and the making of harbours. The art of fortification, likewise, very much engaged his thoughts: with this view he took pains to inspect all the principal strong places in Flanders, during some journies which he made on the continent with persons of distinction. On his return, he undertook a defence of the doctrine of fluxions, as laid down by sir Isaac Newton, in opposition to the objections brought against it by the learned bishop Berkeley. In 1735 Mr. Robins published "A Discourse concerning the Nature and Certainty of Sir Isaac Newton's Method of Fluxions and of prime and ultimate Ratios." On the same subject he wrote two or three other pieces.

In the year 1739 he published, without his name, three pamphlets on political topics, and on the popular side of the question; and so highly did they raise the author in the estimation of the patriotic party, that when a committee of the house of commons was appointed to examine into the conduct of sir Robert Walpole, he was chosen their secretary. In 1742 Mr. Robins published a small treatise, entitled "New Principles of Gunnery;" containing the result of many experiments, by which he discovered the force of gunpowder, and the difference in the resisting power of the air to swift and slow motions. From which it appeared, that the opposition of that medium to bullets and shells, discharged from cannon and mortars, far exceeded what was generally imagined; and that the track which their motion described differed from that of a parabolic line, to a degree unsuspected by any who had written expresly on the subject, from the time of Galileo. This publication was undertaken to demonstrate his own superiority, as a man of talents, over a successful competitor, Mr. Muller, for a situation in the Royal Military Academy at Woolwich. Some time after the publication of this work, a paper having been admitted into the Philosophical Transactions, containing experiments intended to invalidate some of Mr. Robins's opinions, he thought proper, in an account which he gave of his book in the same Transactions, to take some notice of those experiments. In consequence of this, several dissertations of his on the resistance of the air were read, and experiments to confirm his doctrine were exhibited before the Royal Society, in the year 1746-7; for which he was presented with the annual gold medal by that society. His reputation was now so high, that he was invited by the prince of Orange to assist in the defence of Bergen-op-Zoom, which was besieged by the French, and he actually crossed the sea with that view; but he had scarcely reached the Dutch camp, before the French, owing either to negligence or treachery in the garrison, unexpectedly became masters of the place.

In the year 1748, Anson's "Voyage round the World" was published, bearing the name of Walter in the title-page, though it was soon known to have been Mr. Robins's production. No work of the kind ever met with a more favourable reception: four large editions were sold within a year, and it has been since reprinted very frequently in all sizes. It was translated in almost all the European languages. He was next employed to draw up an apology for the unfortunate defeat of the king's troops by the rebels, at Preston-Pans in Scotland, which was prefixed to "The Report of the Proceedings and Opinion of the Board of General Officers, on their Examination into the Conduct of Lieutenant-General Sir John Cope," &c.

After this, Mr. Robins had opportunities, through the favour of lord Anson, of making further experiments in gunnery; an account of which, with other pieces, were published after his death. Through the interest of the same nobleman, he contributed to the improvement of the Royal Observatory of Greenwich, by procuring for it many valuable instruments. In the year 1749 he was made engineer-general to the East India Company; and with a complete set of astronomical instruments, for making observations and experiments, he arrived in India in the summer of 1750. He set about the business which he had undertaken immediately, with the utmost diligence, and soon formed plans for fort St. David and Madras; but he did not live to carry them into execution. The change of climate was more than he could endure, and he died at the early age of 44, in July 1751.

Mr. Robins was one of the most accurate and elegant mathematical writers of this country, and he made more real improvements in artillery, and on subjects relating to the resistance of the air to projectiles, than all the preceding authors on the subject. His "New Principles of Gunnery" were translated into various languages, and commented upon by several eminent mathematicians. Euler translated it into the German, and accompanied the version with a large and critical commentary. This again was published in England, with an English translation of the German commentary and notes, by Mr. Hugh Brown, in 1777. All Mr. Robins's mathematical and philosophical pieces were collected, and published in 2 vols. 8vo. 1761, by Dr. Wilson, with an account of the author, from which the foregoing article is chiefly extracted.

ROBINSON, Robert, born in October 1735, at Swaffham, in the county of Norfolk, was son of Mr. Michael Robinson, a native of North Britain, and Mary, the daughter of Mr. Robert Wilkin of Mildenhall, Suffolk, a man of great respectability in private life, and in possession of a moderate independence. Robert was the youngest of their three children: his elder brother was apprenticed to a painter, and his sister to a mantua-maker; he was sent to a Latin school at the age of six years, where he made a considerable proficiency, and discovered an uncommon capacity for learning. His father, in the course of his profession, was removed from Swaffham to Scarning, in the same county, where finding his situation very unpleasant, he left the place, his family returning home, and he shortly after died at Winchester. At Scarning young Robinson was sent to an endowed grammar-school, then under the care of the Rev. Joseph Brett. Several persons of eminence received the early parts of their education at the same school, among whom was the late lord Thurlow. At this school he gained a considerable knowledge of the French, as well as of the classical languages. At the age of 14 he was put apprentice to a hair-dresser, in Crutched-Friars, London. For this occupation his mind was very ill adapted, and he stole from the hours devoted to sleep no small portion of time for the improvement of his mind. During his apprenticeship he appears to have imbibed serious impressions of religion, which he encouraged, by attending the most celebrated preachers of the day among the Independents, the Baptists, and the clergy falsely named evangelical; for they dwell, in their pulpit discourses, upon all sorts of subjects, excepting only those contained in the four gospels. Dr. Guise and Gill among the dissenters, Romaine in the church, and Whitfield, the leader of the Calvinistical Methodists, were his chief favourites. At this period Robert Robinson had a considerable portion of enthusiasm in his constitution, which is not an undesireable quality in young people

people left much to themſelves, and liable to a thouſand temptations in corrupt and licentious cities and large towns. It is often the beſt preſervative of their morals, and will frequently grow into rational and energetic modes of thinking and acting.

About the age of 20, Robert Robinſon had his indentures given him up, at his own requeſt, feeling a great deſire to become a preacher. He had, previouſly to this, been in the habit of preaching for the hour together to himſelf, thinking that he ſhould thereby be better prepared to addreſs an audience aſſembled to hear his diſcourſes. His firſt ſermon was delivered to a very ſmall congregation at Mildenhall, in Suffolk; and his reception was ſuch as to juſtify the hope that he had taken that direction to which his talents naturally tended. He was ſoon after invited to preach at the Tabernacle in Norwich, and at ſeveral places in Norfolk and Cambridgeſhire. He continued to preach among the Methodiſts two years, during which period he appears to have turned his attention more particularly to the controverſy between the members of the eſtabliſhed church and the diſſenters, and to have determined, upon the fulleſt conviction, to take his lot with the latter. He had, however, according to Dr. Rees, who preached his funeral ſermon, a temptation to connect himſelf with the former, too powerful for any but a man of Chriſtian integrity to reſiſt. "A rich relation," ſays the doctor, "who had promiſed to provide liberally for him, and who had bequeathed him a conſiderable ſum of money in his will, threatened to deprive him of every advantage which he had been encouraged to expect, unleſs he quitted his connection with the diſſenters. But the rights of conſcience, and the approbation of God, were ſuperior in his regard to every worldly conſideration: he preſerved his integrity, ſteadily maintained his principles, and perſevered in his connection with the diſſenters; but forfeited the favour of his relation, and every advantage which, living or dying, he had in his power to beſtow."

He now attempted to incorporate the Methodiſts, among whom he miniſtered, into a regular church; but proving unſucceſsful, he determined to ſeparate from them. Having done ſo, he formed a ſmall *Independent* congregation at Norwich, and during his connection with them, he adminiſtered infant baptiſm; but on leaving this congregation, he renounced infant baptiſm, and adminiſtered this ordinance only to adults, and by immerſion.

In the ſpring of 1759 he was invited to preach to a ſmall congregation of Antepædobaptiſts at Cambridge. About the ſame time he married Miſs Ellen Payne; and in 1761 he accepted the paſtoral office in this church. When Mr. Robinſon firſt ſettled with this ſociety, it conſiſted only of 34 members, moſt of whom were very poor, ſo that he could look only for a ſalary of a few pounds at moſt; but it increaſed rapidly under him, and in a few years he had the ſatisfaction of ſeeing a new and more commodious place of worſhip, erected at the ſole expence of the congregation; and in 1774, the number of families connected with it was not leſs than 200, many of whom ranked among the moſt reſpectable in the town and neighbourhood. Mr. Robinſon preached twice or thrice on each Sunday, and uſually once on ſome other day in the week, at Cambridge. On ſome of the other mornings and evenings in the week, excepting in times of hay and corn-harveſt, he expounded the ſcriptures, or delivered religious and moral lectures, in the village where he lived, or in the neighbouring villages. To young perſons he rendered eſſential ſervice, by delivering lectures to them at his own houſe, or by private converſation. Theſe various employments of his time he rendered conſiſtent with his other numerous engagements, and cloſe application to ſtudy, by the excellent habit which he had acquired, when young, of riſing early in the morning, *viz.* at four or five o'clock; a practice that ought to be recommended to every ſtudent. "I wiſh," ſays the late Gilbert Wakefield, ſpeaking on the ſame ſubject, "my advice and imperfect experience of its benefits could perſuade every youth to engrave it, in impreſſions not to be effaced, on the tablet of his heart, and exemplify it in his daily practice."

" ———————— Ni
Poſces ante diem librum cum lumine; ſi non
Intendes animum ſtudiis et rebus honeſtis,
Invidiâ vel amore vigil torquebere."

" Riſe, light thy candle, ſee thy taſk begun,
E'er redd'ning ſtreaks proclaim the diſtant ſun;
Or luſt's fierce whirlwind will thy calm moleſt,
Or envy cloud the ſunſhine of thy breaſt."

Soon after the opening of the new meeting-houſe, the abilities of Mr. Robinſon as a preacher began to attract the notice of the academics, many of whom, from ſerious motives, became regular attendants; while others came to meeting only to indulge their curioſity, or perhaps to ridicule the miniſter. Of the latter deſcription were ſeveral under-graduates, who frequently diſturbed the devotion of the congregation by an indecency of behaviour. Complaints of their conduct had been repeatedly made to the magiſtrates of the univerſity, and the heads of the colleges, but without procuring redreſs. At length the rudeneſs of theſe young men required meaſures to be taken, which ſhould no longer be treated with contempt. A legal proceſs was began, which induced two of the worſt offenders to agree to aſk pardon in the public papers. The perſons aggrieved, however, remitted this puniſhment in the caſe of one of the delinquents, on account of his otherwiſe excellent character. The evil was, by this meaſure, well nigh cured, and Mr. Robinſon had little or no reaſon to complain afterwards of interruption from that quarter. From this period, many of the moſt reſpectable members of the univerſity ſolicited his acquaintance, and entertained a due reſpect for his worth, however they differed from him in opinion; and through their aid and influence, he obtained freedom and acceſs to the valuable libraries at Cambridge, and was permitted, in many caſes, the more important privilege of having books from them at his own houſe.

In the year 1773, Mr. Robinſon's family having become ſo numerous that his ſalary as a miniſter was found inadequate to his ſupport, he found it neceſſary to have recourſe to other means for making a proviſion for them. He accordingly removed to Cheſterton, near Cambridge, and commenced farmer, to which, in time, he added the buſineſs of a dealer in corn and coals. His farming and mercantile engagements, however, did not diminiſh his ardour for literary purſuits, as is evident from his various publications. The firſt work which contributed to make him known as an author, was publiſhed in 1774, under the title of "Arcana," or the Principles of the late Petitioners to Parliament for relief in Matters of Subſcription, in eight letters to a friend. The reception which this piece met with was extremely encouraging: it procured the author many valuable friends among the diſſenters. His next publication was an "Appendix" to "The Legal Degrees of Marriage, ſtated and conſidered by John Alleyne, Barriſter at Law," 2d edition, 1775. It conſiſts of a diſcuſſion of the queſtion, "Is it lawful and right for a man to marry the ſiſter of his deceaſed wife?" in which he maintained, in a very

very forcible manner, the affirmative ſide of the queſtion. In the ſame year he publiſhed an entire volume of " Sermons, from the original French of the late Rev. James Saurin, Paſtor of the French Church at the Hague," which was followed, at different periods, by four others. Introductory to theſe volumes are prefatory diſſertations, containing intereſting memoirs of the Reformation in France, and the life of Saurin, together with reflections on Deiſm, Chriſtian liberty, &c. The fame which Mr. Robinſon acquired by this publication, induced certain divines, and among them dignitaries of the eſtabliſhed church, to offer him liberal terms for original ſermons for their own uſe.

In the year 1776, the controverſy reſpecting the divinity of Chriſt, which had been carried on principally by members of the church of England, ſome of whom had reſigned their livings, much engaged the public attention. Mr. Robinſon appeared on the popular ſide of the queſtion, and publiſhed " A Plea for the Divinity of our Lord Jeſus Chriſt, &c." This piece is written with much ingenuity, and it procured the author a number of handſome compliments, not only from diſſenting miniſters, but alſo from ſeveral dignitaries of the eſtabliſhed church. Among the latter were Dr. Hinchliffe, biſhop of Peterborough, Dr. Hallifax, afterwards biſhop of Glouceſter, Dr. Beadon, afterwards biſhop of Bath and Wells, and Dr. Tucker, dean of Glouceſter. Some years after, Mr. Lindſey publiſhed, without his name, " An Examination of Mr. Robinſon's Plea for the Divinity of Chriſt;" in a ſecond edition, in 1789, Mr. Lindſey prefixed his name. Mr. Robinſon was frequently called upon to reply to Mr. Lindſey, but he declined. To his friends he ſaid, " The anonymous examiner has not touched my arguments, and his ſpirit is bitter and contemptuous. His faith ſtands on criticiſms; and my argument is, that if the doctrine requires critical proof, it is not popular, and therefore not divine." In 1777, Mr. Robinſon publiſhed a ſmall tract, entitled " The Hiſtory and Myſtery of Good Friday," that has paſſed through numerous large editions, and in which the evil and folly of church holidays is with equal humour, learning, and argument, unanſwerably demonſtrated. In 1778, Mr. Robinſon publiſhed " A Plan of Lectures on the Principles of Nonconformity, for the Inſtruction of Catechumens." This piece contains an outline of the whole controverſy of the diſſenters with the church of England, and of their hiſtory, from the period of the Reformation, to the year 1778. In the houſe of lords it was mentioned with due reſpect by the earl of Shelburne; and it was ably defended in the houſe of commons by Mr. Fox, in oppoſition to an illiberal attack upon the principles of diſſent, from the eloquent Mr. Burke, whoſe calumnies were confined to no people nor ſet of principles. Towards the cloſe of the ſame year, Mr. Robinſon publiſhed " An Eſſay on the Compoſition of a Sermon, tranſlated from the original French of the Rev. John Claude, with Notes," in 2 vols. 8vo. The preface to the firſt volume of the " Eſſay" conſiſts of memoirs of the life of the author.

In 1780, Mr. Robinſon paid a viſit to the univerſity of Oxford, and afterwards accompanied ſome friends in a tour into Scotland, where he was much gratified by civilities ſhewn him by ſome of the literati of Edinburgh; and he might have received the diploma of doctor of divinity, had he not thought proper to decline that compliment. Soon after his return to Cambridge, he publiſhed a little tract well calculated to produce a Catholic ſpirit among his brethren of the Baptiſt denomination, entitled " The General Doctrine of Toleration, applied to the particular Caſe of Free Communion." It was about this period he preached and publiſhed a ſermon, entitled " Slavery inconſiſtent with the Spirit of Chriſtianity," and he was the author of the admirable petition of the gentry, clergy, freeholders, and other inhabitants in the county of Cambridge, which was preſented to the houſe of commons. In the year 1781, Mr. Robinſon, at the deſire of his brethren, began to collect materials for the Hiſtory of the Engliſh Baptiſts. In his reſearches he was led to enter on a larger field than what had been originally propoſed to him, and inſtead of confining himſelf to the hiſtory of Engliſh Baptiſts, he was induced to trace the hiſtory of baptiſm from the earlieſt uſe of that rite, as well as that of Baptiſts in all ages.

In the year 1782, Mr. Robinſon publiſhed " A Political Catechiſm," intended to convey, in a familiar manner, juſt ideas of good civil government, and the Britiſh conſtitution. This tract was written at the time that the North adminiſtration was diſcarded from the councils of their ſovereign for that of the marquis of Rockingham. To ſupport the ſyſtem profeſſed by the latter—to diſſeminate ſafe political principles—to place public happineſs on its true baſis, were the motives which induced Mr. Robinſon to endeavour to attract the attention of youth to this ſubject. This work, as well as the preface to the " Plan of Lectures," and his ſermon, entitled " Chriſtian Submiſſion to Civil Government," afford ample evidence of the ſoundneſs of his principles as a friend to civil government in general, and to that form of civil government, the Britiſh conſtitution, in particular. It was in 1786 that Mr. Robinſon publiſhed " Sixteen Diſcourſes on ſeveral Texts of Scripture, addreſſed to Chriſtian Aſſemblies, in Villages near Cambridge; to which are added Six Morning Exerciſes." Theſe diſcourſes were delivered extempore to plain and illiterate audiences, in a ſimple but animated ſtyle; and they were afterwards written out, from memory, by the author, as nearly as he could recollect them. They are chiefly on practical ſubjects; but ſuch of them as touch on doctrinal ſubjects diſplay much candour and liberality. This ſpirit of liberality excited ſerious apprehenſions concerning the purity of his faith among many of his orthodox friends, who expoſtulated with him, both in perſon and by letter. Soon after this he afforded real ground for entertaining apprehenſions that his faith in the gloomy doctrines of Calviniſm was not ſo ſtrong as in the opinion of his brethren it ought to have been. Many of them attacked him in their pulpits, endeavouring to diminiſh his well-earned popularity, by ſtigmatizing him with the names of Arian and Socinian; but others, though themſelves zealouſly attached to thoſe doctrines, which he ſeemed inclined to abandon, continued his faithful and invariable friends. With his congregation at Cambridge he ſtill continued his miniſterial labours; he had been the miniſter of their choice, and remained high in their eſteem.

During the latter years of his life, the large field of enquiry upon which Mr. Robinſon had entered, led him to ſuch a courſe of intenſe application, as undermined the ſtrength of his conſtitution, before he had given the finiſhing hand to his labours, and brought on a gradual decay, attended with a great depreſſion of ſpirits. In theſe circumſtances, it was hoped by his family that a journey to Birmingham, and an interview with Dr. Prieſtley, which he had long wiſhed for, might prove beneficial to him. Having arrived at that town, he ventured to preach twice on the ſame Sunday for the benefit of the charity ſchools. His friends perceived that he was ill, but none of them ſuſpected his end was ſo near; he ſpent the evening of the following Tueſday in the cheerful ſociety of his friends, and retired to reft as ufual; but on the next morning he was found dead in his bed, where he appears to have expired exactly as he hoped it might be permitted him to leave the world, fuddenly—and alone, without feeling the agonies of death, or occafioning alarm or diftrefs to affectionate relatives and friends. He died June 8th, 1790, in the 55th year of his age.

Mr. Robinfon was a wonderful example of a man who rofe to confiderable eminence by his own exertions. To his great talents and extenfive learning his various writings bear the fulleft teftimony. He poffeffed an ardent love of truth, was laborious in the fearch after it, and at all times was a ftrenuous advocate for fuch principles as he had adopted upon deliberate conviction, while he ever exercifed candour and liberality toward thofe whofe opinions differed from his own. Of civil and religious liberty he was the enlightened, fteady, and zealous friend. In his domeftic relations he was attentive and affectionate; and to the poor a friend, comforter, and, as far as his limited means permitted, a generous benefactor. As a preacher, "there was always a variety, and often an originality, both in what he faid, and in his mode of faying it. It was his conftant aim to lead the attention of his hearers to the weightier matters of the law; to inform the judgment before he attempted to intereft the paffions; and, after inculcating juft notions of truth and duty, to enforce a correfponding practice. There have been few preachers who have done fo much to refcue the human mind from bondage; to correct prevailing errors; to promote a liberal fpirit of inquiry; to recommend mutual forbearance and candour among Chriftians of different opinions; to weaken their attachment to creeds and forms of human device and impofition, and to direct their chief attention to the principles and duties of piety, virtue, and univerfal charity. He had a manner of fupplanting rooted prejudices without occafioning alarm; of fapping inftead of ftorming the fortifications of error; of gaining affent to general principles, inconfiftent with the opinions which he wifhed to expofe: and of leading men to think, judge, and determine for themfelves, and to purfue thefe principles to their confequences, in which he wonderfully excelled, and which produced, in many inftances, the beft effects." See Dr. Rees's Sermon before referred to.

It has already been obferved, that Mr. Robinfon died before he had completed the great work to which his attention had been chiefly confined for feveral years. One part of his comprehenfive plan, however, was finifhed, and the whole, excepting a few fheets, printed off, and corrected by himfelf while paffing through the prefs. This was publifhed in the year 1790, under the title of "The Hiftory of Baptifm," which is one of the moft acute and ingenious defences of the diftinguifhing tenets of the Baptifts which has ever yet appeared, deduced not only from the records of hiftory, but from the relics of Chriftian antiquity, being illuftrated with engravings from ancient paintings and buildings, and from Danifh and Saxon remains in our Britifh churches. This part of the plan was to have been followed by a hiftory of the Baptifts, which was left in an incomplete ftate, but which was publifhed in 1792, under the title of "Ecclefiaftical Refearches." This work was carried through the prefs under the fuperintendance of Mr. Frend, who had long enjoyed the friendfhip of Mr. Robinfon. Befides much information which thefe refearches contain, that is not to be found in any other Englifh work on the fubject, and the interefting views of the progrefs of civil and religious liberty, together with well-drawn characters of its principal advocates, the reader will meet with a variety of important and excellent matter on other topics: the author has introduced into his narrative ingenious remarks, ufeful to elucidate the leading object of his inquiries, on the geography, government, laws, antiquities, commerce, productions, and cuftoms and manners of the inhabitants of the feveral countries treated of. Since the death of the author, Mr. Benjamin Flower has collected all Mr. Robinfon's works, with the exception of his "Hiftory of Baptifm," "Ecclefiaftical Refearches," "Claude's Effay on the Compofition of a Sermon," and his "Village Sermons," and publifhed them in four volumes, 8vo., to which we refer our readers, who will find, by looking them over, that we have in our enumeration of Mr. Robinfon's works omitted fome of minor importance. And in the year 1812, the fame perfon publifhed certain pofthumous pieces of our author in one volume octavo: thefe, on the whole, cannot be faid to add to the reputation of Mr. Robinfon; they confift of feven fermons, and three differtations, "On the Nature and Operations of the Human Mind, as relating more particularly to Theological Inquiries;" "Literary Precautions neceffary to the Study of Theology;" "On Predeftination; or, Moderate Calvinifm confidered as the fafe Path between Two Extremes." To thefe tracts are added "An Hiftorical Account of Proteftant Diffenting Churches in Cambridgefhire," and divers of Mr. Robinfon's letters. See Dr. Rees's Sermon on the Death of Mr. Robinfon; Dyer's Life of Robinfon, 1796; and Flower's Memoirs, prefixed to the firft vol. of the Mifcellaneous Works, 1807.

ROBINSON, RICHARD, archbifhop of Armagh, and baron Rokeby, was born in 1709. He was educated at Weftminfter fchool, from whence he was elected to Chrift-church, Oxford, after which he became chaplain to archbifhop Blackburne, of York, who gave him a prebend in his cathedral. He went with the duke of Dorfet to Ireland, and was preferred to the fee of Killala, from whence, in 1759, he was tranflated to Leighlin and Ferns, and in 1761 to Kildare. In 1765 he was advanced to the primacy of Ireland, and in 1777 he was created a peer. He built a palace in his diocefe of Armagh, with an obfervatory. (See the article OBSERVATORY.) He alfo founded a fchool, and built four new churches. He died in 1794. Europ. Mag.

ROBINSON, JOHN, organift of St. Laurence Jewry, of St. Magnus church, and of Weftminfter abbey. He was regarded as one of the beft performers on keyed inftruments of his time. As an organ-player he was attended by great crowds wherever he performed. He was educated in the chapel-royal, under Dr. Blow. His wife was the daughter of Dr. William Turner, and a public finger. She performed in Scarlatti's opera of Narciffus, brought on the ftage by Rofcingrave, in 1720; and to diftinguifh her from Mrs. Anaftafia Robinfon, who fung in the fame opera, fhe was called Mrs. Turner Robinfon. This celebrated organift died at an advanced age in 1762, and was fucceeded, in Weftminfter abbey, by Dr. Benjamin Cook.

ROBINSON, *Mifs*, daughter of the celebrated organift of Weftminfter abbey, who fung at concerts, and, one feafon, in Handel's oratorios. She was a coarfe finger, with an unpleafant toned voice; but that did not prevent her from becoming a great player on the harpfichord; particularly on a harpfichord made by Rucker, with pedals, of which fhe had acquired, by labour and perfeverance, a facility of execution equal to German organifts. The refult, however, was not equal to the great difficulty of ufing them. The pedals of an organ often produce fine effects in fuftaining notes with the feet, while both hands are at liberty to ramble about in the treble at their pleafure. But on a harpfichord with pedals to fhort-lived founds, the clatter of ftriking them fo often is abominable; it is not mufic, but noife.

ROBINSON, *Mrs.* ANASTASIA, a moft amiable and accomplifhed perfon, who performed as a finger in our firft Italian operas, from the year 1714 to 1724. This performer, defcended from a good family in Leicefterfhire, was the daughter of a portrait painter, who, having vifited Italy for improvement in his art, had made himfelf mafter of the Italian language, and acquired a good tafte in mufic. And finding that his daughter Anaftafia, during her childhood, had an ear for mufic, and a promifing voice, he had her taught by Dr. Crofts, at firft as an accomplifhment; but afterwards being afflicted with a diforder in his eyes, which terminated in a total lofs of fight; and this misfortune depriving him of the means of fupporting himfelf and family by his pencil, he was under the neceffity of availing himfelf of his daughter's difpofition for mufic, to turn it to account as a profeffion. She not only profecuted her mufical ftudies with great diligence, but by the affiftance of her father had acquired fuch a knowledge in the Italian tongue as enabled her to converfe in that language, and to read the beft poets in it with facility. And that her tafte in finging might approach nearer to that of the natives of Italy, fhe had vocal inftructions from Sandoni, at that time an eminent Italian finging mafter refident in London, and likewife from the opera finger called the Baronefs.

Her firft public exhibition was at the concerts in York-buildings, and at other places, where fhe ufually accompanied herfelf on the harpfichord. Her general education had been purfued with the utmoft care and attention to the improvement of her mind, as well as to ornamental and external accomplifhments; and thefe advantages, feconded by her own difpofition and amiable qualities, rendered her conduct ftrictly prudent and irreproachable. And what ftill entitled her to general favour, was a behaviour full of timidity and refpect to her fuperiors, and an undiffembled gentlenefs and affability to others, which, with a native cheerfulnefs that diffufed itfelf to all around her, gained her at all times fuch a reception from the public, as feemed to enfure her fuccefs in whatever fhe fhould undertake. Encouraged by the partiality of the public towards his daughter, and particularly by the countenance aud patronage of fome perfons of high rank of her own fex, Mr. Robinfon took a houfe in Golden-fquare, where he eftablifhed weekly concerts and affemblies in the manner of *converfazioni*, which were frequented by all fuch as had any pretenfions to politenefs and good tafte.

Thus qualified and encouraged, fhe was prevailed upon to accept of an engagement at the Opera, where fhe made her firft appearance in Crefo, and her fecond in the character of Ifmina, the principal female part in Arminio. From this period till the year 1724, fhe continued to perform a principal part at the Opera with increafing favour and applaufe. Her falary is faid to have been 1000*l.*, and her emoluments, by benefits and prefents, were eftimated at nearly as much more. When fhe quitted the ftage it was fuppofed to have been in confequence of her marriage with the gallant earl of Peterborough, the friend of Pope and Swift, who diftinguifhed himfelf fo heroically in Spain during the reign of queen Anne. Though the marriage was not publicly declared till the earl's death in 1735, yet it was then fpoken of as an event which had long taken place. And fuch was the purity of her conduct and character, that fhe was inftantly vifited at Fulham as the lady of the manfion, by perfons of the higheft rank. Here, and at Mount Bevis, the earl's feat near Southampton, fhe refided in an exalted ftation till the year of her deceafe, 1750, furviving her lord fifteen years; who, at the time of the connexion, muft have been confiderably beyond his prime, as he was arrived at his feventy-fifth year when he died.

The following anecdotes of Mrs. Anaftafia Robinfon having been communicated to us in 1787, by the late venerable Mrs. Delany, her contemporary and intimate acquaintance, they will doubtlefs be read with confidence and pleafure, not only by fuch as had the happinefs of knowing her perfonally, but by all thofe to whom rumour has conveyed a faithful account of her longevity, virtues, and accomplifhments; for this excellent perfon having been allowed by Providence to extend her exiftence to the great age of eighty-eight, in the conftant enjoyment of all the felicity which the friendfhip and admiration of rank, virtue, and talents could beftow; it feems as if, without hyperbole, fhe may be faid to have been "beloved by God and man."

"Mrs. Anaftafia Robinfon was of a middling ftature, not handfome, but of a pleafing, modeft countenance, with large blue eyes. Her deportment was eafy, unaffected, and graceful. Her manner and addrefs very engaging; and her behaviour, on all occafions, that of a gentlewoman, with perfect propriety. She was not only liked by all her acquaintance, but loved and careffed by perfons of the higheft rank, with whom fhe appeared always equal, without affuming. Her father's houfe, in Golden-fquare, was frequented by all the men of genius and refined tafte of the times; among the number of perfons of diftinction who frequented Mr. Robinfon's houfe, and feemed to diftinguifh his daughter in a particular manner, were the earl of Peterborough and general H——; the latter had fhewn a long attachment to her, and his attentions were fo remarkable, that they feemed more than the effects of common politenefs; and as he was a very agreeable man, and in good circumftances, he was favourably received, not doubting but that his intentions were honourable. A declaration of a very contrary nature was treated with the contempt it deferved, though Mrs. A. Robinfon was very much prepoffeffed in his favour.

"Soon after this, lord P. endeavoured to convince her of his partial regard for her; but, agreeable and artful as he was, fhe remained very much upon her guard, which rather increafed than diminifhed his admiration and paffion for her. Yet ftill his pride ftruggled with his inclination; for all this time fhe was engaged to fing in public, a circumftance very grievous to her, but urged by the beft of motives, fhe fubmitted to it, in order to affift her parents, whofe fortune was much reduced by Mr. Robinfon's lofs of fight, which deprived him of the benefit of his profeffion as a painter.

"At length lord P. made his declaration to her on honourable terms; he found it would be vain to make propofals on any other; and as he omitted no circumftance that could engage her efteem and gratitude, fhe accepted them, as fhe was fincerely attached to him. He earneftly requefted her keeping it a fecret till it was a more convenient time for him to make it known, to which fhe readily confented, having a perfect confidence in his honour. Among the perfons of diftinction that profeffed a friendfhip for Mrs. A. Robinfon, were the earl and countefs of Oxford, daughter-in-law to the lord-treafurer Oxford, who not only bore every public teftimony of their affection and efteem for Mrs. A. Robinfon, but lady Oxford attended her when fhe was privately married to the earl of P., and lady P. ever acknowledged her obligations with the warmeft gratitude; and after lady Oxford's death, fhe was particularly diftinguifhed by the duchefs of Portland, lady Oxford's daughter, and

and was always mentioned by her with the greatest kindness for the many friendly offices she used to do her in her childhood when in lady Oxford's family, which made a lasting impression upon the duchess of Portland's noble and generous heart.

"Mrs. A. Robinson had one sister, a very pretty accomplished woman, who married Dr. Arbuthnot's brother. After the death of Mr. Robinson, lord P. took a house near Fulham, in the neighbourhood of his own villa at Parson's-Green, where he settled Mrs. Robinson and her mother. They never lived under the same roof, till the earl, being seized with a violent fit of illness, solicited her to attend him at Mount Bevis, near Southampton, which she refused with firmness, but upon condition that, though still denied to take his name, she might be permitted to wear her wedding ring; to which, finding her inexorable, he at length consented.

"His haughty spirit was still reluctant to the making a declaration, that would have done justice to so worthy a character as the person to whom he was now united; and, indeed, his uncontrollable temper, and high opinion of his own actions, made him a very awful husband, ill suited to lady P—'s good sense, amiable temper, and delicate sentiments. She was a Roman Catholic, but never gave offence to those of a contrary opinion, though very strict in what she thought her duty. Her excellent principles and fortitude of mind supported her through many severe trials in her conjugal state. But at last he prevailed on himself to do her justice, instigated, it is supposed, by his bad state of health, which obliged him to seek another climate, and she absolutely refused to go with him unless he declared his marriage; her attendance upon him in his illness nearly cost her her life.

"He appointed a day for all his nearest relations to meet him at the apartment over the gate-way of St. James's palace, belonging to Mr. Pointz, who was married to lord Peterborough's niece, and at that time preceptor to prince William, afterwards duke of Cumberland. Lord P. also appointed lady P. to be there at the same time; when they were all assembled he began a most eloquent oration, enumerating all the virtues and perfections of Mrs. A. Robinson, and the rectitude of her conduct during his long acquaintance with her, for which he acknowledged his great obligations and sincere attachment, declaring he was determined to do her that justice which he ought to have done long ago, which was presenting her to all his family as his wife. He spoke this harangue with so much energy, and in parts so pathetically, that lady P. not being apprised of his intentions, was so affected that she fainted away in the midst of the company.

"After lord P—'s death she lived a very retired life, chiefly at Mount Bevis, and was seldom prevailed on to leave that habitation, but by the duchess of Portland, who was always happy to have her company at Bulstrode, when she could obtain it, and often visited her at her own house.

"Among lord P—'s papers she found his memoirs, written by himself, in which he declared he had been guilty of such actions as would have reflected very much upon his character. For which reason she burnt them; this, however, contributed to complete the excellency of her principles, though it did not fail giving offence to the curious enquirers after anecdotes of so remarkable a character as that of the earl of Peterborough."

ROBINSON'S *Island*, in *Geography*, a small island in the Florida streams. N. lat. 24° 45'. W. long. 81° 35'.

ROBINSON *Crusoe's Coat*, in *Botany*. See CACTUS.

ROBINSONIA, was so named by Scopoli, in his *Introductio ad historiam naturalem*, in honour of one, or all, of the four Robinsons, mentioned in Haller's *Bibliotheca Botanica*. The worthy author informed us, by word of mouth, that Haller's index was his usual resource for names to his new genera; any person mentioned there being, in his opinion, sufficiently worthy of this kind of commemoration. It is pity that Robinson Cruso was not in the list, or he might have shared a botanical crown with Cook and Bouganville. If we must seriously appropriate the above honour, it would be in favour of Dr. Tancred Robinson, a particular friend, and botanical associate, of Ray.—Schreb. 337. Willd. Sp. Pl. v. 2. 999. Mart. Mill. Dict. v. 4. (Touroulia; Aubl. Guian. v. 1. 492. Juss. 434. Lamarck Illustr. t. 424.)—Class and order, *Icosandria Monogynia*. Nat. Ord. uncertain, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate, with five acute teeth. *Cor.* Petals five, roundish, concave, spreading, inserted into the calyx. *Stam.* Filaments numerous, capillary, swelling upwards, inserted into the calyx beneath the petals; anthers of two oblong cells, divaricated at the base. *Pist.* Germen superior; style none; stigma oblong, striated. *Peric.* Berry globose, somewhat depressed, marked with numerous, contiguous, longitudinal furrows, fleshy, of seven cells, with membranous partitions. *Seeds* solitary, oblong, compressed, externally convex, hairy.

Ess. Ch. Calyx five-toothed. Petals five. Berry superior, striated, of seven cells. Seeds solitary, hairy.

1. R. *melianthifolia*. Willd. n. 1. (Touroulia guianensis; Aubl. Guian. v. 1. 492. t. 194.)—Found by Aublet in the forests of Guiana, where the inhabitants know it by the name of Touroulia. The flowers appear in November, and the fruit is ripened in May. A large and lofty *tree*, with a wrinkled bark, and red wood; the *branches* spreading, quadrangular. *Leaves* opposite, pinnate, of about four pair, with an odd one, of elliptic-oblong, pointed, smooth, serrated leaflets, whose lateral veins are numerous and parallel, and their serratures each tipped with a bristle. *Stipulas* acute. *Clusters* terminal, compound, with opposite branches. *Flowers* tufted, nearly sessile, yellow, small. *Berry* an inch in diameter, reddish, of a pleasant acid flavour. The *calyx* being certainly inferior, as Jussieu determined by examination, its teeth can hardly crown the fruit, though, by Aublet's description, its base seems confluent therewith.

ROBION, or ROUBION, in *Geography*, a river of France, which runs into the Rhone, a little below Montelimart.

ROBISON, JOHN, in *Biography*, an eminent Scotch mathematician and natural philosopher, was born at Boghall, in the county of Stirling, in the year 1739. He was sent to Glasgow to receive his education, and was soon distinguished for the rapid progress which he made in classical learning. He went, while very young, to the university, where he enjoyed the benefit of the instructions of professors Simson, Leechman, Moore, Smith, and others. He was led to attach himself particularly to the mathematics, by perceiving how successfully that science was applied to several branches of natural philosophy. Dr. Robert Simson was his tutor in mathematics, and in his class Mr. Robison was soon distinguished beyond any of his fellow students. Among other branches, Mr. Robison made himself well acquainted with the modes of algebra; but from professor Simson he derived a peculiar disposition to the study of geometry, assigning, for a reason, what others have often done, who are tolerably conversant with both subjects, that in the longest demonstration, the geometrician has clear and accurate ideas, which the most expert algebraist can very seldom have. Mr.

 Robison

Robifon had been defigned, by his father, for the clerical profeffion, but it appears he became diffatisfied with it on account of fome of the tenets in the eftablifhed creed. Accordingly, in 1757, he was candidate for the office of affiftant to Dr. Dick, in the profefforfhip of natural philofophy, but, being then only 19 years of age, he was deemed too young for the duties attached to that fituation, and in the following year he went to fea as mathematical tutor to Mr. Knowles, the eldeft fon of admiral Knowles. He embarked, with his pupil, on board the Neptune, of 90 guns, bound to Quebec; and, in the courfe of the voyage, Mr. Knowles being appointed lieutenant on board the Royal William, Mr. Robifon accompanied him into that fhip, and, at his own requeft, was rated as midfhipman. In this fhip he fpent three years, which he thought the happieft part of his life, and during this period he acquired that knowledge of the art of feamanfhip which qualified him to draw up the article on that fubject in the Encyclopædia Britannica, which was underftood to be his. While on board this veffel, in the river St. Lawrence, he noticed a connection between the aurora borealis and the direction of the magnetic needle, which he pointed out to the gentlemen on the quarter-deck. During the fiege of Quebec, Mr. Robifon was fent, with a party of feamen and petty officers, to reinforce the crew of the Sterling-Caftle, which was lying before the city, and was thus enabled to fee much fervice both on board and on fhore. He was likewife not unfrequently employed in taking furveys of different parts of the river. Upon the furrender of Quebec he returned to the Royal William, and fpent the whole of the following year in the Bay of Bifcay, and on the coafts of Spain and Portugal. In the year 1762, upon the expectation of future preferment from lord Anfon, then firft commiffioner of the admiralty, he went to Jamaica, for the purpofe of trying Harrifon's time-keeper, and on his return to England he received the painful intelligence that his beloved pupil had, with the whole crew of the Peregrine, of which he was commander, perifhed, by the veffel's foundering at fea. He now felt that his profpects of advancement in the navy were very flender, and determined to return to college. Very foon after, admiral fir Charles Knowles confided to him the inftruction of his younger fon. At Glafgow he renewed his ftudies with great ardour, and in the year 1767, when Dr. Black was called to Edinburgh, the fenate of the univerfity of Glafgow, on his recommendation, appointed Mr. Robifon his fucceffor, as lecturer in chemiftry. In the year 1770, fir Charles Knowles appointed him his official fecretary to the court of Peterfburgh, whither the gallant admiral was going to affift in improving the Ruffian navy. They fet out upon their journey over land, and paffing through Liege, they were invited to dine with the prince-bifhop: Mr. Robifon obferved, with fome degree of furprife, that all the guefts, and even the principal attendants, had about them the badges of free-mafonry; upon fome enquiries he was induced to become a member, and during his ftay in that city he paffed through all the degrees, till he attained the rank of Scotch mafter. At Peterfburgh he was appointed infpector-general of the corps of marine-cadets; an academy confifting of above four hundred young gentlemen and fcholars, under the tuition of about forty teachers. His duty, in this office, confifted in vifiting daily every clafs of the academy; in receiving weekly reports from each mafter, concerning the diligence and progrefs of every perfon in his clafs; and in advancing, twice in every year, the young gentlemen into higher claffes, according to their refpective merits. Of thefe he was conftituted the fole judge, and againft his decifion there was no appeal. At this period general Kutuzoff was military-head of the academy, and held the third place in the admiralty-college. This general approved all Mr. Robifon's plans, adopted all his meafures, and fupported his authority. While in this fituation, Mr. Robifon prefented to the admiralty-college a plan for rendering the magnificent docks at Cronftadt of fome ufe by means of a fteam-engine, which was adopted and executed with fuccefs after he had left Ruffia. Being attached, by his office, to that ifland, he found it, particularly in winter, to be a difmal folitude, where he was nearly cut off from all fociety. On this account, having held the appointment about four years, he determined to refign it, and to accept of an invitation from the magiftrates and town-council of Edinburgh, to be profeffor of natural philofophy in their univerfity. This fituation he filled with great honour to himfelf, as well as benefit to the ftudents of the univerfity, till his death, which happened in 1805.

Although Dr. Robifon laboured under a very diftreffing and painful diforder during the laft eighteeu years of his life, ftill in general his mind was active. He is well known to be author, not only of the article Seamanfhip, already mentioned, but of all the moft important mathematical and philofophical articles in the third edition of the Encyclopædia Britannica, and the fupplement to that work. They were probably the fubftance of his lectures delivered at college, and feveral of them were afterwards thrown into a different form, and publifhed under the title of "Elements of Mechanical Philofophy." In 1797 this gentleman publifhed a work, entitled "Proofs of a Confpiracy againft all the Religions and Governments of Europe, carried on in the Secret Meetings of Free-Mafons, Illuminati, and Reading Societies," a work full of declamation and abfurdity, but which, owing to the furor of the times, made a great impreffion, and rapidly paffed through feveral editions, but which, when reafon returned to the great mafs of the people, fell into deferved contempt. In 1803 Mr. Robifon performed a very acceptable fervice to the public, by giving them an edition of Dr. Black's lectures on the "Elements of Chemiftry," in two vols. 4to.

ROBLEDA, in *Geography*, a town of Spain, in the province of Leon; 22 miles S. of Civdad Rodrigo.

ROBLINTON, a townfhip of Wafhington county, in Pennfylvania, containing 770 inhabitants.

ROBO, a town of Arabia, in the province of Yemen; 12 miles E.N.E. of Zebid.

ROBOAN. See RUBIN.

ROBORANTIA, in *Medicine, ftrengtheners;* or fuch medicines as ftrengthen the parts, and give new vigour to the conftitution.

ROBORTELLO, FRANCESCO, in *Biography*, an Italian man of letters, born at Udine in 1516, was the fon of a notary and noble of that city. He was educated at Bologna, and about 1538 was invited to occupy the chair of eloquence at Lucca. In 1543 he removed to Pifa, where he held a fimilar profefforfhip. In 1552 he was called to Padua to fill the chair of Greek and Latin eloquence, vacant by the death of Lazzaro Buonamici. He quitted Padua for Bologna in 1557; whence, in 1560, he was recalled by the fenate of Venice to his chair at Padua. He died in 1567, in his 51ft year. The univerfity gave him a fplendid funeral, and the German nation erected a handfome monument to his memory in the church of St. Antonio. At moft of the places of his refidence he was involved in quarrels with his colleagues, and his writings are full of attacks upon his contemporaries. He publifhed numerous works, among which were, "Annotations on various Authors, Greek and Latin," 1543, republifhed in 1548, with feveral fmall treatifes;

treatises; a corrected edition of "Aristotle's Poetics," together with a paraphrase on "Horace's Art of Poetry;" an edition of the "Tragedies of Æschylus;" of "Ælian's Tactics," with a Latin version; and of "Longinus de Sublimitate," with annotations. He also published a valuable work "De Vita et Victu Populi Romani sub Imperatoribus Cæsaribus Augustis," with ten other dissertations on subjects of Roman antiquity.

ROBUR Carolinum, in *Astronomy*. See Royal *Oak*.

ROBUSTI, Giacopo, in *Biography*. See Tintoretto.

ROCA, or Rocca, in *Geography*, a cluster of islands in the Caribbean sea, near the coast of South America. N. lat. 12° 20′. W. long. 66° 6′.

Roca, *Cape*, a cape on the W. coast of Portugal, generally called by the English sailors the "Rock of Lisbon." N. lat. 38° 45′. W. long. 90° 34′.

Roca *Point*, a cape on the E. coast of England, in the county of Durham. N. lat. 55° 1′. W. long. 1° 21′.

ROCAB, a town of Arabia, in Hadramaut; 50 miles S.S.W. of Sahar.

ROCABERTI, John Thomas de, in *Biography*, a Spanish prelate in the seventeenth century, was descended from a noble family, and born at Peselada, on the frontiers of Catalonia, about the year 1624. He entered into the order of St. Dominic; was made provincial of Aragon in 1666; general of his order in 1670; archbishop of Valentia in 1676; inquisitor-general in Spain in 1695; and twice appointed viceroy of Valentia. By his authority as general, he selected from the mass of manuscripts belonging to his order, the most valuable unpublished labours of several of its members, which he directed to be printed, but at his own private expence. Besides some devotional tracts, he published a treatise "De Romani Pontificis Auctoritate," 1693, in three vols. folio. This work was very favourably received in Spain and in Italy; but the sale of it was prohibited in France, by a decree of the parliament of Paris. He spared no pains in procuring all the treatises which had been composed by different authors in defence of the pope's authority and infallibility, and made provision for their being printed in an uniform edition at Rome. This enormous collection is entitled "Bibliotheca Maxima Pontifica," &c., and consists of twenty-one folio volumes. The archbishop died in 1699.

ROCAIBA, in *Geography*, a town of Arabia, in the province of Hedsjas; 120 miles E.N.E. of Mecca.—Also, a town of Arabia, in the province of Nedsjed; 17 miles E. of Mecca.

ROCAMA, in *Botany*, an Arabian name, applied by Forskall, in his Fl. Ægypt-Arab. 71, to the Linnæan *Trianthema pentandra*, which he there establishes as a distinct genus. See Trianthema.

ROCAMADOUR, in *Geography*, a town of France, in the department of the Lot; 22 miles N. of Cahors. N. lat. 44° 48′. E. long. 1° 42′.

ROCAMBOLE, a mild sort of garlic, by some called Spanish garlic; being much of the nature of shalot; and well known in cookery, in quality of a sauce. See Allium.

ROCAPARTIDA, in *Geography*, an island in the North Pacific ocean. S. lat. 16°. W. long. 92° 14′.

ROCAS, a town of Arabia, in the province of Oman, near the sea; 30 miles W.N.W. of Oman.

ROCAVION, a town of France, in the department of the Stura; five miles S.S.W. of Coni.

ROCCA, Angelo, in *Biography*, a learned Italian monk and titular bishop, was a native of Rocca Contrata, a town in the marche of Ancona, and born in the year 1545. When young he took the habit among the hermits of St. Augustine, and pursued his studies at Rome, Venice, Perusia, and Padua. Having distinguished himself by his proficiency in the various branches of literature, sacred and profane, he was honoured with the degree of doctor of divinity by the university of Padua, and afterwards acquired much celebrity as a preacher at Venice. His general appointed him to several confidential and honourable employments, and at last made him secretary to his order. After he had retained this post some years, pope Sixtus V. placed him in the Vatican in 1585, and confided to his superintendance those editions of the bible, the councils, and the fathers, which issued from the apostolical press during his pontificate. In the year 1595, pope Clement VIII., by way of reward for these services, made him apostolical sacristan, and titular bishop of Tagasté in Numidia. He collected a very large and excellent library, which he left by his will to the Augustinian monastery at Rome; but upon the express condition, that it should be always open for the benefit of the public. This was the first library formed in that city to which the public had freedom of access, and it was properly called, after the name of its beneficent founder, the "Angelical Library." Rocca died in 1620, at the age of 75. He published "Bibliotheca Theologica et Scripturalis;" "Notæ in Novum Testamentum;" "De Patientia;" "De Cometis;" "Observationes in VI Libros Elegantiarum Laur. Vallæ;" "Observationes de Lingua Latina;" and other pieces which were collected together, and printed in two vols. folio, in the year 1719. From his manuscripts was also published, in 1745, a very curious collection, entitled "Thesaurus Pontificiarum Antiquitatum, necnon Rituum ac Cæremoniarum;" in two vols. folio.

Rocca, in *Geography*, a town of Istria; one mile N. of Monfalcone.—Also, a town of Naples, in Lavora; 19 miles N. of Sezza.—Also, a small island in the West Indies; 24 miles W. of Orchilla.—Also, a town of the Ligurian republic; nine miles S.E. of Genoa.—Also, a town of Italy, on the east bank of lake Maggiore; 30 miles N.W. of Milan.

Rocca, *La*, a town on the S.W. coast of the island of Canary; 15 miles S.W. of Civdad de los Palmas.

Rocca *Albegna*, a town of Etruria; 28 miles S. of Sienna.

Rocca *dell'Aspro*, a town of Naples, in Principato Citra; 15 miles W.S.W. of Cangiano.

Rocca *Bruno*, a town of France, in the department of the Maritime Alps, near the coast of the Mediterranean; three miles E.N.E. of Monaco.

Rocca *Contrada*, a town of the duchy of Urbino; 24 miles E.S.E. of Urbino.

Rocca *del Este*, a rocky islet among the Canaries; eight miles E. of Gratiosa.

Rocca *Gloriosa*, a town of Naples, in Principato Citra; seven miles W. of Policastro.

Rocca *Lanzone*, a town of the duchy of Parma; nine miles W.S.W. of Parma.

Rocca *del Marino*, a town of Italy, in the Trevisan; 16 miles N. of Trevigio.

Rocca *Minolfa*, a town of Naples, in the county of Molise; eight miles S. of Molise.

Rocca *Mensena*, a town of Naples, in Lavora; three miles N. of Sezza.

Rocca *di Neto*, a town of Naples, in Calabria Citra; four miles S.S.W. of Strongoli.

Rocca *del Oueste*, or *West Rock*, a rocky islet among the Canaries; six miles S.W. of Alegranza.

Rocca *Romana*, a town of Naples, in Lavora; six miles N. of Capua.

Rocca *Vallé Oscura*, a town of Naples, in Abruzzo Citra; five miles S. of Sulmona.

Rocca *Vecchia*, a town of Naples, in Lavora; 14 miles N.E. of Sezza.

Rocca *Voltraia*, a town of Etruria; three miles N.E. of Volterra.

ROCCABIANCA, a town of the duchy of Parma; 15 miles N.N.W. of Parma.

ROCCABILIERE, a town of France, in the department of the Maritime Alps, and chief place of a canton, in the district of Nice. The place contains 1143, and the canton 3631 inhabitants, on a territory of 455 kiliometres, in five communes.

ROCCALANA, a town of Italy, in the country of Friuli; 16 miles N.N.W. of Friuli.

ROCCARION, a town of France, in the department of the Stura; four miles S.W. of Coni.

ROCCELLA, in *Botany*, an Italian name for that species of *Lichen*, known to our dyers under the appellation of Argol, or Orchall; for which, in dyeing red or purple, the Scottish *Lichen tartareus* is but an inadequate substitute, the colours it affords being far less permanent. See Lichen, sect. 8. n. 115.

ROCCO Rodio, in *Biography*, an ancient Neapolitan contrapuntist and writer on music. Padre Martini (Hor. della Mus. vol. i. p. 447.) places Rocco Rodio at the head of the Neapolitan school, after Tinctor. But it is difficult to ascertain the exact period when Rocco Rodio flourished. We have, however, been so fortunate as to find an edition of his precepts, to which P. Martini alludes, that was printed at Naples 1609; but this date tells us nothing, as the work had certainly appeared much earlier in another form. Battista Olifante, the editor of this edition, seems not to give the rules of Rocco Rodio in his own words, but explanations of the doctrines and examples he had left. If this exposition of the rules established by Rocco Rodio was written by himself, he must have flourished late in the sixteenth century: as Adriano Willaert and Cipriano Rore are both mentioned in the text: and both these masters were living after the year 1550. The full title is the following: "Regole di Musica di Rocco Rodio, sotto brevissime risposte ad alcuni dubij propostogli da un Cavaliero, intorno alle varie opinioni de Contrapontisti. Con la Dimostratione di tutti i Canoni sopra il Canto-fermo, con li Contraponti doppij, e rivoltati, e loro regole. Aggiontavi un' altra breve Dimostratione de dodici Tuoni regolari, finti e trasportati. Et di nuovo da Don Batt. Olifante, Aggiontivi un Trattato di Proportioni necessario, á detto Libro, e ristampato. In Napoli, MDVIIII."

The rules and examples for composing canons of all kinds are remarkably short and clear in this tract, which is so scarce, that we have never seen it in any public library or catalogue of books; and P. Martini, who mentions the work, seems never to have been in possession of it. Our copy was purchased at the sale of the late Mr. Belway's collection of music, the admirable organist of St. Martin's church.

Rocco, in *Geography*, a town of the Ligurian republic; 11 miles S.E. of Genoa.

ROCELLA, a town of Naples, on the coast of Calabria Citra, near which is a celebrated coral fishery; 10 miles N.E. of Giarau.

ROCH, Cape, a cape on the E. coast of Majorca. N. lat. 39° 40′. E. long. 3° 5′.

ROCHDALE, a market-town and parish in the hundred of Salford, and county of Lancaster, England, is situated in a valley watered by the river Roch, at the distance of 46 miles S.E. from Lancaster, and 197 N.N.W. from London. In the town, besides the parish church, there are places of worship for Presbyterians, Baptists, and Methodists. Here is a free grammar-school, founded by archbishop Parker, also an English free-school, erected and endowed by Mrs. Hardman, and several Sunday-schools. The market days are Monday and Saturday; and there are fairs annually on the 14th of May, Whit-Tuesday, and the 7th of November. The petty sessions for Rochdale and Middleton division of the hundred of Salford are holden here. This town is situated in three townships, *viz.* Castleton, Spotland, and Wardleworth. The largest portion of it is within Wardleworth. The parish is of great extent, and is divided in seven districts, or townships, *viz.* Blackenworth, Butterworth, Todmorton, Wuerdale, and the three townships above-mentioned, all of which maintain their poor separately. According to the late parliamentary returns, these united districts contained 6552 houses, and 37,224 inhabitants. The vicarage here is superior in value to any other living of a similar description in the kingdom. In the reign of Henry VIII. it was rated as low as 11*l.* 4*s.* 9½*d.*, but it has since increased to nearly a hundred and fifty times that amount. It is in the gift of the archbishop of Canterbury, to whom the tithes belong, which are let for a term of years. Nine chapels of ease are attached to the church of Rochdale, *viz.* St. Mary's in the town, Littleborough, Milnrow, Todmorton, Whitworth, Friermeer, Lydgate, Saddleworth, and Dobcross: most of which are in the patronage of the vicar. Rochdale parish is rich in the mineral products of slate, stone, and coal. It is also, and has long been, distinguished for its trade. A branch of the woollen manufacture is its staple, of which the chief articles are bays, flannels, coatings, and broad cloths; but there is likewise a considerable cotton trade carried on both in the town and its vicinity. In the township of Whitworth formerly resided Messrs. John and George Taylor, better known by the name of the Whitworth Doctors. "The fame of these rustic artists," says Dr. Aikin, "is almost equal to that of the celebrated Swiss doctor mentioned by Mr. Coxe, and has spread not only over the more immediate neighbourhood, but to remote parts of the kingdom, and even to the metropolis itself. They were chiefly noted for setting broken and dislocated bones, and for the cure of cancerous and other tumours by caustics, properly termed by themselves *keen*." Lord Byron, the poet, is lord of the manor of Rochdale, and takes his seat as an English peer under the title of baron Byron of Rochdale. At his court-leet, the officers and constables for the civil government of the parish are annually appointed.

The principal seats in this vicinity are Belfield, which formerly belonged to the Knights Templars; Foxholes, the residence of the Entwisle family; and Studley, long the property of the Holts, a memorable name in this district of the country. The house appears to have been erected by Robert Holt, esq. in the reign of Henry VIII. and consists of a centre and two wings. Whitaker, in his History of Whalley, describes it as containing within "much carving in wood, particularly a rich and beautiful screen between the hall and the parlour, with a number of crests, cyphers, and cognizances

cognizances belonging to the Holts, with other neighbouring families. It was abandoned for the warmer and more fertile ſituation of Caſtleton by Robert Holt, eſq. about the year 1640."

The townſhip of Caſtleton derives its name from an ancient caſtle which formerly reared its embattled walls within its limits, on a ſpot where ſtill remains a lofty artificial mound of earth called the keep. Dr. Whitaker ſuppoſes that a caſtle ſtood here anterior to the Norman conqueſt, as in a record in the Harleian collection, apparently part of an inquiſition taken after the death of Thomas of Lancaſter, "it is deſcribed as the ſcite of an ancient caſtle long ſince gone to decay." A Deſcription of the Country from thirty to forty Miles round Mancheſter, by J. Aikin, M. D. 4to. London 1795. Whitaker's Hiſtory and Antiquities of the ancient Pariſh of Whalley, &c. 4to. 1806. Beauties of England and Wales, vol. ix. by John Britton, F. S. A.

ROCHDALE, a town of Pennſylvania, in Crawford county, containing 401 inhabitants.

ROCHE, a town of France, in the department of the Upper Rhine; two miles S. of Delmont.—Alſo, a river of America, which runs into lake Erie, N. lat. 42° 20'. W. long. 82° 53'.—Alſo, another which runs into the ſame lake, N. lat. 41° 48'. W. long. 81° 25'.

ROCHE, or *Stony River*, a river of America, which runs into the Miſſiſippi, N. lat. 40° 50'. W. long. 91° 42'.

ROCHE, *La*, a town of France, in the department of the Leman, and chief place of a canton, in the diſtrict of Bonneville; 12 miles N.E. of Annecy. The place contains 2447, and the canton 7685 inhabitants, on a territory of 150 kiliometres, in eight communes. The town is ſituated near the river Bonne, and is ſo called from a rock near it, and lies on the declivity of a hill, in a fertile country, diverſified with arable lands and meadows. It is ſurrounded by an ancient wall and defended with towers. The principal occupations of its inhabitants are tanning of leather and making of ſhoes. It contains, beſides a pariſh church, ſeveral religious houſes.—Alſo, a town of France, in the department of Mont Blanc; 10 miles S.E. of Monſtier.

ROCHE, *La*, or *Roche en Ardennes*, or *en Famine*, a town of France, in the department of the Sambre and Meuſe, belonging to the duchy of Luxemburg: formerly a well fortified town, with a caſtle commanding the town and ramparts, ſurrounded with the waters of the river Ourte, which paſſes through it. It is the capital of a comté, called "the comté of Ardennes," which comprehended 51 towns and villages. In 1703 it ſuffered very much from fire; 28 miles S. of Liege. N. lat. 50° 10'. E. long. 5° 33'.

ROCHE *l'Abeille*, *La*, a town of France, in the department of the Upper Vienne; 6 miles N. of St. Yriax.

ROCHE *des Arnauds*, *La*, a town of France, in the department of the Higher Alps; 6 miles W. of Gap.

ROCHE *Beaucourt*, *La*, a town of France, in the department of the Dordogne; 12 miles S.W. of Nontron.

ROCHE *Bernard*, *La*, a town of France, in the department of the Morbihan, and chief place of a canton, in the diſtrict of Vannes, ſituated on the Vilaine; 21 miles S.E. of Vannes. The place contains 6272, and the canton 10,959 inhabitants, on a territory of 212½ kiliometres, in 8 communes. N. lat. 47° 31'. W. long. 2° 12'.

ROCHE *les Beaupré*, a town of France, in the department of the Doubs; 5 miles N.E. of Beſançon.

ROCHE *Blanche*, *La*, a town of France, in the department of the Puy de Dôme; 5 miles S. of Clermont.

ROCHE *Bonnet*, a ſmall iſland, near the W. coaſt of France, in the bay of Bourg Neuf.

ROCHE *Canillac*, *La*, a town of France, in the department of the Correze, and chief place of a canton, in the diſtrict of Tulles; 9 miles S.E. of Tulles. The place contains 375, and the canton 6845 inhabitants, on a territory of 232½ kiliometres, in 11 communes.

ROCHE *Chalais*, *La*, a town of France, in the department of the Dordogne, on the Dronne; 15 miles S.W. of Riberac.

ROCHE *Darrien*, *La*, a town of France, in the department of the Northern Coaſts, and chief place of a canton, in the diſtrict of Lannion, ſituated on the river Treguier; 3 miles S. of Treguier. The place contains 1102, and the canton 10,329 inhabitants, on a territory of 112½ kiliometres, in 12 communes.

ROCHE *Guyon*, *La*, a town of France, in the department of the Seine and Oiſe, on the Seine; 8 miles N.N.W. of Mantes.

ROCHE *Melon*, *La*, a mountain of Piedmont, near Suza, ſuppoſed to be the higheſt in Italy, and to be that from the eminence of which Hannibal ſhewed to his army the fertile country which he thus animated them to conquer.

ROCHE *Milley*, *La*, a town of France, in the department of the Nièvre; 12 miles S.E. of Moulins.

ROCHE *Reigner*, *La*, a town of France, in the department of the Upper Loire; 12 miles N. of Le Puy.

ROCHE *Servière*, *La*, a town of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Montaign; 9 miles W.S.W. of Montaign. The place contains 425, and the canton 4542 inhabitants, on a territory of 165 kiliometres, in 8 communes.

ROCHE *ſur Yon*, *La*, a town of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Montaign, ſituated on the Yon; 30 miles N.W. of Fontenay le Comte. The place contains 631, and the canton 8515 inhabitants, on a territory of 275 kiliometres, in 11 communes. N. lat. 46° 44'. W. long. 1° 20'.

ROCHE, *Cape de la*, a cape on the N. coaſt of the iſland of Hiſpaniola. N. lat. 19° 42'. W. long. 70° 35'.

ROCHEA, in *Botany*, a genus of Decandolle's, in his *Plantes Graſſes*, n. 103, dedicated to the memory of Daniel de la Roche, a phyſician of Geneva, whoſe inaugural diſſertation, printed at Leyden in 1766, contains deſcriptions and plates of many plants of the natural order of *Enſatæ*, and is often cited by writers on the genera and ſpecies of that tribe. *De Theis*.

ROCHECHOUART, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Upper Vienne; 18 miles W. of Limoges. The place contains 1440, and the canton 7872 inhabitants, on a territory of 180 kiliometres, in 7 communes.

ROCHEFORT, WILLIAM DE, in *Biography*, a modern French writer, was born in 1730, at Lyons. He had a ſmall employment in the finances; but finding in himſelf a greater love to letters than to buſineſs, he went to Paris, and devoted himſelf to poetry and Greek literature. He compoſed three tragedies upon the Greek models, which had too much ſimplicity to pleaſe; and a comedy which was not more ſucceſsful. In proſe he publiſhed a "Refutation du Syſteme de la Nature;" a "Critical Hiſtory of the Opinions of the Ancients concerning Happineſs;" and a "Complete Tranſlation of the Plays of Sophocles;" the laſt named work gained him much credit by the elegance and fidelity of the verſion, and the judicious notes annexed to it. He then undertook the taſk of a complete tranſlation of Homer's Iliad and Odyſſey, of which the preliminary diſcourſes and the notes obtained more applauſe than the verſion itſelf, which, however, he had ſplendidly printed at the royal preſs, in 1781, in 4to. He was a member of the

Academy

Academy of Infcriptions and Belles Lettres, to which he contributed feveral learned memoirs. He died in 1788, highly efteemed for his private and focial virtues. Gen. Biog.

ROCHEFORT, in *Geography*, a town of the county of Neufchatel; 5 miles S.W. of Neufchatel.—Alfo, a town of France, in the department of the Puy de Dome, and chief place of a canton, in the diftrict of Clermont; 13 miles S.W. of Clermont. The place contains 110, and the canton 12,177 inhabitants, on a territory of 365 kiliometres, in 14 communes.—Alfo, a town of France, in the department of the Jura, and chief place of a canton, in the diftrict of Dole, feated on the Doubs; 4 miles E.N.E. of Dole. The place contains 562, and the canton 6395 inhabitants, on a territory of 107½ kiliometres, in 19 communes.—Alfo, a town of France, in the department of the Sambre and Meufe, and chief place of a canton, in the diftrict of Marche, furrounded by rocks, with an ancient caftle, faid to be of Roman conftruction. The place contains 878, and the canton 5148 inhabitants, on a territory of 237½ kiliometres, in 18 communes; 33 miles S.S.W. of Liege. N. lat. 50° 9′. E. long. 5° 5′.—Alfo, a fea-port town of France, and principal place of a diftrict, in the department of the Lower Charente, feated on the Charente. The place contains 15,000, and the canton 17,842 inhabitants, on a territory of 162½ kiliometres, in 8 communes. N. lat. 45° 56′. W. long. 0° 52′. This port has excellent docks for building, careening, and refitting veffels, and magazines well replenifhed with naval ftores. It has alfo a marine academy, and an hofpital for feamen; but the adjacent falt-marfhes injure its falubrity. In this refpect it has been improved by the drying of the marfhes by canals. The town was founded by Louis XIV. A.D. 1665; it is elegantly built and fortified, and contains feveral churches and convents. It has water fufficient, even at low water, to float large veffels, and they are fheltered from all hurricanes, and alfo fecured from all attacks of bomb-veffels. It is alfo faid, that the worm, which is fo deftructive to fhips' bottoms, does not affect them here. The approach to the town up the river is defended by feveral forts, and is about two leagues from the fea-coaft, five from the mouth of the river, and fix S.E. of Rochelle.

ROCHEFORT, *La*, a town of France, in the department of the Morbihan, and chief place of a canton, in the diftrict of the Vannes; 16 miles E. of Vannes. The place contains 628, and the canton 9837 inhabitants, on a territory of 187½ kiliometres, in 9 communes. N. lat. 47° 42′. W. long. 2° 15′.

ROCHEFORT, a town of France, in the department of the Seine and Oife; 4 miles N. of Dourdan.

ROCHEFORT *fur Loire*, a town of France, in the department of the Mayne and Loire, on the S. fide of the Loire; 13 miles S.S.W. of Angers.

ROCHEFORT *Samfon*, a town of France, in the department of the Drôme; 12 miles E.N.E. of Valence.

ROCHEFORTIA, in *Botany*, received that name from profeffor Swartz, in commemoration of a French writer, De Rochefort, of whom we know nothing but that he publifhed, in 1639, Hiftoire naturelle et morale des îles Antilles de l'Amerique, with plates; a work of which a fecond edition appeared at Rotterdam in 1665, and an Englifh tranflation, by J. Davies, at London in 1666.—Swartz Prodr. 4. Ind. Occ. v. 1. 551. t. 10. Schreb. 797. Willd. Sp. Pl. v. 1. 1328. Mart. Mill. Dict. v. 4.—Clafs and order, *Pentandria Digynia*. Nat. Ord. *Dumofæ*, Linn. *Rhamni*, Juff.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, in five deep, ovate, obtufe fegments. *Cor.* of one petal; tube fhort, pervious; limb funnel-fhaped, in five deep, ovate-oblong, fpreading fegments. *Stam.* Filaments five, inferted into the mouth of the corolla between the fegments, awl-fhaped; anthers oblong. *Pift.* Germen fuperior, roundifh, compreffed; ftyles two, awl-fhaped; ftigmas fimple. *Peric.* Berry? nearly globofe, of two cells. *Seeds* few, angular.

Eff. Ch. Calyx inferior, in five deep fegments. Corolla funnel-fhaped, pervious at the mouth. Fruit of two cells, with feveral feeds.

1. R. *cuneata*. Wedge-leaved Rochefortia. Willd. n. 1. Swartz Ind. Occ. v. 1. 552.—Leaves wedge-fhaped, obovate, undivided.—Native of dry, ftony, mountainous places in Jamaica. *Stem* fhrubby, three or four feet high, erect, with round, zigzag, fubdivided, grey *branches*, armed with a folitary projecting thorn, near the infertion of each footftalk. *Leaves* about three, rarely more, together, in alternate tufts, ftalked, generally quite entire, fometimes emarginate, rather rigid, fmooth, and fomewhat fhining, on both fides, of a brownifh-green, flightly ribbed; paler beneath. *Footftalks* fhort. *Flowers* fmall, greenifh or whitifh, in denfe forked, cymofe, terminal or axillary, *clufters*, fhorter than the leaves. *Calyx* downy, as well as the *germen* and *ftigmas*. The *fruit* was only feen in an unripe ftate by Dr. Swartz, fo that he could not determine whether it were a berry or capfule.

2. R. *ovata*. Ovate-leaved Rochefortia. Willd. n. 2. Swartz Ind. Occ. v. 1. 554.—Leaves ovate, emarginate.—Native of bufhy ftony places in Jamaica. A *fhrub*, with round fmooth *branches*. Swartz makes no mention of *thorns*. The *leaves* are alternate, ftalked, ovate, emarginate at the fummit, but otherwife entire, flightly villous, veiny, an inch long. *Flower-ftalks* one-fifth only of the length of the leaves, each bearing many *flowers* in pairs. Unripe *fruit* like the foregoing.

ROCHEFOUCAULT, FRANCIS, duke of, prince of Marfillac, in *Biography*, a well-known writer in the age of Louis XIV. was born in 1613. He diftinguifhed himfelf as one of the moft brilliant young noblemen about the court, and formed a connection with the duchefs of Longueville, which involved him in the civil war of the Fronde. At the battle of St. Antoine, in Paris, he fignalized his courage, and received a mufket fhot, which for fome time deprived him of fight. When thefe troubles were terminated, he devoted himfelf to the pleafures of fociety and literature. His houfe was the refort of the beft company at Paris, in point of talents and underftanding, and his converfation was relifhed by Boileau, Racine, Sevigné, and La Fayette, and the other literary characters of France. Nor did he only fhine by his wit and vivacity; he difplayed great firmnefs of mind under domeftic loffes (having had one fon killed and another wounded at the paffage of the Rhine), and under the pain of the gout, with which he was afflicted in his latter years. Mad. de Sevigné fpeaks of him as "holding the firft rank in courage, merit, tendernefs, and good fenfe." In Mad. Maintenon's Letters is the following portrait of the duke. "He had a happy phyfiognomy, a grand air, much wit, and little learning. He was intriguing, fupple, and wary: I never knew a friend more folid, more open, or who gave better counfel. He loved to take the lead. Perfonal bravery appeared to him a folly, and fcarcely did he difguife this opinion; yet he was very brave. He preferved till death the vivacity of his difpofition, which was always very agreeable, though naturally ferious." The duke de Rochefoucault died with philofophical tranquillity at Paris in 1680, in his 68th year. He made himfelf famous by a work entitled "Reflexions et Maximes,"

Maximes," many times printed, and tranflated. Voltaire fpeaks thus of it: "This little collection, written with that delicacy and fineffe which render a ftyle fo captivating, had the rare merit of accuftoming readers to think, and to give a lively and precife expreffion to their thoughts." The fundamental principle of this work is, that felf-love is the motive of all our actions. It is therefore, perhaps, lefs the hiftory than the fatire of the human race: but it is a fatire which, fays a writer, pleafes, becaufe it flatters malignity, and becaufe it excufes men from the admiration of virtue, by giving it a principle in common with vice, and thereby ftripping it of the heroifm attributed to it. It feems allowed, fays Dr. Aikin, that the writer painted very exactly the world in which he lived, but a lover of mankind will fcarcely admit that world to have been a fair example of the fpecies. Mifanthropes have taken pleafure in his fentiments, and Swift has made one of his thoughts the bafis of his moft finifhed piece, the poem on his own death. The duke alfo wrote "Memoires de la Regence d'Anne d'Autriche," 2 vols. 12mo. 1713, an energetic and faithful reprefentation of that ftormy period, in which he was himfelf an actor. Gen. Biog.

Rochefoucault, *La*, in *Geography*, a town of France, in the department of the Charente, and chief place of a canton, in the diftrict of Angouleme; 12 miles N.E. of Angouleme. The place contains 2586, and the canton 14,574 inhabitants, on a territory of 252½ kiliometres, in 17 communes. N. lat. 45° 46′. E. long. 0° 28′.

ROCHELLE, La, a fea-port town of France, and principal place of a diftrict, in the department of the Lower Charente, with a good harbour. The place contains in the E. and W. divifions 18,000 inhabitants: the canton of the former has 14,636, on a territory of 77½ kiliometres, in 7 communes; and that of the latter 13,642 inhabitants, on a territory of 75 kiliometres, in 7 communes. In the middle age it was called Rupella and Portus Santonum: it was, before the revolution, the capital of Aunis, and a bifhop's fee. It was the birth-place of Reaumur, Defaguliers, &c. The town is confiderable, having an academy of fciences eftablifhed in 1732, an hofpital, and two fuburbs. It is regularly built in a marfhy fituation; the entrance of its harbour is narrow, and is defended by two towers. The circumference of its ramparts is about three miles. Its manufactures are delft ware, glafs, refining of fugar, &c. and its commerce, particularly to the French colonies in Africa and America, was, before the laft war, very confiderable. In 1361 Rochelle was given up to the Englifh. In the 16th century, the inhabitants joined in the reformation, fortified the town, and held out a fiege. In 1622 Louis XIII. in order to compel them to furrender, ordered Fort Louis to be conftructed at the entrance of the harbour, and in 1628 a mole was raifed which furrounded it, in order to prevent the town from receiving any fuccour by fea. The befieged were at length compelled by famine to furrender; in confequence of which it was deprived of its privileges and its fortifications demolifhed; but in the reign of Louis XIV. they were repaired by Vauban. N. lat. 46° 9′. W. long. 1° 3′.

Rochelle, *New*, a town of America, belonging to the ftate of New York, in Long ifland found; 6 miles N.N.E. of Weft Chefter. N. lat. 41° 54′. W. long. 73° 46′.

Rochelle *Salt*. See Rupellensis *Sal*.

ROCHEMAURE, in *Geography*, a town of France, in the department of the Ardeche, and chief place of a canton, in the diftrict of Privas; 9 miles S.E. of Privas. The place contains 1110, and the canton 4372 inhabitants, on a territory of 107½ kiliometres, in 8 communes.

ROCHESTER, a city in the hundred of Rochefter, lathe of Aylesford, and county of Kent, England, is fituated on an angle of land formed by the current of the river Medway, at the diftance of 8½ miles N. from Maidftone, and 29 miles E. by S. from London. According to the population cenfus of 1811, it contained, in conjunction with the adjoining town of Chatham, 3838 houfes, and 21,722 inhabitants.

Hiftorical Events.—Rochefter is faid to have been originally founded by the ancient Britons, who gave it the appellation of Dwr-bryf, which fignifies "a fwift ftream," in allufion to the rapidity of the Medway at this part of its courfe. When the Romans eftablifhed themfelves in Albion, it became one of their ftipendiary ftations, and was denominated by them Durobrivæ, or Durobrivis, afterwards contracted to Roibis. Thefe facts are evidenced by the Itinerary of Antoninus, as alfo by the Peutingerian Tables, and receive ftrong confirmation from the frequent difcoveries of Roman remains, which have been made at different periods within the area of the prefent city. During the government of that people, however, its hiftory is completely barren; nor did it attain any celebrity for more than a century after the arrival of the Saxons, who altered its name to Hrof-ceafter, whence its modern defignation is derived. Ethelbert, king of Kent, who was converted to the Chriftian faith A.D. 597, firft erected a church here, and conftituted the town a bifhop's fee. Still, however, it was regarded chiefly as a military ftation, and hence is ftyled by Bede "a caftle of the Kentifh men." In the year 676, Ethelred, king of Mercia, pillaged Rochefter, as did Ceadwalla, king of Weffex, within a few years of the fame period. The Danifh invaders likewife frequently plundered it, particularly in 839, when they facked the city and committed many cruelties. In 885 they befieged it again, but were effectually kept in check by the inhabitants, till the great Alfred arrived with his army, and drove them back to their fhips. About a century afterwards, Ethelred, king of Kent, met with a fimilar reception, and being fruftrated in his attempt upon the city, gratified his vengeance by laying wafte all the lands belonging to the fee. But thefe fieges were trivial to what the inhabitants fuffered from the Danes in 999, when the city was pillaged to the uttermoft, and all the inhabitants who remained in it were put to death. From that period Rochefter feems to have continued moftly in poffeffion of the Danes till the death of Canute the Great. In the time of Edward the Confeffor it belonged to the crown; and as part of the royal domains was feized by the Conqueror, by whom it was granted to his half-brother, Odo, bifhop of Baieux, on whofe difgrace, in 1083, it reverted to the monarch. Henry I. farmed it out to the citizens at the yearly rent of 20*l*., which was paid by the præpofitus or bailiff. He alfo granted to bifhop Gundulph, and to the church of Rochefter, an annual fair to be held on the eve and day of St. Paulinus, together with various rights and immunities. In the fame reign, on the 11th of May 1130, while Henry himfelf, the archbifhop of Canterbury, and other prelates, and many of the nobility were at Rochefter, moft of its buildings were confumed by fire. A fimilar misfortune befell it in the year 1137, and again in April 1379. Thefe feveral calamities retarded the profperity of the city; and the inteftine commotions happening foon afterwards, it did not regain any great degree of confequence till the reign of Henry III. This monarch repaired, or rebuilt, the city walls, and invefted it befides with a deep foffe. In 1251 the fame prince held a folemn tournament here, which was attended by moft of the Englifh nobility, and by a great concourfe of foreign knights. In the time of the wars between York and Lancaster, Rochester suffered much from the arms of the contending parties, and was more than once visited by the plague. Henry VIII. was twice here, once in company with the emperor Charles V. and again when he came hither to meet his consort, Ann of Cleves. During the reign of queen Mary several individuals suffered martyrdom here for their religious opinions. Queen Elizabeth, her successor, lodged upwards of a week at Rochester; and this was the first city in which Charles II. was publicly received, after his restoration to the throne in 1660. In 1665, Rochester was visited with the same plague, which committed such dreadful havock among the inhabitants of the metropolis. From that period nothing worthy of historical record has occurred.

Municipal Government.—Rochester probably possessed a corporate community even in the time of the Saxons, but its nature cannot now be precisely ascertained. The first Norman monarch who granted to the inhabitants any privileges by charter, was Henry II. This prince gave them the city "in fee, or perpetual ferm, for 20*l.* sterling *per annum*, to hold of him and his heirs for ever, with all the appurtenances, liberties, and free customs; and that they should have a guild merchant, and several other privileges and immunities." These advantages were still further increased by Richard I., who directed his writ to the bailiff, and the whole hundred of Rochester, ordaining, "that no one, except his servants, should purchase victuals in the city till the monks of St. Andrew had been first served." This right was afterwards so far extended, that even the servants of the monarch were forbidden to make a prior purchase; and the monks continued to enjoy the privilege thus given till the dissolution. Henry III. not only confirmed to the citizens all former grants, but remitted to them a portion of their annual fee-ferm, and declared they were to be "exempt from toll, lastage, stallage, and murage, throughout England and the sea-ports, and should have a free market within their city, and the return of all writs whatsoever." These privileges were renewed by Richard II. in 1378; by Henry VI. in 1438 and 1446; and by Edward IV., who further extended the bounds of the city, and ordained that the corporation should be styled "the mayor and citizens of Rochester." Henry VIII. was the next monarch who confirmed the privileges of Rochester; and his successors, to the time of Charles I., severally did the same. By the last mentioned monarch, the corporation was made to consist of "a mayor, twelve aldermen, (of which latter number the mayor was to be one,) twelve assistants, or common council-men, a recorder and town-clerk, two chamberlains, a principal serjeant at mace, a water-bailiff, and other inferior officers." Under this charter the city is now governed; and by virtue of it, the mayor is elected annually on the Monday previous to St. Matthew's day. The mayor and citizens hold a court of admiralty once a-year, for regulating the oyster-fishery in those creeks and branches of the river Medway which are within their jurisdiction. Here are also held the county assises, alternately with Maidstone; likewise the petty sessions for the north division of the lathe of Aylesford. The market-day is Friday, weekly; and there are two annual fairs, on the 30th of May and the 11th of December. Rochester sends two members to parliament, and has done so ever since the 23d year of Edward I. The right of election is vested in the freemen, who are about 630 in number. Many of the representatives have been naval officers, distinguished for brilliant achievements in the cause of their country.

Public Structures.—The buildings of a public description that chiefly demand attention, are the castle, the cathedral, the churches, the town-hall, and the bridge, each of which is entitled to separate notice.

The present castle of Rochester was one of those founded by William the Conqueror, to keep in awe his newly acquired subjects; but there seems every reason to believe that a prior one existed on the same scite, as frequent mention is made of the "Castrum Roffense" in the Saxon annals. The Conqueror, indeed, is said, by some historians, to have only repaired the former structure. Whatever it might be, however, he committed to Odo, bishop of Baieux, the execution of the new work, and the custody of the fortress; but that prelate proving unworthy of his trust, he was afterwards seized, and sent as a prisoner to the castle of Rouen, in Normandy, where he continued till the accession of William Rufus, who restored him to his dignities and possessions; a favour which he shortly after ungratefully repaid, by raising an insurrection in favour of the king's brother, Robert, duke of Normandy. Rufus, upon this, laid siege to Rochester castle, and having forced the garrison to surrender, banished the bishop from his dominions. During this siege the buildings sustained considerable injury, which the king enjoined bishop Gundulph and the prior of Rochester to repair, perhaps on account of their having shewn some attachment to the rebellious cause. Gundulph accordingly not only renovated the walls, but laid the foundation of the great square tower, which yet perpetuates his name, and entitles him to rank among the most eminent architects of Anglo-Norman times. About twenty years after this prelate's death, the custody of Rochester castle was granted to William Corboyl, then archbishop of Canterbury, and to his successors; but this grant was resumed by Henry II. on his quarrel with the celebrated Thomas à Becket. In the reign of king John, this fortress was seized and garrisoned by the rebellious barons, and having been besieged by the king, was taken, after a resistance of three months. Lewis, the dauphin of France, who came over to the assistance of the nobles, however, reduced it again in subjection to the barons, by whom it was held till the accession of Henry III., when it was surrendered to the crown, and granted for life to Hubert de Burgh, earl of Kent, and justiciary of England, who was commanded to repair the buildings. The king's favour afterwards declining, Hubert was dispossessed; and Stephen de Segrave, John de Cobham, Nicholas de Moels, William de Say, and Robert Waleran, were, in succession, appointed governors of the castles of Rochester and Canterbury. About the year 1264, after the king had occasioned much discontent among his barons, by his refusal to comply with the statutes of Oxford, he greatly strengthened the fortifications of this castle, and furnished it with every thing necessary to sustain a siege. Roger de Leybourne, who was constituted chief constable, had under him John, earl of Warren and Surrey, and other noblemen. Shortly afterwards, Simon de Montfort, chief of the associated barons, marched hither to besiege the castle, on which occasion several severe contests happened in this vicinity. Montfort succeeded in getting possession of the city, but failed in his attacks upon the castle, the siege of which he was eventually compelled to abandon. After this event, little more occurs in the history of this castle, than the names of those to whom its custody has been entrusted. Edward IV. was the last monarch who paid any attention to the state of its buildings, he having "repaired the walls, both of the castle and city, about the eleventh year of his reign." Since then they have been alike neglected, and have gradually fallen to their present state of decay. Several

veral estates in this county hold of Rochester castle by the ancient tenure of castle-guard. On St. Andrew's day, old style, a banner is hung out at the house of the receiver of rents; and every tenant who does not then discharge his arrears, is liable to have his rent doubled, on the return of every tide of the Medway, till the whole is discharged.

Rochester castle stands at the south-western angle of the city, on an eminence rising abruptly from the river Medway, which preserves it from attack on the west, whilst its south, east, and north sides are defended by a broad and deep ditch. The outward walls, which formed an irregular parellelogram, 300 feet in length, were strengthened by several square and round towers; but these, as well as the walls themselves, are now verging to a state of ruin. The most perfect are on the east side, and at the south-east angle; that at the angle was semicircular, and rose boldly from the ditch, which is now almost filled up. The principal entrance was on the north-east, and was defended by a tower-gateway, with outworks at the sides. The keep, or great tower, already mentioned as founded by bishop Gundulph, occupies the south-east portion of the castle area. It is of a quadrangular form, 70 feet square at the base, and is so planned, that its angles correspond with the four cardinal points of the compass. The walls on the outside are built inclining inwards from the base, and in general measure twelve or thirteen feet thick. Near the centre, on each side, is a pilaster buttress, ascending from the base to the roof; and at the angles are projecting towers, three of them square, and the fourth semi-circular, which rise twelve feet above the roof. The entrance to this part of the castle was most difficult and intricate, and displayed much architectural ingenuity. "The first ascent was by a flight of twelve steps, leading to an arched gate and covered way; beneath which a flight of seven steps led forward to a draw-bridge, that connected with the arched gateway of the entrance tower; this opened into a vestibule, between which and the keep there were no other avenues of communication than by a third arched passage in the thickness of the wall. This latter, being the immediate inlet to the body of the keep, was defended by a massive gate and portcullis, the hinges and grooves of which yet remain; and in the roof are openings for the purpose of showering down destruction on the assailants."

The interior of the keep is divided into two nearly equal parts by a strong wall, with arched door-ways of communication on each floor. In the centre of this wall is a circular hole for a well of considerable depth, neatly wrought, and open from the bottom to the very top of the keep. This tower consisted of three floors, independent of the basement story; but these floors were removed when the castle was dismantled in the reign of James I. The lowest apartments were two dark and gloomy rooms, in which the garrison stores were probably deposited. At the north-east angle is a circular winding staircase, which ascends to the summit; and near it is a small arched doorway, leading to a narrow vaulted apartment underneath the little tower, supposed to have been a dungeon for criminals. The first floor appears to have been allotted for the accommodation of servants and inferior attendants; the second floor contained the state apartments; and the third was designed for a chapel, and for bed-rooms for the family. The roof of the keep is now entirely destroyed; but it most probably consisted of a platform on a level with the top of the wall within the parapet; the latter was about five feet high, and had embrasures about two feet wide. The four towers at the angles were raised another story, and had also small platforms, with parapets and embrasures. These, as well as the first-mentioned platform, commanded a very extensive view over the whole city, the river Medway, and the adjacent country; so that no enemy could approach within the distance of several miles without being discovered.

Cathedral and Priory.—The see of Rochester, though one of the smallest in England, derives considerable consequence from its antiquity. It was established, and a church built, as early as the year 600, by Ethelbert, king of Kent; who, at the same time, attached to the church a priory for secular canons, and dedicated it to the honour of St. Andrew. The first prelate of this see was Justus, a man of eminent learning and integrity, who had been sent from Rome to assist in the conversion of the Saxons to Christianity. He was installed by St. Augustine, the apostle of Britain, and first archbishop of Canterbury, in the year 604, from which period the episcopal dignity of Rochester has been held in succession by ninety-four bishops, many of whom were eminent for their talents, piety, benevolence, and extensive acquirements. Paulinus, the third bishop, was reputed a saint, and his memory was held in high estimation during several centuries. Ithamar, the fourth bishop, was the first Englishman who held a prelacy in Britain. Tobias, the ninth bishop, is highly extolled by Bede, and other writers, for his literary attainments, and particularly for his intimate knowledge of the Greek, Latin, and Saxon languages. These three prelates were all interred in the ancient cathedral, and are the only bishops known to have been so honoured of all the twenty-five who presided previous to the Conquest. At the era of that event the see appears to have been fast verging to entire dissolution; but its impending fate was soon after arrested by Lanfranc, archbishop of Canterbury, who raised Ernost, a monk of Bec, in Normandy, to the bishopric, for the avowed purpose of improving its affairs. That bishop, however, died in the first year of his prelacy, and was succeeded by Gundulph, another monk of Bec, who proved a most active agent in the re-establishment of the see. He not only recovered the alienated estates of the bishopric, but, pulling down the old cathedral, he erected a spacious and magnificent edifice in its stead. He likewise rebuilt the priory, and placed therein twenty monks of the order of St. Benedict, upon whom he bestowed extensive privileges and possessions. Gundulph had for his successor Ernulph, abbot of Peterborough; who composed the "Textus Roffensis," a work replete with information on matters of antiquity. He was likewise distinguished as an architect, having, besides his works at Canterbury and Peterborough, built the dormitory, and refectory, and the chapter-house at Rochester. He was succeeded by John, archdeacon of Canterbury, in whose time the monastery was unfortunately destroyed by fire; an event which occasioned the temporary dispersion of the monks. On the re-erection of the priory, however, they were again collected, and, through the exertions of bishop Ascelin, recovered such of their possessions as had been alienated by the cupidity of his predecessor, John, a Norman bishop, who had obtained this see on the death of his namesake above-mentioned. Ascelin's successor was Walter, brother to Theobald, archbishop of Canterbury, who was elected by the monks of Rochester. This bishop assisted at the coronation of Henry, eldest son of Henry III., on which account he was excommunicated by Thomas à Becket. During his prelacy, the cathedral sustained heavy damages by fire. This bishop died in 1182, and was succeeded by bishop Waleran, who, as well as his successor, Gilbert de Granville, was constantly engaged in litigations with the prior and monks, which were at length settled by solemn adjudication in the year 1207: notwithstanding this, however, the monks thought proper to display their hatred to bishop Granville, by refusing burial to his remains in the cathedral;

and

and on being fruſtrated in their reſiſtance, they haſtened the interment, that it might take place before the interdict which the nation then lay under was removed. This prelate rebuilt the biſhop's palace, which had been burnt down by the fire above noticed; and alſo erected a cloiſter of ſtone for the monks: but the re-edification of the cathedral made very ſlow progreſs, as we find it remained unfiniſhed till the year 1240, when Richard de Wendover held the biſhopric. He had been elected to the ſee by the monks, in oppoſition to the claims of patronage maintained by Edmund, archbiſhop of Canterbury, who appealed on the ſubject to the court of Rome, but without ſucceſs. On his death, in 1250, Laurence de St. Martin was advanced to the epiſcopal dignity, and held it till 1274, when he died, and gave place to Walter de Merton, to whom his country is indebted for the foundation of Merton college, at Oxford, which is conſidered to be the "firſt literary community in this kingdom that had the ſanction of a royal charter." His immediate ſucceſſors were, John de Bradfield, who died in 1283; Thomas de Ingelthorpe, who died in 1291; and Thomas de Woldham, who died in 1316. On the deceaſe of the latter, Hamo de Hethe obtained the biſhopric. He was a very active prelate, and conferred conſiderable benefits on the priory and the church. His ſucceſſor was John de Shepey, who had been a monk in the priory, and was a man of great learning and abilities. Some ſermons attributed to him are ſtill extant in New college, Oxford, and there are in the king's library two MSS. of his on legal ſubjects. He died in 1360, when William Witteſley was conſecrated biſhop, but was ſoon afterwards tranſlated to the ſee of Worceſter. Thomas Trilleck next obtained the biſhopric, and after him Thomas Brinton, confeſſor to king Richard II. and the fifty-firſt biſhop of this ſee. Richard Young, the third in ſucceſſion after him, met with great difficulties in obtaining poſſeſſion of his biſhopric, owing to the death, firſt of pope Boniface, by whoſe mandate he was tranſlated from Bangor, and afterwards of his ſucceſſor, pope Innocent. At length, however, he was inſtalled, in May 1407, and held the ſee till 1418, when he was removed by death, and was ſucceeded by John Kemp, who ſubſequently became biſhop of Chicheſter and of London, and archbiſhop of York and of Canterbury. His ſucceſſor was the learned John Langdon, who was diſtinguiſhed for his extenſive knowledge of hiſtory and antiquities, and was author of a chronicle of England. On his death, which happened in 1434, while he was attending the council at Baſil on the part of Henry VI., Thomas Brown, D.D. was elected to the vacant ſee. John Lowe, the fifty-ninth biſhop, was provincial of the order of Auguſtine friars. He held the biſhopric twenty-three years, and is ſuppoſed to have rebuilt the palace at Rocheſter. He died in 1467, and was ſucceeded by Thomas de Rotherham, ſubſequently biſhop of Lincoln, lord chancellor, and archbiſhop of York. The next biſhop of note was the unfortunate John Fiſher, who was beheaded in 1535, by order of Henry VIII. for maintaining the ſupremacy of the pope in eccleſiaſtical affairs. His ſucceſſor was John Hilſey, D.D. a controverſial writer of conſiderable eminence, who died in 1538. Two years afterwards, the priory here was ſurrendered to the king; and in 1542 a new foundation charter was granted, by which a collegiate body was eſtabliſhed in the church, to conſiſt of a "dean, ſix prebendaries, ſix minor canons, a deacon and ſub-deacon, ſix lay clerks, a maſter of the choriſters, eight choriſters, one grammar maſter, twenty ſcholars, two ſubſacriſts, and ſix poor bedeſmen," beſides inferior officers. In the new eſtabliſhment, Walter Phillips, the prior of the late convent, was made firſt dean of the cathedral; and Nicholas Heath, D.D. was the firſt reformed biſhop of the ſee. From his time to the preſent period, twenty-five biſhops have been advanced to the epiſcopal dignity of Rocheſter, among whom the moſt noted were the pious Ridley, who ſuffered along with biſhop Latimer at Oxford; Francis Atterbury, who was exiled for treaſonable correſpondence in 1723; and the late biſhop Horſley, one of the moſt erudite divines the church of England can boaſt of.

The ſituation of Rocheſter cathedral is at a ſhort diſtance ſouth from the High-ſtreet, and eaſt from the caſtle. It is of a cruciform ſhape, and is divided into a nave, aiſles, two tranſepts, and a choir, with a low tower and ſpire riſing at the interſection of the nave and great tranſept. This edifice evidently appears, from the different ſtyles of its architecture, to have been the work of different eras. The chief part of the nave and weſt front diſplay the maſſive character of the early Norman age. The weſt entrance is particularly deſerving of attention, and muſt have been, when entire, a moſt magnificent piece of workmanſhip. The arch which forms this entrance is ſemi-circular; and is ſupported on each ſide by ſeveral columns, two of which are cut into ſtatues, repreſenting king Henry I. and his queen Matilda, the patrons of the founder, biſhop Gundulph. The capitals of all the columns are compoſed of wreathed foliage, mixed with the heads of birds, and other animals. The lintel of the door, immediately under the arch, exhibits a figure, probably deſigned to repreſent the Saviour, attended by angels, and the attributes of the four evangeliſts. The mouldings of the arch, and the tranſomſtone, are charged with varied ſculpture. The remaining parts of the cathedral are comparatively plain in their exterior. Entering the nave by the weſtern door, the maſſive Norman ſtyle is conſpicuous in the firſt five columns, and half of the ſixth, on each ſide, all of them ſupporting circular arches, decorated with zigzag mouldings, above which is a ſeries of ſmaller arches, having over them arches, correſponding, both in ſize and ornament, with the larger ones beneath. Still higher are two ranges of obtuſe-pointed windows, each divided into three lights. The roof is of timber, with knees ſupported on corbels, the fronts of which are carved into figures of angels ſuſtaining ſhields, on which are painted the arms of the city, the ſee, and the priory of Rocheſter, as well as thoſe of the archbiſhopric and cathedral of Canterbury. The weſt wall appears to have been divided into ranges of niches, ſome of them crowned with arches, having plain and billetted mouldings, ſupported on ſmall three-quarter columns, with fluted capitals: others, having neither pillar nor capital, are decorated with zigzag mouldings, continued down the ſides of the receſs. The alterations made in Gundulph's deſign by the introduction of the preſent weſt window, are clearly to be ſeen in the abrupt termination of the different ranges of theſe niches, ſome of them having been cut through the centre. The two eaſternmoſt arches of the nave, on each ſide, exhibit a very different ſtyle of architecture to the preceding; theſe being in the pointed ſtyle, with deep grooved mouldings, riſing from cluſters of ſlender columns. The great tower is ſupported by four obtuſely-pointed arches, reſting on pieces of ſolid maſonry, which are environed by ſlender columns of Petworth marble. The weſt tranſept is in the pointed ſtyle; but, from having been erected at different periods, the architecture is ſomewhat diſſimilar. In the upper part of the north end is a triforium, behind which are lancet windows, each having a ſcreen in front, divided into three arches of unequal height; the vaulting is of ſtone, groined, with a plain grooved moulding: ſeveral of the leſſer pillars and impoſts of arches are ſupported by corbel

corbel heads, chiefly of monks, which diſplay a degree of ſtrength of feature and expreſſion, evincing an advanced ſtate of the art of deſign. The ſouth end of this tranſept principally varies from the other in its ſuperior lightneſs: like that, it has a triforium in the upper ſtory, with lancet windows behind ſcreens. The roof is of timber frame-work, in imitation of vaulting. Under a large arch, on the weſt ſide, is an opening into the chapel of St. Mary, a ſtructure probably erected in the reign of Henry VII. It meaſures forty-five feet in length, and thirty-five in breadth, and exhibits on its ſouth and weſt ſides five ſpacious windows, under obtuſe arches, and divided by mullions. In this chapel the conſiſtory court of the dioceſe is held; and many of the biſhops are buried within it. The choir is entered from the nave by an aſcent of ten ſteps, leading through an arch, in an unornamented ſtone ſcreen, which ſuſtains the organ and organ gallery. The ſtyle of building in this part of the church is uniform in its character; neat, lofty, and ſolid, though not heavy. The whole conſiſts of two tiers of pointed arches, decorated with grooved mouldings, and reſting upon ſlender columns of Petworth marble, with plain capitals. All the windows are lancet-ſhaped, and are formed of ſingle lights, except thoſe neareſt to the altar, which are divided by mullions, and appear to have been formerly filled with painted glaſs. The eaſt tranſept of the church has two aiſles, over which are apartments, (aſcended to by circular winding ſtaircaſes in the wall,) in which were depoſited the veſtments, and ſacred utenſils appertaining to the altars and ſhrines of St. William, St. Paulinus, and others, in the choir. The northern diviſion of this tranſept is ſtill denominated St. William's chapel, from the popular ſaint ſo named, whoſe remains were there enſhrined; and to the number and value of the oblations made at whoſe altar the preſent choir owes its origin. The crypt, which extends beneath the two laſt mentioned portions of the church, has been thought by ſome to be of Norman ſtructure; but more intelligent antiquaries aſſign it to the architect of the choir and upper tranſept, which were built by William de Hoo, in the reign of Henry III. The pointed arches in the windows and entrances are evidences of the truth. Running parallel with the ſouth ſide of the choir is the chapter-houſe, which contains the library, and is entered by a richly ſculptured door-way. In a large hollow between the inner mouldings is a range of human heads and flowers, in alternate ſucceſſion. Beyond theſe, and riſing above each other in detached receſſes to the centre of the arch, are ſix whole length figures, two of which are conjectured to repreſent Henry I. and his queen Matilda, and the others the biſhops Gundulph, Ernulph, Laurence de St. Martin, and Hamo de Hethe, to the laſt of whom the erection of this door-way is attributed. Over theſe figures are ſmaller ones of angels, two on each ſide, apparently ſinging praiſes and glorifying the Saviour, who is repreſented ſtanding naked under a canopy in the centre of the arch. The library, beſides an excellent collection of printed books, contains ſeveral curious and valuable MSS. among which are the original copies of the Textus Roffenſis and the Cuſtumale Roffenſe.

Rocheſter cathedral extends in length from eaſt to weſt 306 feet, of which 150 are included in the nave and 156 in the choir. The breadth of the nave, with the ſide aiſles, is 75 feet, and that of the choir is nearly the ſame. The weſtern tranſept meaſures 122 feet, and the eaſtern one 90 feet long. The width of the weſt front is 94 feet, and the height of the great tower 156 feet. Several of the monuments in this church are curious, both from their antiquity and their workmanſhip. In the ſouth of the choir is a plain ſtone cheſt, ſuppoſed to contain the remains of biſhop Gundulph, and near it is another, on the top of which is ſculptured, in high relief, the figure of a biſhop in pontificalibus, deſigned to repreſent Thomas de Ingelthorpe, the 44th biſhop of the ſee. A third ſtone cheſt, of a ſimilar deſcription, is thought to be the tomb of biſhop Laurence de St. Martin, who obtained the canonization of St. William. All theſe cheſts are conſtructed of Petworth marble: ſeveral others of them are diſperſed throughout the cathedral. On an altar-tomb, beneath a double pointed arched canopy, variouſly ornamented, is a full-length portraiture of biſhop Walter de Merton, whoſe remains are depoſited beneath. Another altar-tomb, in St. William's chapel, commemorates biſhop Lowe; and near it are the monuments of biſhop John Warner and two others of his family. On the north ſide of St. Edmund's chapel, entering into the crypt, is a headleſs epiſcopal figure, ſuppoſed to have repreſented biſhop John de Bradfield, who died in the year 1283; and in the narrow aiſle leading to St. William's chapel, is a monument attributed to biſhop Hamo de Hethe. The other perſons who have monuments here are, Richard Watts, eſq. recorder of the city, who had the honour of entertaining queen Elizabeth at his ſeat called Satis; John, lord Henniker, and his lady, the former of whom died in 1803, and the latter in 1792; ſir Richard Head, and the Rev. Samuel Denne, the learned compiler of the "Memorials" of this cathedral, inſerted in the Cuſtumale Roffenſe.

Adjoining to the cathedral, on the ſouth, are the remains of the chapter-houſe and cloiſter belonging to the priory, which exhibit a very beautiful ſeries of Norman arches and ornaments, but in a ſtate of great dilapidation. The door-way of the chapter-houſe lies under a richly ornamented arch, having on each another of equal elegance, ſupported on ſhort thick columns with flowered and figured capitals, and diſplaying an unuſual variety of mouldings, zigzag, quatrefoil, and billeted. The mouldings of the ſouthernmoſt arch unite with thoſe of a ſmaller arch, belonging to the cloiſter, and theſe again with the mouldings of a ſecond highly enriched door-way, the ſpace between the tranſom of which and the inner moulding exhibits the mutilated remains of an hiſtorical ſculpture. An arch, riſing from two three-quarter columns, and interſected by two others ſpringing from a central column, connects this door-way with a third, likewiſe rich in ornaments, though leſs ſo than the others. Gundulph's tower ſtands on the north ſide of the cathedral between the tranſepts. The maſonry of this building is extremely ſolid, the walls being ten feet in thickneſs, though the entire building is only 40 feet ſquare. The angles are ſtrengthened by pilaſter buttreſſes, and the windows have ſemicircular arches. The precincts of this cathedral appear to have occupied nearly half the area contained within the walls of the city. There were three gates leading into them, *viz.* the Cemetery gate, St. William's gate, and the Prior's gate; the firſt and laſt of which are ſtill remaining. Only a few traces of the offices of the monaſtery now exiſt ſeparately, but conſiderable parts of their walls are incorporated into other buildings. The porter's lodge conſiſts of a ſmall embattled tower, with a pointed archway in the centre. The ſcite of the biſhop's palace, erected by Gundulph, is occupied by a range of modern houſes; and on that of the prior's lodge ſtands the preſent deanery.

Rocheſter had formerly four churches, beſides the cathedral, which were dedicated to St. Nicholas, St. Margaret, St. Clement, and St. Mary, but the laſt is now totally demoliſhed, and St. Clement's is only to be diſcovered as forming part of ſome houſes on the north ſide of the High-ſtreet, near the bridge. The church of St. Nicholas was built in 1421, and conſiſts of a nave, aiſles, and a chancel, with an embattled tower at the north-weſt angle. The

windows

windows are large and pointed; each being divided into three lights, with crockets above. St. Margaret's church is only remarkable for its fine situation, on a lofty eminence, to the southward of the High-street. The town-hall stands on the north side of the same street, and was erected about the year 1687. In the lower division of this structure is the city prison; and in the higher, the hall, a large and lofty room, containing full-length portraits of king William and queen Anne, and of several persons of distinction, connected with the city. The bridge over the Medway, here, was constructed in the reign of Richard II. by sir Robert Knolles, and John, third baron de Cobham, who not only defrayed the expence of its erection, but also left a considerable estate for its repair. For height and strength, this structure is allowed to be superior to any in England, with the exception of the bridges in the metropolis. It measures 560 in length, but is only 14 feet broad between the parapets. Its arches are eleven in number, but of these, three have been rebuilt in modern times.

The charitable institutions in this city are, St. Catharine's hospital, a grammar-school, an alms-house for the relief of poor travellers, and a free-school. The hospital was founded and endowed in 1316, by Simond Potyn, who represented this city in seven parliaments, for the maintenance of twelve poor people, who have an allowance of coal, candle, and money, annually.

The grammar-school was founded by king Henry VIII., for twenty scholars, to be called "King's scholars," with an upper and under master; together with four exhibitions to the universities. The alms-house, which stands on the north side of the High-street, was built in the reign of queen Elizabeth, the proprietor of Satis, before-mentioned, who left estates for its support. The founder of the free-school was sir Joseph Williamson, knt., who died in 1701, and bequeathed 5000*l.* to be expended in the erection of a suitable building, and in the purchase of lands and tenements to maintain two masters, and defray the incidental expences of the establishment. The History and Antiquities of Rochester and its Environs, &c. 8vo. Rochester, 1772. The History and Topographical Survey of the County of Kent, by Edward Hasted, F. R. S. and S. A., Canterbury, 4 vols. folio, 1778, reprinted, &c. in 8vo. 1797. History of Kent, by John Harris, D. D. F. R. S. folio, Lond. 1719. Registrum Roffense, and Custumale Roffense, by John Thorpe, D. D. Rochester, a township of America, in the county of Windsor and state of Vermont; containing 911 inhabitants.—Also, a township of Plymouth county, Massachusetts, 52 miles S. of Boston; containing 2954 inhabitants.—Also, a township in Strafford county, New Hampshire, on the W. side of the N. branch of Piscataqua river; 22 miles N.W. of Portsmouth; incorporated in 1722, and containing 2118 inhabitants. One term of the court of common pleas is held annually in this town.—Also, a township in Ulster county, New York, extending W. to Delaware river; about 12 miles W. of Esopus.—Also, a township of Upper Canada, on lake St. Clair, between Tilbury and Maidstone.

ROCHET, or Rocket, a lawn garment, worn by bishops and abbots, resembling a surplice, except in this, that the sleeves are gathered at the wrists; whereas the surplice is quite open. This was one of the sacerdotal vestments; and in that respect differed from a surplice in that it had no sleeves.

Menage derives the word from the Latin *rochettus*, a diminutive of *rocchus*; used in writers of the lower Latin for *tunica*, and formed originally from the German *rok*. The regular canons of St. Augustine also wear rochets under their copes.

Rochets also denote the mantles worn on days of ceremony, by the peers sitting in the English parliament.

Those of viscounts have two bands, or borders, and a half; those of earls, three; those of marquises, three and a half; and those of dukes, four.

Rochet, the name given to a fish, otherwise called *cuculus*, and *red-gurnard*. See Gurnard.

ROCHETTA, in the *Glass Trade*, another name for polverine.

Rochetta, in *Geography*, a town of France, in the department of the Maritime Alps; 16 miles N.E. of Nice.

ROCHETTE, La, a town of France, in the department of Mont Blanc, and chief place of a canton, in the district of Chambery, on the Galon; 10 miles S. E. of Chambery. The place contains 855, and the canton 9092 inhabitants, on a territory of 85 kiliometres, in 18 communes.—Also, a town of France, in the department of the Forests; 4 miles S.S.E. of Dierich.

ROCHFORD, a market-town, in a hundred of the same name, and county of Essex, England, is seated on the bank of a small rivulet, called the Broomhill, at the distance of 16 miles S.E. of Chelmsford, and 39 miles E. of London. The petty sessions for Rochford division of Essex are held here. The privilege of holding markets was granted to this town by king Henry III., and confirmed by Edward I. The market-house is a mean structure of timber. The market-day is Thursday, weekly; and there are annual fairs on Easter Tuesday, and the Wednesday next after the 29th of September. None of the buildings in the town are worthy of notice. The parish church, which stands about half a mile to the westward, is a plain edifice, with a lofty brick tower at the west end. Near it stands Rochford-hall, the manor-house. It is a large and stately building, for some time successively the seat and residence of the Rochfords, the Botelers, earls of Ormond and Wiltshire, sir Thomas Bullen, and Richard, lord Riche. This town gives the title of an earl to the family of Nassau. The parish contains, according to the population returns of 1811, 190 houses, and 1214 inhabitants.

The manor of this town was held by Suene at the time of the Domesday survey; and now is vested in the Long family of Wanstead park. A singular custom, called the Lawless-court, appertains to this manor; and is said to have originated in a conspiracy against the lord of the manor; but detecting it, he ordained as a punishment, that the tenants should ever afterwards assemble, at a certain hour of the night, on the same spot where the conspirators met, and do homage for their lands. The place is called King's-hill, where they were to assemble at midnight on the first Wednesday after Michaelmas day, and transact all their business in whispers, and record the minutes with coal, instead of pen and ink. This ridiculous custom was, till lately, continued. About four miles S.W. is Hadleigh Castle, consisting of some bold ruins; and near it is Southend, a noted watering-place. See Southend.

Raleigh, in this vicinity, though now an inconsiderable village, was formerly a market-town, and the head of the barony of Suene, a powerful Anglo-Saxon Dane, who is reported to have built a castle here, of which some important earth-works still remain. These consist of a mount, of an oval shape at the base, which is environed by a double ditch and rampart, and is further secured by additional

tional embankments on the east side. The principal ditch is nearly fifty feet wide, and appears to have been originally of great depth. The church of Raleigh is a handsome building, in the pointed style of architecture, and contains a very ancient tomb, of beautiful "Gothic" workmanship, but without any inscription to determine the name of the person it was designed to commemorate.

About three miles to the N.W. of Rochford, on the summit of a hill, stands the remains of a very ancient church, supposed to be the same which Simeon Dunelmensis states to have been founded by Canute and Turkill in memory of the victory obtained by them over king Edmund Ironside, within the adjoining parish of Assingdon or Ashingdon. The tower is a low massive octagon, supported by strong buttresses; and in the interior are five thick columns with slightly ornamented capitals, dividing the nave from a north aisle. At Canewdon, to the eastward of Ashingdon, is an ancient encampment, of an oblong form, which probable conjecture attributes to the Danes. Its area contains about six acres of ground. The History and Antiquities of the County of Essex, by Philip Morant, M.A. 2 vols. folio, 1768, London. Beauties of England and Wales, vol. v. by E. W. Brayley and John Britton.

ROCHLITZ, a town of Saxony, in the circle of Leipsic, on the Mulda; containing three churches and a citadel, and a manufacture of cloth, stuffs, and linen; 20 miles S.E. of Leipsic. N. lat. 51° 8′. E. long. 12° 41′.

ROCHOIS, La, in *Biography*, one of the first singers in Lulli's famous operas, whose abilities were not very stupendous, if we may judge of them by the songs which he had to execute. Good voices and good action seem to have constituted the principal merit of this singer. Many of them were brought from remote provinces of the kingdom, before they had any knowledge of music, and were taught their parts by Lulli himself and his father-in-law, Lambert, merely by the ear. But Lulli not only taught his vocal performers to sing, but to act; and sometimes gave instructions even to the dancers. The celebrated La Rochois, we find, had no other master in singing than the opera composer, Lulli. Hist. de la Mus. par Bonnet, t. iii. p. 207 and 209.

ROCHSBURG, in *Geography*, a town of Saxony, in the lordship of Schonburg; one mile E. of Penig.

ROCHSTADT, a town of Westphalia, in the principality of Halberstadt; 10 miles E. of Halberstadt.

ROCHUKE, a town of Bulgaria, situated on the banks of the Danube, at the foot of a hill which continues for several miles near the river, and is covered with vineyards. It is a large and populous town, about the size of Liverpool.

ROCITO, a town of Naples, in Capitanata; 7 miles S. of Volturara.

ROCK, in *Geology*, a large mass of stone, forming part of the solid covering or crust of the globe. In common language, rocks are the bare projecting stony masses that rise above the level of the ground or sea; but the geologist denominates every bed of stone that composes the compact part of our planet a rock, whether it be elevated to view, or buried deep under the surface.

The composition, structure, and arrangement of rocks comprise a most important part of the natural history of the earth, which is now beginning to engage the attention of philosophers in various parts of the world. Numerous and extended observations have greatly enlarged our knowledge of facts, and exposed the fallacy of many of those unfounded distinctions and premature generalizations, which, dignified with the name of systems, have retarded the progress of science.

In the earliest periods of civilization, when stone began to be employed for purposes of architecture or sculpture, it must have been immediately perceived that the rocks of different districts varied greatly from each other; and often in the same mountain, the upper and lower rocks were observed to be of various kinds and qualities.

In the knowledge of the qualities which ensure durability to the labours of the architect, the ancients appear to have greatly exceeded the moderns; but they did not extend their inquiries respecting rocks to any other objects than those of immediate utility. Nor, till about the middle of the last century, was the structure of the external part of the earth regarded as an object deserving the investigation of men of science, who confined themselves to forming theories of the earth in their studies, in preference to an active examination of nature.

About that time, Lehman, a German mineralogist, observed that certain rocks occupy the lowest relative position in mountainous districts, and that these rocks contain no remains of animals or vegetables; but in the upper rocks, numerous impressions and petrified relics of animals and vegetables abound. Hence he inferred, that the first were consolidated before the existence of organized life; and on this account, they were called primitive or primary. The latter were called secondary rocks, because they not only contained these organic reliquiæ, but also fragments of the former rocks, and hence were supposed to be of later formation.

This division into two classes was continued by geologists until the close of the last century, when M. Werner, the celebrated professor of mineralogy at Freyburg, introduced into his arrangement another class, called transition rocks, which includes those rocks that are, in many of their characters, similar to primary rocks, but in which some organic remains occasionally occur: hence he supposed they were formed when the earth was passing from an uninhabitable to a habitable state. The stratified secondary rocks he denominated flœtz rocks, from the German word *flœtz*, signifying flat, because these rocks are generally divided into parallel strata, which are not greatly inclined from an horizontal position. The lower of these rocks were called the oldest flœtz rocks, and the upper the newer flœtz rocks. (See Geology, where a detailed account is given of the Wernerian arrangement.) Since that article appeared, more extended observations have induced even the warmest supporters of the Wernerian system to question the propriety of some of its distinctions.

"The system of classification introduced by Werner was formed principally from observations made in Saxony, and had great merit, as illustrating the geology of that part of Germany; but it has been objected with much reason to the general adoption of the terms, that they were framed to suit a particular theory, before a sufficient number of facts had been collected to warrant its reception. Subsequent discoveries have also proved, that the different classes, into which Werner has divided rocks, have not the marked and definite characters necessary to constitute a natural system of arrangement. Even the professor who first introduced into this country the divisions of transition and flœtz rocks, as a most important discovery of Werner, now states his opinion, '*that transition rocks may alternate with flœtz rocks, and, therefore, that the transition and flœtz classes are not separated from each other in the manner generally alleged.*' This admission is the more remarkable, when we recollect the extreme confidence with which the propriety of this classification

claſſification was ſupported, and the ſolemn trifling often employed to determine whether certain rocks belonged to the tranſition or flœtz claſſes." (Bakewell's Introduction to Geology, 2d edit.) Indeed the term primary, or primitive, is objected to by ſome geologiſts, who conſider theſe rocks as having been in a ſtate of igneous fuſion by ſubterranean fire, which gave to them their cryſtalline ſtructure; but the heat acted with leſs force on the rocks by which they are covered, hence the latter are more earthy. Nor are appearances wanting to ſupport this opinion. Well-authenticated inſtances are known of veins ſhooting from the lower into the upper rocks; and though much labour has been employed to controvert this fact, it is now undoubted. The granite of Cornwall ſends up veins into the ſuperincumbent ſchiſtus, or killas; hence it was inferred that the latter, which is conſidered as a ſecondary rock, was older than the granite or primary rock. It is evident the killas cannot be of more recent formation. Both rocks were probably contemporaneous; in which caſe, we may conceive that veins might ſhoot from the lower into the upper, previouſly to their acquiring a compact ſolid ſtate. Nor will the abſence of organic remains alone prove the prior formation of theſe rocks; for among rocks abounding in petrifactions of animals or vegetables, many beds of rock occur in which no ſuch remains are ever met with, although we are certain to find them in the ſtrata immediately above and below. We have no means of aſcertaining that the ſimilar rocks of different diſtricts were formed at the ſame time; nor can we be certain that they have not once contained organic remains, that were deſtroyed during the proceſs by which they acquired their preſent cryſtalline ſtructure. We may, however, with apparent probability, infer, that their formation was prior to the exiſtence of animals and vegetables in our planet, in its preſent ſtate; becauſe the rocks which immediately cover them contain almoſt excluſively the organic remains of zoophytes, or thoſe animals which are conſidered as forming the firſt link in the chain of animated beings.

It is only from the exiſtence of theſe organic remains, we can infer, with any certainty, that the rocks in which they occur were formed in ſucceſſion. The difference of theſe remains in the upper and lower rocks mark diſtinct epochs in the natural hiſtory of the globe. In the loweſt rocks, which have a cryſtalline granitic ſtructure, no animal or vegetable remains have ever been found; but the calcareous rocks, which immediately cover them, contain ſome few remains of zoophytes and ſhell-fiſh; and in the argillaceous ſlate rocks, alſo, we occaſionally meet with vegetable matter. In the ſand-ſtone ſtrata over theſe, the remains of vegetables are abundant. Above theſe again, in the upper calcareous ſtrata, entire fiſh are occaſionally found, with zoophytes and ſhell-fiſh, of a ſpecies different from thoſe in the lower ſtrata. In the thick beds of aluminous ſhale and clay over theſe, occur the remains of the ſhark and alligator; and in the alluvial ſoil which covers the whole, the bones of the elephant, the rhinoceros, the hippopotamus, and the maſtodonton or mammoth, and of various unknown quadrupeds, are found both in our own country, and in many parts of Europe, Aſia, and America. But neither in the upper nor lower rocks, nor in alluvial ground, have any remains of human ſkeletons been found, except where mines had formerly been worked, or in ſituations where their occurrence could be explained by recent cauſes; ſuch as inundations and volcanic operations, as on the ſhores of Guadaloupe and in the neighbourhood of Veſuvius.

We believe our own countryman, Mr. W. Smith, was the firſt perſon who obſerved that remains of diſtinct genera and ſpecies of animals were peculiar to certain ſtrata, and that the occurrence of the ſame remains was ſufficient to identify the ſame ſtratum, throughout a whole diſtrict, wherever it could be examined. The ſagacious naturaliſt M. Cuvier has applied the ſame diſcovery to illuſtrate the geology of the country round Paris, a diſtrict moſt remarkable for the number and variety of foſſile ſkeletons, and other reliquiæ which it contains. See STRATA.

It is not a little remarkable, that few of the reliquiæ, whether in the upper or lower rocks, belong to exiſting ſpecies of marine or terreſtrial animals; and the vegetable petrifactions found in northern latitudes reſemble moſt thoſe of tropical climates.

The natural hiſtory of rocks compriſes, the ſubſtances of which they are compoſed, their internal and external ſtructure, their poſition, and the order of ſucceſſion, from the loweſt rocks with which we are acquainted upwards to the ſurface—their decompoſition, and the mode of their formation. The latter is the province of ſpeculative geology, for it is only in one claſs of rocks, the volcanic, that we have any experience of their actual formation.

The mineral repoſitories peculiar to certain rocks will be deſcribed under the article VEINS, *Mineral* and *Metallic*.

The Compoſition of Rocks.—Rocks are either ſimple or compound. Thoſe rocks which are compoſed of one mineral ſubſtance, are called ſimple, ſuch as ſlate, ſerpentine, lime-ſtone, &c. although theſe minerals may be compoſed of various elementary ſubſtances. Thus clay-ſlate, or ſlate, conſiſts of ſilex and alumine, combined with oxyd of iron and carbon; but the combination is ſo intimate, as to preſent the appearance of an homogeneous ſubſtance. When two or more minerals enter into the compoſition of rocks, they are called compound. Thus granite is compoſed of quartz, felſpar, and mica, cloſely united together, but each of theſe minerals preſerves its own peculiar character. The elementary ſubſtances of which all rocks, both ſimple and compound, are formed, are, the earths ſilex, alumine, lime, magneſia, the oxyd of iron, carbon, and ſulphur. (See SILEX, ALUMINE, &c.) The newly diſcovered earths and metallic ores, except iron, rarely form the ſubſtance of rocks, but are found in the veins and fiſſures by which they are interſected.

From the above elementary ſubſtances, either ſeparately or combined, all the ſimple minerals are formed which compoſe rocks and mountains. But it may be remarked, that ſilex enters moſt largely into the compoſition of all the lower cryſtalline rocks (except granular lime-ſtones): it forms more than two-third parts of the lower cruſt of the globe.

The moſt important ſimple minerals which form rocks and mountains, are quartz, felſpar, argillaceous ſchiſt, or clay-ſlate, lime-ſtone, hornblende, ſerpentine, chlorite, mica, talc, hornſtone, jaſper, flint, bituminous ſhale, and alum-ſlate. Baſaltic or trap rocks, and lava, are ſometimes compoſed of one apparently homogeneous ſubſtance, but more frequently they preſent the appearance of compound rocks. For the characters of theſe minerals, ſee QUARTZ, FELSPAR, &c.

When two or more of theſe minerals are intermixed together, they form compound rocks; in theſe the minerals are either cloſely united together, without any viſible cement; or aggregated and held together by the intervention of another mineral ſubſtance, which ſerves as a cement, and is ſometimes called the paſte.

The Structure of Rocks, internal and external. The latter, or the ſtructure of rocks *en maſſe*, is as diſtinct from the former, as the order of architecture of a building is diſtinct from

from the form of the bricks or stones of which it is constructed. The internal structure of simple minerals belongs properly to the department of the mineralogist, and that of compound rocks, with their external structure, to the geologist. Compound rocks are either

Granitic, composed of grains or crystals, united without a cement, as in granite.

Porphyritic, consisting of a compact ground, in which distinct crystals are imbedded; or of a granitic ground, in which some of the crystals are much larger than the rest.

Amygdaloidal, from the Latin *amygdala*, an almond, containing kernel-shaped cavities, filled with other mineral substances.

Conglomerated, composed of fragments, or rounded stones, cemented together, as in breccias and pudding-stone.

Granular, composed of small grains, either cemented, or adhering, as in sand-stones.

The external structure of rocks is either

Stratified, composed of layers or strata.

Tabular, in large plates: this includes the slaty structure in the mass.

Columnar, in regular columns or prisms.

Globular, in spherical masses.

Indeterminate, which includes all unstratified rocks that have no determinate shape.

Stratified mountains, or rocks, are composed of layers or strata lying over each other, and divided by parallel seams, like the leaves of a closed book. In the seams or partings which divide the strata, there are frequently thin laminæ of soft earthy matter, but sometimes the surfaces of the upper and lower stratum are closely joined, and require considerable force to cleave them asunder. The layers are denominated strata. See STRATA.

It has been admitted, without sufficient evidence, that all stratified rocks were formed of the sediment of turbid water, which arranged them in succession over each other, as the muddy waves of the ocean deposit their contents in regular layers upon the shore. This mode of formation is called mechanical deposition. It has also been generally believed, that all rocks divided by parallel seams were formed mechanically by the action of water, and as such layers occur occasionally in crystalline rocks, it was inferred by some geologists that this was a proof that such rocks had been formed by water. Thus the tabular structure, which consists of tables or plates of rock that have generally a vertical direction, and frequently a slaty cleavage, has been confounded with stratification: this has given rise to much confusion and contradiction in the description of rocks; some geologists denying, and others asserting the stratification of the same rock. The tabular and slaty structure of many rocks may, with as great probability, be attributed to crystalline arrangement, as the lamellar structure of a crystal of felspar, or a plate of mica. The laws of crystallization have but recently arrested the attention of philosophers, and their researches have been principally confined to their effects in a small scale. The crystallization of mountain masses is equally deserving of notice, as to this cause must we refer both their tabular, columnar, and globular structure.

The columnar structure consists of regular columns or polyhedral prisms, and is almost peculiar to trap or basaltic rocks, and to volcanic rocks: these sometimes form vast ranges of natural columns, as in Iceland, the Lipari islands, the Motta in Sicily, the Giants' Causeway in Ireland, and at Staffa. It was long contended against all probability, that these columns were the effects of accidental rents occasioned by the drying or shrinking in of the mass; but their regularity, and (in many instances) the convex and concave articulations of the joints, prove that they are effects of crystallization. These columns have been observed by Col. Imrie and others formed in currents of lava, that could be traced to the craters of volcanoes. Transactions of the Wernerian Society, vol. ii. pt. 1.

The globular structure consists of balls, sometimes detached, at other times imbedded in rocks of the same kind. These balls are frequently composed of concentric spherical layers. This structure is not unfrequent in basaltic and granitic rocks. The balls are generally harder than the rocks in which they are imbedded, and frequently retain their shape after the outer rock is decomposed. Instances of this structure occur in the basaltic rock of Staffordshire, called Rowley Rag. (See ROWLEY *Rag*.) Globular distinct concretions of granite are from one to two or more fathoms in diameter. These concretions are again composed of curved lamellar concretions, and always include a harder central mass. The spaces between the globes are filled with granite possessing less solidity, which decays more readily, and thus leaves the harder central masses heaped on each other, or strewed about. These distinct concretions must not be confounded with rolled masses. Beautiful examples of these concretions occur in the island of Arran, Bohemia, the Hartz, the Fichtelgebirge, and other places.

The indeterminate or amorphous structure appears to be the most common in unstratified rocks; but our confined and partial observations may frequently lead us to conclude, that rocks have no determinate structure, whereas, could we ascertain their arrangement throughout their whole extent, we might perceive that their structure, viewed on a great scale, was as regular as that of many stratified rocks.

The position of rocks, with respect to each other, is an interesting subject of geological inquiry, as it is supposed to determine their relative ages, and to elucidate the mode of their formation. When one rock covers another in such a manner as to appear moulded upon it, having the same elevations and depressions, it is said by the German geologists to lie in a conformable position. In this manner the schistose or slaty rocks frequently cover rocks and mountains of granite. Stratified rocks are also generally conformable to the shape of the lower rocks, except in situations where the strata appear to have been broken by some subsequent convulsion of nature, which has deranged their original position, and occasioned them to abut against each other, or has given the upper strata a contrary inclination to the lower. In this case their position is said to be unconformable. Where masses of unstratified rocks cover other rocks, filling up the cavities, and lie without any conformity to the shape of the lower rocks, they are called unconformable and overlying. This position is common to most rocks of volcanic origin, and to basaltic rocks; in the former there can be no doubt respecting the mode of their formation. Streams of liquid lava pouring through vast fissures and openings have covered the inequalities of the lower grounds, filling up vallies, and accumulating as the lava cooled and consolidated, thus forming immense mounds and abrupt precipices: some geologists ascribe a similar formation to basaltic and porphyritic overlying rocks.

Those rocks which are commonly imbedded in other rocks, are said to be subordinate formations; thus granular lime-stone, serpentine, and hornblende, frequently form beds in schistose rocks, such as gneiss, mica-slate, and clay-slate, and are then described by geologists as subordinate to the latter.

Beside the above positions, the continuity of rocks is frequently broken by vertical seams or fissures filled with mineral matter different from that of the rock which they intersect. (See

(See Veins, *Mineral* and *Metallic.*) These vertical seams of rock are sometimes of vast extent, and vary in width from a few inches to several hundred feet. The most obvious inference is, that the solid covering of the globe has been rent, and the mineral matter ejected in a state of fusion into the interstices. The similarity of the mineral matter in the greater part of these fissures, provincially called dykes, to that of volcanic eruptions, adds much probability to this opinion. Where these dykes occur, the original position of the rocks on each side is generally changed.

The dislocation of rocks and strata has been most noticed in mining districts, where it is not unfrequently observed, that a stratum which has extended with a regular inclination over a large track of country, is suddenly thrown down several hundred yards or more, and often sunk below the power of the miner to regain it. Sometimes the strata are thrown upwards, and a series of rocks, which exist on one side of the fracture, are entirely removed on the other, and have totally disappeared.

The change in the original position of all rocks and strata, with respect to the level of the sea, is a most important and incontrovertible fact. Whether the sea has diminished or retired into cavities in the earth, or whether the rocks and mountains have been raised by an expansive force, which has broken the solid covering of our planet, and lifted them from the watery abyss to the present elevation, are questions that may long divide the opinions of geologists; but that the summits of our highest mountains were buried for ages under the ocean cannot admit of doubt. On some of these summits, remains of marine animals are at present widely spread; indeed, many of the calcareous mountains of vast extent and height appear to be almost entirely formed of marine shells, which are not heaped together in confusion, but the upper and lower beds of rock contain remains of species distinct from each other; this proves that they were not deposited in their present situation by any sudden inundation, but have been collected in succession at distant periods of time.

In schistose mountains, considered as primary, the beds of rock have generally a vertical position. Some geologists suppose that all these beds were originally deposited horizontally, and have been subsequently elevated by some mighty convulsion of nature. Saussure, who has investigated with so much labour the structure of the Alps, has drawn this conclusion with respect to the rocks which compose Mont Blanc, and the mountains in its vicinity; but we are inclined to believe that the structure of these mountains, as described by this intelligent philosopher, may in many instances be explained in a more satisfactory manner, by considering it as the result of crystallization on a large scale, and the vertical beds of rock as plates of enormous crystals: indeed, Saussure himself appears to have been very frequently impressed with surprise at the tendency to crystalline arrangement observable in these mountain masses, which he describes as presenting regular pyramidal or rhomboidal forms. The crystalline nature of the rocks themselves, and the minerals which fill the vertical seams, point to crystallization as the great agent in the formation of these mountains, whether it took place in an aqueous solution, or when the whole was in a state of igneous fusion deep under the surface. In one situation near the great pyramids of granite, on the south-east side of the valley of Chamouni, he describes a chain of mountains seven or eight leagues in extent, in which the vertical section of the beds presents an arrangement exactly similar to that of the sticks of an opened fan. The lowest beds are nearly horizontal, but they gradually rise till they become vertical at the summit. He says, that many other instances might be cited of a similar arrangement. Now, we can scarcely conceive it possible for any overturning of the mountain to have produced such a position of the beds; but in the crystallization of minerals on a smaller scale the diverging structure is common. There is, however, one fact, which, if it can be satisfactorily ascertained, will prove the truth of Saussure's opinion, that the vertical position of some of these rocks was not their original one. In his description of the rocks in Valorsine, he says, that he found vast beds of pudding-stone in a vertical position, between schistose rocks in a similar position; the beds on one side are gneiss or mica-slate, and on the other slate and sand-stone. The bed of pudding-stone is 100 toises thick; it consists of a fine paste or cement, composed of extremely fine schistose sand-stone, with minute plates of mica, that are perfectly parallel to the seams which divide the beds.

The fragments vary in size, from that of a grain of sand, to six or seven inches in diameter; some are angular and others rounded, resembling the boulders on the shores of the lake of Geneva. These fragments and boulders are of gneiss, mica-slate, and quartz, but none are of clay-slate. Saussure has observed, that it is impossible for these rounded boulders to have been originally placed in a vertical situation. If they were formed mechanically by the action of water, like those on the borders of the lake of Geneva, this inference is undeniable; and we must farther admit with Saussure, that the mass of this mountain, which is 1181 toises above the level of the sea, has been overturned by the same revolution which has given a vertical direction to the whole; for all these beds having the same inclination and direction as that of the pudding-stone, we are compelled to grant that their original situation was the same, and that they have suffered the same change from the same cause. The only objection to this inference that can, with any probability, be urged, is, that these rounded stones may not really be water-worn boulders and pebbles, but were formed in the same manner as the bolls of basalt and granite, which are sometimes imbedded in basaltic or granitic rocks, and which are acknowledged to be the result of a tendency to crystalline arrrangement.

Saussure, however, was fully convinced that they were real boulders, and his guide, on seeing a number of the same rounded fragments on the summit of a mountain in the vicinity, expressed his surprise at finding, in that elevated situation, the pebbles and boulders he was accustomed to see on the borders of the lake. The boulders, in this situation, were evidently the remains of similar beds of pudding-stone, of which the paste or cement had been decomposed and washed away.

It is observed, that secondary strata always rise towards the primitive mountains in their vicinity, which adds probability to the opinion, that the latter were forced up from great depths, and have raised with them the rocks by which they were originally covered, and which now border the primary. The disciples of Werner, however, contend, that the elevation of secondary strata is occasioned by the inclination of the rocks on which they were originally deposited, and that they have undergone no subsequent change.

Succession of Rocks.—There are certain rocks, which commonly occupy the lowest relative position in various parts of the world; the rocks which cover them are frequently arranged in a sequence, which has much similarity in distant districts.

Werner, who formed his system from observations made in in Saxony, where the order of succession presented considerable regularity, concluded that each principal rock constituted what he called a universal formation, or was originally spread round the globe, and that these formations succeeded in a determinate order, encircling each other like the coats of an onion.

More recent and extended observations do not confirm this conclusion to the full extent to which it was carried by the German géologists. Of the thirteen rocks which he classes as primary, some are entirely unknown in various parts of the world, and one of them, the topaz rock, has hitherto been found only in Saxony. Many of the secondary rocks, which occupy a considerable space in Europe, are no where met with in North or South America. In Asia, we are informed by travellers, that a range of mountains, composed of jasper, extends far more than a thousand miles through the eastern parts of Siberia, including Gore island, between that country and America. A geologist, who resided in Siberia, might be disposed to regard jasper as the principal rock-formation in the world, as it extends over a far greater space than the districts in which Werner laid the foundation of his system; on the contrary, in many parts of Europe, jasper is little known, nor is it even enumerated among the principal rocks of Werner.

Mr. Bakewell, in his "Introduction to Geology," admits only three principal rocks in the class of primary; in which arrangement he is supported by D'Aubuisson, an intelligent disciple of Werner, who, on a recent examination of the mountains in the department of Mont Blanc, found that many of the rocks, heretofore regarded as primary, contain some organic remains; hence he admits of one primary formation only, which includes granite, gneiss, and mica-slate.

Brongniart, a celebrated French mineralogist, has more recently declared his opinion, that it is no longer possible to admit the classifications established by Werner. "At the time when these were formed, they rendered an essential service to geology, and created the science; but new observations must produce correspondent changes in the denominations and system of arrangement." Journal des Mines, May 1814. Without adhering to systems, further than they are supported by facts, we consider granite as the lowest rock that is generally met with in alpine districts. Granite is frequently covered by a rock called gneiss, a kind of slaty granite; on this occurs micaceous schist, or mica-slate. For the characters of these rocks, see GRANITE, GNEISS, and MICA-*Slate*.

These three rocks are frequently observed graduating into each other, and sometimes alternating. The substances which compose them appear to have been in a fluid state, and to have united in various forms and proportions; and certain causes have given to the outer part a schistose or slaty structure. The gneiss and mica-slate are generally moulded over the granite, with the same elevations and depressions. Beds of other rocks, particularly of granular lime-stone, hornblende rock, and serpentine, occur occasionally in these rocks, with beds and veins of metallic ores.

The highest mountains on the continents of Europe and Asia are composed of these rocks. Mont Blanc is 15,680 feet above the level of the sea.

Granite rocks are in some instances immediately covered by slate; and in others, secondary stratified rocks rest upon granite, without the intervention of rocks which usually accompany it. More commonly, mountains of slate, or the coarse kind of slate-rock, called by the Germans grey-wacke and grey-wacke slate, cover the mica-slate and gneiss. Immense beds of lime-stone frequently accompany this kind of slate, in which the remains of marine animals, principally zoophytes, appear, but different from any known existing species. A very thick bed of sand-stone, frequently coloured red by the oxyd of iron, often accompanies the coarse slate. It is called by Werner the old red sand-stone, and is succeeded by beds of lime-stone, in which the organic remains of zoophytes and shell-fish are more abundant: these are the lowest rocks in which metallic veins usually occur. Over this lime-stone we meet with numerous strata of argillaceous and siliceous sand-stones, and soft slate or shale, abounding with impressions of vegetables, impregnated with bituminous and carbonaceous matter, and alternating frequently with beds of coal. These secondary stratified rocks, called by the Germans flœtz rocks, will be more particularly described under the article STRATA.

Again, over the strata containing coal, or more properly on the boundary of these strata nearest the sea, we meet with calcareous strata containing the remains of marine animals, but different from those found in the lower rocks. These calcareous strata consist of calcareous sand-stone, roe-stone, and chalk. See ROE-*Stone*, and CHALK.

It is remarkable that chalk, which is extensively spread over the southern counties of England, and the opposite coast of France, and in many of the countries adjoining the Baltic, is unknown in North and South America, and various parts of the world. Over the chalk are found thick beds of clay and sand; and in some parts of Europe there occurs over these a series of strata, containing the remains of fresh-water shells and quadrupeds. See STRATA, in which an account will be given of the fresh-water formation of strata in the vicinity of Paris and the southern parts of England. This appears to be the latest formation of rock that we are acquainted with, except what is taking place in our own times by volcanic fires.

It is worthy of remark, that we meet with no organic remains in the lowest rocks we are acquainted with; that the rocks over these contain a few remains principally of marine animals; that the rocks which immediately cover the marine remains, or the coal series, abound in vegetable impressions and carbonaceous matter; but we rarely meet with animal remains of any kind in these strata, until we approach nearer the sea-shore, when other calcareous strata occur again, containing, almost exclusively, the remains of marine animals, but different from those in the lower rocks. These latter strata consist of calcareous sand-stone, roe-stone, and chalk. See ROE-*Stone*.

Beside the rocks, in which some order of superposition may frequently be traced, there are other rocks which are thrown over them, apparently by some great convulsion of nature which has broken the surface of the globe, and forced them into their present position, without any regular order of succession. These rocks consist of porphyry, sienite, trap, or basalt. From the nature of these rocks, and the similarity of their position with that of volcanic rocks, many philosophers have attributed the same mode of formation to both, and suppose that the former have been orignally currents of lavas formed in remote ages.

Humboldt, who has made more extended observations on volcanoes than any philosopher who has preceded him, says, that in the substances which have been ejected during volcanic eruptions, a gradation may be traced from the more ancient to those of more recent date, and that the latter have always a nearer resemblance to the lavas ejected at the present time. If this observation be correct, it will probably lead to the con-

 clusion,

clusion, that rocks of porphyry, sienite, trap, basalt, and lava, had all a similar mode of formation, as they agree in so many characters of composition and structure. See VOLCANO, VOLCANIC *Products*, TRAP, and SIENITE.

As Mont Blanc in Switzerland is the highest mountain on the continent of Europe or Asia that has been examined by any eminent mineralogist, we shall give a short account of its structure, and the rocks which compose its summit, as described by Saussure, who ascended it in 1786, and who had devoted many years to the study of the rocks in its vicinity. These rocks, situated nearly 2400 fathoms above the sea, are interesting, as being the most elevated that have been observed by naturalists; and the scarcity of rock specimens, brought from great elevations, renders his account the more deserving of notice. A more numerous collection of such specimens from various parts of the globe would throw much light on this department of science.

After having gained the highest point of the mountain, "the first thing which struck me," says Saussure, "in the entire view of the high mountainous summits which I had under my eyes from the summit of Mont Blanc, (the highest of them all,) was the kind of disorder which prevailed in their disposition. When we contemplate the range, of which Mont Blanc forms a part, from less considerable elevations, it appears as if these colossal mountains were situated in a line, and formed a chain; but this appearance vanishes entirely from the bird's-eye view which is here presented. The mountains to the north of Mont Blanc, in Savoy and Switzerland, are indeed united among themselves, so as to form mountain chains, but the primitive mountains do not present this appearance. They are distributed in great masses, or in groups of various strange forms, detached from each other, which appear at least but accidentally united, without any regularity. Thus on the east, the lofty peaks called les Aiguilles de Chamouni, the mountains of Argentiere, of Courtes, and of Taleul, form one triangular group, almost detached from Mont Blanc, and only connected with it at the base by a narrow ridge.

"On the south-east likewise, mount Zuc, La Rogne, and the other primitive mountains to the north of the summit of l'Allée Blanche, form a group nearly triangular, separated from Mont Blanc by the valley of the glacier of Miage, and which is only connected with Mont Blanc by the base of the mountains which close that glacier to the north.

"Mont Blanc itself forms a mass almost isolated, the different parts of which are not in the same line, and have no relation of situation with the other groups.

"On casting my eyes still further, I confirmed the same observation. The primitive mountains of Switzerland and Italy, which I had sufficiently near to be under my eyes, presented only separated masses, or detached groups, without order or regularity. Notwithstanding this irregularity in the forms and distributions of the grand masses, I observed certain important resemblances in the structure of their parts. All that I distinctly saw, appeared composed of plates (*feuillets*), arranged in the same manner nearly from north-east to south-west. I had particular pleasure in observing the same structure in the Aiguille du Midi, which I had formerly endeavoured but in vain to study, being prevented by the inaccessible walls of granite that surround the base. I had a view of the Aiguille du Midi on the second day of my ascent, and never lost sight of it as I proceeded. I assured myself that it is entirely composed of magnificent plates of granite, perpendicular to the horizon, and directed from north-east to south-west. Three of these plates, separated from each other, form the summit, decreasing gradually in height from the southern face, on the side of the Col du Géant.

"When seen from the base, these plates had the appearance of being bent, like the leaves of an artichoke; but this must be an optical illusion, for all those which I could now see distinctly appeared straight; and if there were any exceptions, they were only local, and of small extent.

"This great phenomenon of the vertical position of the plates can only be explained, by admitting a great overturning of the whole mass, which has lifted them from their original horizontal position.

"Another question, which I wanted anxiously to resolve, was also now answered. These great plates of rock preserved the same nature and quality at the summit as at the base, where I had so frequently examined them. This observation proves a remarkable property in mountains with vertical beds: each bed preserves the same nature from the bottom to the top.

"From this magnificent observatory I could comprise in one view the whole of that great phenomenon—which I had before contemplated but in parts—the elevation of the beds forming the mountains on the side of Mont Blanc. On whichever part I turned my eyes, I saw the secondary chains of mountains, and even the primitive of the second order, raising their beds against Mont Blanc, and the high summits in its vicinity. Such were the mountains on the north of Repesoir, of Passy, of Servoz, and Le Buet; on the south, the Col du Ferret, Great St. Bernard, and those of the chain of Cremont, more remote, and beyond the mountainous chains, whose escarpments turn to Mont Blanc. We saw others, whose escarpments were turned in a contrary direction. These appearances are in perfect accordance with the theory which supposes that the crust of the globe has been broken, and the beds of rock raised from their horizontal position. It follows from hence, that the horizontal distance from the bottom of the valley of Chamouni (if that were once the ancient surface of the globe) should have some correspondence with the height of Mont Blanc; and that this distance is nearly the thickness of the stony crust, which has been broken and elevated; and that, consequently, Mont Blanc, which actually rises about a league above the surface, was in its original position buried two leagues beneath it."

The naked rocks on the summit, which form two kinds of arretes or crests of a dark colour, are of granite. The felspar in this granite is white, inclining to grey, green, or reddish: when exposed to the flame of the blowpipe, it yields a colourless transparent glass, but full of bubbles. The felspar is sometimes intermixed with a kind of earthy steatite. The quartz in this granite is semi-transparent and whitish, and appears rather unctuous in the fracture. Very minute fragments were rounded by the flame of the blow-pipe: it is, therefore, more fusible than rock-crystal. These granites are also intermixed with green and black hornblende, and with chlorite, which seems to supply the place of mica, as the latter scarcely appears, and only in minute spangles. In some places, these granites graduate into irregularly schistose rocks, composed of quartz and felspar, whose seams are filled with a brown argillaceous and ferruginous earth, that melts into a black glass. The granite on the actual summit is composed, like the above, of quartz, felspar, and hornblende or steatite. Felspar constitutes about three-fourths of the mass: the hornblende and steatite form too small a portion to be estimated, the quartz forming nearly the whole of the remaining fourth part. On the northern summit, besides the above species of granite, he

met

met with a kind of trap rock, compofed of minute cryftals of white felfpar and hornblende. On the fouthern fummit he alfo found rocks of petrofilex (hornftone), of a pearl-grey colour. It is deferving notice, that the definition of thefe granites, as given by Sauffure, would, according to the Wernerian fyftem, bring them under the denomination of fecondary granites; though furely, if any granite can properly be confidered as primary, it is that of Mont Blanc, and the mountains in its immediate vicinity.

The following extract from profeffor Jamefon's Geognofy comprifes a fhort view of the order of fucceffion of rocks, as laid down by the German geologifts; with obfervations on the fucceffion of the rocks of Saxony and Hanover, defcribed in the quaint language peculiar to the fchool of Freyburg.

"In the primitive clafs of rocks, we obferve feveral rocks always difpofed in conformable and unbroken ftratification, and in which the newer and newer ftrata have always a lower and lower level. Gneifs, mica-flate, and clay-flate, are of this kind. The granite ftretches under them uninterruptedly, and fometimes rifes through them, or juts up in the form of fingle caps or great maffes; fo that the gneifs and other rocks are difpofed on its furface, fometimes in a concave, fometimes in a convex direction, fometimes faddle-fhaped, and frequently mantle-fhaped. It is evident from thefe relations of the ftrata, that granite will frequently form the greateft heights on the furface of the globe.

"Porphyry has a very different kind of ftratification from the preceding rocks. It occurs fometimes broken, fometimes unbroken. When broken, it prefents caps, upfillings, and fhield-fhaped ftratification. When unbroken, it forms widely extended maffes: its pofition is unconformable, and overlying.

"Grey-wacke occurs fometimes in a conformable, fometimes in an unconformable pofition; alfo in caps, upfillings, and fhield-fhaped, and frequently mantle-fhaped, ftrata, furrounding the older mountains.

"The lime-ftone and fand-ftone formations are ufually difpofed in a mantle-fhape, round the older formation; fometimes they are broken, but more frequently unbroken. They are very common and widely diftributed formations.

"Coal, again, fhews a very peculiar character: its original extent is not confiderable; it even appears interrupted, or broken; but its internal characters fhew that its prefent apparently broken appearance is its original one. It occurs commonly in trough and bafin-fhaped hollows, and its ftrata have confequently a concave direction.

"The rocks of the neweft flœtz-trap formation are diftinguifhed from the older by their unconformable, overlying, and broken ftratification. In thefe refpects they nearly agree with porphyry. When the continuity of the formation is broken, it occurs in caps, upfillings, and rarely fhield-fhaped.

"The defcription we have now given of the fucceffion and ftructure of the different claffes of rocks, will enable us to inveftigate the ftructure of the whole mountain groups. We fhall illuftrate this by a very fhort defcription of two well-known tracks of country, the Hartz, and the Saxon Erzgebirge, or metalliferous mountains.

"*Defcription of the Hartz.*—An immenfe mafs of granite forms the centre of this country; it rifes through the other ftrata, and is elevated a confiderable height above them all, forming the famous mountain—the Brocken. Mantle-fhaped ftrata of clay-flate are wrapped around this central mafs. It is worthy of remark, that gneifs and mica-flate, two of the moft confiderable of the older formations, are wanting in this country. To the clay-flate fucceeds tranfition lime-ftone, then grey-wacke, and grey-wacke flate; and the whole of thefe are wrapped around the granite in mantle-fhaped ftrata, and invariably with lower and lower outgoings, correfponding to the newer and newer ftrata. The flœtz rocks that immediately fucceed the tranfition furround them in mantle-fhaped ftrata. Immediately on the neweft of the tranfition rocks refts the oldeft of the flœtz, the old red fand-ftone; to this fucceeds the other flœtz formation, in the following order, according to their relative age:—firft flœtz lime-ftone, firft flœtz gypfum; fecond or variegated fand-ftone, fecond or newer flœtz gypfum, fecond flœtz lime-ftone. Thefe flœtz rocks are the links that connect the tranfition with the alluvial, the next clafs of rocks. Thefe are found in the loweft fituations. We have thus, from granite to the alluvial formation, all the feries marked with a diminifhing level, in proportion to the newnefs of the ftrata.

"*Defcription of the Saxon Erzgebirge.*—The mine diftrict of the electorate of Saxony has a bafis of granite which rifes through the fuper-incumbent rocks in the different places at Altenberg, Johanngeorgenftadz, and Bobrifch, on the road leading from Freyberg to Drefden. The newer formations, *viz.* gneifs, mica-flate, topaz-rock, and clay-flate, are wrapped around the granite in mantle-fhaped ftrata, and the diminifhing levels of the outgoings correfpond to the newnefs of the formations. Over thefe we meet with other primitive formations that overlie the older formations, and their continuity is partly broken, and partly unbroken; here are porphyry, fienite, newer granite, quartz, and ferpentine. Still lower down we meet with tranfition rocks, of which the lime-ftone appears at Kalk-grun and Wildenfels; the amygdaloid at Voghtland; and the grey-wacke and grey-wacke flate near Freyberg. Still lower down, and often covering the preceding formations, we find fand-ftone and lime-ftone; and in feveral places, as at Hainchen, Pottchappel near Drefden, and Zwickau, there are depofitions of the coal formation. Laftly, the neweft flœtz-trap formation covers all the others in unconformable, overlying, and very broken ftratification."

Decompofition of Rocks.—Where rocks rife above the furface, and are expofed to the action of air and moifture, they are liable to decompofition and difintegration. The former confifts in the feparation of the conftituent parts, the latter in the feparation of the integrant parts: the one may be compared to the moulding of the ftones of which a building is conftructed, the other to the disjointing and diflocation of the ftones in a found ftate, when a building is thrown down. Both thefe proceffes frequently take place in the fame rock.

The difintegration of rocks is fometimes rapidly effected by earthquakes, lightning, and the immediate action of fubterranean fires. It is, however, to the more conftant operations of moifture and change of temperature, that the deftruction of rocks and mountains may be principally attributed; but no well-authenticated obfervations have yet been made to determine the extent of thefe effects during a given period of time. It has been vaguely ftated, that the height of the Pyrenées is diminifhing about one foot in a century; hence it was calculated that a million years would be required to level the rocky boundary which feparates France and Spain. It is obvious that a lapfe of many centuries would be required to verify fuch a conclufion; and though the decompofition and difintegration of rocks are, in many fituations, fufficiently rapid to be obfervable during the fhort period of a fingle life, yet, in other fituations,

rocks

rocks present the same unvarying outline for ages, and preserve their angular sharpness, which is either natural, or, in some instances, the effect of art. Thus, the blocks of granite remaining in the quarries at Sienna, in Upper Egypt, have all the impressions of the tools with which they were worked during the latter period of the Roman empire; and the basaltic rocks formed by the extinct volcanoes of Auvergne are so compact, as to present, at this day, the appearance of trickling lava suddenly congealed, though the period of their formation was prior to the record of authentic history. The causes of disintegration are, the vicissitudes of the atmosphere, change of temperature, and the absorption and congelation of water. The sudden dilation or contraction produced by the expansion and congelation of water, is alone sufficient to rend the strongest rocks when it enters their fissures. In Greenland the rocks are said, from this cause, frequently to burst with a noise like thunder. The external causes of decomposition are, principally, water and oxygen. Mineral substances, containing sulphur or metallic matter capable of a higher degree of oxygenation, absorb oxygen from water, or the atmosphere. To this cause the decomposition of stones, containing pyrites, is to be attributed. Calces of iron, moderately oxygenated, are the most general cause of decomposition; they act by absorbing a greater portion of oxygen, by which they gradually swell, and are disunited from the other constituent parts of the stone in whose composition they enter. When least oxygenated, their colour is black, or dark brown; and in some instances, when combined with alumine, or magnesia, greenish-grey; the alumine, as it becomes more oxygenated, turns to a purple-red and orange, and finally a pale yellowish-brown; the magnesia becomes at first blue, then purple and red. Iron, in its metallic state, or, at least, when but slightly oxygenated, also decomposes water; but if exposed to the air, it becomes further oxygenated, and the compound into which it enters gradually withers, as Dr. Higgins observed, in imitating pozzolana. Higgins, on Cements, 124.

Stones, into whose composition calces of iron, highly oxygenated, seem originally to have entered, are said, by Mr. Kirwan, to decompose with great difficulty, of which he instances red jasper; but perhaps the more perfect vitrification of these minerals may be the cause of their durability.

Calcareous rocks are liable to the decomposing effects of water, partly mechanical and partly chemical. Carbonate of lime is insoluble in water, except when aided by carbonic acid; but as this exists more or less in almost all water, it acts slowly upon lime-stones, particularly on those of a loose texture. Potash and soda enter also into the composition of many rocks; and to the existence of potash in felspar, one of the constituents of granite, the decomposition of granite rocks may be generally attributed.

From the combination of some extraneous mineral substance with rocks, remarkably rapid instances of the decomposition of rocks are sometimes known to take place. According to Dolomieu, all the houses of Malta are built of a fine grained lime-stone of a loose and soft texture, but which hardens by exposure to the air. There is a circumstance which hastens its destruction and reduces it to powder, namely, when it is wetted by sea-water; after this it never dries, but is covered by a saline efflorescence, and a crust is formed some tenths of an inch thick, mixed with common salt, nitre, and nitrate of lime. Under this crust the stone moulders to dust, the crust falls off, and other crusts are successively formed, until the whole stone is destroyed. A single drop of sea-water is sufficient to produce the germ of destruction, which gradually increases and spreads, like a caries, through the whole mass of stone; nor does it stop there, but after some time affects all the neighbouring stones in the wall. The stones most subject to this decay are those that contain most magnesia; those that are finer grained, and of a closer texture, resist it. Notwithstanding the speculations of Dolomieu and Mr. Kirwan on the cause of this uncommon property in the stone of Malta, we conceive that a satisfactory explanation is still wanting.

We have before stated, that water is the principal agent in the gradual destruction of rocks, but sometimes entire mountains are suddenly levelled by subterranean currents, which work their passage through fissures and cavities, and silently prepare the causes of the most alarming catastrophes in alpine districts. In proportion to the elevation and abruptness of rocks, these catastrophes are more frequent and extended. In the cantons of Switzerland numerous instances of this kind are on record, and one, which we shall subsequently notice, occurred in our own times.

The town of Pleurs, about a league from Chavennes, containing about 2200 inhabitants, and numerous splendid palaces, was suddenly buried under a mountain on the 25th of August, 1618.

On the same evening an inhabitant, who entered the town, advised his neighbours to leave the place, saying, he had seen the mountains cleaving, but could obtain no credit; his daughter, whom he had persuaded to depart with him, returned to lock up some valuables, and was overwhelmed with all the other inhabitants in one common ruin. Mr. Coxe says vineyards, chesnut trees, and houses, now cover the spot where this unfortunate town once stood.

On the 23d of September, 1714, a great part of the mountain Diableret fell in between two and three o'clock in the afternoon, and buried more than 100 huts, and a considerable part of the valley. Those who saw this disaster say that it happened in a moment, and at the same time whirling clouds of dust arose suddenly, which darkened the air like a sudden night.

In 1751, a mountain fell down, situated near Passy, between Salenches and Servoz. Saussure says, the noise was so dreadful, and so thick and dark a cloud of dust arose, that many persons supposed that the world was at an end. Intelligence was received at Turin, that a terrible volcano had broken forth in these mountains: in consequence of which the king sent the celebrated naturalist, Vitaliano Donati, to verify the report, who gives the following account of the event. "I hurried with extreme pleasure to examine so extraordinary a phenomenon. After having travelled four days and four nights without halting, I came in front of a mountain all covered with smoke, and from which were incessantly detached, both by day and night, large masses of stone with a noise perfectly like that of thunder, or of a large battery of cannon, but louder and more terrible. The peasants had all retired from the vicinity, and did not dare to look at the ruin, but at the distance of two miles, or even farther. All the neighbouring hills were covered with a dust much resembling ashes. All said they had seen at intervals a smoke, which was red during the day, and accompanied with flames at night. I attentively examined the smoke, but neither perceived flames nor any smell of sulphur. Nor did the rivulets I examined with care, present the least appearance of sulphuric matter. Thus persuaded, I entered the smoke, and though quite alone, went to the brink of the abyss, where I saw a large rock darted down, and observed that the smoke was only dust raised by the fall of the rocks, the cause of which I soon

ſoon after ſought for and diſcovered.—A great part of the mountain ſituated above that which had fallen was compoſed of earth and ſtones, not diſpoſed in beds, but confuſedly heaped together. I thus perceived that the mountain had been ſubject to ſimilar falls, which had left the large rock that fell this year without a ſupport, and with a conſiderable projection. This rock was compoſed of horizontal beds, of which the lower were of ſlate, or rather of fragile ſchiſtoſe ſtone of little conſiſtency, while the two beds beneath theſe were of marble like that of Porto Venere, but full of fiſſures, which croſſed the beds. The fifth bed was wholly compoſed of ſlate in vertical plates, entirely diſunited; this bed formed all the upper part of the fallen mountain. Upon the ſame level ſummit were three lakes, the waters of which penetrated conſtantly through the fiſſures of the beds of rock, and decompoſed their ſupports. The ſnow, which had fallen in Savoy in greater abundance than had ever been ſeen in the memory of man, increaſed the effect, and the united waters occaſioned the fall of three million cubic fathoms of rock, a maſs ſufficient to form a large mountain."

On the 2d of September 1806, at five in the evening, the Knippenhoul rock, which formed the ſummit of mount Roſenberg, was on a ſudden detached from its ſituation; and at the ſame time part of the mountain, about 280 feet thick on the eaſt ſide, and ſeveral feet thick on the weſt, gave way, and fell into the valley which ſeparates the lake of Zug from that of Lauwertz. One part of the mountain fell into the lake of Lauwertz, which cauſed ſuch an agitation in the waters of the lake, that they overthrew a number of houſes, chapels, mills, &c. along the northern ſhore. Upwards of 1000 perſons were the victims of this calamity. A ſociety of thirteen travellers were on the road from Arth to Schwetz; nine who walked firſt periſhed, the other four eſcaped. In this convulſion enormous pieces of rock were carried through the air to prodigious diſtances. The lake of Lauwertz has loſt about a quarter of its extent. That rich plain, before ſo beautiful, now preſents a mountain of 100 feet in height, $1\frac{1}{2}$ league in length, and as much in breadth. The villages of Goldau and Rothen, conſiſting of 115 houſes; that of Buſingen, of 126; and that of Kuſlock, have totally diſappeared. Of Lauwertz, which had 25 houſes, there remain ten buildings, all much damaged. Twenty years previouſly, general Pfyffer predicted this cataſtrophe, from the knowledge he had of the nature of the mountain. A profeſſor of Schwitz ſaid, that above Spietsfleu there was a lake of water which had undermined the rock for ſeveral years, and that below there was a cavern of great depth, where the waters were ingulphed. The quantity of water which had fallen during the preceding years haſtened the cataſtrophe, and the rains of ſome preceding weeks decided it. On the 10th, eight hundred perſons were employed in digging for the bodies of thoſe who were deſtroyed by the falling of the mountain. In forming a channel to draw off the waters, between thirty and forty labourers were ſwallowed up by a torrent of muddy water which broke in upon them ſuddenly. Annual Regiſter, 1806, page 449.

In the mountainous parts of North Wales, Cumberland, and Weſtmoreland, ſimilar effects, on a diminutive ſcale, are taking place; and the ſcattered maſſes of rock, ſpread widely over the ſides and feet of the hills, prove that they have once had a greater elevation.

By the decay of rocks and mountains, new and productive ſoils are formed to renovate the ſurface of the globe, and fit it for the ſupport of vegetable and animal life; and it has been remarked that thoſe rocks which form the moſt fertile ſoils, are preciſely thoſe which decompoſe with the greateſt rapidity, whilſt thoſe which are unfavourable to vegetation reſiſt, for ages, the effects of atmoſpheric influence. It can ſcarcely be denied that this beneficent proviſion of the Author of nature, is ordained to repair the conſtant waſte and change which are taking place on the ſurface.

> "Nec ſpecies ſua cuique manet, rerumque novatrix
> Ex aliis alias reparat natura figuras." Ovid.

The formation of rocks, or the proceſs by which they acquired their preſent form and conſiſtence, may, perhaps, ever remain a ſubject of uncertain ſpeculation, as no analogous formations are now taking place, except in one claſs of rocks, the volcanic.

Some geologiſts contend that all the ſolid materials in the mineral kingdom were once in a ſtate of aqueous ſolution, from which rocks and ſtrata were formed, partly by chemical precipitation, and partly by ſediment; the lower cryſtalline rocks being entirely chemical products, the intermediate or tranſition partly chemical and partly mechanical depoſitions; and the upper rocks and ſtrata principally mechanical, or formed of ſediment or the fragments of former rocks. It has been objected to this hypotheſis, that neither the elementary ſubſtances, nor the compounds of which rocks are formed, are ſoluble in water. In reply to this it has been contended, that though the ſubſtances called elementary are inſoluble, in all probability there was a time when they exiſted in a more ſimple uncombined ſtate; and that the more ſimple elements were once ſoluble in water, though the preſent ſubſtances called elementary are not ſo; in the ſame manner as very ſoluble ſubſtances are known to become nearly inſoluble by chemical union with each other, of which we have an inſtance in the tartareous acid and potaſh, which are both very ſoluble, but when united in certain proportions, they form a ſalt that can only be diſſolved in twenty times its weight of water.

According to theſe geologiſts, the quantity of water which once covered the whole globe muſt have been much greater than at preſent; but in what manner it has been diminiſhed they do not attempt to explain.

Other geologiſts ſuppoſe that moſt of the rocks, whether ſtratified or not, were formed of the ſand, or ſediment, waſhed down from former continents, and that they have acquired their preſent ſtructure and hardneſs from the action of a central fire, which they believe to exiſt conſtantly in our planet, but which is called into greater activity at certain periods by laws with which we are unacquainted. According to the ſyſtem of theſe philoſophers, the preſent continents were raiſed from the bottom of the ocean by the action of the ſame fire, and the rocks of baſalt and porphyry were forced through, and ſpread over, the ſurface in a ſtate of fuſion, like currents of lava from active volcanoes. It muſt be admitted, that the only inſtances we have of the formation of rocks, in our own times, are from the agency of fire; and that ſome of the lavas preſent the cryſtalline internal ſtructure, or contain imbedded cryſtals as perfect as thoſe found in primary rocks. It is foreign to the purpoſe of this article to diſcuſs the probabilities of thoſe two theories which have acquired the names of the Neptunian and Plutonian, for an account of which, ſee EARTH. The deſcent of ſtony maſſes from the atmoſphere, ſometimes of great ſize and weight, is now fully proved; and the formation of theſe ſtones, from the concretion of gaſeous matter, may probably throw ſome light ultimately on the moſt abſtruſe queſtions in geology, and lead to new, and more correct, views of the nature of our planet. Perhaps the different primary beds of ſtone, that environ the globe, were formed by ſimilar concretions from an atmoſphere of vaſt extent. Of one thing

thing we are certain, that the formation of many of the secondary ſtrata was ſubſequent to the exiſtence of animal and vegetable life; were it not ſo, their remains could not be enveloped in them. Another fact is not leſs certain, that many of theſe beds were depoſited very gradually, and form a medium in a ſtate of perfect tranquillity: this is proved by the extremely delicate unbroken fibres and ſpines of ſome of the organic remains which could not have been preſerved entire, had the particles of the ſtony matter, by which they are covered and imbedded, been of conſiderable ſize, or had they been depoſited in a tumultuous element. See STRATA.

Rocks, beſide furniſhing the metallic ores, and materials for architecture, have the moſt important uſes in the phyſical conſtitution of the globe, not only as forming the ſolid baſes or ſkeletons on which iſlands and continents are conſtructed, but theſe elevations and inequalities are abſolutely neceſſary to ſupply the dry land with pure and running ſtreams, and to drain the ſuperfluity of moiſture in rainy ſeaſons, which would otherwiſe form ſtagnant and putrid pools, infecting the air with death: without theſe rocky elevations the earth muſt remain a ſolitary deſert, fitted only for the abode of reptiles and amphibious animals. Thus, by the very irregularity and confuſion which ſeem to prevail in the diſpoſition of the fractured ſurface of the globe, it is rendered ſalubrious and productive, and prepared to ſatisfy the wants, and gratify the various inclinations and inſtincts, of its numerous inhabitants.

ROCK, in *Agriculture*, a ſtony ſubſtance of different kinds, that frequently affords much interruption to tillage, and is highly injurious as a ſubſtratum, that occaſionally upholds water, and prevents its paſſing downwards. Where this laſt is the caſe, they are moſtly of the cloſe, hard, compact kind. They may likewiſe be hurtful in other ways, as by covering the ſurface of graſs-land, and by occupying lands which might otherwiſe produce uſeful plants. Their effects, as non-conductors of water, depends upon their qualities, in ſome meaſure, as well as upon that of the beds of earthy matter in which they are ſituated, and will be more fully conſidered in ſpeaking of SPRING-*draining*. The rocky beds of free-ſtone, blue-ſtone, and lime-ſtone, as well as thoſe of ſome other ſorts, exiſt in very different ſtates, in different parts of the kingdom; and are, on that account, more or leſs favourable to the purpoſes of huſbandry, in the ground by which they are covered.

Rocks of particular kinds are not unfrequently inſtrumental, in their decompoſitions, in contributing to the formation of land or ſoil. Thoſe lands or ſoils which ariſe, in ſome degree, from the decompoſition of rocks of the ſandſtone and granite kinds, are for the moſt part of the thin, poor, hungry deſcription; continuing for very great lengths of time, in many caſes, with but very ſlight coverings of vegetable matter or plants of the graſſy ſort upon them. But thoſe proceeding, in ſome meaſure, from the decompoſition and mouldering down of rocks of the lime-ſtone, chalk, and ſome other kinds, are in general well and cloſely beſet with plants of the permanent graſs kind, and give, when broken up, deep rich earthy beds, for the nouriſhment and ſupport of different ſorts of vegetables as crops.

Where lands are ſituated immediately upon beds or layers of rocks or ſtones, they moſtly become dry, and ſuitable for the purpoſes of vegetation, much ſooner than where they are depoſited upon an under-ſoil of a clayey or marly nature. This approach of the rocky ſtrata towards the ſurface-beds of land or ſoil, is probably one great cauſe of the fertility of land in moiſt or wet climates, ſuch as thoſe of ſome parts of this country, as many of the more northern diſtricts, and moſt parts of Ireland.

The rocks and ſtrata of other kinds, from the decompoſitions of which land or ſoils have been formed, as well as thoſe which conſtitute the more internal parts of the globe itſelf, have a certain order and arrangement, which is not altogether uſeleſs to the inquiring farmer; eſpecially as ſtrata of the rocky nature, which are very different in their kinds, not unfrequently happen to be aſſociated together; and thoſe which are placed directly below the layers of land or ſoil contain materials, which may, in many caſes, be of utility in ameliorating them. But the general view of the nature, compoſition, and poſition of rocks, whether of the primary or ſecondary kind, as well as of other natural ſtrata of a ſimilar deſcription, properly belongs to the general head of *rock;* which ſee. See alſo SOIL and SUBSOIL.

ROCK, in *Ornamental Gardening*, a ſubſtance or body, which is of much utility in producing effect in the forming and laying out the grounds of country reſidences. It is ſuggeſted by Mr. Loudon, that, though in reality theſe can neither be created, increaſed, nor taken away, yet that ſeveral operations may be effected with them, which ſeem of the ſame nature, and conſequently to be of much importance in landſcape. They may, it is ſuppoſed, be either *ſhewn*, *concealed*, or rendered more *characteriſtic*. They may be ſhewn with more and better effect, by taking away earth from about them, and forming breaks and abruptneſſes in the ſurface of the ground where they are. This may, it is ſaid, be accompliſhed in many different ways; but that thoſe methods are to be preferred, which are moſt effectual in ſhewing a perpendicular ſurface, or upright front of rock; as it is not only the grandeſt manner of ſeeing them that can be contrived, but, at the ſame time, the moſt economical and conſiſtent with the good management of the land; no horizontal ſurface of any conſequence, whether of the wood or paſture kind, being to any material extent deſtroyed. Rocks appear in this way in a great many ſituations, in different parts of the country, in the ornamental grounds of reſidences.

It is alſo further ſuggeſted, that rocks may be ſhewn by removing of wood, either alone, or in connection with ground. This practice, it is ſuppoſed, would often have a fine effect on the ſides of hills, mountains, and ſteeps, as well as upon the banks of rivers and lakes; in the laſt of which caſes, it would frequently be aſſiſted in connection with the removal of water, which can often be effected with eaſe: as, for inſtance, when a lake has an outlet, or when the channel of a river has conſiderable declivity. In all caſes where rocks are to be ſhewn, it is conſtantly the moſt preferable to exhibit erect, projecting, or at leaſt nearly perpendicular ſurfaces; as other kinds never occur in nature, except under the ſurface of water, or in barren deſerts: for although they were originally, or after convulſions of nature, left wholly naked, yet by time and circumſtances they have gradually become clothed on their upper ſurfaces by an earthy matter and vegetable productions.

Rocks may be concealed, it is imagined, either completely, or in a partial manner, and by any one or the whole of the materials which ſhew them. Complete concealment is, however, it is thought, rarely deſireable, except in caſes where the rocks are of the barren or diſagreeable kind; as in the inſtance of a perfectly naked ſurface of rocks, or ſmall naked angular fragments of them ſtaring through ground of uniform or ſimple ſurface: in the former of which caſes, they ſhould be covered with earth; and in the latter, be blown out of the ground by means of gunpowder,

powder, or dug out of it in other ways, as is frequently the cafe in forming and laying out ornamented grounds.

But partial concealment may often take place in circumftances of this kind, and is, it is fuppofed, beft effected by wood; and in cafe the form of the part or parts, which appear, be in the grand ftyle, and the concealment accomplifhed in a judicious manner, the imagination, which is ever ready to magnify the extent or power of indiftinct objects, will, it is fuppofed, conceive the reft to be much more noble, than if they had been of forms capable of being advantageoufly difclofed. Partial concealment may likewife fometimes be effected by earth or water, and even by buildings; in all of which, the general principles are the fame, it is fuppofed.

It is ftated, that in rendering rocks more characteriftic, the firft requifite is to attend to their general characters: thefe may either be grand, terrific, fanciful, or romantic and picturefque. Grandeur here confifts, it is fuppofed, commonly in the breadth of light and fhade, or the height of the maffes; and may be heightened by increafing thefe, either by removing fmall parts of the rock itfelf, or by clearing away the appertaining matters, which tend to conceal or injure the principal maffes. Romantic or terrific rocks may, it is thought, fometimes be improved by concealment or difclofure, but rarely by increafing their character. And thofe of picturefque beauty may often be operated upon with fuccefs, either by giving more breadth, variety, or intricacy to the rocks themfelves; or by covering them with vegetation; or planting trees before them, to effect variety or harmony; or bufhes and creepers above them, to hang over and produce fhade and intricacy. An excefs of intricacy is, however, fuggefted, as dangerous, and as tending more than any other quality to make a rock trifling. Crags are faid to be frequently trifling on this account, as well as the rock in different fituations. In fhort, the management of rocks, it is imagined, is yet very little, if at all, underftood in this country. In many parts they are indeed feen fhewn, but in fuch a way as that they appear little better than upright maffes of red earth. The fubject is unqueftionably deferving of more attention than it has hitherto met with, from the defigners of ornamented grounds.

Rock-*Work*, any fort of work or defign, which is formed of the parts or fragments of rocks, or large ftones, in gardens or pleafure-grounds.

All works of this nature fhould be contrived in fuch a manner, as to harmonize as much as poffible with the peculiarities of the fituations or places in which they are made. See Rock and Stone.

They were formerly much more common, in both thefe fituations, than they are at prefent.

Rock *Alum*. See Alum.

Rock-*Butter*, in *Mineralogy*, a faline mineral, formed in the fiffures of rocks of alum-flate. It occurs both maffive and ftalactitical, and fometimes pulverulent. It has a greyifh-white or a ftraw-yellow colour, and a fweetifh and fomewhat acidulous aftringent tafte, like alum. It is indeed a kind of native alum. The feel is fomewhat greafy, from which and its colour it has received its name.

Rock-*Cork*, *Suber Montanum*, a flexible and fomewhat elaftic mineral, found in mineral veins. It is fometimes maffive, and fometimes in laminæ or plates: thefe have been called rock-leather and rock-flefh. The common colour is a yellowifh-grey of various fhades: it is fometimes a yellowifh-brown and cream-colour. It has a fibrous ftructure, and but little luftre. The fractured furface is delicately uneven. This mineral is opaque, and very foft, yielding to the nail. It breaks with great difficulty, and cracks when handled: it is fo light as to fwim on water, and is almoft infufible in the flame of the blowpipe.

The conftituent parts, as given by Bergmann, are,

Silex	56.2
Magnefia	26.1
Alumine	2
Lime	12.7
Iron	3
	100

Rock-cork approaches in its nature to afbeftus, from which it differs principally by the promifcuous arrangement of the fibres.

Rock-*Cryftal*, the pureft variety of cryftallized quartz. (See Quartz.) This ftone is fometimes employed in jewellery, and is differently named, according to the places from whence it is procured, as Briftol ftone, Scotch pebbles, &c.

Rock-*Fifh*, a common Englifh name for the *gobius marinus*, or fea-gudgeon. See Gobius *Niger*.

Rock *Germander*, in *Botany*, a fpecies of *veronica*; which fee.

Rock-*Oil*. See Petroleum.

Rock-*Ouzel*, in *Ornithology*. See *Ring* Ouzel, and Amzel.

Rock-*Rofe*, in *Botany*. See Cistus.

Rock-*Salt*, in *Mineralogy* and *Geology*, a natural falt, of the fame kind as common table falt. This ufeful mineral forms large beds and maffes in many parts of the world, and even compofes entire mountains. It occurs in large columnar or in fpheroidal concretions, and alfo cryftallized in cubes. Rock-falt is fubdivided by Werner into two kinds, foliated and fibrous. The more common colours of foliated rock-falt are, white, grey, reddifh-brown, and red; but fometimes it is violet, fky-blue, and green, and is more or lefs tranfparent or pellucid: it breaks into cubical fragments, which have a vitreous luftre: the ftructure is indiftinctly foliated. In fibrous rock-falt the fibres are generally fmall and curved; in other refpects it differs little from the former. The tafte of both is like that of common falt. The red varieties are coloured by earthy matter and oxyd of iron; the white and tranfparent are extremely pure, being compofed almoft entirely of muriatic acid and foda, or, according to Davy, of chlorine and fodium. In the pureft kind alfo, there is fcarcely any trace of water of cryftallization. According to Henry, pure tranfparent rock-falt, calcined for half an hour in a low red heat, equal to four or five degrees of Wedgewood's pyrometer, loft abfolutely nothing of its weight. It is remarkable, alfo, that if free from any adventitious moifture, it may be fuddenly and ftrongly heated with fcarcely any of that found called decrepitation, which is produced by a fimilar treatment of all the varieties of manufactured common falt. The fpecific gravity of the pureft fpecimens of rock-falt is about 2.170, of the lefs pure about 2.130.

Rock-falt is widely diftributed over the globe; it appears principally in the lower fecondary ftrata. It is moft frequently accompanied with fulphate of lime or gypfum, and by beds of clay impregnated with falt. Befide the beds of rock-falt which are known, numerous brine-fprings in various parts of the world atteft the exiftence of this mineral deep under the furface, as it is evident thefe fprings percolate beds of falt, or ftrata impregnated with it. Several brine-fprings have recently been difcovered in the deep coal-mines of of Northumberland and Durham. In the coal-mines near Afhby-de-la-Zouch, in Leicefterfhire, there are fprings of brine 245 yards below the furface; and though thefe fprings are in the centre of the ifland, they are 140 yards below the level of the fea. How much deeper their fource may be, has not been afcertained.

The moft obvious hypothefis refpecting the formation of rock-falt is, the one which fuppofes that it was depofited from the fea, or by the deficcation of falt lakes which formerly covered the prefent continents. Againft this it has been objected, that the compofition of rock-falt is much more pure than the contents of fea-water, which contains a quantity both of muriate and fulphate of magnefia, fulphate of foda, and of fulphate of lime. Rock-falt is alfo found at great heights above the prefent level of the fea. Thefe objections will, in a confiderable degree, be invalidated by the confideration that whatever impurities there may be in fea-water, if the procefs of evaporation go on very flowly the falt will be cryftallized nearly pure. Of this we have an inftance in the fpecies of falt made at Lymington, in Hampfhire, called *falt cat*, which is gradually formed in the courfe of ten or twelve days, by fpontaneous evaporation of the liquor which drains from the common falt. This falt is fo pure (though evaporated from the moft impure part, the mother water, or refidue of fea-water), that 1000 parts contain only 12 of foreign impurities, or little more than one *per cent*. Thus if the deficcation of lakes or bafins filled with falt water were very gradual, as it muft be, except in the vicinity of fubterranean fires, the muriate of foda or rock-falt would be cryftallized before the other falts, which being more deliquefcent might be feparated and wafhed away. In this manner the fulphate of lime or gypfum, which exifts in fea-water, and accompanies rock-falt, may alfo have been depofited, and being nearly infoluble would remain.

The occurrence of rock-falt deep under the earth, or high above the level of the fea, can fcarcely form an objection to its formation from fea-water; for it is admitted by all geologifts, and is proved by undoubted facts, that the ocean once covered our prefent continents. Now by whatever procefs the dry land was raifed above the fea, whether by the elevation of the former, or the depreffion of the beds of the latter, extenfive hollows and clofed vallies muft have formed lakes of falt water, from which the falt might be depofited by evaporation. Some of thefe vallies or hollows would occur in elevated fituations. With refpect to the beds of rock-falt placed under other ftrata, however difficult it may be to explain the formation of the fecondary ftrata, the exiftence of organic remains in them prove that each ftratum was once the uppermoft part of the globe, and the ftrata by which it is covered were depofited upon it in fucceffive and probably at diftant periods. Nor is the difficulty greater with refpect to the ftrata covering rock-falt, than the ftrata covering coal and beds of coal-fhale abounding in vegetable impreffions. No organic remains have indeed been difcovered in the ftrata over the rock-falt of Chefhire, but they are commonly met with at greater depths over the rock-falt beds in Poland, and in other parts of Europe. The occurrence of rock-falt at the fides or feet of extenfive mountainous chains, may perhaps illuftrate its formation, as it is probable thefe extenfive chains once formed the boundaries of inland feas or lakes, when the relative level of the ocean and our continents was very different from the prefent.

Rock-falt is not mined in any part of our ifland, except Chefhire, though it was bored through at Droitwich; and it exifts, in all probability, in many of the weftern counties through which the red fand-rock extends. We have proofs of its exiftence from the brine-fprings at Droitwitch, in Worcefterfhire, at Lemington in Warwickfhire, and at Afhby Wolds, in Leicefterfhire; and alfo in the counties of Northumberland and Durham, on the eaftern fide of England. The fprings at Droitwitch furnifh a brine as ftrong as thofe of Chefhire. A defcription of the rock-falt of Chefhire being given as an article of rural economy, we fhall proceed to give a fhort account of the moft important repofitories of this ufeful mineral in other parts of the world.

Salt is very abundant in Africa; all the plains and fandy defarts are impregnated with falt, and the greater part of the fprings in thefe defarts are fo faline, that it is not poffible to drink the water. To the fouth of Abyffinia, at the feet of the mountains which feparate that country from that of the Gallas negroes, falt exifts in dry and folid maffes. The fummit of the mountains which border the defart to the weft of Cairo, prefents an immenfe plain covered with a mafs of falt. According to Horneman it is fpread over fo large a track of furface, that no eye can reach its termination in one direction; its breadth extends feveral miles. To the weft of the defart of Sahara are the great falt rocks of Tegaza, on the fouth-eaft frontier of the defart of Zuenziga, a little diftance from Cape Blanc. They are worked by the Moors. Thefe falt mines furnifh the white and coloured falt, which is carried by caravans to Cafnah and Tombuctoo, to fupply the Negro ftates; for it does not appear that there are any falt mines in Negro land properly called. The mines of falt fpread in that part of Africa which the ancients called Libya, have been well indicated by Herodotus, and it is in this country that he has defcribed buildings conftructed of rock-falt, like thofe in Caramania and Arabia. Other falt mines, according to Park, are found on the fouthern frontier of the great defart Sahara. Their produce is alfo fold to the Negroes on the borders of the Niger and the Jolibe. In the kingdom of Tunis, mount Had Delfa is entirely compofed of very compact falt of a red and violet colour. The lake des Marques, and the plains near it, alfo contain much falt. There are mines of rock-falt in the country of Bamba, in the kingdom of Congo. On all the weftern coaft of Africa there are falt lakes and marfhes. In the neighbourhood of the Cape of Good Hope, and in Caffraria, rock-falt is lefs common; but there are falt lakes to the eaft of the Cape, on the frontiers of Caffraria, which contain at the bottom beds of falt varioufly coloured.

Salt lakes exift in the Cape Verde iflands, and natural falt-marfhes, particularly in Bona Vifta.

Spain is the only country in the fouth of Europe which contains extenfive repofitories of rock-falt in confiderable maffes above the furface. It is found there in elevated fituations, forming entire hills: brine-fprings alfo iffue from the feet of the mountains which traverfe that country. According to the defcription of Mr. Bowles, the repofitory of rock-falt which lies between Caparofo and the river Ebro, is in a chain of hills which extend from eaft to weft. Thefe hills are compofed of lime-ftone, mingled with gypfum, the chain extending more than two leagues. In the moft elevated part is fituated the village of Valtierra, on a flope towards the middle of which is found a bed of rock-falt. It may be about 400 paces long, and 80 wide. The falt is contained in a bed of about five feet in thicknefs.

"I examined," he adds, "with attention thofe beds of falt; I compared them with the layers of earth and gypfum in which it is imbedded; I found the outfide layer to be compofed of gypfum; and, immediately afterwards, I met with two

two inches of white ſalt, ſucceeded by two inches of ſtony ſalt, and a layer of earth. I found others alternately compoſed of earth and ſalt to the very bottom of the mine, which is of gypſum, undulated like the other layers. The layers of ſaline rock are of a duſky blue, thoſe of ſalt are white.

"This mine is conſiderably elevated above the ſea, for you aſcend continually all the way from Bayonne.

"The ſecond hill is that of Cardona, in Catalonia, near the mountain of Montſerrat, ſixteen leagues to the N.W. of Barcelona, and a few leagues from the Pyrenees.

"The village of Cardona is ſituated at the foot of a rock of ſalt, which, from the ſides of the river Cardonere, ſeems nearly mural. This rock is a block of maſſive ſalt, which riſes from the earth about four or five hundred feet, without crevices, chaſms, or layers. No gypſum is found near it. This block is about a league in circumference; and its elevation is equal to that of the ſurrounding mountains: as its depth is not known, it is impoſſible to ſay on what it reſts.

"In general, the ſalt, from the top to the bottom, is white, though ſome parts are red; ſome is alſo found of a fine blue. There are alſo in Spain other repoſitories of rock-ſalt and ſaline ſprings. In La Mancha, at Almengranilla, there is a maſs of ſalt ſimilar to that of Cardona; it is ſeventy yards in diameter, mixed with ſulphate of lime, and covered with the ſame ſtone, including cryſtals of red quartz; above which are ſiliceous pudding-ſtones, and a ſtratum of carbonate of lime."

The mines of rock-ſalt that are wrought at Poza, near Burgos, in Caſtille, are remarkably ſituated, being placed in a vaſt crater. A French traveller, M. Fernandez, found pumice-ſtones, puzzolana, and other volcanic productions there.

Rock-ſalt is likewiſe found near Aranjuez and Ocanna, in the tranſition hills between Sierra Morena and Madrid.

On the north ſide of the Pyrenées no beds of rock-ſalt have been diſcovered, but numerous brine-ſprings occur, particularly at Salies: in the department of the Lower Pyrenées the ſoil is calcareous, and ſulphate of lime is found in the neighbourhood of the ſpring.

There are ſalt-ſpring at Salies, to the ſouth of Thoulouſe. alſo at Salins and Montmorat, in the department of the Jura; in the firſt of theſe the water contains fifteen *per cent.* of ſalt.

There are about twenty brine-ſprings in the department of La Meurthe, which contain, on the average, thirteen *per cent.* of ſalt. Theſe ſprings are at no great diſtance from each other; ſome are at the foot of the chain of Jura, the others at the foot of the Voſges: the product of theſe brine-ſprings ſupplies Switzerland with ſalt. There are ſalt-ſprings in the department of Mont Blanc, in the midſt of the Higher Alps. In the ſame department, near St. Maurice, there is a ſalt-rock near the region of perpetual ſnow, which is probably the higheſt ſituation in Europe where this mineral occurs. The rock conſiſts of gypſum, intermixed or impregnated with ſalt, which is extracted by ſolution in water; the inſoluble part remains porous and light. Various brine-ſprings alſo occur in other parts of France.

Though there are numerous brine-ſprings in the north of Germany, no beds of rock-ſalt appear on the ſurface, until we approach the circle of Auſtria and the neighbouring countries. The range of ſalt-rocks commences at Halle, in the Tyrol, paſſes through Reichenthal in Bavaria, and continues to Hallein in Salzburgh, Halſtadt, Iſchel, and Ebenſel, in Auſtria, and terminates at Auſſe in Styria. The ſalt at Halle is worked in a peculiar manner: parallel galleries are run into the rock, in theſe dykes are formed, and water is let into them, where it remains from five to twelve months. When the water is ſaturated, it is drawn off in pipes, and the ſolution is evaporated.

On comparing the geological ſituation of the greater part of the beds of rock-ſalt and brine-ſprings, it will be ſeen that they occur moſt frequently at the foot of high mountainous chains. The mines of rock-ſalt in Tranſylvania, Upper Hungary, Moldavia, and Poland, may be cited in further proof of this. Theſe mines are numerous, and very important from their extent, and the vaſt maſſes of ſalt they contain. They are found along the chain of the Carpathian mountains, and ſpread nearly in an equal degree on each ſide of the chain accompanying theſe mountains to the extent of more than two hundred leagues, from Wieliczka in Poland, towards the north, to Fokſzian or Rymnick in Moldavia, to the ſouth.

The ſtrip of land that contains the ſalt-rock or brine-ſprings, is near forty leagues broad in ſome parts. In it may be reckoned about ſixteen mines, that are worked for ſalt; forty-three indieations of mines that have never been wrought; and four hundred and twenty, or four hundred and thirty, brine-ſprings.

The moſt remarkable of theſe commence in the north-eaſt, and extend in a ſoutherly direction, including thoſe of Wieliczka, Bochnia, and Samber, in Poland; and ſome brine-ſprings in Buchovina and Moldavia, particularly near Ockna. On the ſouth-weſt of the chain, following the ſame direction, are thoſe of Sowar, near Eperies, in Upper Hungary; of Marmaroſch, in Hungary; of Dees, Torda, Paraid, and Viſackna, near Hermanſtadt, in Tranſylvania, &c.

The ſalt-mines of Wieliczka, near Cracow, and thoſe of Bothnia, which appear to be a branch of them, have become celebrated from the accounts given of them by almoſt every traveller who has viſited that country; many of their deſcriptions are too highly coloured. They are, indeed, very ancient, having been worked ever ſince the year 1251; but have nothing to diſtinguiſh them above others, except the extent of the works in the beds of rock-ſalt, the dimenſions of which ſtill remain unknown. The ground that covers the rock-ſalt is compoſed, like that over moſt other ſalt-mines, of alternate ſtrata of ſand, pebbles, and marle, including large blocks of ſalt. You go down to theſe mines by ſix ſhafts, of four or five yards in diameter. Various ſtructures have been formed in the body of the ſalt itſelf. We find there a ſtable, chambers, and chapels, all the parts of which, as pillars, altars, and ſtatues, are of ſalt. The ſhafts and galleries are perfectly dry, ſo that you are more incommoded by duſt than dirt. There are ſprings, however, both of ſalt water and of freſh in theſe mines. It appears that the air is not ſo foul in them as in moſt ſalt mines; but the workmen do not reſide in them, as ſome have aſſerted. In certain parts of the mine, hydrogen gas ſometimes collects and explodes.

The ſalt is cut out in little aſcending ſteps. It is formed into parallelepipedons, weighing about eighty or a hundred pounds, or into cylinders, which are put into caſks. This mine produces about ſix thouſand tons of ſalt every year.

According to the deſcription of Dr. Townſon, the ſalt in the upper mines does not form continuous ſtrata, or rocks, but exiſts in immenſe detached blocks or maſſes, imbedded in marle. He gives the following account of the ſtrata which cover the ſalt.

 Vegetable

	Yards.
Vegetable foil	4
Sandy clay	10
Fine fand effervefcing with acids	7
Marle with fand, containing fragments of fand-ftone	18
Sand-ftone	2
Marle mixed with falt, in fmall particles and cubes	40

At the depth of forty yards in this marle the falt is found. The blocks of this mineral are of fuch a fize, that in paffing through the galleries formed in them, fometimes the upper, and fometimes the lower end only of a block may be feen ; but often, though the galleries are three or four yards high, the breadth can only be obferved, and even in fome places the blocks of falt form the fides of the gallery for fifteen or twenty yards. Thefe blocks compofe the upper bed of falt, and from them the whole of what is called the green falt is obtained. This falt, which is of a greenifh or blackifh hue, owes its colour to numerous fine particles of a fubftance which feems to be of the nature of argillaceous fchiftus fcattered through it. This variety of falt, on account of its impurity, is retained in the country for home confumption. In this marle, alfo, blocks of fand-ftone are fometimes found imbedded, and the marle itfelf is ftrongly impregnated with falt. Lower down there is another bed of falt, called fzybicker falt, which is in fome places two or three yards thick ; it is of a purer quality than the former, and is exported to foreign countries. This variety of falt-rock is difpofed in very extenfive beds. The mine has been driven in one place twelve hundred yards, from eaft to weft, and four hundred from north to fouth ; falt being ftill found there. The utmoft extent is yet unknown. The nature of the ftratum beneath the fzybicker falt has not been afcertained ; for the miners, being apprehenfive of increafing the quantity of water, have never proceeded to a great depth in this ftratum. The greateft depth of the mine is two hundred and forty yards. It does not appear that the remains of organized bodies have been found in great abundance in the ftrata connected with the falt-rocks now defcribed. None have been obferved, according to Dr. Townfon's information, in the fzybicker falt, or the lower ftrata ; but fome have been feen in the marle which envelopes the block of green falt ; fuch as bivalve fhells, at the depth of feventy-two yards ; crabs' claws, at the depth of eighty yards ; and charred coal, mixed with falt and gypfum, at the great depth of two hundred yards.

From the circumftance of mafs being formerly celebrated in thefe mines two or three times a week, it has been faid that the workmen, to the amount of five hundred, live conftantly below ground. They do not, however, continue longer than their hours of working. To keep the mines dry, the falt water is drawn up in leathern facks, and is thrown away ; the fmall quantity of frefh water which they afford is referved for the ufe of the horfes which are employed in the fubterraneous operations. At the time Mr. Townfon vifited them, twenty-four horfes were conftantly kept below ground.

In the mine of Bochnia the falt prefents itfelf in a ftratum at once, and not in detached pieces. The ftrata of clay, as well as thofe of falt, are undulated, and not of an uniform thicknefs. The falt is fometimes brown, at others reddifh, and at others tranfparent. The different coloured falt is not arranged in parallel layers. The ftrata dip at an angle of about forty degrees with the horizon. Dr. Townfon informs us that very beautiful fpecimens of fibrous muriate of foda are found in it.

At Thorda the mafs of falt is divided into horizontal but undulated ftrata. Thefe ftrata are about eight or ten inches thick. The loweft are the moft undulated.

Near Ockna, in Moldavia, there is a hill of rock-falt, in many parts of which the falt appears expofed to view.

The mines on the fouth-eaft of the Carpathian chain appear more numerous, and are difperfed through a greater fpace of ground than thofe on the north-eaft. They are in general very near the furface. Some of thofe in Tranfylvania are fo to fuch a degree, that perfons are appointed to cover the falt with turf, when it is wafhed bare by the rain. Thefe maffes, however, are fo thick, that their bottom has never been found. They are not worked to the depth of more than a hundred and feventy or eighty yards, becaufe the extraction of the falt becomes then too expenfive. In the county of Marmarofch they have been wrought to the depth of upward of two hundred yards. Thefe mines contain likewife a great deal of petroleum, and the ground in which they are contained is every where furrowed by rivers. The mud interpofed between the water of thefe and the falt, is imagined to prevent the falt from being diffolved by them.

At Paraid, in Tranfylvania, there is a valley, the bottom and fides of which are of pure falt. Walls of falt appear there fixty or feventy yards high.

The mine of Eperies is three hundred and fixty yards deep.

In the falt mines of Marmarofch, water has been found included in the fubftance of the falt-rock.

The mines of the fouth-weft of the Carpathian mountains are generally wrought by means of fhafts. There are at leaft two to each mine ; one for the workmen, the other for drawing up the falt. The falt is cut out in afcending fteps, which produces empty fpaces, of a conical form, in the midft of the ftrata. The ladders reach perpendicularly to the bottom of this conical fpace : fo that within it they ftand perfectly detached. Thus the greater part of the body of falt is extracted, leaving empty fpaces, which are conical, and which communicate with one another by means of galleries. It has been thought, that, in order to leave lefs falt, it would be better to give thefe fpaces the fhape of a parabola. The falt is fo plentiful, that the miners are paid only for fuch pieces as weigh upwards of eighty pounds, the others being rejected as ufelefs. When the workmen are incommoded by water, it is drawn up in leathern bags, to be emptied out of the mine.

The Tranfylvanians and Moldavians extract falt from their brine-fprings, by throwing the water on wood fires, as the Gauls and Germans did in former times.

No falt-mine, or brine-fpring, is known either in Sweden, or in Norway.

There are a great number of both, and particularly of falt lakes, in Ruffia. Among thefe is the falt lake of Tor, towards the northern extremity of Little Tartary.

There are fimilar falt lakes in the Crimea.

At Balachna, on the banks of the Wolga, are fome very rich brine-fprings.

In Ruffia, in Afia, we find the brine-fprings of Permia, of which there are a great number at the foot of the mountains of Poyas.

About eighty verfts from Yena Tayeofka, in the defart between the Wolga and the Uralian mountains, there is a mine of rock-falt.

In the government of Aftracan, to the north of the Cafpian fea, in the environs of Orenburgh, and in the country of the Bafhkirians, falt lakes are very common, and the water evaporating during the fummer, the falt appears

appears cryſtallized on their ſurface, and round their borders. When this water is highly concentrated, it has a deep red colour. The ſalt formed in them has often the ſame hue; and when this is the caſe, it diffuſes a very perceptible violet ſmell.

One of theſe is the ſalt lake of Elton, above Aſtracan, in the re-entering angle formed by the Wolga. The Kalmucks called it the Golden lake, becauſe of its red appearance, when the ſun ſhines on it.

The lake of Bogdo, ſituate near this, yields a perfectly white ſalt, free from ſulphate of magneſia, and preferred to that of lake Elton.

Near Aſtracan, too, is the mine of Iletzki, celebrated for the quantity of ſalt it furniſhes. The ſalt lies at no great depth, and reſts on a very hard clay. The ſoil above it is ſandy, and full of holes, containing water ſaturated with ſalt.

In Siberia there is a mine of rock-ſalt on the right bank of the Kaptendoi; and on that of the Kawda are fourteen brine-ſprings. Others are found in the government of Kolivan, and in the environs of Irkutſk, near the lake Baikal, in the centre of Aſiatic Ruſſia. Laſtly, the country near the Caſpian ſea is ſo impregnated with muriate of ſoda, that in the environs of Gourief, the fogs and dew that ſettle on people's clothes, and on plants, are ſaline. Pallas.

Among the Mongul Tartars, the ſoil is ſo thoroughly penetrated with muriate of ſoda, that the people lixiviate it, and evaporate the ſolution to obtain ſalt.

That part of China, which borders on Tartary, contains ſalt-mines, and the ground is ſtrongly impregnated with ſalt.

Salt is found in the ſame manner throughout almoſt the whole table-land of Great Tartary, Thibet, Hindooſtan, and particularly Perſia, where very extenſive plains are ſeen covered with a ſaline efflorescence. The iſle of Ormus, at the mouth of the Perſian gulf, appears, according to the accounts of travellers, to be one large rock of ſalt. This ſubſtance is alſo found in ſolid maſſes near Balach, on the eaſtern ſide of Perſia. In the deſart of Caramania, according to Chardin, rock-ſalt is ſo abundant, and the atmoſphere ſo dry, that the inhabitants uſe it for building their houſes. It is found in the neighbourhood of Iſpahan, and in the mountains to the north of that city.

The repoſitories of rock-ſalt in America are leſs known. According to Ulloa and others, it is found in vaſt quantities in the elevated deſarts of Peru, at the extraordinary height of 10,000 feet, or more, above the preſent level of the ſea. It is extremely hard, forming ſolid, continuous rocks of a dull violet colour.

The mountain of Xaragua, in the iſland of St. Domingo, affords ſalt; and in the ſame iſland there is a very remarkable ſalt lake, about 22 leagues in circumference, called Henriquelle. The water, which is inhabited by lizards, alligators, and land-tortoiſes, all of a large ſize, is deep, clear, bitter, ſalt, and of a diſagreeable ſmell. Near the middle of the lake is an iſland, about ſix miles long and three broad, well ſtocked with goats, whence it has the name of Cabrito iſland; and in this iſland is a ſpring of freſh water.

Salt lakes occur in other of the Weſt India iſlands. In North America, weſt of the Alleghany mountains, in the ſtate of Kentucky, are numerous repoſitories of rock-ſalt and brine-ſprings: theſe are called *licks*, where the elks and buffaloes formerly repaired in herds, to lick the ſoil impregnated with rock-ſalt. On the weſtern ſide of the great river Miſſouri, a chain of mountains extends 80 miles in length, and 45 in breadth, and of conſiderable height: it conſiſts of pure rock-ſalt, barely covered with earth, but without any tree or ſhrub. Further weſt, in California, ſalt is found in a very pure ſtate, in large and ſolid maſſes.

From the preceding account it will be ſeen that this moſt uſeful mineral is found in every quarter of the globe; and in many parts it exiſts in maſſes of immenſe ſize and extent, compared with the rock-ſalt in our own iſland, in the county of Cheſter. Such, however, is the ſuperior induſtry of our inhabitants, that the quantity annually exported from that county alone greatly exceeds that procured from any other diſtrict in the known world, being not leſs than 140,000 tons, the produce of the ſalt-rock and brine-ſpring; while the celebrated mines at Wieliczka, in Poland, are ſtated to yield only about 6000 or 7000 tons. Where rock-ſalt is white or colourleſs, it is immediately applicable to all uſeful purpoſes; but when mixed with earthy matter, it is rendered pure by the ſimple proceſs of ſolution in water. The liquor is afterwards drawn off into pans, leaving the inſoluble part behind; and the water is then evaporated either by the natural warmth of the climate, or by fires. See SALT.

ROCK-*Salt*, in *Rural Economy*, that ſort of foſſile, rocky, ſaline material, which is dug out of the bowels of the earth, from different depths, in ſome parts of this and other countries, where it exiſts in layers of different thickneſſes. The beds of this kind of ſalt, which are found in the county of Cheſter, are highly intereſting and important to the country, whether conſidered as affording an article of manufacture and commerce, or as forming a ſource of revenue. The diſcovery of the beds or ſtrata of this ſort of matter, in this diſtrict, is, however, of no very remote date, as will be ſeen under the head of ROCK-*Salt Pits;* but the layers are pretty numerous, and of conſiderable extent, differing greatly in their purity, though, in many inſtances, requiring a greater or leſs degree of preparation before the ſalt can be uſed.

It is remarked by the writer of the account of the Agriculture of Cheſhire, that, from ſome experiments made on different ſpecimens of rock-ſalt, it would appear that the tranſparent kind of it is an almoſt pure muriate of ſoda, which contains no admixture of either earth or earthy ſalts; and that the colour of the leſs tranſparent and brown ſpecimens is derived from the earth that enters, in greater or leſs proportions, into their compoſitions. That on 480 grains of tranſparent rock-ſalt being diſſolved in four ounces of diſtilled water, there was, firſt, no precipitate let fall, on the addition of carbonate of potaſh. Secondly, no alteration was produced by this ſolution on blue vegetable juices. Thirdly, on the addition of a few drops of tincture of galls, a ſlight purple tinge was given to the ſolution; and after ſtanding ſome hours, there was a brown ſediment at the bottom of the veſſel. Fourthly, on the addition of muriate of barytes, there was no precipitate thrown down. From the firſt of theſe trials, it is ſuppoſed that rock-ſalt has no muriate of lime, or muriate of magneſia, combined with it; from the ſecond, that it has no uncombined acid or alkali; from the third, that it contains ſome portion of iron; and from the fourth, or laſt, that there is no ſulphate of lime contained in it.

And that, on examining different ſpecimens of the leſs tranſparent, and the brown rock-ſalt, with the ſame reagents as in the above trials, it was found that theſe conſiſted of muriate of ſoda, or ſea-ſalt, in combination with a certain proportion of earth, varying in quantity from one to thirty *per cent.*; alſo, that the earth was wholly the argillaceous or common clay; but that ſome of the ſpecimens contained a few grains of ſulphate of lime, in 480 of thoſe of the rock-ſalt.

The beds of this ſalt are now well known to be the principal

cipal cauſe of the ſalt-brine ſprings in this county; and, in connection with ſome other circumſtances, to have a great ſhare in cauſing the vaſt differences in their ſtrength, in different places. See SALT-*Brine Springs*.

This is a ſtrong ſort of ſalt, which is found uſeful for a variety of domeſtic purpoſes, according to the different manner in which it is prepared, or the difference in the ſize of the particles or cryſtals of which it is compoſed, as will be more fully ſhewn under the head SALT.

Although rock-ſalt is found in various parts of the above diſtrict, there are no pits of it wrought at preſent, except in the vicinity of Northwich. And part of the inferior rock-ſalt, which is procured there, is, it is ſaid, uſed at ſome of the refineries in that neighbourhood; and a further quantity ſent down the river Weaver, for the ſupply of the refineries at Frodſham, in the ſame county, and thoſe on the banks of the Merſey, in Lancaſhire. The purer rock-ſalt, or that which is called in general Pruſſian rock, is carried by the ſame conveyance to the port of Liverpool; whence, according to the above writer, it is exported chiefly to Ireland, and the ports of the Baltic. The annual quantity of rock-ſalt ſent down the firſt of the above rivers is found, on the average of the laſt ten years, to be 51,109 tons. But in this, it is obſerved, is included what is uſed at the Frodſham and Lancaſhire refineries, which may probably be about one-third of the whole. And it is added, that it appears, from the report of the committee of the houſe of commons, appointed to inquire into the laws reſpecting the ſalt duties, printed in June 1801, that,

in 1798	were exported	20,162	tons of rock-ſalt.
1799		33,913	
1800		34,939	

Of this quantity,

in 1798, - -	16,095	tons
1799, - -	22,374	
1800, - -	19,663	

were ſent to different ports in Ireland: the remainder was principally exported to Denmark, Ruſſia, Sweden, Pruſſia, and Germany. However, a ſmall quantity went to Guernſey, Jerſey, and the Weſt Indies.

This ſhews, in a ſtriking manner, the great utility and advantage of this article in a manufacturing and trading point of view, as well as in other ways.

In regard to the original formation of the beds or ſtrata of rock-ſalt, in this and other countries, different theories, opinions, and conjectures, have been formed and propoſed; but it is one of thoſe geological queſtions which is extremely embarraſſing in its nature, and very difficult in its ſolution. Mr. Holland has, however, in the above work, ingeniouſly ſtated ſeveral ſuppoſitions on the ſubject, and the objections to which they are expoſed. It is remarked, that wherever rock-ſalt is met with, ſulphate of lime ſeems to be very generally diſcovered in mixture with the earthy ſtrata above it. And the writer of the "Memoire ſur le Ser Marin," in the 11th volume of the Annals of Chemiſtry, it is added, informs us, that this is the caſe in Poland, Tranſylvania, and Hungary; alſo, that there is commonly a layer of gypſum betwixt the ſtrata of ſtone and the bed of ſalt. This gypſeous layer is of different colours, and is found cryſtallized, ſtriated, and mixed with marine ſhells. The gypſum above the beds of rock-ſalt in Cheſhire is, in like manner, found cryſtallized and ſtriated; but no marine exuviæ, or organic remains, it is obſerved, are ever met with in any of the ſtrata. Nor does gypſum accompany it, as is uſual in other places, as near Cordova, in Spain, where rock-ſalt forms a mountain 500 feet in height, and three miles in circumference, as noticed by Kirwan and Townſhend. Jars, the author of the "Voyages Metallurgiques," who, it is aſſerted, has given the moſt particular account we have of the upper ſtratum of rockſalt about Northwich, remarks, that "it appears to have been depoſited by layers or beds of ſeveral colours;" and that "theſe layers of ſalt are in ſuch a poſition, as to lead us to believe that the depoſition of it was made in waves, ſimilar to thoſe which are formed on the ſea-coaſt."

This, Mr. Holland ſays, coincides with an opinion ſuggeſted by Mr. Stanley, a friend of his, in regard to the probable origin of the beds of rock-ſalt, now in exiſtence in this diſtrict; who ſtates that rock-ſalt is there found in ſeveral ſtrata, one above the other, with intermediate beds of indurated clay, in the vallies of the Weaver, and thoſe of the other rivers and brooks emptying themſelves into it; but that it has never been found ſo near the ſurface, as to be above the level of the ſea, or beneath any ſolid rock. If beds of rock-ſalt are to be conſidered as ſo many depoſits of ſalt from ſea-water, we muſt ſuppoſe the ſea, at ſome former period, to have occupied the vallies in this county; and that, from time to time, the communications were interrupted between theſe vallies (then deeper than they are now) and the ſea. Earthquakes, or accumulations of ſand in the eſtuaries of the Merſey and the Dee, might, it is contended, have cauſed the interruptions. Whenever the ſea-water in the vallies became ſeparated from the ſea, the ſalt contained in it would ſubſide, by the natural proceſs of evaporation. This, it is ſuppoſed, would the more eaſily have taken place, if, by any ſubterraneous fermentation, the ground below the water ſhould have been heated. To account for a greater accumulation of ſalt than the ſea-water filling all the loweſt parts of the diſtrict would contain, we muſt ſuppoſe, it is ſaid, that the obſtruction interpoſed between the vallies and the ſea had been repeatedly broken down, and renewed again. Tides, unuſually high, might occaſionally overcome the reſiſtance of the accumulated ſand; and if the intervals between the inundations were only of ſhort duration, a ſubſidence of ſalt might take place, equal to the formation of the thickeſt ſtratum of the rock-ſalt now exiſting. Long intervals between the inundations would admit of an accumulation of clay, and other earthy particles, over the ſalt thus depoſited; and in this manner would be formed a new baſis for another ſtratum of rock-ſalt to repoſe upon. Thus, it is thought, the regular and aſtoniſhing exiſtence of the ſalt ſtrata may be accounted for, without neceſſarily ſuppoſing them coeval with the original formation of the earth: but to confirm the theory, it is ſuggeſted that much obſervation and cloſe inquiry into the natural hiſtory of the county would be required.

Mr. Holland, however, juſtly thinks that there are many objections to the theory which ſuppoſes the beds of rock-ſalt, in this diſtrict, to have been formed by depoſition from the waters of the ſea; ſome of which he ſtates rather for the ſake of promoting diſcuſſion and inquiry, than of affording any very decided opinion on a matter of ſo much doubt, uncertainty, and obſcurity. Though on making a perpendicular ſection of the upper bed of rock-ſalt, an irregular ſtratification, ſuch as noticed by Jars, may, he ſays, by frequent accurate examination, be obſerved, the general appearance of the ſides of the openings, whence the rock-ſalt is taken, is that of a confuſed and irregular red maſs; in which ſome portions of ſalt have a greater, others a leſs, proportionate admixture of earth; while, here and there, they may be ſeen perfectly pure and tranſparent. He, therefore, aſks, is it likely that this irregularity and confu-

ſion

ſion would have exiſted, had the beds of rock-ſalt in this diſtrict been formed by the evaporation of ſea-water inundating the land at certain intervals of time, as the above theory ſuppoſes? On the contrary, ſays he, would it not be natural to expect from reaſonings, *à priori*, that the ſalt, thus depoſited from ſea-water, would be diſpoſed in layers perfectly regular, and differing from one another merely in thickneſs, or a few other circumſtances of inferior moment?

Another fact which, it is ſuppoſed, invalidates, in ſome meaſure, the notion that the rock-ſalt has been depoſited from the waters of the ſea, is the great diſproportion of quantity, ſhewn by analyſis to exiſt, between the earthy ſalts contained in the brine of this diſtrict, and thoſe held in ſolution by ſea-water; the ratio here being as one to ten, or the proportion which the earthy ſalts bear to the pure muriate of ſoda in ſea-water is ten times greater than that which prevails in the Cheſhire brine. The aſcertaining of this fact proves, it is ſuppoſed, that the rock-ſalt (from the ſolution of which the brine is formed) is combined with a much ſmaller proportion of earthy ſalts than exiſts in ſea-water; a circumſtance difficult to be accounted for, on the ſuppoſition that the beds of this ſubſtance were formed by the evaporation of the ſea-water, occupying the vallies and loweſt parts of the land. It muſt be noticed, however, as worthy of attention, that the earthy ſalts, intermixed with the rock-ſalt in the above diſtrict, are the ſame which are held in ſolution by ſea-water, being principally muriated magneſia and ſulphate of lime.

There is, however, a ſtill ſtronger proof, it is ſuppoſed, againſt the notion that the beds of rock-ſalt in this county are depoſitions from the ſea-water, in the circumſtance that no marine exuviæ have ever been diſcovered in the ſtrata. This, it is imagined, would almoſt indubitably have been the caſe, had the land been covered with ſea-water during a period of ſufficient length for the depoſition of beds of ſalt of ſuch prodigious thickneſs; and the fact, that no ſuch exuviæ do actually exiſt, is ſuppoſed in itſelf ſufficient to induce a ſuſpicion that the theory in queſtion cannot be well founded. Other objections too, it is obſerved, offer themſelves to its validity; ſuch as the enormous depth of ſea-water neceſſary to the production of a body of rock-ſalt forty yards in thickneſs; the difficulty, if not impoſſibility, on ſuch principles, of accounting for the formation of the ſingular inſulated mountain of rock-ſalt at Cordova, in Spain; with others of a more trivial nature, which will readily preſent themſelves in this inquiry.

It is, however, at the ſame time candidly acknowledged, that there are many facts and circumſtances of actual obſervation, that confer a ſtrong degree of plauſibility on the opinion, againſt which it has been contended. The certainty that the ſurface of the county was at ſome former period much lower than it is at preſent, and the diminution of the thickneſs of the ſtrata of rock-ſalt in proportion as they recede from the ſea, are circumſtances which undoubtedly range themſelves on this ſide of the queſtion: and, upon the whole, it is thought, that it may be doubted whether the theory, which regards the beds of rock-ſalt as depoſits from ſea-water, does not accord more exactly with exiſting appearances, than any other which has been adduced on the matter.

It is ſuppoſed that many things, which at firſt ſeem objections, may be obviated by a reference to the principles of the Huttonian theory of the earth, and the excellent illuſtrations of it by profeſſor Playfair. However, in the preſent ſtate of our knowledge, any opinion formed on the matter muſt, it is imagined, from its very nature, be purely theoretical. See Rock-*Salt Pits*.

Rock-*Salt Pits*, ſuch pits, ſhafts, mines, or openings, as are dug or made in any other manner in the ground, for the purpoſe of getting and raiſing rock-ſalt from them. Pits of this ſort are met with in many parts of the county of Cheſter, which are wrought to very conſiderable extents, and are of great importance to the intereſts of the diſtrict in many different ways, as well as to the nation in general, as may be ſeen under the head Rock-*Salt*.

According to the ſtatement of Mr. Holland, in his Agricultural Survey of the above county, the firſt bed and pit of ſalt-rock was found and wrought in Marbury, at a ſmall diſtance from the town of Northwich, at the depth of about thirty yards from the ſurface, in the year 1670, when ſearching for coal. The bed was thirty yards in thickneſs, and reſted upon a ſtratum or layer of hard clay. In conſequence of this diſcovery, other ſimilar attempts were made; and on ſinking ſhafts or pits any where in the vicinity of it within the ſpace of half a mile, it was found to exiſt at about the ſame depth from the ſurface of the earth, when not prevented from being dug down to by brine-ſprings or thoſe of common water. This continued the only place in which it was found until the year 1779, when this ſort of rock was again met with in ſearching for brine in the neighbourhood of Lawton, at the depth of about forty-two yards, but only of the thickneſs of about four feet; there being beneath it a bed of indurated clay ten yards in thickneſs, which being penetrated through, a ſecond ſtratum of rock-ſalt was diſcovered twelve feet in thickneſs; and on continuing the ſinking of the pit, another layer of indurated clay, fifteen yards in thickneſs, was paſſed through; below which appeared a third ſtratum of rock-ſalt, which was ſunk into not leſs than twenty-four yards; the loweſt fourteen yards, being the pureſt, or the leaſt mixed with other ſubſtances, were the only parts that were wrought.

Until this period, in the neighbourhood of Northwich, no attempts had, however, been made to ſink pits in order to find a lower ſtratum of rock-ſalt; as the one which had been firſt met with was ſo thick, and furniſhed ſuch an abundant ſupply for every demand, there could be no other inducement to this than the expectation of meeting with a ſtratum, at a greater depth, which might contain a leſs admixture of earthy matters. It would ſeem, too, that the fear of meeting with ſprings below, which might impede the working out of the materials from the pits, and even render this wholly impracticable, prevented the proprietors of them from ſinking deeper. As, however, no inconvenience or interruption of this nature had occurred, on ſinking through different alternate ſtrata of rock-ſalt and clay at Lawton; and it had been found that there was a lower ſtratum of rock-ſalt there, which was more pure than thoſe nearer the ſurface, the owners of one of the works or pits in this vicinity were induced, a little time after the trials at Lawton, as in 1781, to ſink deeper than had yet been done, and to paſs through the bed or body of indurated clay lying underneath the rock-ſalt, which had been ſo long known and wrought. This indurated clayey material was found to be from ten to eleven yards in thickneſs; and immediately beneath it a ſecond ſtratum of rock-ſalt was met with, the upper part of which differed little in purity from that of the higher ſtratum or layer of rock; but on penetrating into it to the extent of from twenty to twenty-five yards, it was there found to be much more pure and free from earthy admixture.

ture. But it continued to have this increafed degree of purity for four or five yards only; while, for fourteen yards ftill lower, to which depth the pit or fhaft was funk, the proportion of earthy matter was again as large as in the upper part of the ftratum. It was therefore, on this account, thought ufelefs to fink the pit to any greater depth. Many other proprietors of pits, fhafts, or mines, in the fame neighbourhood, it is ftated, followed the example which had been thus fet them; and penetrated through the bed of indurated clay lying beneath the upper ftratum of rock-falt. A fecond ftratum of rock-falt was conftantly met with below this; and on paffing down into it, the fame order of difpofition as to purity was obferved, as in the pit or mine in which it had been firft noticed and examined; and the fame has been found to prevail in all the pits, fhafts, works, and mines, which have fince been funk in the fame vicinity.

It is further noticed, that there is great uniformity in the ftrata which are paffed through in finking pits for rock-falt or brine; and that they very generally confift of clay and fulphate of lime mixed in various proportions; that of the latter fomewhat increafing as the pit, fhaft, or work approaches the rock or brine. The workmen diftinguifh the clay by the appellation of *metal*, giving it the name of red, brown, or blue metal, according to its colour; and the fulphate of lime by that of *plaifter*. See Quarry.

The ftrata formed by thefe are, in general, clofe and compact; allowing very little frefh water to pafs through them. In fome places, however, they are broken and porous: and they admit fo much frefh water into the pit or work, that whenever they have been met with, it has been ufual to difcontinue any attempts to pafs through them in finking the pits. In thefe places the workmen call the metal *faggy*. It was thought not only impracticable to overcome a water, which vulgar prejudice had magnified into a great ftream running under ground; but it was believed, even if the finking could be continued below this, that the water could not be kept out of the pit, fhaft, or work, and that it would either weaken the brine fo as to deftroy its value, or would find its way into the cavity of any rock, pit, or mine which might be found below it. Later experience, it is faid, has proved, that thefe ideas were not altogether well founded. A few years ago an attempt was made in Witton to pafs through this porous ftratum, in order to get to the brine. It was met with about twenty-eight yards from the furface; the thicknefs of it was about thirteen feet; and the quantity of water, which was forced through it into the pit or fhaft, was three hundred and fixty gallons a minute. By means of a fteam-engine, the finkers were enabled to pafs through this water; to fix a gauge or curb a few yards below it, in a ftratum of indurated clay; and thence to bring up a wooden frame, fupporting a wall of puddled earth twelve inches thick, by which the accefs of the frefh water into the pit or fhaft was in a great degree prevented, and an opportunity given to pafs down to the brine below. A fhaft was afterwards funk through this porous ftratum, for the purpofe of obtaining rock-falt; which object was, after a fhort time, defeated, by the influx of brine into the fhaft at the furface of the upper ftratum of rock-falt; an accident originating in a caufe completely diftinct from the frefh water in the porous ftratum or bed. An exact fection of the different ftrata funk through in reaching the fecond bed of rock-falt in the pit at Witton, near Northwich, is given by Mr. Holland in the above report; and all the ftrata in the neighbourhood of the laft town are fuppofed to have nearly a fimilar difpofition. The inclination of them in the pit or fhaft at the above place was from north-weft to fouth-eaft; and the dip about one yard in nine. The ftratum through which the frefh water flowed is fhewn, and the level it found, it is faid, was fixteen yards from the furface, which, it is remarked, nearly correfponds with that of the brook below. The line of feparation between the loweft ftratum of earth, and the firft of rock-falt, is very exactly defined; they are perfectly diftinct, and do not at all run into each other. It is farther noticed, that in carrying a horizontal tunnel for one hundred yards along the upper ftratum of rock-falt, this was found to be irregular and unequal on its furface; the irregularities in a great meafure correfponding with thofe on the furface of the ground above.

The higheft bed or body of rock-falt in the pits near Northwich is the thickeft in thofe fituated the moft to the north-eaft, gradually declining in thicknefs towards the fouth-weft, fo as to lofe one-fixth of it in the courfe of about a mile. It decreafes from about thirty yards in thofe the fartheft to the north-eaft, to about twenty-five in that the moft to the fouth-weft.

A fingular appearance is remarked to prefent itfelf on making a horizontal fection of the ftratum of rock-falt in the pits: on the whole of the furface made by fuch a fection, various figures, it is faid, may be obferved, differing in form and fize, fome of them being nearly circular, others approaching more to an oval form, while in many an irregular pentagon may be traced. Some of them are not more than two or three feet in diameter; others are ten or twelve feet. The lines which form the boundaries of thefe figures are white, and from two to five or fix inches wide. On examining thefe appearances, they are found, it is faid, to be owing to the rock-falt, in the white lines forming the divifions of the figures, being perfectly pure, and free from earthy admixture. When combined with the falt, having earth in various proportions mixed with it, a general effect is produced, it is faid, not very diftantly refembling mofaic work. This difpofition is uniformly obferved, it is faid, throughout the whole thicknefs of the ftratum of rock-falt; and that in whatever part of it fuch a fection as the above is made, fimilar appearances are met with. To what caufe it has been owing that the rock-falt has been depofited in this fingular manner, it is thought difficult to conceive. The whole ftratum of rock-falt may, it is fuppofed, be compared to a mafs of bafaltic columns; the lines of feparation in each pillar being marked by the pure and tranfparent white falt. Thefe appearances, it is noticed, afford feveral grounds for inferences favourable to the theory of the earth mentioned under the head rock-falt, to the illuftrator of it. See Rock-*Salt*.

It is likewife further obferved, that the divifion betwixt the lower portion of the upper bed of rock-falt, and the indurated clay or ftone beneath it, in pits of this kind, is as exactly defined, as that between the upper portion of it and the earth above. That in paffing through this ftone fmall veins of rock-falt are met with, here and there running in it, in various directions; and that wherever there has been any little crevice in it, it is found filled up with rock-falt, to which the clay and oxyd of iron have given a deep red tinge. The thicknefs of this ftratum of ftone is faid to be uniformly found to be from ten to eleven yards; and the lower part of it is as diftinct from the fecond bed of rock-falt, as its upper part is from the firft: alfo that its termination is equally abrupt or fudden.

And that the perpendicular section of the second bed of rock-salt varies little from that of the upper bed, till it has been penetrated about twenty yards from the surface, when it assumes a more stratified appearance, and is here found, as already noticed, to have a much smaller proportion of earth combined with the muriate of soda. A section of this stratum, similar to the above, displays the same figured appearance in the roof of the pit, as that of the upper stratum.

In the very instructive report mentioned above, the writer has given a coloured representation of the roofing of a rock-salt pit, and another of the part where the lower surface of the upper bed of rock-salt joins the inferior clayey or other strata. These, as well as other matters in that work, are particularly worthy of the attention of the inquirer on this subject.

But though beds of this sort of material have been occasionally met with in some other parts of the same district, they have not been wrought, principally on account of the want of water carriage: as the working of those pits at Lawton was soon discontinued, it is now only from the pits in the neighbourhood of the town of Northwich that rock-salt is procured. At this time there are ten or twelve in number; at all of which the rock is wrought in the lower stratum or bed only. The pits or shafts are for the most part square, and built or formed with timber; but there is one at the distance of about a mile from the town of Northwich, which is of a circular form, and built in brick-work.

In regard to the manner of working the pits or mines, there is nothing of any very great interest or moment to be noticed. By means of boring and blasting the rocky stratum, and the use of wedges with the different mechanical instruments employed in mining, the salt-rock is separated, so as to be raised in large masses, which vary in form and purity. However, before any considerable extension of the workings in the pits, in any particular direction, takes place, care is taken to make sure of a good safe open roofing for the cavity which is to be formed in getting out the rock. In doing this the workmen make use of pointed implements of the common pick kind, working the materials out in an horizontal manner, so as to form an excavation in the rock, and making it in as simple a way as possible, or as the work will admit. In consequence, however, of its being situated a few feet above the purer part of the stratum, the rock which is obtained during this process is commonly of inferior quality, and is, for the most part, made use of in the refineries. The depth of the workings from the excavations or roofings, it is remarked, depends in a great measure upon the nature of the stratum, and the proportion of it occupied by the rock of the purer quality, or, as it is termed, *Prussian rock*. Fifteen or sixteen feet may perhaps, however, be taken, it is thought, as the average depth of the workings in the pits. The cavity thus formed presents a striking appearance; and when illuminated by candles fixed in the rock, the effect, it is asserted, is highly brilliant. In some of the pits or shafts, the excavated roofs are supported and kept up by pillars eight or ten yards square, which are in general arranged with a degree of irregularity: others are worked out in aisles; the choice here however seems to be wholly arbitrary, depending on the men who are employed in the work. Until these few late years, horse labour was wholly employed in raising rock-salt from the pits and shafts about the town of Northwich; but this method has now, in some measure, given way to the best kind of steam-engine, which has been substituted in its stead, in many of them with very great advantage. In others, however, horse labour is still continued to be made use of for this purpose. The men who are employed in working the rock-salt pits, have their pay by the quantity of the material which they raise, having in general somewhat less than half a crown for the ton weight, they finding tools and every thing else necessary for the work.

ROCK-*Fish Creek*, in *Geography*, a river of Virginia, which runs into James river. At the mouth of this river is a precipice, hanging over a navigable part of the river, formed of marble, variegated with red, blue, and purple. N. lat. 37° 37′. W. long. 78° 54′.

ROCK-*Castle River*, a river of Kentucky, which runs into the Cumberland, N. lat. 36° 43′. W. long. 84° 14′.

ROCK *Point*. See PUNTA *de Calenduras*.—Also, a cape on the N. coast of the island of Cumbava. S. lat. 8° 8′. E. long. 118° 35′.

ROCK *River*, a river of America, which runs into lake Michigan, N. lat. 37° 37′. W. long. 83° 35′.

ROCK *Town*, a town of Africa, on the Grain Coast. N. lat. 4° 35′. W. long. 7° 50′.

ROCKAWAY, a small post-town of America, in Morris county, New Jersey, on the S. side of a river of the same name; 15 miles N. by W. from Morristown.

ROCKBENT, a township of Pennsylvania, in Lancaster county, containing 1026 inhabitants.

ROCKBRIDGE, a mountainous county of Virginia, bounded N. by Augusta, and S. by James river, which divides it from Botetourt county. It contains 10,318 inhabitants. The famous natural bridge is in this country. Here is an useful academy, for twenty to forty students, liberally endowed by the late general Washington, and called, after him, "Washington Academy." The chief town is Lexington.

ROCKCASTLE, a county of Kentucky, containing 1731 inhabitants.

ROCKEN, a cape on the S. coast of the Isle of Wight. N. lat. 50° 34′. W. long. 1° 13′.

ROCKENBACH, a town of Germany, in the principality of Culmbach; 5 miles N. of Neustadt.

ROCKENHAUSEN, a town of France, in the department of Mont Tonnerre, and chief place of a canton, in the district of Kaiserslautern; 10 miles N. of it. The place contains 940, and the canton 5129 inhabitants, in 17 communes.

ROCKENHOF, a town of Germany, in the territory of Nuremberg; 8 miles N.N.E. of Nuremberg.

ROCKET, in *Pyrotechny*, an artificial fire-work, consisting of a cylindrical case of paper, filled with a composition of certain combustible ingredients; which being tied on a stick, mounts into the air to a considerable height, and there bursts.

The rocket has a great part in all fire-works of entertainment, being not only used singly, but sometimes also as an ingredient in others.

Besides the rocket here defined, which is properly called the *sky-rocket*, there is another, which, from the sphere it moves in, *viz.* the water, is denominated *water-rocket*. For the mechanism, preparation, &c. of each of them, we refer to the article PYROTECHNY.

Dr. Pemberton, in his Chemistry, p. 209, &c. has given the following concise account of rockets. A rocket (he says) is a hollow cylinder, usually made of paper, of a thickness equal to about one-sixth of its diameter within, and filled with gunpowder, or some like composition. If a rocket a rocket be made of great bignefs, intended for a fignal in war, or fuch like ufe, its cafe may be made of a more folid material.

Near one end the cafe of the rocket is drawn in, till its diameter be reduced to one-half of the whole internal diameter. This place is ufually called the choke. The moft approved length of the cafe, from the choke, is about fix times its internal diameter, to be filled with gunpowder ; if the rocket be fmall, beat into fine duft, and rammed in with as even ftrokes as can be, that the powder be uniformly compreffed. In great rockets, the charge is ufually a little weakened by adding to the gunpowder a fmall portion of charcoal and of fulphur.

To the end of the rocket is added a cylindrical cavity, not above half the length of the rocket from its choke in height, and of fuch a diameter, that, together with the materials put into it, it may not exceed the weight of the reft of the rocket. Thefe materials, befides fome corn powder to burft the cafe, confifts of fome compofition, that may give the appearance of ftars, a fhower of fire, or the like.

Thefe fiery fhowers may be made of faw-duft, boiled in water, ftrongly impregnated with nitre, and while wet rolled among gunpowder in duft ; or by gunpowder mixed with melted brimftone, and when cold, grofsly beaten.

Thefe ftars are a mixture of gunpowder, nitre, fulphur, antimony, camphor, and the like combuftible materials, moiftened with a folution of fome gum, in order to form pellets of a convenient fize. Thefe pellets are to be covered over with thread, well foaked in a ftrong folution of nitre, and while wet rolled in gunpowder. To charge the rocket with larger balls, any of the aforefaid ingredients (of which nitre, in a fufficient quantity, muft always be one) may be mixed with turpentine, melted pitch, or rofin, and tow fteeped in it. In this way larger balls may be formed, which fhould be covered over with thread, prepared as juft now defcribed.

It is neceffary for giving the rocket a fufficient degree of motion, that the powder within the rocket be bored with a tapering cavity from the choke. At the choke this cavity muft be as wide as the choke itfelf ; at the farther end it need not be more than one-half that width. The length of this bore muft be but one inner diameter of the rocket fhort of the whole height to which the rocket is rammed. The ufe of this bore is to increafe the furface, that takes fire at once ; that a greater body of fire may iffue out of the mouth of the rocket. For from the vehemence with which the fire iffues out, the rocket receives its motion. Rockets are ufed in all fire-works that have motion, except fuch as are thrown into the air after the manner of bombs. When the rocket is defigned to mount upwards, a ftick, eight or nine times the length of the rocket, is tied to it, fufficient to poife the rocket at an inch or two from its mouth.

Rockets, *Sky, Theory of the Flight of.* Mariotte takes the rife of rockets to be owing to the impulfe or refiftance of the air againft the flame. Dr. Defaguliers accounts for it otherwife, as we fhall ftate in the next article, with remarks upon the theory. We fhall here add, that the ftick is attached to keep it perpendicular; for if the rocket fhould begin to tumble, moving round a point in the choke, as being the common centre of gravity of rocket and ftick, there would be fo much friction againft the air, by the ftick between the centre and the point, and the point would beat againft the air with fo much velocity, that the re-action of the medium would reftore it to its perpendicularity. When the compofition is burnt out, and the impulfe upwards is ceafed, the common centre of gravity is brought lower towards the middle of the ftick ; by which means the velocity of the point of the ftick is decreafed. and that of the point of the rocket is increafed ; fo that the whole will tumble down, with the rocket end foremoft.

All the while the rocket burns, the common centre of gravity is fhifting and getting downwards, and ftill the fafter and the lower as the ftick is lighter ; fo that it fometimes begins to tumble before it be burnt out : but when, the ftick being a little too heavy, the weight of the rocket bears a lefs proportion to that of the ftick, the common centre of gravity will not get fo low, but that the rocket will rife ftraight, though not fo faft.

Mr. Robins, confidering the great ufe that may be made of rockets, in determining the pofition of diftant places, and in giving fignals for naval and military purpofes, procured fome, with a view of afcertaining the height to which they rife, and the diftance at which they may be feen. The greateft part of them did not rife to above 400 yards, one to about 500, and one to 600 yards nearly. The greateft diftance at which thefe were obferved, was from 35 to 38 miles. Others were fired at a different time ; one of which rofe to 690 yards ; and it was obferved, that the largeft, which were about $2\frac{1}{2}$ inches in diameter, rofe the higheft. In fome fubfequent experiments, conducted by M. Da Cofta, Mr. Banks, &c. it was found that of two rockets, of about $3\frac{1}{2}$ inches diameter, one rofe to about 833, and the other to 915 yards. In another trial, a rocket of 4 inches diameter rofe to 1190 yards. In other experiments, a rocket of $1\frac{1}{2}$ inch rofe to 743 yards ; one of 2 inches to 659 ; one of $2\frac{1}{2}$ inches to 880 ; another of the fame fize to 1071 ; one of 3 inches to 1254 ; one of $3\frac{1}{2}$ inches to 1109 ; and one of 4 inches rofe to near 700 yards, and, turning, fell to the ground before it went out. Befides thefe, there was one of the rockets of 24 inches in diameter, which rofe to 784 yards, and another of the fame fize to 833 yards. From thefe experiments it is inferred, that rockets from $2\frac{1}{2}$ to $3\frac{1}{2}$ inches in diameter are fufficient to anfwer all the purpofes for which they are intended ; and they may be made to rife to a height, and to afford a light capable of being feen to confiderably greater diftances than thofe juft mentioned. The manufacture of large rockets is expenfive ; and they are more uncertain than thofe of a fmaller fize. Phil. Tranf. vol. xlvi. p. 578, &c. or Robins's Math. Tracts. vol. i. p. 317, &c.

To prevent mifchief from the fall of the rocket-fticks, which are fometimes very heavy, they now bore the fticks of large rockets, and fill them with powder, that they may fhiver in the air before they fall. See Fire-*Works*.

Rockets, *Congreve's*, a new fpecies of war rockets, being thus called from the name of their inventor, fir William Congreve. They differ from the common rocket, as well in their magnitude and conftruction, as in the powerful nature of their compofition ; which is fuch, that without the incumbrance of any ordnance, (the rocket containing the propelling power wholly within itfelf,) balls, fhells, cafe-fhot, and carcaffes, may be projected to the diftance of from 1000 to 3000 yards, which renders them a moft efficacious fpecies of artillery ; as they may not only be employed in every cafe, and for every purpofe, of the ufual light and heavy ordnance, but they are available alfo in a variety of inftances, in which the nature of the ground or other

other impediments prevent the effectual introduction of that arm.

These rockets are of various dimensions, as well in length as in calibre, and are differently armed according as they are intended for the field, or for bombardment and conflagration; carrying, in the first instance, either shells or case-shot, which may be exploded at any part of their flight, spreading death and destruction amongst the columns of the enemy; and in the second, where they are intended for the destruction of buildings, shipping, stores, &c. they are armed with a peculiar species of composition, which never fails of destroying every combustible material with which it comes in contact.

The latter are called *carcass-rockets*, and were first used at Boulogne, their powers having been previously demonstrated in some experiments made at Woolwich by sir William Congreve, in the presence of Mr. Pitt and several of the cabinet ministers, in the month of September 1805. Sir Sidney Smith was ordered to command the expedition intended for this purpose; but from the lateness of the season, it being near the end of November before the preparations were completed, nothing was done that year. In 1806 sir William Congreve renewed his proposition for the attack of Boulogne by rockets, which was ordered to be put in execution after lord Moira, at that time master-general of the ordnance, and lord Howick, first lord of the admiralty, had satisfied themselves of the efficacious nature of the weapons, from other experiments made again at Woolwich for that purpose. The attack was accordingly made under the command of commodore Owen, late in October 1806; having been put off during the summer months, in consequence of the negociations for peace, at that time pending between the courts of England and France.

From this delay, however, instead of being conducted upon the grand scale at first intended, it became a mere desultory attack, in which not more than 200 rockets were fired. The town, however, was set on fire by the first discharge, and continued burning for near two days: it was supposed also that some shipping were destroyed, but the greater part of the rockets certainly went over the basin into the town.

After this, their first introduction as a military weapon, the carcass-rockets have been used in almost every expedition, and in nearly all under the immediate inspection of their inventor. Their reputation was completely established at Copenhagen, where they did incredible execution: after the siege, they were ordered by lord Chatham, the master-general of the ordnance, to be reported upon by a committee of field officers of artillery, who had witnessed their effect in that bombardment, and who pronounced them to be "*a powerful auxiliary to the present system of artillery*." Indeed the powers of this weapon are now established upon the best of all testimonies, the best of all criterions, the testimony of the enemy; a striking instance of which occurred at the siege of Flushing, where general Monnet, the French commandant, made a formal remonstrance to lord Chatham respecting the use of them in that bombardment; than which no better fact need be recorded of the effect they must have produced. If such, therefore, be the acknowledged power of the weapon in such an early stage of its progress, and only when a handful, as it were, were used, merely by way of experiment, under the inventor, with not more than twenty or thirty men to assist him, what may not be expected, when regularly organized in the service, and generally combined with the other implements of bombardment?

At present we have spoken only of the carcass-rockets; it is not, however, in bombardment only that this species of artillery may be advantageously employed; their powers in the field having been demonstrated to be equally irresistible. The crown prince of Sweden was the first general who bore testimony to their effects in this service; a small corps of rocketeers, under the command of Capt. Bogue of the royal artillery, having been attached to this division of the allied armies; and who, in the ever memorable battle of Leipsic, while yet the fate of empires was suspended in fearful equilibrium, gloriously maintained the honour of the British arms, and incontrovertibly established the reputation of the rocket-system.

They were afterwards employed with great effect when the British army, under the command of the duke of Wellington, crossed the Adour; and, had the war continued, we should, in all probability, have seen them as commonly in active service in the field as the other artillery. In consequence of these successes, and a variety of other instances, which our limits will not allow us to enumerate, his royal highness the prince regent commanded the formation of a rocket corps, which took place on the 1st of January 1814, by augmentation to the regiment of royal artillery, as proposed by lord Mulgrave, master-general of the ordnance.

Having thus given a sketch of the history, improvement, and introduction of the rocket-system of artillery, we shall proceed to give such explanation of the nature and application of the weapon in different species of attack and defence, as may be consistent with the general interest of the service; such only being suffered to transpire; for, the military rocket being exclusively an English weapon, all the more minute and important particulars, both of construction and composition, are very properly kept a profound secret, being probably known in complete detail by no person except the inventor himself.

The general form of all the different kinds of rockets, for whatever service they may be designed, is cylindrical, being formed in strong metallic cases, and armed, as we have before stated, either with carcass composition for bombardment and conflagration, or with shells and case-shot for field-service. They are, however, of various weights and dimensions, from the eight-inch carcass, or explosion rocket, weighing nearly three hundred weight, to the six-pound shell-rocket, which is the smallest size used in the field. The sticks which are employed for regulating their flight are also of different lengths, according to the size and service of the rocket; and which, for the convenience of carriage, are stowed apart from the rocket, and so contrived as to consist of two or more parts, which are connected to it, and to each other, when requisite, with the utmost expedition.

Rocket ammunition is divided into three classes, *heavy*, *medium*, and *light*; the former including all those of above 42lbs., which are denominated according to their calibre, as eight-inch, seven-inch, six-inch, &c. rockets; the medium include all those from the 42lb. to the 24lb. rocket; and the light, from the 18-pounder to the 6-pounder inclusive.

The carcass-rockets are armed with strong iron conical heads, containing a composition as hard and solid as iron itself, and which, when once inflamed, bids defiance to any human effort to extinguish it; and consequently involves, in an inextinguishable flame, every combustible material with which it comes in contact. The 42-pounder and 32-pounder carcass-rockets, are those which have hitherto been chiefly employed in bombardments: the penetration of the 32lb. carcass-rocket in common ground is nine feet; and in in ſome inſtances where they have been employed, they have been known to pierce through ſeveral floors, and through the ſides of houſes: this is the ſmalleſt rocket uſed in bombardment, and the largeſt employed in the field; the more uſual ſize for the latter ſervice being the 24, 18, 12, and 6-pounders.

The ranges of the eight-inch, ſeven-inch, and ſix-inch rockets, are from 2000 to 2500 yards; and the quantity of combuſtible matter, or burſting powder, from 25lbs. to 50lbs.; and from their weight combined with leſs diameter, they poſſeſs a greater power of penetration than the heavieſt ſhells, and are therefore equally efficient for the deſtruction of bomb-proofs, or the demolition of ſtrong buildings; ſo that the facility of application, on which the inventor has hitherto reſted the merit of the rocket-ſyſtem, is not its only excellence; for it thus appears, that it actually will propel heavier maſſes than can be done by any other means, that is to ſay, maſſes, to project which, it would ſcarcely be poſſible to caſt, much leſs to tranſport, mortars of ſufficient magnitude. The largeſt rocket that has yet been conſtructed, has not, we believe, exceeded three hundred weight; but ſir William Congreve ſeems to have in contemplation others of much ſuperior magnitude, weighing from half a ton to a ton weight, which being driven in very ſtrong caſt-iron caſes, may poſſeſs ſuch force, that, when fired along trenches cut to the foot of the glacis, from the neareſt point of the third parallel, againſt the revetement of any fortreſs, even unimpaired by a canonnade, it ſhall, by its maſs and form, pierce the ſame; and, having pierced it, ſhall with one explosion of ſeveral barrels of powder, with which it is loaded, blow ſuch portion of the maſonry into the ditch, as may, with very few rounds, complete a practicable breach.

The 42 and 32-pounders are thoſe, as we have before ſtated, which have hitherto been principally uſed in bombardment, and which, for the general purpoſes of that ſervice, are found quite ſufficient, as they will convey from 7lbs. to 10lbs. of combuſtible matter each, and have a range of upwards of 3000 yards.

The 32-pounder rocket may be conſidered as the medium rocket, being the ſmalleſt uſed in bombardment as a carcaſs or exploſion rocket, and the largeſt uſed with ſhot or ſhell in the field; but as the 24-pounder is very nearly equal to it in all its applications in the latter ſervice, being quite equal to the propelling of the Cohorn ſhell, or 12-pounder ſhot, it is, from the ſaving in weight, generally preferred to the 32-pounder.

The 18-pounder, which is the firſt of the light nature of rockets, is armed with a 9lb. ſhot or ſhell; the 12-pounder with a 6lb. ditto; the 9-pounder with a grenade; and the 6-pounder with a 3lb. ſhot or ſhell. From the 24-pounder to the 9-pounder rocket incluſive, a deſcription of caſe-ſhot rocket is formed of each nature, armed with a quantity of muſket or carbine balls, put into the top of the cylinder of the rocket.

The following table preſents a general view of the ranges, elevations, and other particulars of ſeveral of the moſt uſual deſcriptions of Congreve rockets.

Nature of Ammunition.	Armed with		Extreme Range.	Elevation for extreme Range.
			Yards.	
42-Pounder carcaſs-rockets	Carcaſſes	large, 18lbs. of combuſtible matter	3500	Elevation for extreme range not leſs than 60°
		ſmall, 12lbs. ditto		
42-Pounder ſhell-rockets	Shells	$5\frac{1}{2}$-inch		
		12-pounder ſpherical		
32-Pounder carcaſs-rockets	Carcaſſes	large, 18lbs. of combuſtible matter	2000	60°
		medium, 12lbs. = 13-inch carcaſs	2500	60° to 55°
		ſmall, 8lbs. = 10-inch ditto	3000	55°
32-Pounder ſhell-rockets	Shells, 9-pounder ſpherical		3000	50°
32-Pounder caſe-ſhot rockets	Caſe-ſhot	large, containing 200 carbine balls	2500	55°
		ſmall, 100 ditto	3000	50°
32-Pounder exploſion rockets	Strong iron cones, containing from 5lbs. to 12lbs. of powder, to burſt by fuzees		from 2500 to 3000	55°
12-Pounder caſe-ſhot rockets	Caſe-ſhot	large, 72 carbine balls	2000	45°
		ſmall, 48 ditto	2500	45°

Note. The mean velocity of any rocket is to that of its equivalent ſhell in about the ratio of 8 to 9, the ranges being the ſame.

From the preceding table it will be ſeen, that the 32-pounder carcaſs-rocket will range 3000 yards, with the ſame quantity of combuſtible matter as that contained in the 10-inch ſpherical carcaſs; and 2500 yards, with the ſame quantity as that of the 13-inch ſpherical carcaſs. It will be ſeen alſo, that the 12-pounder caſe-ſhot rocket, which is ſo portable that it may be uſed with the facility of muſquetry, has a range nearly double that of field artillery, carrying as many bullets as the 6-pounder ſpherical caſe: add to which, that from the nature of the conſtruction of the rocket, theſe bullets are projected from it in any part of its track, with an increaſe of velocity, whereby its operation becomes frequently moſt deſtructive at that point where any different ſpecies of ammunition ceaſes to be effective.

Of this deſcription of caſe-ſhot rocket, 100 infantry ſoldiers will carry into action, in any ſituation where muſquetry can act, 300 rounds, and 10 frames for diſcharging them; from each of which, four rounds may be fired in a minute. And of the ſame deſcription of caſe-ſhot for the uſe of cavalry, four horſes will carry 72 rounds, and four frames; from which may be fired 16 rounds in a minute; each horſe not having more than the ordinary burden of a dragoon's horſe.

The rockets uſed by the cavalry are, however, now deſigned to be the 12-pounders, armed with a 6-pounder ſhell or caſe-ſhot; each horſe carrying four of theſe rockets.

Every third man, beſides his portion of ammunition, has, in addition, to carry the chamber from which the rockets are diſcharged. This chamber, however, weighs

but

but ſix pounds, and is, therefore, but little additional burden; ſo that the rockets may be diſcharged parallel to the ſurface, and as near to it as poſſible.

The weight of ammunition carried by the troop horſe, with the full complement going into action, is ſuch, that the horſe is fully equal to any ordinary operations. But in long marches, ſmall tumbrils are provided for carrying a part of the ammunition; which leaves the horſe, in travelling, one ſtone four pounds of ammunition to carry, a burden of two ſtone leſs in line of march than that of the heavy dragoon's or artillery-man's horſe: to which we may further add, that as the rocketeer has no heavy duty to perform, no guns to ſponge, nor any to limber up or unlimber, he may, upon an average, be a lighter man by three ſtone than is required for an artillery-man, who has conſtantly the above duties to perform; a difference amounting, within a few pounds, to the whole weight of the ammunition carried by the men even in action.

A ſubdiviſion of rocket cavalry conſiſts of 24 horſes and 20 men, four of the horſes being employed in carrying the ammunition for the ſubdiviſion. Each of theſe ammunition horſes carries 18 rockets and rocket-ſticks, and a proportion of ſmall ſtores, weighing in all, including ſaddle, ſaddle-bags, &c. 19 ſtone; ſo that theſe 20 men will carry into action 152 rounds of 12-pound ſhell or caſe-ſhot, and ſix chambers, or *bouches à feù*; from which, without any extraordinary exertion, 80 rounds of 6-pound ammunition may be diſcharged in three minutes.

It is obvious that the combined celerity and quantity of the diſcharge of ammunition of this deſcription of artillery cannot be equalled, or even approached, taking in view the means and nature of the ammunition employed, by any other ſyſtem. The univerſality, alſo, of the operation, not being encumbered with wheel-carriages, muſt be duly appreciated; as, in fact, it can proceed not only wherever cavalry can act, but even wherever infantry can get into action, as has been already ſtated.

The heavier ſpecies of rockets, as the 32-pounder or 24-pounder, as alſo the 18 and 12-pounders, are ſometimes carried in cars of a peculiar deſcription, which not only convey the ammunition, but are contrived alſo to diſcharge each two rockets in a volley, from a double iron-plate trough, which is of the ſame length as the boxes for the ſticks, and travels between them; but which, being moveable, may, when the car is unlimbered, be ſhifted into its fighting poſition at any angle from the ground ranges, or point blank, up to 45°, without being detached from the carriage. The limbers are always ſuppoſed to be in the rear. The rockets are fired with a port-fire and long ſtick: two men will fight the light car, and four men the heavy one.

At preſent we have confined our remarks to rocket cavalry: it is obvious, however, that they may, with equal facility, be accommodated to the uſe of infantry. In this caſe, one man in ten, or any greater proportion, carries a frame of very ſimple conſtruction, ſtanding on three legs, like a theodolite, when ſpread; and which cloſes ſimilarly, for the convenience of carrying. It is mounted at top with an open cradle, from which the rockets are diſcharged, either for ground ranges, or at any required elevation. The reſt of the men carry each three rounds of ammunition, which for this ſervice is propoſed to be either 12-pounder ſhell-rockets, or the 12-pounder rocket caſe-ſhot; each round equal to the 6-pound caſe, and ranging 2500 yards; ſo that 100 men will bring into action, in any ſituation where muſquetry can be uſed, nearly 300 rounds of this deſcription of artillery, which ranges at 45°, nearly double thoſe of light field ordnance.

When the rockets are employed in bombardments, they are diſcharged from frames of a different conſtruction; the rockets employed in this ſervice being larger than thoſe uſed for the field: they are, however, equally ſimple, and the diſcharges may be made with great rapidity. In many caſes, however, the frames are diſpenſed with, and the rockets are thrown from a battery erected for that purpoſe. The great advantage of this ſyſtem is, that as it diſpenſes with apparatus, where there is time for forming a work of this ſort, of conſiderable length, the quantity of fire that may be thrown in a given time is limited only by the length of the work; one of 200 feet in length being ſufficient for firing 100 rockets in a volley, and ſo on for any greater length; or an inceſſant and heavy fire may, by ſuch a battery, be kept up from one flank to the other, by replacing the rockets as faſt as they are fired in ſucceſſion.

Another uſe is for the defence of a paſs, or for covering the retreat of an army, by placing any number, hundreds or thouſands, of 32 or 24-pounder ſhell-rockets, or 32-pounders armed with 18-pounder ſhot, limited as to quantity only by the importance of the object which is to be obtained; as, by this means, the moſt extenſive deſtruction, even amounting to annihilation, may be carried amongſt the ranks of an advancing enemy, and that with the expoſure of ſcarcely an individual. For this purpoſe, the rockets are laid in batteries of 100 or 500 in a row, according to the extent of ground to be protected; ſo that one man is in fact alone ſufficient to fire the whole in ſucceſſion, beginning with that neareſt to the enemy, as ſoon as he ſhall perceive him near enough to warrant his firing. Where the batteries are very extenſive, each battery may be ſubdivided into ſmaller ones; ſo that the whole, or any part, or particular diviſion, may be fired, according to the number and poſition of the enemy advancing.

A ſimilar application of the rocket artillery is as follows: a low work is thrown up for the defence of a poſt, or of a chain of poſts, conſiſting merely of as much earth and turf as is ſufficient for forming the ſides of ſhallow embraſures, for large rockets, placed from two to three feet apart, or nearer; from which the rockets are ſuppoſed to be diſcharged independently, by a certain number of artillery-men, employed to keep up the fire according to the neceſſity of the caſe. In this manner, ſuch an inceſſant fire may be maintained as would be next to impoſſible for an advancing enemy to paſs through, not only from the quantity, weight, and deſtructive nature of the ammunition, but from the cloſeneſs of its lines, and its contiguity to the ground. The larger kind of theſe rockets are alſo equally applicable to the attack and defence of fortified places. They may alſo be employed by infantry againſt an attack from cavalry: they may be even carried by a ſtorming party into the place, by which the parapet may be ſcoured of the enemy, any ſtreet or paſſage enfiladed; or thrown occaſionally into the town, as well to diſtract the attention of the garriſon, as to ſerve as an index to each of the ſtorming diviſions, as to the ſituation and progreſs of each party. In fact, there is no limit to their application, being as general and extenſive as that of gunpowder itſelf.

In naval warfare the rocket-ſyſtem likewiſe poſſeſſes peculiar advantages; for in conſequence of there being no re-action in theſe projectiles on the point of diſcharge, rockets, carrying the quantity of combuſtible matter, as, by the ordinary ſyſtem, would require to be thrown from the largeſt mortars, and from ſhips of very heavy tonnage, may be be used in the smallest boats of the navy; and the 12-pounder, and 18-pounder, have been frequently fired from four-oared gigs; and it should also be remarked, that rockets of the above weight will ricochet in the water remarkably well at low angles; they may also be employed to facilitate the capture of a ship by boarding, by being thrown, by hand, into the ports, &c. by the boarding party, as soon as they get along-side, as the confusion and destruction which will thence inevitably ensue, cannot but facilitate the performance of this dangerous duty. These rockets are also peculiarly adapted to add to the dreadful effects of fire-ships; for, according to the present system, it is not improbable that a number of fire-ships may pass harmlessly through an enemy's fleet, by the exertion of their crews in towing them clear, whereas, if they were supplied each by a sufficient number of rockets, such an extensive and devastating fire would be spread in every direction, as to involve every vessel of the enemy in that destructive element. After the above statement, little need be said in reference to the general utility and importance of the rocket-system. It will be sufficient to observe, that it consists, first, in their being a species of projectiles of the most destructive kind, which, containing in themselves the propelling power, dispenses with the use of heavy ordnance, and consequently offers great facilities to the movement of an army. 2dly. The extensive nature of the fire that may be kept up, by a few men, against any important point. 3dly. It may be employed in a variety of cases in which the usual artillery, from the nature of the ground, or other impediments, cannot be rendered effective; and lastly, in naval bombardments, in consequence of its trifling re-action, it may be thrown from cutters and small boats, and therefore from points which could never be approached by the vessels usually employed in that service.

It may also not be amiss to observe, that in point of expence the rocket likewise possesses the advantage. The 32-pounder carcass-rocket costs only 1*l.* 1*s.* 11*d.* complete, in every respect, for service; whereas its equivalent, the 10-inch spherical carcass, with the charge of powder necessary to convey it 3000 yards, which power is contained in the rocket, costs 1*l.* 2*s.* 7*d.*, independent of any charge for the mortar, mortar-bed, platform, difference of transport, &c. &c. attaching to the spherical carcass, and not to the rocket, which actually requires no apparatus whatever to use it in a bombardment, and has, therefore, no charge attaching to it, beyond the first cost, but that of transport; and a vessel of 300 tons will carry 5000 of them at least. It is also further to be observed, that the above 1*l.* 1*s.* 11*d.* supposes the whole construction to be effected by manual labour: by introducing machinery, which we understand is about to be done, the expence of the 32-pounder carcass-rocket will be reduced to 18*s.*, or even to 16*s.*, by using bamboo instead of the usual stick, which is but about three-fourths of the expence of the 10-inch spherical carcass, independent of all the other charges of transport, &c. attending the latter.

But the comparison, as to expence, is still more in favour of the rocket, when compared with the larger nature of carcasses. The 13-inch spherical carcass costs 1*l.* 17*s.* 11½*d.*, to throw it 2500 yards, while its equivalent rocket costs but 1*l.* 5*s.* 0*d.*, being a saving, on the first cost, of 12*s.* 11½*d.*, and a similar proportion of saving runs through the whole system.

Rocket *Light Ball*, also invented by sir William Congreve, is a species of light ball thrown into the air by means of one of his rockets; where, having reached the summit of the rocket's ascent, it is detached from it by an explosion, and remains suspended in the air by a small parachute, to which it is connected by a chain. Thus, in lieu of the transient momentary gleam obtained by the common light ball, a permanent and brilliant light is obtained, and suspended in the air for five minutes at least, so as to afford time and light sufficient to observe the motions of an enemy either on shore or at sea; where it is particularly useful in chasing, or for giving distant and more extensive night signals. It is to be observed, that nothing of this kind can be obtained by the projectile force of either guns or mortars, because the explosion infallibly destroys any construction that could be made to produce the suspension in the air.

Floating Rocket Carcass.—This is another of the inventor's applications of his rocket, and of the parachute; for the purpose of conveying combustible matter to distances far beyond the range of any known projectile force; at the same time that it is cheap, simple, and portable. The floating carcass, like the light ball, is thrown into the air attached to a rocket, from which being liberated at its greatest altitude, and suspended to a small parachute, it is driven forward by the wind, and will, in a moderate breeze, afford ranges at least double those of the common carcass; and may, therefore, for naval purposes, from a blockading squadron, be thrown in great quantities, by a fair wind, against any fleet or arsenal, without the smallest risk, or without approaching within range either of guns or mortars. Thus, in the blockade, a few years back, of the Russian fleet at Baltic fort, it might have been continually used, at all events, with great prospect of success, and certainly where no other means of annoyance could be applied. The rocket containing this carcass is not larger than the 32-pounder carcass-rocket; and the whole expence, added to the rocket, does not exceed five shillings; nor are the approaches of the carcass itself necessarily visible by night, as it may be so arranged, as not to inflame till some time after it has settled. It is evidently, therefore, capable of becoming a very harassing weapon, with a great chance of doing as much mischief as any other carcass amongst large fleets and flotillas, by lodging unperceived in the rigging, or lighting on extensive arsenals, in situations where no other means of annoyance whatever exists.

Rockets, *Theory of the Motion of.* The theory of the flight of rockets differs very essentially from that of the usual projectiles. In the latter, the body is launched into space with a certain and determinate velocity; and by rejecting the resistance of the air, a most beautiful theory is established, possessing great simplicity and generality, and which is, therefore, highly interesting to the speculative mathematician, notwithstanding it is of little or no use to the practical artillerist. In order to render the theory useful in the latter sense, a great variety of experiments have been made to ascertain the effect of the air's resistance, which is not at all considered in the former case, the initial velocity of the ball, the strength of fired gunpowder, &c. &c.; yet after all, it must be acknowledged that very little has been gained, and the practitioner is still much more guided by his own experience, than by any light that has been thrown upon the subject from long and intricate mathematical theories.

The motion of rockets is more complicated than that of common projectiles, partaking, in fact, of all the anomalies that attend the accelerated motion arising from the rocket composition, and the uniform motion of the rocket-case, after the composition is expended; and as little or no advantage

tage

tage has yet been gained from the experiments that have been made with cannon, even where the angle of elevation and the initial velocity of the ball were both accurately known, it seems totally useless to look for any assistance from mathematical investigations, with respect to determining the ranges, &c. of military rockets: because if we could determine with the greatest accuracy the point, position, and velocity of the rocket, at the moment when the composition was expended, the remaining part of its track would still be subject to all the inequalities attending on common projectiles.

If we confine our investigations only to that motion which has place during the time the composition is burning, it is not improbable that much light might be thrown on the subject from a well arranged course of experiments; and that their motion might be reduced to precise rules, in several applications of the rocket-system, particularly in the cases we have mentioned, where they are intended to be used as a kind of battering-train.

The great impediment in gunnery to the exact determination of the momentum of any given ball, when projected with a given velocity, and from a given distance, is the resistance of the air; because it can only be found from experiment at certain distances, and it is difficult from a few partial cases to infer a general law. That the resistance of the air to the same ball is as some function of the velocity, there can be no doubt; but we much question whether that determined by Dr. Hutton, *viz.* $r = .00002576\,v^2 - .00388\,v$, although the most accurate of any yet found, is as correct as could be wished. Indeed, when we consider the infinitude of different forms under which the function of a single variable may appear, it seems much too confined a scale to attempt to reduce it to the simple form $a\,v^2 + b\,v$; *viz.* to limit the dimension of the function, and attempt every accommodation by means of the co-efficients a and b. With regard to the rocket, the case is very different: the very medium, which in the former instance is the great impediment to an accurate theory, is here the principal agent in producing the motion; and moreover, we are here, from the nature of the weapon, enabled to ascertain all the successive energies of the propelling power, and the resisting force, which, in the other case, are only determinable at two or three different distances: on which account, it is to be presumed that more advantage may be here expected to be gained from experiment, than in the cases above referred to.

Instead of a ball impinging on the ballistic pendulum, at the distance of 60 or 100 yards, as practised in gunnery experiments, a rocket might be fixed to the same pendulum, and its whole energy observed with the greatest accuracy; or, in case such experiment should be thought inconclusive, for want of that partial vacuum which has place behind the rocket when in flight, it might be attached to some wheel, or revolving body, and its successive energies measured by the motion of some weight attached to the revolving axis of the machine. This is a most important advantage attending experiments on the momentum of rockets, which it is impossible to accommodate to other projectiles.

We are not aware, however, that any such experiments have yet been undertaken; and, therefore, all our investigations on the flight, momentum, &c. of rockets must necessarily be hypothetical. In fact, we have two distinct theories of the motion of rockets, the one by Mariotte, and the other by Desaguliers; the latter attributing their motion to the momentum of combustion, and the other to the elastic nature of the gas generated by the combustion and the resistance of the air. Desaguliers illustrates his hypothesis as follows: "Conceive the rocket to have no vent at the choke, and to be set on fire; the consequence will be, either that the rocket will burst in the weakest place, or if all its parts be equally strong, and able to sustain the impulse of the flame, the rocket would burn out immoveable. Now as the force of the flame is equable, suppose its action downwards, or that upwards sufficient to lift 40 pounds; as these forces are equal, but their directions contrary, they will destroy each other's action. Imagine then the rocket opened at the choke; by this means, the action of the flame downwards is taken away, and there remains a force equal to 40 pounds acting upwards, to carry up the rocket and stick." Although there is some ingenuity and plausibility in the above reasoning, we are by no means inclined to admit its accuracy. The action of the flame or gas within the rocket, when closed, as supposed above, we conceive to arise wholly from the elastic nature of the gas, and the re-action it experiences against the ends and sides of the rocket-case; the whole of which ceases, as soon as a free vent is given to the flame; and, therefore, if a rocket could be fired in a vacuum, as the flame would, in that case, experience no resistance, there would be no re-action, and consequently no motion would ensue. In order to submit the above supposition to experiment, take a strong piece of whale-bone, and bend it into the form of a bow, by means of a bit of thread or silk fastened to each extremity: then if this bow be suspended by its middle, and two pieces of board, or two books, be set up on their edges, each touching one end of the bow, and the string by which it is bent be cut, both books will, from the elastic nature of the whale-bone, be thrown down with considerable force. Now repeat the experiment, but set up only one book, leaving the other end of the bow entirely free; then cut the string as before, and it will be found that, for want of the re-action of the other book, no effect, or very little, is produced on the standing book: it may be a little disturbed, but it will not fall. This we consider to be a very similar case to the action of the gas on the rocket, when shut up and opened, as supposed by Desaguliers; and if so, it shews very distinctly the inaccuracy of his hypothesis.

As a mere matter of mathematical investigation, it certainly reduces the theory to the most simple form; because here it is not essential, so far as regards the propelling power, what may be the velocity of the rocket; which power is, therefore, supposed uniform during the whole time of combustion: whereas, in Mariotte's theory, which attributes the motion of the rocket to the resistance or re-action of the air, the propelling force will decrease as the velocity increases, in consequence of the partial vacuum left behind the rocket in its flight; so that the velocity becomes, as it were, both a *datum* and *quæsitum;* and the correct solution of the problem necessarily involves the integration of partial differences of the highest orders.

We must confess that we feel no inclination to meet the problem under this formidable shape, unless we had a good set of experiments on which to rest our first premises, and from which, therefore, some useful conclusions might be expected to be deduced. We shall, therefore, in what follows, avail ourselves of a few problems relative to the motion and flight of rockets in non-resisting mediums, as given by Mr. Moore of the Royal Military Academy, in his Treatise on the Motion and Flight of Rockets; who, we presume for want of experiments, has adopted the hypothesis of Desaguliers, by supposing the motion of the rocket to arise from the momentum of the ignited composition. We shall also suppose the rocket and stick perfectly free the moment after being fired; for, without this, it is obvious that the angle of elevation of the rocket's direction, and that of its actual diſcharge, will be eſſentially different. The firſt motion of the rocket, like all other motions not produced by a great momentary impulſe, is ſlow; and before the ſtick is clear of the frame, gravity has been acting upon the rocket, and depreſſed it below its natural poſition, while the ſtick is prevented from being equally depreſſed, by the top of the frame; ſo that the angle of projection is in fact conſiderably leſs than the angle of the frame, or ſlope of the rocket's firſt poſition. In conſequence of this, the rocket has the appearance of falling the moment after projection; and, for this reaſon alſo, the angle for producing the greateſt range of a rocket exceeds very conſiderably that which gives the extreme range of a ſhell projected from a mortar.

Prop. I.

The ſtrength or firſt force of the gas from the inflamed compoſition of a rocket being given, as alſo the weight and quantity of the compoſition, the time of its burning, and the weight and dimenſions of the caſe and ſtick; to find the height to which it will aſcend, when projected perpendicularly upwards.

It is obvious here, that the principal point of inveſtigation is the height to which the rocket will riſe, and the velocity it will have acquired, at the moment when the compoſition is all expended; as the determination of its farther aſcent, with theſe data, depends upon well-known and eſtabliſhed principles. We ſhall, therefore, only conſider the former caſe. For this purpoſe, put

$w =$ the weight of the rocket-caſe and ſtick.
$c =$ the weight of the compoſition.
$a =$ the time in which it will be conſumed.
$n =$ the medium preſſure of the atmoſphere.
$sn =$ the aſſumed force of the inflamed compoſition.
$d =$ the diameter of the rocket's baſe, and pd^2 its area.
$x =$ the ſpace deſcribed. And
$v =$ velocity acquired in any indeterminate time t.

Then $snpd^2$ is the conſtant impelling force of the compoſition.

Now the weight of the quantity of rocket-matter that is conſumed in the time t is $\frac{ct}{a}$; therefore, $c - \frac{ct}{a}$ is the weight of the part unconſumed; and $w + c - \frac{ct}{a}$, or $m - \frac{ct}{a}$ (making $m = w + c$), is the weight of the whole maſs, at the end of the time t.

Hence $snpd^2 - \left(m - \frac{ct}{a}\right)$ is the *motive* force, and

$$\frac{snpd^2 - \left(m - \frac{ct}{a}\right)}{m - \frac{ct}{a}} = \frac{asnpd^2}{am - ct} - 1, \text{ the } \textit{accelerating} \text{ force.}$$

Therefore, from the known formulæ for variable forces, we have $\dot{v} = 2gf\dot{t}$, which hence becomes

$$\dot{v} = \frac{2agsnpd^2\dot{t}}{am - ct} - 2g\dot{t};$$

the fluent of which is

$$v = -\frac{2agsnpd^2}{c} \times \text{hyp. log.} \left(\frac{am}{c} - t\right) - 2gt, \text{ or}$$

$$v = -b \text{ . hyp. log.} \left(\frac{am - ct}{c}\right) - 2gt;$$

$$\text{where } b = \frac{2agsnpd^2}{c}.$$

This fluent, corrected for the caſe in which $t = 0$, gives the correct fluent,

$$v = b \text{ . hyp. log.} \frac{am}{am - ct} - 2gt;$$

which, when $t = a$, becomes

$$v = b \text{ . hyp. log.} \frac{m}{m - c} - 2ga,$$

the velocity required.

Again, to find the ſpace deſcribed in the ſame time, we have $\dot{s} = v\dot{t}$, or $\dot{x} = b\dot{t} \times \text{hyp. log.} \frac{am}{am - ct} - 2gt\dot{t}$.

The correct fluent of this is $x = \left(bt - \frac{bam}{c}\right)$ hyp. log. $am + \frac{b}{c}(am - ct)$. hyp. log. $(am - ct) + bt - gt^2$; and in the caſe when $t = a$, it becomes $x = \frac{ab}{c} + \left((m - c) \text{ hyp. log.} \frac{m - c}{m} + c - \frac{acg}{b}\right)$ the ſpace ſought.

It will be obſerved, however, that in both theſe caſes, gravity has been ſuppoſed to act directly in oppoſition to the motion of the rocket; but had we conſidered the flight uninterrupted by gravity, (as we muſt ſuppoſe, in eſtimating its flight, when projected at any given angle, where gravity is not conſidered as in any reſpect retarding the rocket's motion in the firſt line of projection,) then the laſt terms in each of the above expreſſions will diſappear, and we ſhall have ſimply

$$v = b \text{ . hyp. log.} \frac{m}{m - c}, \text{ and}$$

$$x = \frac{ab}{c} + \left((m - c) \text{ hyp. log.} \frac{m - c}{m} + c\right).$$

Having thus determined the height of the rocket, and its velocity, when the compoſition is juſt conſumed, it follows that its whole height may be determined in the uſual manner, by the known formula for the aſcent and deſcent of heavy bodies.

Prop. II.

To determine the path of a rocket near the earth's ſurface, neglecting the reſiſtance of the air.

If, during the time the rocket was on fire, the weight of the whole maſs remained conſtant, the path of the rocket would, from the known laws of the compoſition and reſolution of forces, be a right line; but this not being the caſe, on account of the continual waſting of the compoſition, the accelerative force will be different at every inſtant; and, therefore, ſince the accelerative force of gravity is conſtant, the path of the rocket will neceſſarily be a curvilinear one.

Let A C (*Plate Pyrotechny, fig.* 16.) be the firſt direction of the rocket, and A D the curve in which it moves; draw C D B perpendicular to the horizontal line A B. Now the path of the rocket will be determined by finding the relation between A B and B D, or between A C and C D, the angle B A C being given.

Now

Now we have found, generally for A C, $x = \left(bt - \frac{abm}{c}\right)$ h. l. $am + \frac{b}{c}(am - ct)$ h. l. $(am - ct) + bt$, while $CD = gt^2$. Hence, by assuming any number for t, the relation between A C and C D will be determined, or the relation between A B and D B; for representing A C by $\varphi(t)$, we have $AB = \text{cof. } A . \varphi(t)$, and $CB = \text{tan. } A . \text{cof. } A \varphi(t)$, and $DB = \text{tan. } A . \text{cof. } A \varphi(t) - gt^2$.

Prop. III.

To find the velocity of the rocket in the curve at any given instant.

Let A C (*Plate Pyrotechny, fig.* 17.) $= x$, and $AD = z$, being the space described by the rocket in the time t; then calling the velocity at $C = b$. h. l. $\frac{am}{am - ct} = V$; the velocity at D in the curve will be expressed generally by $\frac{\dot{z}V}{\dot{x}}$, following from the laws for the resolution and composition of motion. Now, by the laws of falling bodies, $CD = gt^2$: and putting k and l for the natural sine and cosine (to rad. 1) of the angle C A B of projection, we shall have $AB = lx$, $CB = kx$, and D B (the ordinate of the curve) $= kx - gt^2$. Therefore

$$\dot{z} = [(k\dot{x} - 2gt\dot{t})^2 + l^2\dot{x}^2] \text{ and}$$

$$v = \frac{\dot{z}V}{\dot{x}} = \frac{[l^2\dot{x}^2 + (k\dot{x} - 2gt\dot{t})^2]^{\frac{1}{2}}}{\dot{x}} \times V.$$

Again, by the theory of variable motions, $\dot{x} = v\dot{t}$; consequently

$$v = \frac{[l^2 v^2 \dot{t}^2 + (kV\dot{t} - 2gt\dot{t})^2]^{\frac{1}{2}}}{V\dot{t}} \times V, \text{ or}$$

$$v = [v^2 l^2 + (kV - 2gt)^2]^{\frac{1}{2}}, \text{ or}$$

$$v = [l^2 b^2 . \text{h. l.}^2 \frac{am}{am - ct} + (kb . \text{h. l.} \frac{am}{am - ct} - 2gt)^2]^{\frac{1}{2}},$$

the velocity of the rocket at D; which requires no correction.

When the angle of projection is 90°, $l = 0$, and $k = 1$; therefore v, in this case, will be $= b$. hyp. log. $\frac{am}{am - ct} - 2gt$, as determined in the preceding part of this article; and when $g = 0$, or when the action of gravity is not considered, the velocity of the rocket in its rectilinear path is $v = b$. hyp. log. $\frac{am}{am - ct}$, which agrees with what has been already observed.

When the angle of elevation is 30°, $k = \frac{1}{2}$, and $l = \frac{1}{2}\sqrt{3}$, therefore

$$v = \left(\tfrac{3}{4}b^2 . \text{h. l.}^2 \frac{am}{am - ct} + (\tfrac{1}{2}b . \text{h. l.} \frac{am}{am - ct} - 2gt)^2\right)^{\frac{1}{2}}.$$

And when the angle of elevation is 60°, then changing the values of k and l, we have

$$v = \left(\tfrac{1}{4}b^2 . \text{h. l.}^2 \frac{am}{am - ct} + \left(\frac{\sqrt{3}}{2}b . \text{h. l.} \frac{am}{am - ct} - 2gt\right)^2\right)^{\frac{1}{2}}.$$

Prop. IV.

To find the horizontal range of a rocket, the angle of elevation, and the time the composition is on fire, being given.

Let D (*Plate Pyrotechny, fig.* 18.) be the place of the rocket, when all the matter it contained is just exhausted; and C m and C n the measures of the velocities of the rocket in the directions A C, D I, the latter of which is a tangent to the curve at D; then by trigonometry, sin. $< Cnm$ ($= nCB = IDB$) $= \frac{Cm}{Cn}$. sin. $< Cmn = \frac{Cm}{Cn}$ cos. of the angle of elevation $= \frac{\text{velocity at C}}{\text{velocity at D}}$ cos. C A B.

Whence, calling the velocities at C and D, V and v, computed on the principles of our second proposition, we have sin. $IDB = \frac{V}{v}$ cos. C A B: and since we have found the angle I D B, it will be easy to determine that part of the range denoted by B L. For the curve from D being a parabola, $DH = \frac{suv^2}{g}$, and $VE = \frac{s^2v^2}{4g}$, (from the laws of projectiles in vacuo,) where s and u represent the sine and cosine of the angle I D H; consequently $VF =$

$$VE + EF = VE + DB = \frac{s^2v^2}{4g} + kx - gt^2,$$

whereof x is given by the first proposition.

Again, by the nature of the parabola $VE : VF :: EH^2 :$

$$FL^2 = \frac{u^2v^2}{g}\left(\frac{s^2v^2}{4g} + kx - gt^2\right), \text{ and therefore}$$

$$FL = \frac{uv}{\sqrt{g}}\left(\frac{s^2v^2}{4g} + kx - gt^2\right)^{\frac{1}{2}}, \text{ whence}$$

$$AL = \frac{uv}{\sqrt{g}}\left(\frac{s^2v^2}{4g} + kx - gt^2\right)^{\frac{1}{2}} + \frac{suv^2}{2g} + lx,$$

the entire range of the rocket, as required.

For a great variety of other propositions relative to this subject, see Moore's Treatise on the "Motion and Flight of Military Rockets."

ROCKFORD, in *Geography*, a post-town of America, in North Carolina; 573 miles from Philadelphia.

ROCKHILL, a township of America, in Bucks county, Pennsylvania, containing 1508 inhabitants.

ROCKINGHAM, a market-town and parish in the hundred of Corby, and county of Northampton, England, is situated close to the river Welland, at the distance of 26 miles N.N.E. from Northampton, and 84 miles N.N.W. from London. In former times it was a place of some note on account of its castle and appendant forest. This castle was built by William the Conqueror, on the summit of a hill overlooking the town, and appears to have been occa-

occasionally the residence of several of our early monarchs. In the reign of William Rufus, a great council of the nobility, bishops, and clergy, was assembled here to terminate the dispute between the king and Anselm, archbishop of Canterbury, respecting the right of investiture, and obedience to the see of Rome. The council sat on Sunday the 11th of March, 1094, in the chapel belonging to the castle. Edward III. frequently honoured this fortress with his presence, as is evident from the numerous dispatches, and other instruments of royal authority, which are dated at Rockingham, in different years of his reign. Edward IV. settled the manor here, together with the castle and forest, on his queen, Elizabeth, for her life-time. These afterwards formed part of the duchy of Cornwall, and continued so till the reign of Edward VI., when they were granted to Edward, lord Clynton, from whose family they passed to the Watsons, one of whom, sir Lewis Watson, was created baron Rockingham, of Rockingham castle, in the year 1644. At what period the castle was dismantled is uncertain; but it is probable that event happened early in the reign of Henry III., as in the 34th year of that monarch, it is described as being in a ruinous condition. Leland, who visited it in the time of Henry VIII., gives the following account of this structure in the first volume of his Itinerary. "The castelle of Rokingham standith on the toppe of an hill, right stately, and hath a mighte diche, and bulwarkes agayne withoute the diche. The utter waulls of it yet stond. The kepe is exceding fair and strong; and in the waulles be certein strong towers. The lodgings that were within the area of the castelle be discovered and faul to ruine. One thing in the waulls of this castle is much to be notid; that is, that they be embatelid on booth the sides. So that if the area of the castelle were won by cumming in at either of the 2 greate gates of the castelle, yet the keepers of the waulles might defende the castelle. I marked that there is a stronge tower in the area of the castelle, and from it over the dungeon dike is a drawbridge to the dungeon toure." All that now remains of the original building is the arched gateway of the grand entrance, which is flanked by two massy bastion-towers. Rockingham forest extended about 20 miles in length, from Oxendon bridge to Stamford bridge, and four or five miles in breadth. Leland says there were only "fallow dere in it" "with dyers lodges for kepers" in his time.

The town of Rockingham consists chiefly of one irregular street. The market-day is Thursday, weekly; and there is an annual fair on the 25th of September. These privileges were granted by Henry III., at the request of Edmund, earl of Cornwall, the then possessor of the manor; but they are at present only nominal. According to the population returns of 1811, this parish contains 49 houses, and 230 inhabitants. The church is not remarkable, except for some handsome monuments, erected to commemorate different individuals of the Watson family. An altar-tomb, in the chancel, bears the recumbent statue of a man in armour, with that of a female by his side; and on the entablatures are the figures of nine children, sculptured in relief. This tomb was erected in memory of Edward Watson, grandfather of the first lord Rockingham, and his wife, one of the daughters of sir Edward Montague, lord chief justice of the court of king's bench. Another handsome monument commemorates Lewis Thomas, lord Sondes, who died June 21, 1806. Beauties of England, &c. vol. xi. by John Britton, F.S.A. The History and Antiquities of Northamptonshire, compiled from MS. Collections of the late learned Antiquary, John Bridges, esq. by the Rev. P. Whalley, 2 vols. fol. Oxford, 1791.

ROCKINGHAM, one of the six counties into which the state of New Hampshire is divided. It lies on the S.E. part of the state, having the Atlantic on the S.E., the county of Hillsborough on the W., Strafford on the N., and the state of Massachusetts on the S.; about sixty miles long and thirty broad, and comprehending the only sea-port, and most of the commercial towns, in the state. The number of inhabitants is 50,175. Its chief towns are Portsmouth, Exeter, and Concord.—Also, the N.E. township in Windham county, Vermont, on the W. bank of Connecticut river, which separates it from Walpole, in New Hampshire. It contains 1954 inhabitants.—Also, a county of Salisbury district, in North Carolina, bounded E. by Caswell, and W. by Stokes. This county is watered by the river Dan, on the banks of which are large tracks of low fertile land. Many parts of the county furnish iron ore. The number of inhabitants is 10,316.—Also, the chief town of Richmond county, North Carolina, situated on an eminence, about 6 miles E. of Great Pedee river, and containing a court-house, gaol, and a few dwelling-houses; 74 miles from Hillsborough.—Also, a mountainous county of Virginia, bounded N. by Shenandoah, and S. by Augusta. It contains 12,753 inhabitants.—Also, a post-town (usually called *Rocktown*, though its legal name is *Harrisonburg*) and the seat of the courts of the above county, situated on a branch of the Shenandoah river, and containing a court-house, gaol, and about 30 houses; 52 miles S.W. of Strasburg, in Pennsylvania.

ROCKINGHAM *Bay*, a bay on the N.E. coast of New Holland, N.W. of Cape Sandwich. This bay was so called by Cook in June 1770, who says that it is large, and appears to afford good shelter and good anchorage. The N. point of this bay is in S. lat. 17° 59′, and its boundary is formed by an island of considerable height, which is marked in the chart by the name of "Dunk Isle," and which lies so near the shore as not to be easily distinguished from it. The longitude of the N. point of the bay is 213° 57′ W.

ROCKLAND, a county of New York, in the United States, on the W. side of Hudson river: it was separated from Orange county, and is now the southernmost county in the state on that side of the river, bounded by New Jersey S.W., Orange county N.W., and Hudson's river E. The number of inhabitants is 7758.

ROCKLINGEN, a town of Germany, in the margraviate of Anspach; 2 miles N.E. of Wassertrudingen.

ROCKMANSTATT, a town of Bavaria, in the bishopric of Bamberg; 5 miles S.W. of Weismain.

ROCKNABAD, *Abi Rockny*, a famous rivulet of the clearest water, about two feet broad, running between two gardens in the vicinity of Shirauz, in Persia. See SHIRAUZ.

ROCKSALT, a township of Philadelphia county, in Pennsylvania, containing 1508 inhabitants.

ROCKSALT, in *Mineralogy*. See ROCK-*Salt*.

ROCKY, in *Geography*, a small river of North Carolina, which discharges itself into Yadkin river.

ROCKY *Bay*, a bay on the E. coast of Labrador. N. lat. 53° 30′. W. long. 56° 10′.—Also, a bay on the coast of Terra del Fuego, in the straits of Magellan; 6 miles S.E. of Dolphin bay.—Also, a bay on the S.E. coast of Nova Scotia, N.E. of Halifax harbour.

ROCKY *Island*, a large rock in the river Detroit, Upper Canada, on the E. side of Grosse isle, composed of limestone, lying in pretty regular strata.

ROCKY *Meadow*. See PRAIRIE *de Rocher*.

ROCKY *Mount*, lies in Catabau river, in the lowest part

part of Chester county, South Carolina, and is one of the largest fishing places in the southern states. It is said that a fisherman, with a hand net, sometimes takes 10 or 12,000 shad in a day.

Rocky *Point*, a cape on the S. coast of Jamaica, S. of Carlisle bay.—Also, a cape on the S. shore of lake Erie.—Also, a cape on the coast of New Albion. N. lat. 41° 8′. E. long. 236° 5′.—Also, a cape on the S.E. coast of Alashka, so named by Capt. Cook in 1778. N. lat. 55° 10′. E. long. 198° 50′.

Rocky *River*, a river of the Indiana territory, which runs into the E. side of Mississippi river, about 70 miles below the mouth of Mista river.

Rocky *Land*, in *Agriculture*, that sort which is much covered or beset with rocks or stones, either upon the surface or underneath it. Land of this kind is very common, and of considerable extent in many parts of the country, and, of course, often very injurious to the operations of tillage, as well as of planting, and many others. See Clearing, and Reclaiming, *Land*.

ROCO Grande, in *Geography*, an island on the coast of the Spanish Main, in the West Indies. N. lat. 11° 5′. W. long. 67° 39′.

ROCOU. See Roucou.

ROCQUIGNY, in *Geography*, a town of France, in the department of the Ardennes; 12 miles N. of Rethel.

ROCROY, a town of France, and principal place of a district, in the department of the Ardennes. The place contains 2875, and the canton 8077 inhabitants, on a territory of 237½ kiliometres, in 12 communes. N. lat. 49° 55′. E. long. 4° 35′.

ROD, Virga, *Virge*, a wand, or long slender stick, or staff. See Verge.

Rod is also used for a land-measure of 16½ feet: the same with perch and pole. It is likewise a long measure in Sweden, equal to 8 ells or 16 feet, the Swedish foot being to the English as 40 to 39. See Measure.

There are also local rods of seven yards and an half, or more. Likewise some of smaller lengths in particular places. See Weights and Measures.

Rod, in *Gauging*. See Gauging-*Rod*.

Rod, in the *Manege*, called in French *gaule*, is a switch, held by the horseman in his right hand, partly to represent a sword, and partly to conduct the horse, and second the effects of the hand and heels.

Rod, *Golden*, or *Aaron's*, in *Botany*. See Golden-*Rod*.

Rod, *Shepherd's*. See Teazel.

Rod, *Golden, Tree*. See Bosea.

Rod-*Knights*, in *Ancient Customs*. See Redmans.

Rod, *Black*. See Black-*Rod*, and Usher.

Rod, *Ezekiel's*. See Ezekiel.

Rod, *Fishing*. See Fishing.

Rod, *Rhineland*. See Rhineland.

RODA, in *Geography*, a town of Saxony, in Thuringia; 3 miles N. of Sangerhausen.—Also, a town of Spain, in the province of Aragon; 20 miles S. of Ainsa.—Also, a town of Spain, in Catalonia, on the Tar; 6 miles N.N.E. of Vicque.—Also, a town of Saxony, in the principality of Altenburg; 28 miles W.S.W. of Altenburg.—Also, a river of Germany, which runs into the Mayne, 2 miles below Hanau.—Also, a town of Egypt, on the Nile; 3 miles E. of Ashmunein.

Roda, *La*, a town of Spain, in New Castile; 19 miles S. of Alarcon.

RODABERG. See Rœttvik.

RODACH, a town of Germany, in the principality of Coburg; 6 miles W.N.W. of Coburg. N. lat. 50° 21′. E. long. 10° 57′. The town lies on a river of the same name, which runs into the Itsek, 6 miles S. of Coburg.

RODAK, a town of Hindoostan, in the country of Delhi; 50 miles E. of Hissar. N. lat. 29°. E. long. 76° 35′.

RODANSEE, a lake of the Ucker Mark of Brandenburg, S. of Templin.

RODAS, a town of South America, in the province of Popayan; 65 miles S. of Santa Fé de Antioquia.

RODATIO, unusual shortness of the eye-lashes.

RODAU, in *Geography*, a town of Saxony, in the Vogtland; 6 miles W. of Plauen.—Also, a river of Germany, which runs into the Wumme, 2 miles W. of Rotenburg, in the county of Verden.

RODAUN, a river of Prussia, which joins the Motlau at Dantzic, near which both together fall into the Vistula.

RODAW, a town of Prussia, in the province of Oberland; 14 miles E.N.E. of Marienwerder.

RODBYE, a sea-port town of Denmark, in the island of Laaland, with a convenient harbour. The principal article of trade is corn; 10 miles S.E. of Naskov. N. lat. 54° 42′. E. long. 11° 24′.

RODDA, a town of Arabia, in the province of Yemen; 4 miles N.W. of Sana.—Also, a town of Egypt, on the Nile, at the mouth of one of the branches of the canal of Joseph; 115 miles S. of Cairo.

RODDEN, a river of England, in the county of Salop, which runs into the Tern, 3 miles W. of Wellington.

Rodden *Cribs*, in *Agriculture*, a sort of large wicker-work basket, for containing the hay or other fodder in farm-yards. It is observed by Mr. Marshall, in his "Rural Economy of the Vale of Gloucester," that these large baskets are made of the top wood of willow pollards, and are an utensil common to this county and to Lincolnshire, though situated on the opposite sides of the island: but they are alike grass-land counties, wherein cattle are fattened on hay. They are about six feet in diameter. The height of the basket-work is two feet and a half; of the stakes, three feet and a half; their heads rising about a foot above the basket. The width between the stakes twelve to fourteen inches. The size, that of large hedge-stakes. The thickness of the rods varies from that of a small hedge-stake, down to a well-sized edder.

And in making these hay-baskets, the stakes are first driven in a ring of the required size firmly into the ground. Some of the larger rods are then wound in at the bottom, in the basket-work manner. Upon these the smaller rods are wound; the middle part of the work requiring the least strength, reserving the largest for the top. In the winding and due binding of those the principal part of the art of withy crib making rests. Some makers warm these thick rods in burning straw: others wind them cold; one man drawing them with a rope, while another beats them at the stake with a wooden beetle, until they acquire a degree of suppleness. They are mostly made by men who go about the country, and who by practice make them very completely; winding in the top rods so firmly and so regularly, that it is difficult to know which has been the last put in.

When in use, the cattle lay their necks between the tops of the stakes. Each being thus kept in its place, the master cattle are in a degree prevented from running round and driving away the underlings. The closeness of these cribs prevents a waste of hay, either by the wind or by the cattle. On the whole they are useful, simple, cheap, and if well made, will last several years.

RODEBACK, in *Geography*, a town of the duchy of Holſtein; 10 miles E.N.E. of Braamſted.

RODELHEIM, a town of Germany, which gives title to a branch of the houſe of Solms; 3 miles W. of Francfort on the Maine.

RODEMACK, or RODEMACHERON, a town of France, in the department of the Moſelle; 7 miles N. of Thionville.

RODEN, a town of the duchy of Wurzburg; 8 miles S. of Gemunden.—Alſo, a town of Pruſſia, in the palatinate of Culm; 4 miles N.W. of Bretchen.

RODENBERG, a town of Weſtphalia, in the county of Schauenburg, annexed to Heſſe Caſſel; near which is a medicinal ſpring; 4 miles S. of Hagenburg.

RODENBURG. See ARDENBURG.

RODENTHALL, a town of Saxony, in the circle of Erzgeberg; 6 miles E. of Chemnitz.

RODEO *de Tala*, a town of South America, in the province of Tucuman; 100 miles N. of St. Miguel de Tucuman.

RODER, GROS, a river of Saxony, which runs into the Schwartz Elſter, 2 miles below Elſterwerda.

RODER, *Klein*, a river of Saxony, which runs into the Schwartz Elſter, near Hertzberg.

RODERICKE, a town of Switzerland, in the canton of Berne; 3 miles S. of Aarburg.

RODERODE, a town of Germany, in the county of Henneberg; 4 miles E.N.E. of Smalkalden.

RODERSDORF, a town of Saxony; 4 miles S.W. of Plauen.

RODES, or RHODEZ, a town of France, and principal place of a diſtrict, in the department of the Aveyron, and capital of that department; before the revolution the ſee of a biſhop, ſuffragan of Bourges; 32 miles N.N.E. of Alby. The place contains 6233, and the canton 12,168 inhabitants, on a territory of $247\frac{1}{2}$ kiliometres, in 33 communes. N. lat. 44° 21′. E. long. 2° 39′.

RODHEIM, a town of Germany, in the county of Hanau Munzenberg; 9 miles N. of Francfort on the Maine.

RODIA, a town of Naples, in Capitanata, on the coaſt of the Adriatic; 14 miles W.N.W. of Vieſte.

RODIALOWITZ, a town of Bohemia, in the circle of Boleſlau; 12 miles S.E. of Jung Buntzel.

RODIGA, a town of Italy, in the duchy of Mantua; 9 miles N.W. of Mantua.

RODING, or RODEN, a river of England, in the county of Eſſex, which runs into the Thames, below Barking.

RODITZ, a town of Germany, in the principality of Culmbach; 2 miles W. of Hof.

RODNEY, GEORGE BRYDGES, in *Biography*, a celebrated naval commander, was the ſon of Henry Rodney, eſq. of Walton on Thames, a naval officer, who commanded the yacht in which king George I., attended by the duke of Chandos, uſed to embark in going to or coming from Hanover, and who, in conſequence, aſked leave that his ſon might be called George Brydges. He was the ſecond ſon, and born in 1718. At the deſire, or by the command, of his royal and noble god-fathers, he entered early into the navy, and in 1742 he was lieutenant in the Namur, commanded by admiral Matthews. In November of the ſame year, he was promoted by the admiral to the command of the Plymouth, of ſixty guns; on returning home he was removed into the Sheerneſs, a ſmall frigate; and in 1744 he was appointed to the command of the Ludlow-caſtle, of forty-four guns. Captain Rodney was, during the war, very ſucceſsful, and attained to a conſiderable degree of profeſſional eminence. In 1753 he married Miſs Compton, daughter of Charles Compton, eſq. and ſiſter to Spencer, then earl of Northampton. In 1757 he was engaged, under the command of admirals Hawke and Boſcawen, to attempt a deſcent on the coaſt of France, near Rochefort: and in 1759 he was advanced rear-admiral of the blue. In this ſame year he was ſent to bombard Havre de Grace, where a large force was collected for the purpoſe of attempting an invaſion of this country. He executed the truſt committed to him ſo completely, that the town itſelf was ſeveral times on fire, and the magazines of ſtores and ammunition burnt with fury upwards of ſix hours, notwithſtanding the exertions uſed to extinguiſh it. Thus had admiral Rodney the happineſs of totally fruſtrating the deſign of the French court; and ſo completely did he deſtroy their preparations, that the fort itſelf, as a naval arſenal, was no longer, during the war, in a ſtate to annoy Great Britain. In 1761 admiral Rodney was very inſtrumental in the capture of the iſlands of St. Pierre, Granada, St. Lucia, and St. Vincent, when the whole Caribbees came into the poſſeſſion of the Engliſh. For his ſkill and bravery in the war, he was, after the concluſion of it, raiſed to the dignity of a baronet. In 1768, after an expenſive, and to ſir George Rodney a ruinous, conteſt with Mr. Howe, he was elected member of parliament for Northampton. His affairs were now ſo deranged that he exiled himſelf to France, the government of which had long ſince trembled at his name. The French king wiſhed to take advantage of his pecuniary embarraſſments, and through the duke de Biron made him the moſt unbounded offers, if he would quit the Engliſh for the French ſervice. In reply to this ſhameful propoſal, he ſaid, "my diſtreſſes, ſir, it is true, have driven me from the boſom of my country, but no temptation can eſtrange me from her ſervice. Had this offer been voluntary on your part, I ſhould have deemed it an inſult, but I am glad to learn it proceeds from a ſource that can do no wrong." The duke was ſo ſtruck with the patriotiſm of the admiral, that he became attached to him as a friend.

Before ſir George Rodney's arrival in England, the French had united with the Americans in a war againſt this country. Towards the cloſe of the year 1779, the chief command of the Leeward iſlands was given him; upon which he hoiſted his flag on board the Sandwich. From this time he was very ſucceſsful againſt his majeſty's enemies, but our limits do not allow us to particularize all the advantages that reſulted from his ſervices during the remainder of the war of which we are ſpeaking. In the firſt year he had done enough to obtain a vote of thanks from the houſe of lords; and the freedom of the cities of London and Edinburgh; but his great triumph, and that which muſt not be paſſed over, was on the 12th of April 1782, in an engagement in the Weſt Indies with count de Graſſe. This battle was fought among the iſlands of Guadaloupe, Dominique, the Saintes, and Marigalante. As ſoon as the day broke, admiral Rodney threw out the ſignal for cloſe action, and every veſſel obeyed it moſt ſcrupulouſly. The Britiſh line was formed at the diſtance of one cable's length between each ſhip. As the ſhips came up ſeparately, they ranged cloſe alongſide their opponents, paſſing along the enemy for that purpoſe, giving and receiving, while thus taking their ſtations, a moſt dreadful and tremendous fire. The action continued in this manner till noon, when admiral Rodney reſolved to carry into execution a manœuvre, which he expected would gain him a complete and deciſive victory: for this purpoſe, in his own ſhip, the Formidable, ſupported by the Namur, the Duke, and the Canada, he bore down with all the ſail ſet on on the enemy's line, within three ſhips of the centre, and ſucceeded in breaking through it in a moſt maſterly ſtyle. As ſoon as he had accompliſhed this, the other ſhips of his diviſion followed him, and they all wore round, doubled on the enemy, and thus they placed between two fires thoſe veſſels which, by the firſt part of the manœuvre, they had cut off from the reſt of the fleet. As ſoon as admiral Rodney, and the veſſels which followed him, wore, he made the ſignal for the van to tack, by which means they gained the windward of the French, and completed the diſorder and confuſion, in which the *breaking of the line* had thrown them. One conſequence of the breaking of the line was, that opportunities were given for deſperate actions between ſingle ſhips. The whole loſs of the enemy on this occaſion amounted to eight ſhips; one had been ſunk, and another blown up after ſhe had been taken, and ſix ſhips remained in poſſeſſion of the conquerors. It was eſteemed remarkably fortunate, and glorious for the victors, that de Graſſe's ſhip, the Ville de Paris, was the only firſt rate man-of-war that had ever, at that time, been taken and carried into port by any commander of any nation. And this ſhip was on the preſent occaſion fought ſo well, that when it ſtruck there were but three men left alive and unhurt on the upper deck.

The Britiſh nation were ſo ſenſible of the bravery diſplayed both by officers and men in this action, and of the importance of it as the only means of preſerving the remainder of the Weſt India iſlands, that they manifeſted the moſt exceſſive joy when intelligence of the victory arrived. It came extremely ſeaſonable in other points of view. Neither by land, nor by ſea, except where admiral Rodney had been engaged, had we been able to meet the enemy, on any occaſion, with great and deciſive advantage; and, in too many inſtances, we had retired from the conteſt not in the moſt honourable manner. As the means of obtaining more favourable terms of peace, this important victory was hailed with joy and exultation; and as admiral Rodney was looked up to as the cauſe of it, the gratitude of the nation towards him was deeply felt, and expreſſed in warm and glowing language. It was recollected that the fortune of ſir George Rodney had been peculiarly ſingular, as well as highly glorious in the war. Within little more than two years he had given a ſevere blow to each of our three powerful continental enemies, the French, Spaniards and Dutch. He had in that time taken an admiral of each nation; added twelve line of battle ſhips, all taken from the enemy, to the Britiſh navy; and deſtroyed five more. He received the unanimous thanks of both houſes of parliament; and his majeſty added dignity to the peerage of the realm, by calling the victorious admiral to a ſeat in the upper houſe.

It has been obſerved, that the victory of the 12th of April was gained by putting in practice an entirely new ſyſtem of naval tactics, the adoption of which formed an era in our naval hiſtory, and may be regarded as the cauſe of the glorious victories, by which the fame of Britiſh ſeamen has been raiſed to ſuch a pitch of glory; and the maritime power of our enemies in the late war, has not only been crippled, but abſolutely annihilated. It has been ſaid, in order to derogate from the honour of the admiral, that, in the inſtance of the 12th of April, it was the effect of chance, and not effected by the foreſight of ſir George Rodney. This idea has been ſatisfactorily expoſed and refuted. The only queſtion on the ſubject is, and into which we ſhall enter at large under the word TACTICS, *Naval*, whether the honour of the plan is due to admiral Rodney or Mr. Clerk, the author of a treatiſe on "Naval Tactics."

With the brilliant victory of the 12th of April ſir George cloſed his profeſſional career; to his title was added a penſion of 2000*l.* to deſcend to his heirs. He died in London the 24th of May, 1792. For his important ſervices to the Weſt Indian iſlands in particular, a temple was built to receive his ſtatue at Spaniſh Town, Jamaica.

A contemporary of the noble admiral ſaid, that as an officer of nautical abilities, none were his ſuperiors, and but few his equals. He poſſeſſed a bold and original genius, which always carried him directly to the object he had in view. As a man, he was benevolent, generous, and friendly. He has been known to be writing his private letters, and dictating to three ſecretaries at the ſame time. "In private life he diſplayed the manners of an accompliſhed gentleman; and he who, when called by his country, could hurl its thunders againſt the foes, and lead its navies to almoſt undeviating victory, was, in peace, the ornament of domeſtic ſociety, and a pattern of that elegant and poliſhed behaviour, which almoſt always diſtinguiſhes the higher orders among us." Stockdale's edition of Campbell's Lives of the Admirals.

RODNEY, *Cape*, a cape of New Zealand, being the N.W. point of the entrance into the river Thames. S. lat. 36° 15′. W. long. 184° 53′.

RODNEY *Point*, the N. point of Norton Sound, on the N.W. coaſt of North America, ſo called in honour of admiral Rodney. N. lat. 64° 30′. W. long. 166° 3′.

RODOE, a ſmall iſland near the coaſt of Norway; four miles E.N.E. of Chriſtianſand.

RODOLDESCO, a town of Italy, in the department of the Mincio; 10 miles S.E. of Mantua.

RODOLPH I., in *Biography*, emperor of Germany, founder of the imperial houſe of Auſtria, born in 1218, was the eldeſt ſon of Albert IV., count of Hapſburgh and landgrave of Alſace. He was brought up in the court and camp of the emperor Frederic II., and early diſtinguiſhed himſelf by his courage and dexterity in martial exerciſes. On the death of his father, in 1240, he ſucceeded to a territory of moderate extent, which he endeavoured to augment by military enterpriſe. He entertained a band of adventurers of different nations, whom he employed either in defending him from his enemies, or in attempts to aggrandize himſelf at their expence. In 1245 he married a daughter of Burcard, count of Hohenburgh, with whom he obtained ſome acceſſion of eſtates. Some years afterwards he ſerved under Ottocar, king of Bohemia, againſt the Pagan Pruſſians. In 1273, as he was encamped before the walls of Baſil, with whoſe biſhop he was at enmity, he received the very unexpected intelligence, that he was unanimouſly elected king of the Romans.

Rodolph, then in his 55th year, willingly accepted the offered elevation, though ſenſible of the arduous taſk he was undertaking againſt the oppoſition of two unſucceſsful candidates. He was crowned at Aix-la-Chapelle, and immediately ſtrengthened himſelf by marrying two of his daughters to the count palatine of Bavaria, and duke of Saxony. He alſo took meaſures for ingratiating himſelf with the pope, Gregory X., who gave his ſanction to the election. Alphonſo, one of the unſucceſsful candidates, was induced by the pope to renounce his pretenſions; but Ottocar, the other, king of Bohemia, refuſed to acknowledge the new emperor, and manifeſted the bittereſt animoſity againſt him. The king of Bohemia was, at this time, one of the moſt powerful princes in Europe, and was diſtinguiſhed by his abilities and military ſkill. Beſides Bohemia and Bavaria, he poſſeſſed territories in the north of Germany and Hungary; and had lately acquired Auſtria, with Carinthia and Carniola,

Carniola. Both parties having prepared for the conteſt, war broke out between the emperor and the king in 1275, and Rodolph commenced his operations with all the vigour of his character. He firſt marched againſt Henry, duke of Lower Bavaria, whom Ottocar had ſecured in his intereſt, and ſoon brought him to change his party. He then penetrated into Auſtria, and appeared under the walls of Vienna, before Ottocar thought of his danger. This prince, finding himſelf unable to ſave the Auſtrian capital, bent his haughty ſpirit to ſue for peace, which was granted upon the condition of his renouncing his claims upon the Auſtrian provinces, and conſenting to acknowledge the emperor, and do homage for Bohemia and his other fiefs. The Auſtrian provinces, as fiefs, devolved to the empire, and were taken poſſeſſion of by the emperor.

The mind of Ottocar was ſo much irritated by the loſs and diſgrace he had undergone, that he could not bring himſelf to a faithful execution of the treaty, and the war was renewed in 1277. A fierce battle enſued, in which Rodolph was beaten to the ground by a Thuringian knight, and brought into great danger; but, on the other hand, Ottocar was killed, and his army entirely defeated. Rodolph was prevented from taking poſſeſſion of Bohemia by Otho, margrave of Brandenburgh, and he entered into an accommodation, by which Wenceſlaus was acknowledged king of Bohemia, while he himſelf was to hold Moravia for five years, and was to retain the Auſtrian provinces. The ſecuring of theſe to his family was thenceforth a great object of his policy, in which he encountered many difficulties, but at length he ſucceeded in ſettling them upon his two ſons, Albert and Rodolph.

In the midſt of theſe tranſactions, the emperor, thinking it would be for his honour to revive the imperial authority in Italy, after the death of Gregory, during the ſubſequent ſhort-lived pontificate, ſent commiſſaries into that country to exact homage from ſeveral of the towns; but, on the acceſſion of Nicholas III. he found it expedient to confirm to the papal ſee its poſſeſſions in Romagna. He afterwards attempted to reſtore the authority of the empire in Tuſcany; but in this he alſo failed, and was obliged to content himſelf with drawing large ſums from Lucca and other cities for the confirmation of their privileges. No foreign foe now remaining, Rodolph turned his attention to the reſtoration of peace and order in Germany; and for this purpoſe it was neceſſary to enforce the laws againſt building private fortreſſes, which were the retreats of banditti, or the refuge of turbulent nobles, who defied all law and authority. Of theſe ſtrong-holds he razed ſeventy in one year, condemning to death many of their owners for their violations of the public peace. He made many progreſſes through the imperial cities, adminiſtering juſtice and making ſalutary regulations, ſo that he obtained the title of "a living law," and deſerved to be regarded as a ſecond founder of the German empire. In 1283 he engaged in a war againſt Philip, count of Savoy, who had appropriated ſeveral imperial fiefs in Helvetia; but in an action near Morat he was overpowered by numbers, unhorſed, and obliged, for ſaving himſelf, to ſpring into the lake, where he ſupported himſelf by the branch of a tree till reſcued by his followers. He was, however, victorious, and brought the count to terms of ſubmiſſion. He was likewiſe ſucceſsful againſt the count of Burgundy, who had tranſferred his homage from the empire to France; but he failed in an attempt to gain poſſeſſion of Bern, which had declared itſelf an independent republic. The troubles of Bohemia, in which the oppreſſions of the regent Otho had excited revolts, while the minor king, Wenceſlaus, was detained as a priſoner, called Rodolph into that country. He delivered Wenceſlaus, whom he married to one of his daughters, and left him at the head of the government, in a ſtate of tranquillity. The final object of this emperor was to ſecure the imperial crown to his only ſurviving ſon, Albert; but the electors were not to be perſuaded into this meaſure, and Rodolph was ſeverely mortified with the diſappointment. His ſtrength had already begun to fail, and as he was upon his way to Spire he was obliged to ſtop at Germerſheim, where he died in July 1291, in the ſeventy-third year of his age, and the nineteenth of his reign.

There is ſcarcely an excellency of body or mind which the biographers of the houſe of Auſtria have not attributed to its founder; and it appears from the hiſtory of his actions, that few princes have ſurpaſſed him in energy of character, and civil and military talents. In the beginning of his career, he ſeems to have been little ſcrupulous in the means of aggrandizement; but, as an emperor, he was in general moderate and equitable. In his ſixty-fourth year he married, for his ſecond wife, a princeſs of Burgundy, only fourteen years of age, but no iſſue proceeded from this ill-ſorted union. By his firſt marriage he had a numerous offspring, of whom ſix daughters were all united to powerful families. Mod. Univ. Hiſt.

Rodolph II., emperor of Germany, ſon of Maximilian II., was born in 1552. His father procured him the crown of Hungary in 1572, and that of Bohemia in 1575, together with the title of king of the Romans. On the death of Maximilian, in 1576, he ſucceeded to the imperial throne, being then regarded as a highly accompliſhed prince, converſant with various branches of knowledge. Unfortunately, his taſte and acquirements were ſo far from qualifying him for the ſtation to which he was elevated, that they diverted his attention from the principal duties of a ſovereign. He was attached to mechanical inventions, and ſpent whole days in the ſhops of clock-makers, turners, and other artiſts. Chemiſtry was alſo one of his favourite ſtudies, with its uſual attendant in that age, alchemy. Having been educated among the Jeſuits, his zeal for the Catholic religion rendered him unfriendly to thoſe tolerating principles upon which his father had acted. He had ſucceeded to the ſole poſſeſſion of the territories of the houſe of Auſtria, and finding that the Proteſtant religion had ſpread in them to a degree that threatened to ſubvert the ſuperiority of the Catholic, his firſt care was to reſtore the preponderance of the latter. His meaſures for this purpoſe occaſioned revolts, and a total alienation of the minds of his Proteſtant ſubjects. In the other parts of the empire, Rodolph took part againſt the Proteſtants, and his interference was a principal cauſe of the depoſition and expulſion of the archbiſhop and elector of Cologne, who had embraced the Proteſtant religion, and married. Troubles ſoon aroſe in his Hungarian dominions, where ſultan Amurath III. made various incurſions, in which he over-ran part of Hungary and Croatia. Theſe were, however, chaſtiſed by ſeveral defeats given to the Turks by the imperial generals. But Mahomet III., the ſucceſſor of Amurath, took the important town of Agria, in Upper Hungary, and war was maintained, with various fortune, in that kingdom, till a peace was concluded with ſultan Achmet, in 1606. Rodolph took little perſonal ſhare in theſe events, being chiefly occupied with his ſtudies; and his Hungarian ſubjects had contracted ſuch a contempt for his character, that they invited his brother, the archduke Matthias, to undertake the government, and in 1607 elected him for their king. Matthias prepared to take poſſeſſion of his kingdom, and, marching with an army through Auſtria, projected to make himſelf maſter of that duchy. The timid and pacific Rodolph was perſuaded to enter into a treaty with

with his brother, by which he ceded to him Hungary and Auftria, and Matthias was folemnly inaugurated as fovereign of thofe countries.

Soon after, difturbances arofe in the empire on account of the difputed fucceffion to the duchies of Juliers and Cleves, with which were affociated the caufes of diffention between the Catholics and Proteftants of Germany. Confederations were formed, and both parties prepared for war. The emperor convoked diets, and diligently exerted himfelf, in order to prevent extremities. He, however, gave his chief confidence to his coufin the archduke Leopold, who, at length, marched into Bohemia, to awe the Proteftants that had been rendered difcontented, by attempts to introduce the infernal inquifition into the country, and by violations of their privileges. In this emergency they applied for affiftance to Matthias, who entered Bohemia, and obliged Leopold to difband his troops. Not content with this fuccefs, he fo wrought upon his brother, that Rodolph refigned to him his remaining kingdom of Bohemia, of which Matthias received the crown in 1611. Rodolph was, at that time, in a declining ftate of health; he died in January 1612, in the fixtieth year of his age, and thirty-fixth of his reign. It is faid, that the predictions of the celebrated but fuperftitious aftronomer Tycho Brahe, had rendered him diftruftful of all his relations, fo that he finally fhut himfelf up in his palace, which he never quitted either for exercife or amufement. Among his various ftudies was that of aftronomy, his attachment to which induced him to invite Tycho Brahe to Prague, where he was patronized till his death; and the fame patronage was afterwards given to the more eminent Kepler. The Rodolphine tables, commenced by the former, and completed by the latter, have perpetuated the name of this emperor as a promoter of fcience. Mod. Univ. Hift. Gen. Biog.

RODOLPHE, ——, one of the moft celebrated profeffors on the French horn that ever exifted. Though he ufually played the fecond horn, he mounted as high as the firft ever went. His execution was truly wonderful! and he had found the means of producing founds with his inftrument that were never heard before.

This able mufician was equally powerful in compofition as in performance. In 1773 he fet "Jemona," a ferious opera, for the marriage of the compt d'Artois. For the Italian theatre he had previoufly fet, in 1765, the comic opera called "Marriage by Capitulation;" and, in 1767, "The blind Man of Palmyra."

RODOME, in *Geography*, a town of France, in the department of the Aude; 9 miles S.W. of Quillan.

RODON, a town of Sweden, in Jamptland, on lake Storfio; 7 miles N.W. of Ofterfund.—Alfo, a fmall ifland on the weft fide of the gulf of Bothnia. N. lat. 62° 23′. E. long. 17° 20′.

RODONDA, a fmall ifland at the entrance of the harbour of Rio Janeiro.

RODONI, Cape, a cape on the coaft of Albania, in the Adriatic. N. lat. 41° 55′. E. long. 19° 16′.

RODOPE, a mountain of Romania; 50 miles S. of Filippopoli.

RODOSTO, a town of European Turkey, in the province of Romania, on the north coaft of the fea of Marmora, where the Armenians have one church, and the Greeks five. The environs are fertile in corn and wine; 53 miles N.E. of Gallipoli.

RODRIGO. See Civdad *Rodrigo*.

RODRIGUEZ. See Diego *Ruis*.

Rodriguez *Key*, a fmall ifland on the coaft of Florida. N. lat. 25°.

RODRIGUEZIA, in *Botany*, a genus fo named in the *Flora Peruviana*, p. 105, after Emanuel Rodriguez, a Spanifh botanift, apothecary to the king of Spain. *De Theis*.

RODSEG, in *Geography*, a town of Iftria; 16 miles N.N.E. of Pedena.

ROE, *Sir* Thomas, in *Biography*, a diftinguifhed traveller and negociator, was born, in 1580, at Low Layton, in Effex. He was fent at an early age to Magdalen college, in Oxford: after he had left that feminary of learning, he paffed fome time at one of the inns of court. He was made an efquire of the body to queen Elizabeth, towards the clofe of her reign; and in 1604 he was knighted by king James. At the inftigation of Henry, prince of Wales, he undertook an exploratory voyage to Guiana. Having fitted out a fhip and pinnace at his own charge, and that of his friends, he failed in 1609 for the river Amazons, up which he proceeded to the diftance of 300 miles, landing in various places to examine the country. Having fpent thirteen months in a laborious furvey of this part of the American continent, in fearch of gold, no doubt, he returned to England in 1611. In 1614 he was fent, at the defire of the Eaft India Company, as ambaffador to the Mogul emperor, for the purpofe of concluding a treaty of peace and commerce. He arrived at Surat in the autumn of that year, and refided at the Mogul court till the beginning of 1618. His conduct in this ftation did honour to himfelf and his country; and he made a great number of curious obfervations on the court and people, of which we have fpecimens in Purchas's Pilgrims. On his departure from this country, he vifited the court of Schah Abbas in Perfia, with whom he made a treaty, by which the Eaft India Company obliged itfelf to affift him with a fleet, for the purpofe of expelling the Portuguefe from Ormus, on condition of being allowed a free trade with Perfia. After his return, fir Thomas Roe was elected in 1620 a reprefentative in parliament for Cirencefter; and in the following year he was nominated ambaffador to the Ottoman Porte, which poft he occupied under the fultans Ofman, Muftapha, and Amurath IV. He performed, in this capacity, fome moft important fervices for his country; and he was, at the fame time, very ferviceable to the Greek church, by protecting it from the oppreffions of the Turkifh minifters, and from the intrigues of the Jefuits, and other perfons attached to the Papal fee. In return for his various fervices, he was affifted in his collection of manufcripts in the Greek and Oriental languages, which he prefented to the Bodleian library; and to his care was entrufted the celebrated Alexandrian manufcript of the Bible, prefented to Charles I. by Cyril, patriarch of Conftantinople. During his embaffy, fir Thomas drew up "A true Relation of what lately happened in Conftantinople, concerning the Death of Sultan Ofman, and the fetting up of Muftapha, his Uncle," &c. This was printed in London in 1622. He alfo kept minutes of his negociations at the Porte, which remained in manufcript till 1740, when they were publifhed by the fociety for promoting learning, under the title of "The Negociations of fir Thomas Roe, in his Embaffy to the Ottoman Porte, from the Year 1621 to 1628 inclufive."

After his return from Conftantinople, he was fent, in 1629, to mediate a peace between Poland and Sweden. He was afterwards employed in negociating a treaty with the king of Denmark at Copenhagen; and he went a fecond time to that court, and alfo to thofe of feveral German princes; and was prefent at the congrefs of Hamburgh, and its removals to Ratifbon and Vienna. In 1640 he was a reprefentative in parliament for the univerfity of Oxford, and

and made feveral fpeeches upon very important occafions. While a member of parliament, he was fent, in 1641, to the diet at Ratifbon, to negociate for the reftoration of the late king of Bohemia's fon to the Palatinate; and after his return, the king created him a privy-counfellor, and chancellor of the order of the Garter. The view of the approaching national difturbances was thought to have fhortened his life, which was terminated in 1644. He left the character of a very able and upright minifter, a true patriot, and accomplifhed gentleman. Befides the works already referred to, he left in manufcript "A compendious Relation of the Proceedings and Acts of the imperial Dyet, held at Ratifbon in 1640 and 1641;" and "A Journal of feveral Proceedings of the Knights of the Garter." Biog. Brit.

Roe, in *Geography*, a river of Ireland, in the county of Londonderry, which rifing in the Cairntogher mountains, flows northward through Newtown Limavaddy into lough Foyle.—Alfo, the name of a fmall ifland in Clew bay, county of Mayo, Ireland.

Roe, *La*, a town of France, in the department of the Mayenne; 7 miles N.W. of Craon.

Roe of a fifh is that part which contains the fpawn or feed thereof.

That of the male fifh is ufually diftinguifhed by the name of *foft* roe, or milt; that of the female by *hard* roe, or fpawn.

The foft roe, when fqueezed, yields a liquor refembling milk; whence its name *milt*. The French call it exprefsly *milk, lait*.

M. Petit found 342,144 ovula, or little eggs, in the hard roe of a carp eighteen inches long.

Leuwenhoeck, tom. ii. p. 216, only found 211,629 eggs in a carp, but four times the number in a cod; and, p. 188, he fays, that a common cod contains 9,344,000 eggs; and that the eggs of a fifh of one year old are as big as thofe of a fifh of twenty-five years old. Mem. Acad. R. Scien. an. 1733, p. 290. See Milt and *Fecundity of* Fish.

Roe is alfo one of the beafts of chafe.

Roe-*Buck*, the Englifh name of the *cervus* with ramofe, cylindric, and erect horns. It is the fmalleft of the deer-kind, and has been called *capreolus* and *caprea*, though without the leaft refemblance of the goat-kind. See Cervus *Capreolus* and Deer.

The roe-buck is called a *hind* the firft year; *gyrle*, the fecond; *henufe*, the third; *roe-buck of the firft head*, the fourth; and a *fair roe-buck*, the fifth.

The roe-buck is a deer well known in Germany; and feems to have alfo been formerly found in England, though now the race be extinct.

Roe-*Buck Hunting*. See Hunting.

Roe-*Buck Ifland*, in *Geography*, a fmall ifland in the gulf of Mexico, near the coaft of Weft Florida. N. lat. 30° 17'. W. long. 88° 44'.—Alfo, a fmall ifland at the eaft extremity of lake Ontario.

Roe-*Stone, Oolite*, in *Mineralogy*, a variety of lime-ftone, fo called becaufe it is compofed of fmall round globules, fuppofed to refemble the roes of fifhes, imbedded in a calcareous cement. Thefe globules are compofed of concentric lamellæ, and are evidently the refult of cryftallization. They vary in fize from a grain of muftard-feed to that of a pea: when they are as large as the latter, it is called pea-ftone. Roe-ftone is one of the fecondary lime-ftones, which may be confidered as belonging to the chalk-formation. It lies under chalk in various parts of England, being feparated from it by beds of fand and clay. It is found alfo in many parts of Europe, but, according to Humboldt, is not met with in South America. Some of the ftrata of this ftone are extenfively ufed for purpofes of architecture: the moft diftinguifhed are the Ketten ftone in Northamptonfhire, the Bath fire-ftone in Somerfetfhire, and Portland ftone in the ifland of Portland. Portland ftone is of a yellowifh-white colour: the more compact varieties, when clofely infpected, fhew a tendency to cryftalline arrangement; it is compofed of carbonate of lime, with a fmall admixture of filex and alumine.

The ifland of Portland is properly an ifthmus, fituated in Weymouth bay, in the Britifh Channel. The ftone is got in every part of the ifland, but the quarries at Kingfton are the moft productive. According to Mr. Smeaton, the firft ftratum in the quarry is a dark coloured reddifh earth, about one foot thick. To this fucceed fix feet of ftone of an inferior quality, called cap. Immediately under this lies the roe-ftone or free-ftone, which is ten or twelve feet deep; and beneath this bed there is flint or clay. In fome parts, irregular veins of quartz run through the roe-ftone. The ftratum of ftone that is wrought for fale lies nearly parallel with the upper furface of the ifland; and, in general, the cover of earth and rubbifh upon it is thin. Several beds of ftone lie continuous one above another, varying in thicknefs from two to four feet, and fometimes more.

Portland ftone was brought into repute in the reign of James I., and was employed in the conftruction of the banquetting-houfe at Whitehall. After the great fire in London, this ftone was generally ufed by fir Chriftopher Wren in the conftruction of the new public edifices, as St. Paul's cathedral, the monument, and almoft every building of note in the metropolis. See Stone *for Architecture*.

The different beds of roe-ftone abound in marine organic remains, of which the pear encrinite is perhaps the moft remarkable. In the lower beds are found the hippocephaloides, or horfe-head mufcles, which, according to Mr. Townfon, are not cafts, but petrifactions of the fifh itfelf, and do not reprefent the interior furface of the fhells, from which they are perfectly diftinct. This ftratum alfo contains the anomia Spinofa of Linnæus. The fpines are extremely delicate, and in fome fpecimens are more than half an inch in length; from which circumftance we may infer, that the calcareous earth of this ftratum was depofited in an extremely comminuted ftate, and in a tranquil element, otherwife it is almoft impoffible to conceive that thefe fpines could have remained unbroken.

ROEDBACH, in *Geography*, a river of the duchy of Berg, which runs into the Rhine, two miles below Zons.

ROELL, Hermann-Alexander, in *Biography*, a celebrated Proteftant divine, and theological profeffor, was born in 1653 at Doëlberg, in Weftphalia. He received an excellent education in the languages and elementary branches of fcience. In 1670 he went to the univerfity of Utrecht, where he received lectures from the celebrated Francis Burmann on the fcriptures; and on his return to Germany, he ftudied for fome time at Marpurg, and after that at Heidelberg. From thence he went to Bafil and Zurich; and in 1676 he once more vifited the United Provinces, and fpent two years at the univerfities of Utrecht and Leyden. No fooner had he returned to his native country than he received an invitation to become paftor of the Proteftant church at Cologne, which he declined, owing to ill health; and he undertook the chaplainfhip to Elizabeth, abbefs of Hervorden, and daughter of Frederic, king of Bohemia; which poft he retained till the death of the princefs, in 1680. After this he was appointed preacher to Albertine, princefs of Orange, and widow of William of Naffau; in whofe houfehold, and at Deventer, he exercifed the

the miniſtry till the year 1686, when he was elected profeſſor of divinity at the univerſity of Franeker. In 1704 he accepted an invitation to fill the divinity chair at the univerſity of Utrecht, a poſt which he retained with great reputation till his death in 1718, when he was in the 66th year of his age. He was author of many works chiefly on theological topics, among which are "A Commentary upon the Epiſtle to the Epheſians;" "An Analyſis of the Epiſtle to the Coloſſians;" "An Analyſis and Abridgment of the Prophetical Books of the Old Teſtament;" "Two philoſophical Diſſertations on Natural Religion, and one on Innate Ideas."

ROELLA, in *Botany*, ſo named by Linnæus, in Hort. Cliff. 492, to commemorate William Roëll, profeſſor of anatomy at Amſterdam, who enriched Cliffort's garden with many rare plants, the ſeeds of which he had procured from Africa and Japan. Among thoſe from the Cape of Good Hope, was the firſt ſpecies of the preſent genus.—Linn. Gen. 88. Schreb. 118. Willd. Sp. Pl. v. 1. 918. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 353. Juſſ. 165. Lamarck Illuſtr. t. 123. Gærtn. t. 31.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, turbinate, permanent, in five large, deep, lanceolate, acute, toothed ſegments. *Cor.* of one petal, funnel-ſhaped, deciduous; tube rather ſhorter than the calyx; limb ſomewhat ſpreading, longer than the calyx, deeply five-cleft. Nectary of five converging ſcales, in the bottom of the corolla, permanent. *Stam.* Filaments five, awl-ſhaped, ſtanding on the nectary; anthers awl-ſhaped, converging, equal in length to the filaments, and on a level with the calyx. *Piſt.* Germen inferior, oblong; ſtyle thread-ſhaped, the length of the ſtamens; ſtigmas two, oblong, depreſſed, ſpreading. *Peric.* Capſule cylindrical, ſhorter than the calyx, crowned with its enlarged ſpreading ſegments, two-celled, burſting at the ſummit. *Seeds* numerous, angular.

Eſſ. Ch. Corolla funnel-ſhaped, cloſed at the bottom by valves bearing the ſtamens. Stigma in two ſegments. Capſule inferior, cylindrical, opening at the ſummit.

Obſ. Linnæus attributes two cells to the capſule; Gærtner only one. Probably one may be occaſionally abortive. The eſſential diſtinction ſeems to conſiſt in the capſule having a vertical opening, inſtead of diſcharging the ſeeds by torn lateral orifices, as in *Campanula*, to which genus this is certainly, in other reſpects, very nearly allied. All the known ſpecies are natives of the Cape of Good Hope, being green-houſe plants in England, and having blue flowers.

1. R. *ciliata*. Ciliated Roella. Linn. Sp. Pl. 241. Hort. Cliff. t. 35. Willd. n. 1. Ait. n. 1. Curt. Mag. t. 378. (Campanula africana fruteſcens aculeoſa, flore violaceo; Comm. Hort. v. 2. 77. t. 39.)—Leaves lanceolate, fringed, with a prominent point. Flowers terminal, ſolitary.—Found in various parts of ſouthern Africa. The Dutch have long cultivated it. Mr. Maſſon ſent ſeeds to Kew in 1774. The plant is not very common, though much to be admired for the beauty of its flowers, which are produced in ſucceſſion, throughout moſt part of the ſummer; but it is not eaſily increaſed, nor long preſerved, being impatient of our damp winters. The *ſtem* is ſhrubby, of humble growth, branching in a determinate manner; the *branches* ſlender, round, leafy. *Leaves* copious, alternate, ſmall, of a pale dull green, linear-lanceolate, fringed, each ending in a prominent, awl-ſhaped, rigid point. *Flowers* ſolitary at the ends of the branches, an inch and half, or more, in diameter, their colours well deſcribed by Curtis as follows. "The bottom of the *flower* is white, of a yellowiſh caſt; next ſucceeds a circle of deep blue, inclining to black, with a ſurface highly glazed; the next circle is greyiſh-blue, reſembling ſatin; the next nearly white, and the outermoſt, (or limb,) pale purple." Each *leaf* of the plant is accompanied by an axillary tuft of ſmaller, obtuſe, entire, naked ones.

2. R. *ſquarroſa*. Trailing Roella. Linn. Suppl. 143. Thunb. Prodr. 38. Willd. n. 2. Ait. n. 2.—Leaves ovate, recurved, toothed, fringed. Flowers terminal, aggregate. Stem herbaceous, diffuſe.—Gathered by Thunberg at the Cape, and ſent from thence to Kew garden, by Maſſon, in 1787. It bloſſoms in June. The *branches* are more ſpreading and decumbent, as well as of a leſs ſhrubby nature, than the former. The *ſquarroſa* of Bergius, from whom the younger Linnæus adopted the name, is deſcribed as a *ſhrub*, with ſolitary *flowers*. Ours, beſides the terminal tuft, has generally ſeveral ſcattered lateral *flowers*, on ſhort leafy ſtalks, or branches, which may explain this apparent diſagreement.

3. R. *decurrens*. Decurrent Roella. L'Herit. Sert. 4. t. 6. Willd. n. 3. Ait. n. 3.—Leaves lanceolate, entire, fringed, decurrent. Flowers ſolitary, terminal.—Sent from the Cape, by Mr. Maſſon, in 1787. This ſpecies is annual, flowering in September. The *root* is ſmall and tapering. *Stem* much branched from the very bottom, ſpreading and partly decumbent, hairy. *Leaves* ovato-lanceolate, fringed, for the moſt part entire; ſtrongly decurrent, ſo as to render the ſtem winged. *Flowers* terminal, ſeſſile, pale blue, ſolitary, except occaſionally on the moſt luxuriant branches.

4. R. *muſcoſa*. Moſſy Roella. Linn. Suppl. 143. Willd. n. 4. Thunb. Prodr. 38.—Leaves ovate, toothed, reflexed, ſmooth. Flowers terminal, ſolitary. Stem herbaceous, diffuſe.—Gathered at the Cape by Thunberg. A very ſmall annual ſpecies.

5. R. *ſpicata*. Spiked Roella. Linn. Suppl. 143. Willd. n. 5. Thunb. Prodr. 38.—Leaves lanceolate, fringed, nearly entire. Flowers terminal, ſomewhat ſpiked. Stem ſhrubby, erect.—Found by Thunberg at the Cape. We have ſeen no ſpecimen of this or the laſt.

Linnæus, in Sp. Pl. 241, has ? *R. reticulata*, adopted from Van Royen and Petiver, which appears to be no other than his own *Gorteria ciliaris*; *Cullumia ciliaris* of Brown, in Ait. Hort. Kew. v. 5. 137.

ROEMER, Olaus, in *Biography*, a Daniſh aſtronomer and mathematician, who flouriſhed in the 17th and 18th centuries, was born at Arhuſſen, in Jutland, in the year 1644. From an elementary ſchool at his native city he was ſent to the univerſity of Copenhagen, in 1662, where he diſtinguiſhed himſelf by the progreſs which he made in his academical ſtudies, and particularly in the mathematical ſciences, which were the favourite ſubjects of his purſuit. By diligent ſtudy he had, in 1671, become ſo expert an aſtronomer, that, being introduced to M. Picard of the Academy of Sciences at Paris, who was ſent by Louis XIV. to make aſtronomical obſervations in the northern regions, he was ſelected to accompany him when he returned to France. Here he preſented him to the king, who appointed him mathematical preceptor to the dauphin, and ſettled a penſion upon him. Roemer was united with Picard and Caſſini in making aſtronomical obſervations, and in 1672 he was admitted a member of the Royal Academy of Sciences at Paris. He reſided ten years at Paris, and acquired a high reputation by his many diſcoveries, among which was the very important one by which he aſcertained the velocity with which light moves, by means of the eclipſes of Jupiter's ſatellites. (See Light.) This diſcovery was afterwards confirmed by Dr. Bradley. In 1681 Roemer was recalled to his own country by Chriſtian V. king of Denmark, who

who appointed him professor of astronomy, at the university of Copenhagen, and gave him the flattering title of *his own mathematician*, with a considerable salary. He was also employed in reforming the coin; improving the public buildings; regulating the weights and measures; and in surveying and laying out the high roads throughout the kingdom. In 1687 the king directed him to travel through Germany, France, England, and Holland, in order to collect such information, on a variety of points, as might be applied to beneficial purposes in Denmark. Upon his return home in the following year, he was made counsellor of the chancellery, and in 1693, assessor of the supreme tribunal of justice.

Christian V. was succeeded by Frederic IV. who appointed Roemer, in 1705, burgomaster of Copenhagen, and in 1706, honoured him with the dignity of counsellor of state. Roemer died in 1710, just as he was about to give the world the result of his observations. These, however, were published under the title of "Basis Astronomiæ," in 1753, by Peter Horrebow, who had been his disciple, and was, at the time, professor of astronomy at Copenhagen. Accounts of Roemer's astronomical observations, and some other of his pieces, will be found in the different volumes of the "Memoires" of the Royal Academy at Paris, particularly vols. i. and x.

ROENBERG, in *Geography*, a town of Brandenburg, in the New Mark; 8 miles E. of Zullichau.

ROENENG, a long measure in Siam, equal to one league, containing 4204 English yards, or 2⅓ miles nearly.

ROENSEL, in *Geography*, a river of the county of Mark, which runs into the Wipper, about a mile above Wipperfurt.

ROER, a river of Germany, which rises near Winterburg, and runs into the Rhine at Roerort.—Also, a river of France, which rises S. of Montjoe, in the department to which it gives name, and runs into the Meuse at Ruremond.

ROER, one of the three departments of the region of France, called the Reunited country; composed of the duchy of Juliers and a portion of the electorate of Cologne, situated in N. lat. 51°, on the left hand of the Rhine. It contains 6697 kiliometres, or 259 square miles, and 516,246 inhabitants. It is divided into 4 circles or districts, 40 cantons, and 993 communes. The districts are Aix-la-Chapelle, including 165,261 inhabitants; Cologne, with 157,215; Crevelt, with 137,605; and Cleves, with 76,206 inhabitants. According to Hassenfratz, this department is 23 French leagues in length and 13 in breadth; and comprehends 4 circles, 40 cantons, and 324,960 inhabitants. Its capital is Aix-la-Chapelle. Its contributions, in the 11th year of the French era, were 4,564,150 fr. and its expences for administration and public instruction were 331,936 fr. 66 cents. Interspersed with heaths and marshes, this territory is, in general, fertile in grain, fruits, and pastures. It has mines of copper, iron, lead, and coal, with cold and hot mineral springs.

ROERMONT. See RUREMOND.

ROERORT, a town of the duchy of Cleves, at the conflux of the Roer and the Rhine; 15 miles N. of Dusseldorf.

ROESBACH, a river of the duchy of Berg, which runs into the Rhine at Dusseldorf.

ROESCHILD, ROSCHILD, *Roeskild*, or *Roskild*, a town of Denmark, in the island of Zealand, erected into a bishopric in the year 1012. In the year 1150 it was first encompassed with a rampart and ditch, and in 1268 or 1278 it obtained the privileges of a city. It gradually increased to such an extent as to contain 27 large churches and convents within its walls. Some of the churches of the neighbouring villages were included within its circuit, and its streets extended as far as the sea-shore. The kings of Denmark were formerly elected and crowned in this city, and made it the place of their residence. Its subsequent decay has been owing to frequent fires, to the tyranny of its bishops, and also to the flourishing state of Copenhagen. The reformation contributed also to its decline, as the monks and clergy who spent a great part of their revenues in this place, were obliged to quit the country. At present Roeschild is a mean place, containing about 200 houses; the cathedral, built A. D. 930, where the royal families of Denmark have for many ages been buried; and the ruins of a royal palace. Here are some monuments worthy of attention, particularly four elegant mausolea in alabaster, of late kings and queens. The first king who was buried here was Harol Blaacland, A. D. 980, and the last was Frederic V. surnamed the Great, A. D. 1766. The inhabitants support themselves chiefly by agriculture, and the planting of tobacco. In the year 1658, the famous peace of Roeschild, between the Swedes and Danes, was concluded here: 16 miles W. of Copenhagen. N. lat. 55° 39′. E. long. 12° 6′.

ROESCHULT, a town of Sweden, in the province of Smaland, said to be the native place of the famous Linnæus.

ROESENDAEL, a town of Brabant; 8 miles E. of Berg-op-Zoom.

ROESSEL. See ROSSEL.

ROETTVIK, or RAETTVIK, a mountain of Sweden, which, according to Bergman, is calcareous, and the height of which he estimates at 6000 feet above the sea; observing, as a singularity, that upon this mountain and that of Rodeberg, are found vast blocks of reddish felspar, mingled with quartz and brown mica.

ROEVAERT, a river of Brabant, which runs from Breda into the sea.

ROEULX, LA, a town of France, in the department of Gemappe; 8 miles N.E. of Mons.

ROEUX, a town of France, in the department of the straits of Calais; 9 miles E. of Arras.

ROFANI, a cape of European Turkey, on the S. coast of Romania. N. lat. 40° 35′. E. long 24° 14′.

ROFFENSIS TEXTUS. See TEXTUS.

ROFRANO, in *Geography*, a town of Naples, in Principato Citra; nine miles N.W. of Policastro.

ROGA, a town of Naples, in the province of Otranto; seven miles N. of Otranto.

ROGA, ῥογα, in *Antiquity*, a donative, or present, which the Augusti, or emperors, made to the senators, magistrates, and even the people; and the popes, or patriarchs, to their clergy.

The word is derived by some from the Latin *erogare, to give*, or *distribute*; according to others from *rogo, I ask*; hence, say they, it is that St. Gregory the Great calls such distributions *precaria*, as being to be demanded in order to be had. Others, again, derive it from the Greek ῥοξος, sometimes used for *corn*; because it anciently consisted in corn, distributed among the populace, the soldiery, &c.

The emperors used to distribute these rogæ on the first day of the year, or on their birth-day, or on the natalis dies of the cities. The popes and patriarchs in Passion Week.

This custom of rogæ, or largesses, was introduced by the tribunes of the people, to gain the populace more effectually over to their interest. The emperors at length took it up, and made such distributions to the people, and even to the soldiery, who are hence called by the Greek writers of the middle age ῥογατορες.

ROGA is also used for the ordinary pay of the soldiery.

ROGA-

ROGANELLO, in *Geography*, a river of Naples, which runs into the gulf of Tarento, near Civita Mendrino.

ROGATCHEV, a town of Ruſſia, in the government of Mogilev, on the Dnieper; 76 miles S. of Mogilev. N. lat. 52° 36′. E. long. 30° 14′.

ROGATIO, Rogation, in the *Roman Juriſprudence*, a demand made by the conſuls, or the tribunes, of the Roman people, when a law was propoſed to be paſſed.

The demand was made in theſe terms: *Do you will and appoint that* (for inſtance) *war be declared againſt Philip?* This was the *rogatio;* and what the people returned in anſwer, as, *The Roman people do appoint war to be made againſt Philip*, was the *decretum*, *decree*, or *reſolve*.

The word *rogatio* is frequently alſo uſed for the decree itſelf, to diſtinguiſh it from a ſenatus-conſultum, or decree of the ſenate.

Frequently, alſo, *rogatio* is uſed in the ſame ſenſe with *law*, becauſe there never were any laws eſtabliſhed among the Romans, but what was done by this kind of rogation. Otherwiſe they were null.

ROGATION Week, the week immediately preceding Whitſunday; thus called from three faſts therein; *viz.* on the Monday, Tueſday, and Wedneſday, before Holy Thurſday, or the Aſcenſion of our Lord; called alſo *Rogations*, or *Rogation days*, becauſe of the extraordinary prayers, and proceſſions then made, for the fruits of the earth.

Dr. Godolphin ſays, the Rogation days derive their name from certain ordinances for abſtinence, or days of faſting, which the biſhop of Rome recommended to be obſerved by the Weſtern churches, before he aſſumed the power of compulſion; and which he, therefore, called by the gentle name of *Rogation*, the time of abſtinence being appointed at the beginning by that ordinance, which was called *Rogatio*, and not *lex*, or *decretum*.

The firſt who appointed theſe rogations was St. Mamertus, biſhop of Vienne, who, in 474, aſſembled ſeveral biſhops, to implore the mercy of God by a faſt of three days, on occaſion of an incurſion then made into the country by a number of wild beaſts. Others ſay, it was firſt ſet on foot by the ſame Mamertus, in 463, on occaſion of ſome great public calamities.

His example was ſoon followed, firſt by the church of Clermont, in Auvergne, then by all their neighbours, and afterwards throughout all Gaul.

In 801, Leo III. confirmed this faſt, and made it univerſal.

ROGATORES, among the Romans, thoſe who in the comitia centuriata brought the cheſt into which the people threw the ballots containing their votes.

ROGE, in *Geography*, a town of Sweden, in the province of Skone; 28 miles N.W. of Chriſtianſtadt.

ROGEHAUSEN, a town of Pruſſia, in the palatinate of Culm; 21 miles N.E of Culm.

ROGELGRUBE, a town of Pruſſia, in the Friſche Nerung; 15 miles N.W. of Elbing.

ROGELIM, in *Scripture Geography*, a place of Judea, in the tribe of Gad, the reſidence of Barzillai; mentioned in the book of Kings.

ROGER, in *Biography*, firſt king of Sicily, born in 1097, was ſon of Roger, count of Sicily, and grandſon of the Norman Tancred of Hauteville. He ſucceeded in his fourth year to the ſovereignty of Sicily, under the guardianſhip of his mother Adelaide. As ſoon as he aſſumed the reins of government, he endeavoured to obtain the undivided poſſeſſion of Palermo, of which a half belonged to the elder branch of his family, and alſo to enlarge the bounds of his eſtates in Calabria. On the death of his relation, William, duke of Apulia, he was proclaimed at Reggio duke of Apulia and Calabria; but the pope, Honorius II., refuſed for ſome time to grant him an inveſtiture to thoſe duchies; at length, however, an accommodation was effected, and the pope became his friend. He was now a powerful prince, and being urged by ſome of his ſubjects to aſſume the regal title, he readily complied with their wiſhes. In 1130 he convoked an aſſembly of his barons at Palermo, and received with great pomp and ceremony the royal crown of Sicily from the hands of a cardinal, delegated for the purpoſe. He was inveſted at the ſame time with the principality of Capua and the dukedom of Naples. A rebellion broke out among his new ſubjects in Italy, which obliged him to retire to Salerno, and thence to Sicily. Roger, at this period, had eſpouſed the cauſe of Anacletus, while the emperor Lothaire had eſpouſed the cauſe of Innocent II., who was likewiſe acknowledged by ſeveral of the Italian ſtates. A formidable confederacy was formed againſt Roger, in which the republic of Piſa, then a powerful maritime ſtate, took a leading part. An active war was carried on for ſeveral years with various ſucceſs in the ſouth of Italy. In 1137 the emperor reduced the whole of Apulia, of which a new duke was created, while Roger was excommunicated by Innocent II. In 1139 he took the pope priſoner, who was obliged to purchaſe his liberty by the abſolution of the king, and his inveſtiture in Sicily, Apulia, and Capua. From this period the affairs of Roger became proſperous, and the ſucceſſors of Innocent, who had refuſed to acknowledge his regal title, were brought to comply by the terror of his arms. About the year 1146, Roger carried his arms into Africa, and after reducing Malta, which from this period was annexed to the crown of Sicily, he made himſelf maſter of Tripoli, Tunis, and other extenſive tracks along the ſea-coaſt, which he rendered tributary. About the ſame time he avenged himſelf of the injuſtice of the Greek emperor, Manuel, who had impriſoned his ambaſſadors, and offered him other indignities, by ſending a powerful fleet, which took the iſland of Corfu, and cruelly ravaged the coaſt of Morea. One reſult of this expedition was, the carrying off a number of ſilk manufacturers, and ſettling them in Apulia and Sicily, where they introduced their art. His admiral advanced as far as Conſtantinople, the ſuburbs of which he pillaged and burnt; and he had the honour of ſetting at liberty Lewis VII. of France, who, on his return from the Holy Land, had been intercepted by a Grecian ſquadron. Manuel, however, aſſiſted by the Venetians, purſued and in part deſtroyed the Sicilian fleet, and recovered Corfu. Roger now aſſociated his only ſurviving ſon with him on the throne, and after employing the laſt years of his life in erecting monuments of his munificence and piety, he expired at Palermo in the year 1154, in the 58th year of his age, and 25th of his reign as king, leaving the character of one of the ableſt, moſt vigorous, and fortunate princes of his time. Gibbon, vol. x. Mod. Univer. Hiſt.

Roger de Hoveden, a learned hiſtorian of the 13th century, was probably born at the town of Hoveden or Howden, in Yorkſhire, ſome time in the reign of Henry I. Having received the early parts of his education, he began to ſtudy the civil and canon law, which were then become the moſt faſhionable branches of learning. He was appointed domeſtic chaplain to Henry II., who employed him in many eccleſiaſtical affairs, in which he acquitted himſelf with high honour. He is, however, beſt known by his Annals of England, from the year 731, where Bede's Eccleſiaſtical

Hiſtory ends, to 1202. This work, which is one of the moſt voluminous of our ancient hiſtories, is more valuable for the ſincerity with which it is written, and the great variety of facts which it contains, than for the neatneſs of its ſtyle, or the regularity of its arrangement.

ROGERS, John, an Engliſh divine, was educated at Cambridge, and became chaplain to the factory at Antwerp, where he aſſiſted Tindal and Coverdale in tranſlating the Bible into Engliſh. In the reign of Edward VI. he returned to England, and obtained a prebend in St. Paul's cathedral, where he was a frequent and zealous preacher. He was the firſt perſon executed in the reign of the bloody Mary, being burnt in Smithfield in 1555. In the former reign he had been, at leaſt, an abettor of the ſame ſort of perſecution of which he himſelf became the victim. This fact deſerves to be recorded. When the Proteſtant biſhops had determined to burn Joan of Kent, a friend of Rogers, the divinity reader in St. Paul's church, came to him, earneſtly deſiring him to uſe his intereſt with the archbiſhop, that the poor woman's life might be ſpared, and other means uſed to prevent the ſpreading of her opinions, which might be done in time; urging, though that while ſhe lived ſhe infected few with her opinion, yet ſhe might bring many to think well of it by ſuffering death for it; he pleaded, therefore, that it was better ſhe ſhould be kept in ſome priſon, without an opportunity of propagating her notions among weak people; and ſo ſhe would do no harm to others, and might live to repent herſelf. Rogers on the other hand pleaded, ſhe ought to be put to death. Well then, ſays his friend, if you are reſolved to put an end to her life, together with her opinions, chooſe ſome other kind of death more agreeable to the gentleneſs and mercy preſcribed in the Goſpel, there being no need that ſuch tormenting deaths ſhould be taken up in imitation of the Papiſts. Rogers anſwered, that burning alive was no cruel death, but eaſy enough. His friend, then hearing theſe words, which expreſſed ſo little regard to the poor creature's ſufferings, anſwered him with great vehemence, and ſtriking Rogers's hand, which he before held faſt, ſaid to him, "Well, it may perhaps ſo happen, that you yourſelves ſhall have your hands full of that mild burning." And ſo it came to paſs. Mr. Pierce, who has recorded this anecdote, conjectures with great probability, that the friend of Rogers was the hiſtorian himſelf.

Rogers, captain Wood, a famous Engliſh navigator in the early part of the eighteenth century, of whoſe private hiſtory little is known, ſailed in the Duke, a private ſhip of war, of 30 guns and 170 men, in company with the Ducheſs, a ſmaller veſſel, commanded by captain Stephen Courtney, on an expedition into the South ſeas againſt the Spaniards. Theſe ſhips were fitted out by a company of merchants at Briſtol, and they ſet ſail on the 1ſt of Auguſt, 1708. On board one of them as pilot was the afterwards celebrated captain Dampier, (ſee his article.) In paſſing the ſtraits of Magellan, they not only captured ſeveral ſhips, but likewiſe took ſeveral towns upon the coaſt, and on the 22d of December 1709, they met with the famous Acapulco ſhip, which was the leſſer of two ſhips, which at that period ſailed annually from the Eaſt Indies to Mexico. She carried 20 guns, and would not ſurrender until ſhe was overcome: an action began and laſted about half an hour, when the Spaniard hauled down her colours; and ſhe was found to be a moſt valuable prize, worth 2,000,000 pieces of eight. After this they met with the larger Acapulco ſhip, but having ſkirmiſhed two days, they found it impoſſible to capture her. They therefore determined to return by the Eaſt Indies, and arrived in the Downs after having circumnavigated the globe, on the 2d of October, 1711. This voyage, which was abundantly ſucceſsful, led to the foundation of the South Sea Company; which ſee. In 1718, captain Rogers having been appointed governor of the Bahama iſlands, proved himſelf well adapted to the ſituation, by the vigorous meaſures which he adopted againſt the pirates, who had become moſt inimical to the trading intereſts of the country. He arrived at Providence, after a ſhort and eaſy paſſage, on the 11th of April, took poſſeſſion of the town of Naſſau, and the whole iſland, much to the ſatisfaction of the inhabitants, and many of the pirates, who had ſettled themſelves there, ſubmitted at once to his authority. He proceeded ſoon after in forming a council, and ſettling the government of thoſe iſlands, appointing civil and military officers, raiſing militia, and taking every other ſtep neceſſary for procuring ſafety at home, and ſecurity from any thing that might be attempted from abroad, in which by degrees he completely ſucceeded. Some of the pirates at firſt rejected the terms, and continued to do a good deal of miſchief on the coaſt of Carolina; but when they ſaw that captain Rogers had thoroughly ſettled himſelf at Providence, and was not to be trifled with, and that the inhabitants of the Bahamas found it to be to their intereſt to be honeſt, they thought proper to ſolicit mercy; ſo that by the 1ſt of July, 1719, to which day the king's proclamation had been extended, there were not above three or four veſſels of thoſe pirates which continued to trade, two of theſe being captured, and their crews executed, the reſt diſperſed. "Thus," ſays the judicious Campbell, "in a ſhort time, and chiefly through the ſteady and prudent conduct of governor Rogers, this herd of villains was in ſome meaſure diſſolved, who for many years had frighted the Weſt Indies and the northern colonies, coming at laſt to be ſo ſtrong that few merchantmen were ſafe, and withal ſo cruel, that ſlavery among the Turks was preferable to falling into their hands." See Campbell's Lives of the Admirals, Stockdale's edition, vols. iii. and iv.

Rogers, Benjamin, doctor of muſic, an eccleſiaſtical compoſer, whoſe works are ſtill contained in our cathedral ſervice, and for whoſe fame Anthony Wood has manifeſted great zeal. This muſician was born at Windſor, and brought up in that college under Dr. Nath. Giles; being employed there, firſt as a ſinging boy, and afterwards in the capacity of lay clerk or ſinging man. Thence he went to Ireland, and was appointed organiſt of Chriſt-church in Dublin, where he continued till the breaking out of the rebellion, in 1641; at which time, being forced to quit his ſtation, he returned to Windſor, where he was again reinſtated as choirman; but being ſoon after ſilenced in conſequence of the civil wars, he procured a ſubſiſtence by teaching in the neighbourhood. And during this time, according to his friend Ant. Wood, having addicted himſelf much to ſtudy, he acquired great credit as a compoſer, and produced ſeveral ſets of airs in four parts for violins and an organ, which being then imagined the beſt that *could* be compoſed of that kind, were ſent as great rarities to the archduke Leopold, afterwards emperor, and himſelf a great muſician; and, upon their being performed by his band, they were very much admired.

In 1658, by the favour of his friend Dr. Ingelo, he obtained the degree of bachelor in muſic at Cambridge, and acquired great reputation in that univerſity by his exerciſe. Soon after, on Dr. Ingelo going chaplain to Bulſtrode lord Whitelock, into Sweden, he carried with him ſome of Ben. Rogers's beſt compoſitions, which, upon being repeatedly

peatedly performed in the presence of Christiana, queen of Sweden, were very much applauded.

At the Restoration he was appointed to compose the music that was performed at Guildhall, on the day his majesty and his brothers, the dukes of York and Gloucester, dined there with the lord mayor, by which he greatly increased his reputation.

About this time he was chosen organist of Eton college, which he resigned soon after, on being invited to Oxford, where he was appointed to the same office in Magdalen college. And in 1669, upon opening the new theatre in that city, he was created doctor in music. He continued, says Ant. Wood, in the university, where he was much esteemed, till the year 1685, when he was ejected, in company with the fellows of his college, by king James II. after which he long resided in the skirts of the town, wholly disregarded.

"His compositions for instruments," says Ant. Wood, "whether in two, three, or four parts, have been highly valued, and were thirty years ago always first called for, taken out and played as well in the public music schools, as in private chambers: and Dr. Wilson, the professor, (the greatest and most curious judge of music that ever was,) usually wept when he heard them well performed, as being wrapt up in an ecstacy; or, if you will, melted down: while others smiled, or had their hands and eyes lifted up, at the excellence of them."

It is to be feared, that instead of *weeping*, the wicked lovers of modern music would now *laugh*, if they were to hear the quaint and starched strains, and see on paper the ruffs and roll-ups of honest Ben. Rogers at the Opera-house, or professional concert, Hanover-square. But, alas! what is the secular music, that thirty years have not wrinkled, withered, and rendered superannuated!

ROGERS'*s Point*, in *Geography*, a cape on the W. side of lake Huron. N. lat. 44° 19'. W. long. 82° 45'.

ROGERSVILLE, the chief town of Hawkins county, in the state of Tenessee, pleasantly situated in Carter's valley, with a prospect agreeably variegated by some round hills at a distance. It contains about 20 dwelling-houses, some public buildings, stores, &c. It has a number of perennial springs, and one above the level of the streets.

ROGETS, a town of the duchy of Magdeburg, at the conflux of the Oura and Elbe; 16 miles N. of Magdeburg.

ROGGENDORF, a town of Austria; 8 miles W. of Aggspach.

ROGGEWELD, a transmontane division of the district of Stellenbosch and Drakenstein, at the Cape of Good Hope, called the Rye-grass country, and divided into Upper, Middle and Little. These are the summit of a long extended Table mountain, whose western front rises out of the Karroo plains, behind the Bokkeweld, almost perpendicularly, to the height of two or three thousand feet. Stretching to the eastward, this summit becomes more broken into inequalities of surface, and rises at length into the mountains of Nieuweld, the Camdeboo, and the Seeuwberg, which may be considered as one extended chain. The great elevation of the Roggeweld, and its being surrounded by the Karroo plains, make the temperature in winter so cold, that for four months in the year, the inhabitants are under the necessity of descending to the feet of the mountains, with their horses, cattle, and sheep. The strongest and largest breed of horses in the whole colony is that of the Roggeweld. See NIEUWELD.

ROGIERS, a town of France, in the department of the Var; 4 miles S. of St. Maximin.

ROGLIANO, a town of Naples, in Calabria Citra; 9 miles S.S.E. of Cosenza.—Also, a town of the island of Corsica; 20 miles N. of Bastia.

ROGME, in *Surgery*, a rupture or fracture.

ROGNES, in *Geography*, a town of France, in the department of the Mouths of the Rhone; 13 miles N.W. of Aix.

ROGO, an island of Sweden, near the E. coast, in the Baltic. N. lat. 57° 53'. E. long. 16° 36'.

ROGONATGUNGE, a town of Bengal; 30 miles S.W. of Rogonatpour. N. lat. 23° 17'. E. long. 86° 21'.

ROGONATPOUR, a town of Bengal, and capital of the circar of Pachete; 150 miles S.S.E. of Patna. N. lat. 23° 33'. E. long. 85° 44'.—Also, a town of Bengal; 31 miles S.E. of Kishenagur.

ROGOSNO, a town of the duchy of Warsaw; 16 miles N. of Posen.

ROGOWA, a town of Prussia, in the palatinate of Culm; 7 miles E. of Thorn.

ROGSTA, a town of Sweden, in Helsingland; 2 miles N.E. of Hudwickwall.

ROGUE, in *Law*, an idle and sturdy beggar, who, by ancient statutes, for the first offence, is called a *rogue of the first degree*, and punished by whipping, and boring through the gristle of the right ear, with a hot iron, an inch in compass; and, for the second offence, is called a *rogue of the second degree*, and ordered to be put to death as a felon, if he be above eighteen years of age. For the description and punishment of rogues, as they are established by 17 Geo. II. cap. 5, see VAGABOND.

ROGUES, or *Whores' March*, in *Military Language*, a beat of the drum, accompanied by the fifes, when a soldier is drummed out of the regiment, or common prostitutes are drummed out of camp or garrison.

ROGUES *Yarn*, a name given to a rope-yarn, which is placed in the middle of every strand, in all cables and cordage in the king's service. It differs from all the rest, as being untarred and twisted in a contrary manner, by which it is easily discovered. The use of this contrivance is to examine whether any cordage, supposed to be stolen or embezzled, has been formed for the king's service, the possessor of which is subject to a heavy fine. Falconer.

ROGUINS, in *Geography*, a town of France, in the department of the Rhone and Loire; 6 miles E. of Roanne.

ROGUN, a town of European Turkey, in Albania; 6 miles W.N.W. of Arta.

ROHACZOW, a town of Lithuania, in the palatinate of Minsk, on the Dnieper; 85 miles S.E. of Minsk. N. lat. 52° 50'. E. long. 29° 33'.

ROHALE, a small island on the W. side of the gulf of Bothnia, N. lat. 60° 37'. E. long. 17° 49'.

ROHAN, HENRY, *duke of*, in *Biography*, second of the name, but one of the first rank, talents, and character of the French nobility of his time, was born in 1579, at the castle of Blein, in Britanny. At the age of sixteen he distinguished himself at the siege of Amiens, under the eye of Henry IV., to whom he was presumptive heir, before the birth of the dauphin. After the death of Henry, he was at the head of the Calvinist party in France, a station which he retained during three religious wars against the authority of Lewis XIII. In the first, in 1621, he defended Montauban in person: the siege was raised, and in the following year a favourable peace was granted to the Protestants. The war was rekindled in 1625, but was soon terminated by a peace. At length Richelieu resolved entirely to subdue a party which had become a sort of separate republic

in

in France, allied for its own defence with her enemies. He besieged and took Rochelle, the ſtrong hold of the Calviniſts; and though the duke of Rohan vigorouſly maintained the war in Languedoc, he was at length obliged, in 1629, to make his ſubmiſſion, and the party was deprived of all its fortreſſes, but ſtill allowed the public exerciſe of its religion. To ſome of the moſt violent, who were enraged at the terms of accommodation, and accuſed their chief of having ſold them, he preſented his naked breaſt, ſaying, "ſtrike! I am content to die by your hands, after having ventured my life in your ſervice." As it was one of the conditions that he ſhould quit the kingdom till it pleaſed the king to recall him, he retired to Venice, and it is affirmed, that, during his reſidence in that city, the duke engaged in a negociation with the Ottoman Porte, for the purchaſe of the iſland of Cyprus, with a view of ſettling in it Proteſtant refugees from France and Germany, and that it failed principally through the death of the patriarch Cyril, by whoſe mediation it was carried on. The Venetian republic nominated him its general in chief againſt the Imperialiſts; but the king of France took him from its ſervice to ſend him ambaſſador to the Swiſs and Griſons. At the head of the troops of the latter, he drove the Germans and Spaniards out of the Valteline in 1633. He after this defeated the Spaniards on the banks of the lake Como, but the Griſons becoming ſuſpicious that it was not intended to withdraw the French troops from their country, roſe in arms, and the duke was obliged to make a ſeparate treaty with them in 1637. He now retired to Geneva, and from thence went to join his friend, the duke of Saxe-Weimar, with whom he fought againſt the Imperialiſts at Rheinfeld, in 1638. He was ſeverely wounded in the action, and died ſome weeks after, at the abbey of Konigfeld, in Switzerland, at the age of fifty-nine. His body was interred in the church of St. Peter, at Geneva, where a magnificent monument was erected to his memory. The duke was author of ſeveral works, military and political. Theſe are, "Les Interets des Princes;" "Le parfait Capitaine, ou l'Abrège des Commentaires de Cæſar;" "Un Traitè de la Corruption de la Milice ancienne;" "Un Traitè du Government des Treize Cantons;" "Memoires," containing the tranſactions in France from 1610 to 1629; "Recueil des quelque Diſcours politiques ſur les Affaires de l'Etat, depuis 1612 juſqu'en 1629;" "Memoires et Lettres de Henri, duc de Rohan, ſur la Guerre de la Valtelin." The duke was one of the greateſt captains of his time, and poſſeſſed all the qualities requiſite in the head of a party, together with diſintereſtedneſs, generoſity, and gentleneſs of manners. His wife, Margaret of Bethune, daughter of the great duke of Sully, warmly eſpouſed the intereſts of her huſband and party, and was greatly celebrated for her courage. His brother alſo, Benjamin de Rohan, lord of Soubiſe, acted a diſtinguiſhed part in the Calviniſt wars, and finally took refuge in England, where he died in 1690.

Rohan, in *Geography*, a town of France, in the department of the Morbihan, and chief place of a canton, in the diſtrict of Ploërmel; 10 miles N.W. of Joſſelin. The place contains 422, and the canton 9951 inhabitants, on a territory of $267\frac{1}{2}$ kiliometres, in 9 communes. N. lat. 48° 6′. W. long. 2° 40′.

ROHAN-ROHAN, a town of France, in the department of the Two Sevres; 6 miles S.S.W. of Niort.

ROHAULT, James, in *Biography*, a French philoſopher and mathematician, was born at Amiens, in Picardy, in 1620. Having received the early part of his education at his native place, he was ſent to Paris, to ſtudy mathematics and philoſophy. In his enquiries he appears to have been poſſeſſed of an ardent love of truth, and to have ſought after it with the utmoſt diligence and impartiality. He ſtudied both the ancients and moderns, but Des Cartes was the author which engaged moſt of his notice, and of that celebrated philoſopher he became a zealous follower. His attachment to the ſyſtem of Des Cartes introduced him to the acquaintance of Claude Clerſelier, who gave him his daughter in marriage, in oppoſition to the remonſtrances of his family. He engaged his ſon-in-law to draw up an abridgment and explanation of the philoſophical works of Des Cartes, and to illuſtrate the ſame with notes. The reſult of his labours, which he entitled "Phyſics," was taught by him at Paris, during ten or twelve years before he gave it to the public. Rohault died in the year 1675, at the age of fifty-five, leaving behind him the character of an amiable, as well as very learned man. His Phyſics were tranſlated from the French into Latin by Dr. Samuel Clarke, who accompanied his verſion with notes that overſet the ſyſtem of Des Cartes, in order to make way for that of the illuſtrious ſir Iſaac Newton. The beſt edition of this tranſlation is that of 1718. Rohault alſo publiſhed "Elements of Mathematics," and "Dialogues concerning Philoſophy:" and after the author's death, a collection of pieces was made from his manuſcripts, and printed firſt at Paris, and afterwards at the Hague, in 1690, in two vols. 12mo. containing the firſt books of Euclid, Trigonometry, Practical Geometry, Fortification, Mechanics, Perſpective, &c.

ROHBA, in *Geography*, a town of Arabia, in the province of Hedsjas; 10 miles S. of Vadelkora.

ROHEETA, a town of Hindooſtan, in the circar of Gohud; 20 miles S.E. of Gohud.

ROHILCUND, or Rohilla, a circar or province of Hindooſtan, ſituated on the E. ſide of the Ganges, and N.W. of the ſubah of Oude. The territory of the Rohillas was formerly called Catheir, and recently derived its name from the conquerors of that tribe, who, about the year 1720, left Afghaniſtan, and the mountains which they occupied between India and Perſia, and came thither in purſuit of military ſervice. Theſe emigrants were firſt entertained by Madar Saha, the Hindoo chief of Serowly, a ſmall town in the N.W. quarter of Rohilcund, who, by robbery and predatory excurſions, maintained a large party of banditti. Some time afterwards, the Rohillas quarrelled with Madar Saha, and aſſociated with the chief of Bareilly; but, ſeparating from this chief, they made incurſions into the territory of the rajah of Kemaoon. In this expedition they at firſt ſucceeded, but were afterwards defeated; their leader, who was an original emigrant from Afghaniſtan, being taken priſoner and put to death. After his death, his aſſociate, Ali Mahomet, a youth of the ſect of Jats, whom he had captured in one of his excurſions, and brought up in the Mahometan religion, became the chief of the party; and being brave and enterpriſing, though young, he availed himſelf of every opportunity that occurred for advancing his power, and enlarging his territory. Ali, chiefly by the aſſiſtance of the vizier Kummer ud Dein, obtained a commiſſion for collecting the revenue of the penſion land, which, it is ſaid, he punctually remitted. From this period we may date the firſt eſtabliſhment of the Rohilla power in Rohilcund, the name by which they diſtinguiſhed the Cuttera or Kutterah diſtricts, and their other territories on the eaſt ſide of the Ganges. Ali Mahomet fixed his reſidence at Owlah, and eſtabliſhed throughout his territory a permanent ſyſtem of government, which, though occaſionally rigorous, afforded protection to the lower claſs of people. In proceſs of time, and in conſequence of ſeveral predatory acts which he committed, Ali was attacked by the prince Mahomet

Shah, who entered Rohilcund with a powerful armament, and took possession of the open country. At length he was compelled to surrender himself to the king, but by the intercession of Kummer ud Dein he was pardoned. With this event, which happened in the year 1745, the power of the Rohillas was annihilated in Rohilcund; and all their officers and principal people were removed to Delhi. Ali, having remained about a year at Delhi, under the protection of the vizier, was, by his recommendation, appointed the military governor of Sirhind, who, during his residence in this place, was joined by a body of 2000 or 3000 marauding Afghans; so that his party was computed to consist of 10,000 cavalry, and 15,000 or 20,000 infantry, of various denominations. Whilst the Mogul and Afghan armies were preparing for action, he quitted the Panjab and retired to Hurdwar, from whence he penetrated, in 1747, into Rohilcund, which he rapidly conquered, and soon after died at Owlah. The last army that might be reckoned *imperial*, was, in 1749, defeated by the Rohillas; by which their independency was firmly established in the eastern part of the province of Delhi. About the year 1750, the territory which had been personally possessed by Ali Mahomet, was, by the deliberation and agreement of the principal Rohilla officers, divided among his sons. At length, however, Hafiz Ahmed, who possessed military talents, in the exercise of which he had acquired influence in Rohilcund, superseded the authority of Saud Ullah, the third son of Ali Mahomet, and was advanced to the supreme administration of affairs; and at the death of Saud Ullah, which happened at Owlah in 1761, the power of Hafiz was established. The form of government adopted by the Rohillas in India, similar to that which subsisted in their native country, may be denominated feudal. The successors of one of the first invaders, *viz.* Daoud Khan, possessing very moderate hereditary pretensions, and surrounded by persons who had afforded essential assistance in the first conquest, held but a limited sway. Two of the most respectable of the Rohillas never ceased to oppose the progress of Hafiz Rhamut, who aimed at sovereign authority; but zealously attached to the interest of the widow of Saud Ullah, they formed a counterpoise to the encroaching power of that chief. The Afghan conquerors of Rohilcund, were a bold, rapacious, and lawless set of men; and after they had established a kind of government in India, they adopted the more effeminate vices of the south, and became intriguing, deceitful, and treacherous. The Rohillas, particularly those of the lower class, were, with few exceptions, the only Mahometans in India who exercised the profession of husbandry, and their attention to agriculture was amply recompensed by the abundance and superior qualities of the productions of Rohilcund. This country is said to have yielded to the Rohillas one million sterling, a sum which, in later times, has been very considerably reduced. According to Mr. Hamilton, the Rohillas themselves have been the great cause of the ruin of the country which bears their name; it was parcelled out among their chiefs, who had afterwards but a feeble connection with each other; while their dependence on Hafiz (Hasley) Rhamut, their prince, was more nominal than real. In the year 1773 the Mahrattas crossed the Ganges to invade the Rohilla country; but a brigade of the British marched to the western frontier of that country, and drove the Mahrattas across the river. For this protection the Rohilla chiefs had stipulated to pay Sujah Dowlah, nabob of Oude, 40 lacks of rupees; but when this essential service was performed by the British army, which moved as the allies of Sujah Dowlah, the payment of the money was evaded. This breach of treaty led to the invasion and conquest of the Rohilla country in the following year, 1774; and it was then added to the subah of Oude. Since this conquest, the country has rapidly degenerated into a waste, under the deleterious politics of the ministers of Oude. The natives are said to be a tall, handsome race of people; and when compared with the other inhabitants, are white and well featured. They continued for a considerable time to carry about in triumph some couches and palankeens of European officers that were killed by their army in the fatal action of 1774, by which we purchased a victory at a greater expence of European lives than was ever suffered by the same number of troops in India. The capital of Rohilcund is *Bereilly* or *Barelly*, which see. The district of Rampour, situated at the foot of the Northern mountains, and possessed by a Rohilla chief, is included in Rohilcund, but it was secured to Fizzoolah Cawn, the chief, by the treaty of Loldong, in 1774. It is valued at 30 lacks of rupees *per annum*; but he is, in effect, tributary to *Oude*, (which see,) by being bound to furnish his quota towards an establishment for the common defence.

ROHILLAMOW, a town of Hindoostan, in Oude; 21 miles S.S.E. of Kairabad.

ROHINI, in *Astronomy*, the Sanskrit name of a star, supposed to be that designated on our globes by α Tauri. In mythology it is an asterism that furnishes more poetical allusion than any other in the zodiac. Rohini is one of the sixty daughters of Daksha, and one of the twenty-seven espoused by Soma, or the moon; the lunar regent being male among the Hindoos, as it is with some European mythologists. (See SOMA.) Under the article NAKSHATRA, which means the asterisms marking the moon's path, mention is made of the poetical derivations from this fruitful source, and we will here add another instance of it, relating to Rohini, the favourite consort of the fickle Soma. In one of their terrestrial journies, arriving at the southern mountain Sahyadri, they unwarily entered the forest of Gauri, or Parvati, where some men, having formerly surprised Mahadeva caressing that goddess, they were punished by a change of their sex, and the forest had retained a power of effecting a like change on all males who should enter it. Soma, or Chandra, instantly becoming a female, (Chandri,) was so afflicted and ashamed, that she hastened far to the west, sending Rohini to her seat in the sky, and concealed herself in a mountain, afterwards named Somagiri, where she performed acts of the most rigorous devotion. Darkness then covered the world each night, the fruits of the earth were destroyed, and the universe was in such dismay, that the Devas, or divinities, with Brahma at their head, implored the assistance of Mahadeva, who, placing Chandri on his head, she became male again. Mahadeva, in statues and pictures, is usually seen with the moon on his head and forehead, and one of his names is Chandra-sekra, or *moon-crowned*. (See SIVA.) Another fable states that she was visited in her retreat by Surya, or the sun, from which conjunction arose a numerous progeny. Mahadeva is the sun; and this sol-lunarian progeny is, perhaps, vegetation. Under the article ILA is another lunarian fable, probably connected with these. Siva's spouse, Parvati, is as jealous as Juno.

These fables, taken from the Asiatic Researches, vol. iii. are related by Mr. Wilford, from Puranic authority; and were thus explained to him by an ingenious Pandit. To the inhabitant of the countries near the source of the Kali, or Nile, the moon, being in the mansion of Rohini, or the Pleiades, seemed to vanish behind the southern mountains. Now when the moon is in opposition to the sun, it is the god Chandra; in conjunction, the goddess Chandri. The moon is believed, by Hindoo naturalists, to have a powerful

ful influence on vegetation, especially on certain plants, and, above all, on the Somalata, or moon-plant. (See SOMALATA.) This mode of interpretation, Mr. Wilford adds, may serve as a clue to the intricate labyrinth of the Puranas, which contain all the history, physiology, and science of the Indians and Egyptians, disguised under similar fables. See PURANA.

ROHITZ, in *Geography*, a town of Stiria, in which is a medicinal spring; 20 miles E. of Cilley.

ROHL, a small island in the gulf of Finland. N. lat. 59° 55′. E. long. 26° 26′.

ROHLA, a river of Bohemia, which runs into the Egra, near Carlsbad.

ROHN, a town of Germany, in the county of Henneberg; two miles N.N.W. of Salzungen.

ROHN. See PULO *Ron*, and POOLARON.

ROHND, a town of Bengal; 15 miles N. of Toree.

ROHOB, a town of Judea, in the tribe of Asher, mentioned in the books of Joshua and Numbers. To this place Moses sent twelve men to reconnoitre the land of promise. It was assigned to the Levites of the family of Gershon.

ROHOSSETZ, a town of Bohemia, in the circle of Boleslaw; eight miles N.W. of Turnau.

ROHR, a town of the duchy of Stiria; nine miles W. of Gnaa.—Also, a river of the duchy of Bremen, which runs into the Weser near Carlsburg.—Also, a town of Germany, in the principality of Culmbach; five miles S.E. of Culmbach.—Also, a town of Germany, in the county of Henneberg; two miles E. of Meinungen.

ROHR, *Inn*, a town of Austria; 10 miles N.W. of Neustadt.

ROHRBACH, a town of Germany, belonging to the priory of Odenheim; 10 miles W. of Heilbronn.

ROHRBECK, a town of Saxony, in the principality of Querfurt; two miles S. of Juterbock.

ROHRIA, in *Botany*, a genus of Schreber's, has been supposed, by De Theis, to commemorate Julius Bernard von Rohr, a German botanical writer of the middle of the 18th century, whose works are little known out of his own country. We rather presume, with professor Martyn, that the author of this name had in view a more recent, and very eminent, practical botanist, long resident in South America, Julius Philip Benjamin von Rohr, perhaps a relation of the former, whose discoveries are often mentioned by Vahl, and who has written on *Quassia amara*, the culture of Cotton, and other subjects. Thunberg has also a *Rohria*, adopted from Vahl; which having been previously called *Berckheya*, by Ehrhart, is now retained under the latter name in Willd. Sp. Pl. v. 3. 2269.—Schreb. Gen. 30. Willd. Sp. Pl. v. 1. 186. Mart. Mill. Dict. v. 4. (Tapura? Aubl. Guian. v. 1. 126. Juss. 419. Lamarck Illustr. t. 122.)—Class and order, *Triandria Monogynia*. Nat. Ord. uncertain, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-shaped, in five deep, ovate, concave, obtuse, fringed, coriaceous segments, the two interior ones rather longest. *Cor.* Petals five, erect, longer than the calyx, the two uppermost rather largest, the three lower smallest; claws narrow, dilated at the base, woolly on the inside, a little bent outwards under the border; which in each petal is ovate, erect; in the larger petals hooded inwards; in the smaller expanded and bluntish. *Stam.* Filaments three, one between the two larger petals, two at their sides, connected below with their claws, all thread-shaped, longer than the corolla, woolly at the inside; anthers roundish, erect, directed inwards. *Pist.* Germen superior, turbinate, downy; style thread-shaped, villous, the length of the stamens; stigmas three, revolute. *Peric.* and *Seeds* unknown.

Eff. Ch. Calyx bell-shaped, in five deep segments. Petals five, unequal. Stigmas three, revolute.

Obs. Schreber doubted whether his plant were the same with Aublet's, because the latter describes the corolla as monopetalous, and the three long stamens as accompanied by two short ones besides. This last circumstance may be accidental; the corolla seems more material. The flowers however are so minute, that Schreber, having seen them in a dried state only, might easily be mistaken. As he is the author of the name *Rohria*, we prefer his description, as Aublet's plant, if different, must have another generic appellation.

1. R. *petioliflora*. Willd. n. 1. (Tapura guianensis; Aubl. Guian. v. 1. 126. t. 48?)—The plant of Aublet was found in forests, near the Serpent mountain, in Guiana, flowering in August. It is a shrub, 12 feet, or more, in height, with many flexible, roundish, smooth *branches*. *Leaves* alternate, on short thick stalks, elliptic-lanceolate, pointed, entire, smooth and shining, about four inches long; paler beneath. Of *stipulas* we can perceive no traces in Aublet's specimen, except a slight intrafoliaceous abrupt border. *Flowers* yellow, small, five, seven, or more together, on very short stalks, springing from the summit of each *footstalk*, at the base of the leaf.

We presume Schreber received his specimens from von Rohr; and as they agreed with Aublet's in the very remarkable mode of inflorescence, and must have come from the same country, there can be little reason to suspect any real difference.

ROI *des Violons*, or king of the fidlers, in France. Each profession, or incorporated company, had formerly a superior, who was dignified with the title of king. The masons, carpenters, barbers, lawyers' clerks, cross-bow-men, the principal soldiers called *ribauds*, even the poets, and many other orders of men, had their particular kings; but their exactions and tyranny, by degrees, occasioned the abolition of these phantoms of sovereignty.

The minstrels, religious observers of ancient usages, were the last to relinquish this precious relic of antiquity. The king at arms, and king of the minstrels, were the only surviving monarchs of their calling. But the first has few tributaries, and his functions are only exercised occasionally; the other, on the contrary, was always in power, and pretended to exercise his empire over the whole realm.

The history of the first kings of the minstrels is unknown; it is only recorded that, after the decease of Constantin, the famous violin of the 17th century, the crown passed, in 1630, to Dummoir I., then to Dummoir II., who relinquished the crown by a voluntary abdication, occasioned by an anarchy, in 1685. Louis XIV. saw with indifference the extinction of this royalty, and declared that it was not his intention it should be restored.

This monarchy had been long agitated by internal troubles, and civil and foreign wars. The dancing-masters, originally incorporated with this company, had been 50 years soliciting its extinction; indignant at being united with such vile artizans, who dishonoured their faculty by playing at alehouses (cabarets) and places of debauchery; or if not totally silenced, that one of the strings of their fiddles should be cut off, and they reduced to their ancient level, and be allowed to play on no instrument but the three-stringed rebec.

They had commenced a suit against the city dancing-masters, and obtained a solemn sentence against them, January 14th, 1667. No company was ever more discordant, more tumultuous; all the courts of juſtice rang with their diviſions and quarrels, by which the law was enriched, and the public amuſed, at their expence. The interregnum laſted from 1685 to 1741, when the celebrated Guignon, the violiniſt, was ambitious of having the royalty revived in his favour. The king had the goodneſs to comply with his requeſt, and honoured him with the minſtrel crown, on the 15th of June the ſame year. But his election awakening a deſire to revive certain prerogatives, which he pretended to be inherent in his crown, he had ſuits and actions to defend againſt a hoſt of muſicians, particularly the organiſts, who obtained a complete victory; and Guignon, willing to give a proof of his love for the arts and diſintereſtedneſs, generouſly, and voluntarily, reſigned his ſovereignty of king of the minſtrels.

ROIDALK, in *Geography*, a town of Norway; 48 miles N.N.E. of Stavanger.

ROIHA. See OURFA.

ROIOC, in *Botany*, a barbarous South American, or perhaps Spaniſh, name, for one of Plumier's genera, rightly referred by other botaniſts to MORINDA; ſee that article.

ROISELLE, in *Geography*, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Péronne; ſix miles E.N.E. of Péronne. The place contains 1122, and the canton 14,428 inhabitants, on a territory of 190 kiliometres, in 23 communes.

ROKEJECA, in *Botany*, an Arabic name, inadmiſſible in ſyſtematic language, applied by Forſkall, Fl. Ægypt-Arab. 90, and adopted by Juſſieu, Gen. 313, for a ſuppoſed genus of the natural order of *Portulaceæ*, found in ſandy waſte ground about Cairo. Juſſieu ſuppoſes it akin to *Trianthema*. The *capſule* however is ſaid to have only one cell, and there is a *corolla* of five petals. We know not that thoſe who have ſeen Forſkall's ſpecimens, have thrown any light on this ſubject.

ROKETNITZ, a town of Bohemia, in the circle of Konigingratz; ſeven miles N. of Geyerſberg.

ROKHAGE. See AROKHAGE.

ROKIT, CAPE, a cape on the N. coaſt of Africa, at the entrance into the ſtraits of Babelmandeb; 60 miles W. of cape Guardefai.

ROKITNO, a town of Lithuania, in the palatinate of Brzeſk; 72 miles E.S.E. of Pinſk.

ROKITZANY, a town of Bohemia, in the circle of Pilſen; eight miles E. of Pilſen.

ROKOL, an iſle, or rather large rock, which, according to M. Kerguelen, is ſituated in N. lat. 57° 50', and long. 16° W. of Paris; or about 5° S.W. of St. Kilda.

ROKOSNIA, a town of Poland, in the palatinate of Braclaw, on the Bog; 16 miles W.N.W. of Braclaw.

ROLAND, DE LA PLATIERE, J. M., in *Biography*, born at Villafranche, near Lyons, of a family diſtinguiſhed in the profeſſion of the law. He was the youngeſt of five brothers, left orphans and without fortune. To avoid entering into the church, like his elder brothers, he left home at the age of nineteen, alone, without money, or friends; he traverſed a part of France on foot, and arrived at Nantes, intending to embark for India. He was, however, diſſuaded from this project, by a merchant who had ſeen him throw up blood, and who was aware that the climate of the Eaſt would infallibly kill him. He accordingly went to Rouen, engaged in the direction of ſome manufactories; diſtinguiſhed himſelf there by his love of ſtudy, and his taſte for economical and commercial purſuits; and obtained the place of inſpector-general at Amiens, and then at Lyons. Having travelled in Italy, Switzerland, and other countries, he accumulated a great maſs of valuable information, particularly in what related to the arts, which, on his return, gained him admiſſion into a great number of learned ſocieties. Early in the revolution he became a member of the municipality of Lyons, and founded there a club, which he connected with the Jacobin club of Paris. In 1790 he went to the capital, took a decided ſhare with the popular party, and in March 1792, was raiſed to the adminiſtration of the interior. He ſeems now to have poſſeſſed an enthuſiaſtic love and attachment to a republican form of government. The firſt day that he appeared before the king, he went with ſtraight undreſſed hair, a black coat, and ſhoes without buckles; his behaviour was, at the ſame time, ſo very uncourtly, that his majeſty diſmiſſed him a very ſhort time before he himſelf was reduced to ſcenes of adverſity and the moſt poignant diſtreſs. From this time Roland attached himſelf more than ever to the Jacobins, and was probably deeply implicated in the buſineſs of the 20th of June and 10th of Auguſt of that ſame year. He deprecated, however, the cruelties of the 2d of September, and denounced the horrors that were tranſacting under the maſk of patriotiſm. As the violent gained aſcendency, Roland was declining in credit. On the 20th of January 1793, he, as member of the proviſional executive council, ſigned the order for the execution of the king: this was one of his laſt official acts: yielding to the voice of the Mountain faction he reſigned, and was involved in the proſcription which iſſued againſt the Briſſotines; but he contrived to eſcape from Paris, and conceal himſelf among his friends at Rouen: as ſoon, however, as he heard of his wife's execution, he determined not to ſurvive her. He ſtabbed himſelf near the high road, leaving a paper containing the following lines; "whoever you may be that find me lying here, reſpect my remains; they are thoſe of a man who devoted his whole life to being uſeful, and who died, as he lived, virtuous and honeſt." Roland was kind and obliging to his friends, but the iraſcibility of his temper made him many enemies. He was deeply read in the learned, and in ſeveral modern languages, and was author of the following works: "An Eſſay on the Rearing of Flocks and the Improvement of Wool;" "The Art of the Woollen-Cloth Printer, of the Cotton-Velvet Maker," &c. This work forms the Compendium of Mechanical Arts, publiſhed by the Academy of Sciences. "Letters written from Switzerland, Italy, Sicily, and Malta, in 1782." A new edition of this work was publiſhed in 1800. They are addreſſed to a lady whom he ſoon after married, and are filled with uſeful views and intereſting accounts of the manufactories of various countries. See the next article.

ROLAND, MARIE-JEANNE PHILEPON, wife of the preceding, was born at Paris in 1754. She was the daughter of an eminent engraver, who, though highly diſtinguiſhed in his profeſſion, had brought himſelf to ruin by extravagance and diſſipation. The daughter, brought up in the midſt of the fine arts, ſurrounded by books, pictures, and muſic, became learned and ſkilled in muſic and painting. Though not what might be called regularly handſome, her perſon was attractive, and her character excited general admiration in the circle in which ſhe moved. Her mother dying while ſhe was young, ſhe was obliged, owing to the ruined fortunes of her father, to ſeek an aſylum in a convent. Here ſhe lived in honourable ſolitude, ſubmitting cheerfully to the privations which were found neceſſary in her reduced ſituation, while ſhe took every means to improve her mind by ſtudy. In 1780, Roland addreſſed to her, as we have ſeen, his letters on Italy, and offered her his hand. She accepted the offer, and when married they went to Amiens, where ſhe ſtudied botany, and made an herbal of the plants of Picardy. She afterwards, in 1787, viſited Switzerland

and England, and was led, from what ſhe obſerved in the conſtitutions of thoſe countries, to ſtudy the theory of government, the reſult of which was an ardent attachment to the principles of liberty. M. Roland having been appointed inſpector of the manufactories at Lyons, was deputed to the conſtituent aſſembly, to obtain from it ſuccours neceſſary for the payment of the debt of that town. Madame Roland at this period ſettled with her huſband in the capital, and took delight in receiving at her houſe the chief of the popular party, and the moſt diſtinguiſhed deputies of the Gironde, that is, of the Briſſotine party. Briſſot, Barbaroux, Louret, Claviere, and Vergniaud, were admitted there; ſhe not only infuſed ardour into their political deliberations, but is ſuppoſed, in many caſes, to have been ſomething more than ſecretary, inditing as well as writing their moſt celebrated papers: for a time, ſhe was the ſecret power that directed the whole government of France. In the month of March 1792, when the king found it neceſſary, in order to allay the public diſcontents, to nominate a popular adminiſtration, Roland was appointed miniſter of the interior: the principal part of his labours was generally attributed to madame Roland; ſo much ſo, that when he reſigned, and was urgently preſſed by the aſſembly to reſume his functions, Danton exclaimed, "if we give an invitation to Roland, we muſt give one to his wife too. I know all the virtues of the miniſter, but we want men who ſee otherwiſe than by their wives." According to the memoirs which ſhe wrote of herſelf, ſhe was in fact the miniſter without the name: ſhe reviſed, or perhaps dictated, the letter which Roland addreſſed to the king on going out of office; "if he had written ſermons," ſaid ſhe, "I ſhould have done the ſame." On the 7th of December 1792, having appeared at the bar of the national convention, to repel a denunciation made againſt her, ſhe ſpoke with eaſe and eloquence, and was afterwards admitted to the honours of a ſitting. She preſented herſelf there again, when the decree was paſſed againſt her huſband; but then, the power of eloquence having loſt its charms in the ruffian breaſts of the ſenators, ſhe was refuſed a hearing, and was herſelf ſent to the Abbaye, that dreadful bourn, from whoſe gate few paſſed but to a mock-trial and ſavage execution. From this abode of miſery ſhe wrote to the aſſembly, and to the miniſter of the interior; her ſection alſo demanded for her liberty, but it was in vain; and on the 24th of June 1793, ſhe was ſent to the convent of St. Pélagie, which had been converted into a priſon, where ſhe paſſed her time in conſoling her fellow priſoners, and compoſing an account of her own life, and of the tranſactions of which ſhe had been the eye-witneſs, and in many of which ſhe had been an actor. At length ſhe was called before the revolutionary tribunal, and underwent an examination with calmneſs and ſerenity, diſturbed only when one of the ermined ſavages put to her queſtions offenſive to her modeſty. On the 8th of November ſhe was condemned to death for having conſpired againſt the unity and indiviſibility of the republic. Her execution immediately followed. On paſſing the ſtatue of liberty, in the Place de la Revolution, ſhe bent her head towards it, exclaiming, "O Liberty, how many crimes are perpetrated in thy name." Madame Roland was a woman capable of inſpiring all the elevated ſentiments that ſhe felt; with the grace and animation of one ſex, ſhe poſſeſſed the firmneſs and ſolidity of the other; and ſhe was generally admitted to be ſuperior to all the men of the party with whom her huſband acted. She particularly excelled in the penetration and knowledge of the human character. She left one daughter, whoſe only proviſion was her mother's writings, which are as follow: "Opuſcules," on moral topics, which treat of the ſoul, melancholy, morality, old age, friendſhip, love, retirement, &c.; "Voyage en Angleterre et en Suiſſe;" and when in priſon ſhe compoſed what ſhe entitled, "Appel à l'impartiale Poſterité," containing hiſtorical notices, anecdotes, and her own private memoirs. This work preſents many well-drawn characters of that period, with the pureſt ſentiments of public and private morality. Her own memoirs are extremely valuable, as giving a picture of life and manners in the middle ranks of life in France, with a view of the progreſs of a mind which was unqueſtionably one of the higheſt order with reſpect to virtue and intellect. Biog. Moderne, 3 vols. 1814. Biographical Anec. of the Fr. Revol.

ROLAND, or Orlando, the poetical hero of Boiardo, Berni, and Arioſto, and nephew of Charlemagne, celebrated in ſome ancient military ſongs; for an account of which, ſee Chanson. One of theſe begins with the following verſe:

> "Let ev'ry valiant ſon of Gaul
> Sing Roland's deeds, her greateſt glory,
> Whoſe name will ſtouteſt foes appal,
> And feats inſpire for future ſtory."

See Burney's Hiſt. of Muſic, vol. ii. p. 277.

ROLANDINO, an early Italian hiſtorian, was the ſon of a notary at Padua, in which city he was born, in the year 1200. He ſtudied at Bologna, and in 1220 received the honorary title of maſter and doctor in grammar and rhetoric. He had kept a chronicle of memorable events as they occurred, and put his papers into his ſon's hands after he returned from Bologna, with a charge to continue them. This he executed with care and fidelity to the year 1260, when he was urged to reviſe and complete his work. He employed two years in this reviſion; and in 1262, his chronicle, in twelve books, in the Latin language, was read publicly before the univerſity of Padua, ſubmitted to an attentive examination, and ſolemnly approved. Rolandino died in 1276. His hiſtory is accounted one of the moſt exact and faithful records of that time. Though his ſtyle is not free from barbariſms, his narrative is clear and well arranged. Voſſius affirms, that he ſurpaſſed all the writers of his age in perſpicuity, order, and judgment, and that he ſhewed himſelf well verſed in ſacred and profane literature. An edition of his work, with other chronicles, was given at Venice in 1636, by Felix Oſius, and it has been reprinted by Muratori, in the 7th volume of his Italian hiſtorians.

ROLANDRA, in *Botany*, ſerves to commemorate Daniel Rolandra, a pupil of Linnæus, who viſited Surinam, and communicated an account of the *Doliocarpus* to the Academy of Stockholm, which appeared in the 17th volume of the Tranſactions of that learned body, publiſhed in 1756. Several of his papers on Entomology are to be found in the ſame collection. He was almoſt the only naturaliſt, educated by Linnæus, whoſe character diſappointed the hopes of his preceptor; but he is ſaid to have been ſtill more unfortunate, than negligent or ungrateful. We know no particulars of his hiſtory. The name was given by Rottböll, in the Collectanea of the Medical Society at Copenhagen, v. 2. 256. —Schreb. Gen. 593. Willd. Sp. Pl. v. 3. 2400. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 5. 186. Swartz Prodr. 116. Ind. Occ. v. 3. 1388. (See Juſſ. 176.)—Claſs and order, *Syngeneſia Polygamia-ſegregata*. Nat. Ord. *Compoſitæ capitatæ*, Linn. *Cinarocephalæ*, Juſſ.

Gen. Ch. *Common Calyx* none. Florets cluſtered into a roundiſh head, the cluſters diſtinct, ſtalked, ſeparated by numerous, ovate or lanceolate, awned ſcales, ſhorter than the florets. Partial perianth chaffy, of two unequal, compreſſed, preffed, keeled valves; the upper one largeft, awned, enclofing the other, which is pointed. *Cor.* of each floret very minute, of one petal, funnel-fhaped; tube long, thread-fhaped; limb in five very fhort, erect, acute fegments. *Stam.* Filaments in each floret, five, fhorter than the tube; anthers united into a cylinder, below the throat. *Pift.* Germen, in each floret, triangular, compreffed, acute at the bafe, abrupt at the fummit; ftyle the length of the tube, divided at the top; ftigmas tumid, erect. *Peric.* none, the feed being enclofed in the unchanged partial calyx. *Seed* triangular, crowned with a toothed border.

Eff. Ch. Common Calyx none. Perianth of two valves, fingle-flowered. Florets all perfect. Seed with a toothed crown.

Obf. Rottböll defcribes the corolla of each floret as four-cleft; Swartz found it always five-cleft, with five ftamens.

1. R. *argentea.* Silver-leaved Rolandra. Swartz Ind. Occ. v. 3. 1389. Willd. n. 1. Ait. n. 1. (Echinops fruticofus; Linn. Sp. Pl. ed. 1. 815? Amaranthoides fruticofum, foliis longis, anguftis, fubtùs niveis; Sloane Jam. v. 1. 43. t. 7. f. 3.)—Native of Jamaica, Cayenne, and Surinam. Cultivated in Chelfea garden, before the year 1714, and faid to flower in the ftove in July. We have never met with the living plant. The *ftem* is fhrubby, erect, branched, round, reddifh; the young branches whitifh and downy. *Leaves* ftalked, alternate, ovato-lanceolate, minutely ferrated, about two inches long, ribbed; green and fhining, but roughifh to the touch, on the upper fide; fnow-white and downy beneath. There are ufually axillary tufts, of a few much fmaller leaves. *Flowers* in fmall, round, feffile, folitary, axillary, whitifh heads.—Plumier's Echinops, t. 125. f. 1, which Linnæus adopted from him under the name of *fruticofus*, without feeing a fpecimen, but afterwards rejected, bears too little refemblance to Sloane's plant to be confidered, with any probability, as the fame.

ROLAS, in *Geography*, a fmall ifland in the Atlantic, near the S.W. coaft of the ifland of St. Thomas.

ROLDUC, a town of France, in the department of the Lower Meufe, and chief place of a canton, in the diftrict of Maeftricht; called, in the language of the country, "Hertogenrode," formerly well fortified, but greatly demolifhed by wars, and the capital of a county, which contained a great number of villages; 10 miles S.W. of Juliers. The place contains 940, and the canton 11,196 inhabitants, on a territory of 100 kiliometres, in 12 communes. N. lat. 50° 52′. E. long. 6° 5′.

ROLE, a town of Bengal; 25 miles S.S.E. of Palamow.

ROLEPARA, a town of Hindooftan, in Oriffa; 25 miles S.E. of Boad.

ROLL, in the *Manufactories*, fomething wound and folded up in a cylindrical form.

Few ftuffs are made in rolls, except fattins, gauzes, and crapes, which are apt to break, and take plaits not eafy to be got out, if folded otherwife. Ribbands, however, and laces, galloons, and paduas of all kinds, are thus rolled.

The ancients made all their books up in form of rolls, or little columns; and, in Cicero's time, the libraries confifted wholly of thofe rolls. The dearnefs of parchment, and the cheapnefs of papyrus, of which the rolls were made, was the reafon that fcarcely any but paper rolls were ufed.

Voffius fays, they pafted feveral fheets end to end, when filled on one fide, and rolled them up together, beginning with the laft, which they called *umbilicus*, and to which they faftened an ivory or boxen ftick, to fuftain the roll. To the other extremity they pafted a piece of parchment, to cover and preferve it.

Thefe rolls were placed in the libraries perpendicularly to the horizon. The Jews ftill preferve the ancient ufage of rolls for the books they read in the fynagogues.

Roll, *To*, in *Military Language*, is to continue one uniform beat of the drum, without variations, for a certain length of time. When a line is advancing in full front, or in echellons, for any confiderable diftance, the mufic of one regulating battalion may, at intervals, be permitted to play for a few feconds at a time, and the drums of the other battalions may be allowed occafionally to roll: drums likewife roll when troops are advancing to charge. For the method of performing the roll, fee *Roll*, under Drum.

Roll, *Long*, a beat of drum by which troops are affembled at any particular fpot of rendezvous or parade.

Roll, *Short*. See *Ruffle* under Drum.

Roll *of Tobacco*, is tobacco in the leaf, twifted in the mill, and wound twift over twift, about a ftick or roller.

The generality of tobacco in America is there fold in rolls of various weights; and it is not till after its arrival in England, Spain, France, and Holland that it is cut. Roll tobacco is what is chiefly ufed, both for chewing and rafping. See Tobacco.

Roll *of Parchment* contains 20 fkins.

Roll, *Rotulus*, in *Law*, denotes a fchedule of paper or parchment, which may be wound up by the hand into the fafhion of a pipe.

Of thefe there are, in the Exchequer, feveral kinds; *viz.* the great *wardrobe-roll*, the *cofferer's-roll*, the *fubfidy-roll*, &c.

The word is formed from the French *rolle*, of the Latin *rotulus*; becaufe moft inftruments and expeditions in law were anciently written on papers, or parchments, fewed or glued together, and thus rolled up: whence the word *enrol*, and the like.

Rolls *of Parliament*, are the manufcript regifters of the proceedings of our ancient parliaments.

Before the ufe of printing, and till the reign of Henry VII. our ftatutes were all engroffed in parchment, and (by virtue of the king's writ for that purpofe) proclaimed openly in every county.

In thefe rolls we have alfo a great many decifions of difficult points in law, which were frequently, in former times, referred to the decifion of that high court.

Roll, *Rider*, a fchedule, or fmall piece of parchment, frequently fewed, or added to fome part of a roll, or record.

Noy obferves, that the court ex-officio may award a certiorari ad informandam confcientiam; and that which is certified fhall be annexed to the record, and called a *rider-roll*.

Roll is alfo ufed for a lift of the names of feveral perfons of the fame condition, or entered in the fame engagement.

Roll, *Court*. See Court-*Roll*.

Roll, *Mufter*. See Muster-*Roll*.

Roll, *Size*, a lift containing the names of all the men belonging to a troop or company, with the height or ftature of each fpecifically marked. Every ferjeant keeps a regular fize-roll, and every captain of a troop or company ought to have one likewife.

Roll, *Squad*, a lift containing the names of each particular fquad. Every non-commiffioned officer and corporal, who are entrufted with the care and arrangement of a fquad, muft have a roll of this kind.

Roll-*Calling*, is the calling over of the foldiers of a troop, or company, by their names, to fee that they are all prefent.

 This

and England, and was led, from what ſhe obſerved in the conſtitutions of thoſe countries, to ſtudy the theory of government, the reſult of which was an ardent attachment to the principles of liberty. M. Roland having been appointed inſpector of the manufactories at Lyons, was deputed to the conſtituent aſſembly, to obtain from it ſuccours neceſſary for the payment of the debt of that town. Madame Roland at this period ſettled with her huſband in the capital, and took delight in receiving at her houſe the chief of the popular party, and the moſt diſtinguiſhed deputies of the Gironde, that is, of the Briſſotine party. Briſſot, Barbaroux, Louret, Claviere, and Vergniaud, were admitted there; ſhe not only infuſed ardour into their political deliberations, but is ſuppoſed, in many caſes, to have been ſomething more than ſecretary, inditing as well as writing their moſt celebrated papers: for a time, ſhe was the ſecret power that directed the whole government of France. In the month of March 1792, when the king found it neceſſary, in order to allay the public diſcontents, to nominate a popular adminiſtration, Roland was appointed miniſter of the interior: the principal part of his labours was generally attributed to madame Roland; ſo much ſo, that when he reſigned, and was urgently preſſed by the aſſembly to reſume his functions, Danton exclaimed, "if we give an invitation to Roland, we muſt give one to his wife too. I know all the virtues of the miniſter, but we want men who ſee otherwiſe than by their wives." According to the memoirs which ſhe wrote of herſelf, ſhe was in fact the miniſter without the name: ſhe reviſed, or perhaps dictated, the letter which Roland addreſſed to the king on going out of office; "if he had written ſermons," ſaid ſhe, "I ſhould have done the ſame." On the 7th of December 1792, having appeared at the bar of the national convention, to repel a denunciation made againſt her, ſhe ſpoke with eaſe and eloquence, and was afterwards admitted to the honours of a ſitting. She preſented herſelf there again, when the decree was paſſed againſt her huſband; but then, the power of eloquence having loſt its charms in the ruffian breaſts of the ſenators, ſhe was refuſed a hearing, and was herſelf ſent to the Abbaye, that dreadful bourn, from whoſe gate few paſſed but to a mock-trial and ſavage execution. From this abode of miſery ſhe wrote to the aſſembly, and to the miniſter of the interior; her ſection alſo demanded for her liberty, but it was in vain; and on the 24th of June 1793, ſhe was ſent to the convent of St. Pélagie, which had been converted into a priſon, where ſhe paſſed her time in conſoling her fellow priſoners, and compoſing an account of her own life, and of the tranſactions of which ſhe had been the eye-witneſs, and in many of which ſhe had been an actor. At length ſhe was called before the revolutionary tribunal, and underwent an examination with calmneſs and ſerenity, diſturbed only when one of the ermined ſavages put to her queſtions offenſive to her modeſty. On the 8th of November ſhe was condemned to death for having conſpired againſt the unity and indiviſibility of the republic. Her execution immediately followed. On paſſing the ſtatue of liberty, in the Place de la Revolution, ſhe bent her head towards it, exclaiming, "O Liberty, how many crimes are perpetrated in thy name." Madame Roland was a woman capable of inſpiring all the elevated ſentiments that ſhe felt; with the grace and animation of one ſex, ſhe poſſeſſed the firmneſs and ſolidity of the other; and ſhe was generally admitted to be ſuperior to all the men of the party with whom her huſband acted. She particularly excelled in the penetration and knowledge of the human character. She left one daughter, whoſe only proviſion was her mother's writings, which are as follow: "Opuſcules," on moral topics, which treat of the ſoul, melancholy, morality, old age, friendſhip, love, retirement, &c.; "Voyage en Angleterre et en Suiſſe;" and when in priſon ſhe compoſed what ſhe entitled, "Appel à l'impartiale Poſterité," containing hiſtorical notices, anecdotes, and her own private memoirs. This work preſents many well-drawn characters of that period, with the pureſt ſentiments of public and private morality. Her own memoirs are extremely valuable, as giving a picture of life and manners in the middle ranks of life in France, with a view of the progreſs of a mind which was unqueſtionably one of the higheſt order with reſpect to virtue and intellect. Biog. Moderne, 3 vols. 1814. Biographical Anec. of the Fr. Revol.

ROLAND, or ORLANDO, the poetical hero of Boiardo, Berni, and Arioſto, and nephew of Charlemagne, celebrated in ſome ancient military ſongs; for an account of which, ſee CHANSON. One of theſe begins with the following verſe:

> "Let ev'ry valiant ſon of Gaul
> Sing Roland's deeds, her greateſt glory,
> Whoſe name will ſtouteſt foes appal,
> And feats inſpire for future ſtory."

See Burney's Hiſt. of Muſic, vol. ii. p. 277.

ROLANDINO, an early Italian hiſtorian, was the ſon of a notary at Padua, in which city he was born, in the year 1200. He ſtudied at Bologna, and in 1220 received the honorary title of maſter and doctor in grammar and rhetoric. He had kept a chronicle of memorable events as they occurred, and put his papers into his ſon's hands after he returned from Bologna, with a charge to continue them. This he executed with care and fidelity to the year 1260, when he was urged to reviſe and complete his work. He employed two years in this reviſion; and in 1262, his chronicle, in twelve books, in the Latin language, was read publicly before the univerſity of Padua, ſubmitted to an attentive examination, and ſolemnly approved. Rolandino died in 1276. His hiſtory is accounted one of the moſt exact and faithful records of that time. Though his ſtyle is not free from barbariſms, his narrative is clear and well arranged. ROLAS, in *Geography*, a fmall ifland in the Atlantic, near the S.W. coaft of the ifland of St. Thomas.

ROLDUC, a town of France, in the department of the Lower Meufe, and chief place of a canton, in the diftrict of Maeftricht; called, in the language of the country, "Hertogenrode," formerly well fortified, but greatly demolifhed by wars, and the capital of a county, which contained a great number of villages; 10 miles S.W. of Juliers. The place contains 940, and the canton 11,196 inhabitants, on a territory of 100 kiliometres, in 12 communes. N. lat. 50° 52′. E. long. 6° 5′.

ROLE, a town of Bengal; 25 miles S.S.E. of Palamow.

ROLEPARA, a town of Hindooftan, in Oriffa; 25 miles S.E. of Boad.

ROLL, in the *Manufactories*, fomething wound and folded up in a cylindrical form.

Few ftuffs are made in rolls, except fattins, gauzes, and crapes, which are apt to break, and take plaits not eafy to be got out, if folded otherwife. Ribbands, however, and laces, galloons, and paduas of all kinds, are thus rolled.

The ancients made all their books up in form of rolls, or little columns; and, in Cicero's time, the libraries confifted wholly of thofe rolls. The dearnefs of parchment, and the cheapnefs of papyrus, of which the rolls were made, was the reafon that fcarcely any but paper rolls were ufed.

Voffius fays, they pafted feveral fheets end to end, when filled on one fide, and rolled them up together, beginning with the laft, which they called *umbilicus*, and to which they faftened an ivory or boxen ftick, to fuftain the roll. To the other extremity they pafted a piece of parchment, to cover and preferve it.

Thefe rolls were placed in the libraries perpendicularly to the horizon. The Jews ftill preferve the ancient ufage of rolls for the books they read in the fynagogues.

Roll, *To*, in *Military Language*, is to continue one uniform beat of the drum, without variations, for a certain length of time. When a line is advancing in full front, or in echellons, for any confiderable diftance, the mufic of one regulating battalion may, at intervals, be permitted to play for a few feconds at a time, and the drums of the other battalions may be allowed occafionally to roll: drums likewife roll when troops are advancing to charge. For the method of performing the roll, fee *Roll*, under Drum.

Roll, *Long*, a beat of drum by which troops are affembled at any particular fpot of rendezvous or parade.

Roll, *Short*. See *Ruffle* under Drum.

Roll *of Tobacco*, is tobacco in the leaf, twifted in the mill, and wound twift over twift, about a ftick or roller.

The generality of tobacco in America is there fold in rolls of various weights; and it is not till after its arrival in England, Spain, France, and Holland that it is cut. Roll tobacco is what is chiefly ufed, both for chewing and rafping. See Tobacco.

Roll *of Parchment* contains 20 fkins.

Roll, *Rotulus*, in *Law*, denotes a fchedule of paper or parchment, which may be wound up by the hand into the fafhion of a pipe.

Of thefe there are, in the Exchequer, feveral kinds; *viz.* the great *wardrobe-roll*, the *cofferer's-roll*, the *fubfidy-roll*, &c.

The word is formed from the French *rolle*, of the Latin *rotulus*; becaufe moft inftruments and expeditions in law were anciently written on papers, or parchments, fewed or glued together, and thus rolled up: whence the word *enrol*, and the like.

Rolls *of Parliament*, are the manufcript regifters of the proceedings of our ancient parliaments.

Before the ufe of printing, and till the reign of Henry VII. our ftatutes were all engroffed in parchment, and (by virtue of the king's writ for that purpofe) proclaimed openly in every county.

In thefe rolls we have alfo a great many decifions of difficult points in law, which were frequently, in former times, referred to the decifion of that high court.

Roll, *Rider*, a fchedule, or fmall piece of parchment, frequently fewed, or added to fome part of a roll, or record.

Noy obferves, that the court ex-officio may award a certiorari ad informandam confcientiam; and that which is certified fhall be annexed to the record, and called a *rider-roll*.

Roll is alfo ufed for a lift of the names of feveral perfons of the fame condition, or entered in the fame engagement.

Roll, *Court*. See Court-*Roll*.

Roll, *Mufter*. See Muster-*Roll*.

Roll, *Size*, a lift containing the names of all the men belonging to a troop or company, with the height or ftature of each fpecifically marked. Every ferjeant keeps a regular fize-roll, and every captain of a troop or company ought to have one likewife.

Roll, *Squad*, a lift containing the names of each particular fquad. Every non-commiffioned officer and corporal, who are entrufted with the care and arrangement of a fquad, muft have a roll of this kind.

Roll-*Calling*, is the calling over of the foldiers of a troop, or company, by their names, to fee that they are all prefent.

This neceffary duty is performed by the ferjeants of companies, morning and evening, in every well-regulated corps. Hence we have "morning roll-call," and "evening roll-call," on critical occafions; and in fervices that require promptitude and exertion, frequent roll-calls fhould be made.

ROLL, *Calves-head*, is a roll in the two Temples, in which every bencher is taxed yearly at 2*s*., every barrifter at 1*s*. 6*d*., and every gentleman under the bar at 1*s*. to the cook, and other officers of the houfe, in confideration of a dinner of calves-heads, provided in Eafter term.

ROLL, *Ragman's*, or *Ragimund's Roll*, is a roll denominated from *Ragimund*, a papal legate in Scotland; who, calling before him all the people who held benefices in that kingdom, caufed them, upon oath, to give in the value of their eftates, according to which they were taxed in the court of Rome.

ROLLS, or *Office of Rolls*, in Chancery-lane, London, is an office appointed for the cuftody of the rolls and records in chancery.

The mafter of this office is the fecond perfon in that court; and, in the abfence of the lord chancellor, he fits as judge. See MASTER *of the Rolls*.

This houfe, or office, was anciently called *Domus Converforum*, as being appointed, by king Henry III., for the ufe of converted Jews; but their irregularities occafioned king Edward II. to expel them thence: upon which, the place was deputed for the cuftody of the rolls.

ROLLS, *Clerk of the*. See CLERK *of the Rolls*.

ROLLS, or *Roul*, among *Military Men*. See ROUL.

ROLL, *Bead*. See BEAD-*Roll*.

ROLL, *Check*. See CHECK-*Roll*.

ROLL, *Counter*. See COUNTER-*Roll*.

ROLL, in *Antiquity*. From the time of Anaftafius, we find in the hands of the emperors, on medals, a kind of narrow long roll, or fachel; the meaning of which has greatly puzzled the antiquaries.

Some imagine it to be a roll or bundle of papers, memoirs, petitions, &c. prefented occafionally to princes, confuls, and the like. Others take it to be a plaited handkerchief, which the perfons who prefided at the games caft forth as a fignal for their beginning. Others will have it a bag of duft and afhes, prefented the emperor at the ceremony of his coronation, and called *akakia*, *q. d.* a means of preferving innocence, by the remembrance of duft, &c.

ROLL, or *Roller*, is alfo a piece of wood, of a cylindrical form, ufed in the conftruction of feveral machines, and in feveral works and manufactures; though fometimes under other names.

It is on fuch rolls, properly called *beams*, that the woollen, filken, and other threads are wound, of which the weaver's works confift. For which end, each loom has ufually two, and that of the gauze-weavers three.

In the glafs manufacture, they have a running-roll, being a thick cylinder of caft brafs, ferving to conduct the melted glafs to the end of the table, on which large looking-glaffes are to be caft.

The founders alfo ufe a roller to work the fand which they ufe in making their moulds.

The preffes called calenders, as ferving to calender ftuffs, confift, among other effential parts, of two rollers.

It is alfo between two rollers that the waves are given to filks, mohairs, and other ftuffs proper to be tabbied.

Prints, or impreffions, from copper-plates, are alfo taken by paffing the plate and the paper between two rollers. See *Rolling-prefs* PRINTING, and COPPER-*Plate Work*.

ROLLS, in *Coining*, are two iron inftruments, of a cylindrical figure, which ferve to draw or ftretch out the plates of gold, filver, and other metals, of which the planks or pieces are to be formed for the fpecies.

ROLLS, in *Printing*, are two large cylinders or barrels of wood faftened in the middle of what they call the cradle or gallows of the prefs; and which, by means of a cord or girt paffing over each, and a handle which gives motion to one of them, draw the carriage of the prefs backwards and forwards. See PRINTING.

ROLLS, in the *Sugar-Works*, are two large iron barrels, which ferve to bruife the canes, and exprefs the juice. They are caft hollow, and their cavities are filled up with wood, the cylinders of which are properly the rollers.

ROLLS, or *Rollers*, among *Carpenters*, *Mafons*, &c. are plain cylinders of wood, feven or eight inches in diameter, and three or four feet long; ufed for the removing of beams, huge ftones, and other like burdens, which are cumberfome, but not exceedingly heavy.

Thefe rollers are placed, fucceffively, under the fore-part of the maffes to be removed; which, at the fame time, are pufhed forward by levers, &c. applied behind.

ROLLS, *Endlefs*. When blocks of marble, or other exceffive heavy loads, are to be removed, they ufe what they call *endlefs* rolls.

Thefe, to give them the greater force, and prevent their burfting, are made of wood joined together by crofs-quarters; they are about double the length and thicknefs of the common roller, and, befides, are girt with feveral large iron hoops at each end. At a foot's diftance from the ends are four mortifes, or rather only two, but pierced through and through, into which are put the ends of long levers which the workmen draw by ropes faftened to the ends, ftill changing the mortife, as the roll has made a quarter of a turn.

ROLL-*rich Stones*, in *Antiquity*, a feries of huge ftones, ranged in a circle, near Morton in the Marfh, in Oxfordfhire. There are many fabulous traditions about them. Among the antiquaries, fome take them to be a monument of a victory; others, a burying place; and others, a place for the coronation of the Danifh kings.

Near Penros, in Cornwall, is a like monument.

ROLLAND, in *Geography*, an ifland in the South Indian fea, difcovered by Kerguelen in the year 1773, fo called by him after the name of the veffel in which he failed; about nine miles in circuit. N. lat. 48° 37′. E. long. 68° 43′.

ROLLE, MICHAEL, in *Biography*, a French mathematician, was born at Ambert, a fmall town in Auvergne, in the year 1652. His father was in rather low circumftances, and placed him to gain his livelihood, at firft with a notary, and afterwards with different country attornies. Difgufted with an occupation fo little fuited to his genius, at the age of 23 he went to Paris, depending for his fupport on his penmanfhip. At firft he taught writing and the early rules of arithmetic: from arithmetic he advanced by gradual fteps to algebra, to which he became fo enthufiaftically attached, that he fpent every leifure moment in the ftudy till he became diftinguifhed in that branch of fcience. In 1682, the learned Ozanam having propofed a difficult mathematical problem to exercife the ingenuity of mathematicians, M. Rolle fent him a very clear folution of it, together with methods which he had invented of folving other problems, attended with ftill greater difficulty. The minifter Colbert, always the patron of talent, having heard of Rolle, determined to draw him out of the obfcurity in which he had hitherto been concealed, and fettled on him a penfion. He now gave up the occupation of a writing mafter, and devoted himfelf entirely to the ftudy of algebra, and the other

other branches of pure mathematics; and so great was his success, that in 1685, three years only after his name was first known in the mathematical world, he was chosen a member of the Academy of Sciences. In the year 1690, M. Rolle published a treatise on Algebra, which was followed by a new work, entitled "A Demonstration of a Method for the Resolution of Equations of all degrees;" to which succeeded two other methods; by the first of which the same equations are resolved geometrically; and by the second, several unresolved questions of Diophantus are answered. In the year 1699 he published a work, entitled "A Method of resolving indeterminate Questions in Algebra," and he was appointed second geometrical-pensionary of the Academy of Sciences. About this time he united with that party in the Academy which opposed the new geometry, and carried on a controversy against the marquis de l'Hôpital, on the subject of infinitesimals, till the society imposed silence on all the disputants. M. Rolle thought that his favourite science, algebra, was capable of almost indefinite improvement, and he announced his design of drawing up entirely new elements, but death put an end to his plans. He died in 1719, in the 68th year of his age, having uniformly borne an excellent character for piety, probity, and amiable manners. Besides the works already mentioned, many curious papers were communicated by him to the Academy of Sciences, and may be found in their "Memoirs," from the year in which he took his seat in that body till 1714. The higher branches of the mathematics are the subjects of almost all these papers.

Rolle, Johann Heinrich, the youngest of three brothers, all eminent musicians, and sons of a father who, as music director at Magdeburg, had rendered the name illustrious. Henry, who succeeded his father as music-director in his native city, was born in 1718, and died in 1785. He was an excellent composer for the church, as well as author of pieces for the organ and harpsichord of great merit. His oratorio of "Thirsa and her Sons," is full of good taste, new passages, pleasing effects, and true pathos.

Rolle, Fr. a part in *Music* and *Dramatic Works*. The French have a distinct term in music for a vocal and instrumental part in an opera or concert. The singer's or the actor's part in an opera or play, is equally termed *rolle;* in a concert or opera each instrumental part is called *partie.* We make no distinction, in England, between a vocal or instrumental part in an opera or concert: each is called part: as the part of Hamlet, in a play, of Mandane, in an opera; the first violin, tenor, or violoncello part needs no other distinction than the name of the character, or instrument.

Rolle, in *Geography*, a town of Switzerland, and capital of a lordship, situated on the N.W. side of the lake of Geneva; 14 miles S.W. of Lausanne.

ROLLER. See Roll.

Roller, in *Gunnery*, a round piece of wood of about nine inches diameter, and four feet long, which serves in moving mortars from one place to another, when near. This is done by raising the fore-part of the bed so high that a roller may be laid under it; then pushing the bed forwards, and laying another in its way, and another before that, and so on, the mortar is easily moved.

Roller is also a small wheel placed at the foot of the hammer of a gun, or pistol-lock, in order to lessen the friction of it against the hammer or feather-spring.

Roller, in *Agriculture*, a well-known implement formed of wood, cast-iron, or stone, so as to turn upon its axis, and be drawn over the surface of the land by means of horses, for the purpose of reducing the lumpy or cloddy state of tillage lands, and rendering these, as well as those of the grass kind, smooth and even. They are constructed in different ways for different purposes, and of different sizes and weights to suit different uses in husbandry. They are, however, in general distinguished into the tillage and grass kind. It has been a matter of dispute, whether rollers with large or small diameters have the advantage, in point of effect upon the land. It is probable that there may be inconveniencies in both extremes. The roller should not, however, be so small as to require much loading, as by such means much time and labour are lost. A late practical writer, however, advises that in constructing heavy rollers, the workmen should be careful that they have not too great a diameter, whatever the material be of which they are formed, as the pressure is diminished where the implement is of very large size, by its resting on too much surface at once, except an addition of weight in proportion be made. By having the roller made small, when loaded to the same weight, a much greater effect will be produced, and a considerable saving of expence be made in the construction of the implement. And he recommends that all the larger sorts of rollers should have double shafts, in order that they may be drawn by two horses abreast; and such as are employed for arable lands should have a scraper attached to them. This addition, he thinks, saves much time, and prevents the driver the trouble of constantly scraping the machine, especially in wet seasons, and clayey tenacious lands. Strong frames are also necessary for rollers, so that proper weights may be put upon them; and open boxes or carts placed upon them may sometimes be requisite, in order to contain any additional weight that may be thought proper, as well as to receive stones or other matters that may be picked up from the ground. Pieces of wood or stone, as heavy as a man can lift, are the most suitable substances for loading these implements with, where they have not the advantage of boxes for the purpose of containing such weighty substances.

There has been much inconvenience experienced in the use of this sort of implement in turning at the ends of ridges, fields, or other places, from their not moving upon their axes, but being drawn along the surface of the ground, by which they are liable to tear it up, and make deep holes and depressions before they come again into the direct line of draught, and are not brought round without great exertion in the teams: it has therefore been attempted, in order to obviate these inconveniencies, to construct rollers in two pieces, and by the division in the middle to enable the different parts to twist round on their proper axes, one forward and the other in a retrograde direction. When formed in this way, the cylinders are best made of cast-iron, as they turn with greater ease and readiness.

Roller, *Common.* This is a sort of roller which is employed for the common purposes of tillage, and which is mostly used for rolling wheat in the spring, and grass-seeds; they are generally about five or six feet long, and from fifteen to thirty inches in diameter; but those employed for flattening one-bout ridges, in order to prepare them for drilling turnips upon, are commonly shorter and of much less diameter, and frequently attached to the drilling implement.

But of the various kinds of these rollers that are made use of, Mr. Morley of Newark thinks that those of the best construction, and which answer the most perfectly in practice, are such as are made of cast-iron, and divided into two parts: the length from three feet to three feet six inches, covering a surface of from six to seven feet, and being above ten hundred weight: the frame should be made in a ſtout manner, with ſhafts for one horſe, to be fixed on the near ſide, and hooks put in on the other ſide in order to have recourſe to an additional horſe when it may be neceſſary. The gudgeons or pivots ſhould act upon ſmall caſe-hardened friction-wheels, two to be fixed upon each ſide the frame; with a ſmall roller made of hard wood, about nine inches long and three inches in diameter, bound at each end with iron, and to be fixed to the back part of the frame, ſo that both rollers may act with each other in the centre wheel, which will be a means of keeping the great roller ſteady, and at the ſame time very much diminiſh the draught of the implement.

And it is obſerved in the Agricultural Report of Norfolk, that Mr. Prieſt of Beſthorpe uſes a roller that is divided in two parts, riſing and falling in the centre, for the purpoſe of rolling the ſlopes of ridges. And that the ſame uſeful tool is in practice in Suffolk by the Rev. Mr. Hill.

In Dengey and Rochford hundreds, in the county of Eſſex, where the wire-worm has long been ſo very deſtructive to the grain crops, an extremely heavy ſtone roller is a common implement on every farm; they are made ſix or ſeven feet long, and eighteen inches, and ſome more, in diameter, weighing from one and a half to two tons.

In Devonſhire they uſe heavy granite and moor-ſtone rollers with two horſes, which are from five to eight feet in length, and of proportionate diameters, for rolling wheat and paſture grounds, as well as for aiding the operation of ſeparating the ſpine from the mould on the burn-beat-lands, in preparation for the former crop and turnips.

In many other diſtricts heavy ſtone rollers, of the freeſtone and other kinds, are preferred to all other ſorts for tillage uſes.

Roller, *Compound.* This is an implement of the roller kind, conſtituted of the plane or common and ſpike kinds united in the ſame frame; but it is capable of being uſed ſeparately, and its weight varied according to the nature or circumſtances of the land. It is the ingenious invention of Mr. Amos of Lincolnſhire, in which the ſpike part of the roller is made of a piece of oak wood, ſeven feet long, and fifteen inches and a quarter in diameter, hooped with iron at each end. The inventor adviſes in conſtructing it to divide the circumference of this roller into twelve equal parts, from which to draw parallel lines, one diviſion oblique the whole length of the roller. On the firſt of theſe lines to ſet off two inches at each end, and divide the remainder into twenty equal parts, of four inches each. On the ſecond line to ſet off four inches at each end, and divide the remainder into nineteen equal parts; and ſo of all the other lines alternately. In every diviſion to fix an iron ſpike, ſo that there will be twenty ſpikes in one row, and nineteen in the other, throughout the whole circumference, making in all two hundred and thirty-four ſpikes. That part of the ſpike which projects out of the wood is four inches long, one inch ſquare at the circumference of the roller, and three-quarters of an inch ſquare at the point. The tongue, which goes into the wood, is four inches long, ſeven-eighths of an inch ſquare at the circumference of the roller, and tapers to a point at the end. The plain roller is made of a piece of oak wood, ſeven feet long and eighteen inches diameter. In the centre of each end of both rollers are fixed iron buſhes of two inches diameter. The bow part of the left-hand ſide of the frame is made of iron, four inches broad, half an inch thick, and is a ſegment of a circle twenty-ſeven and a half inches radius, fixed for turning the roller upſide down. The ſtring part of the bow is five feet two inches long, and eight by three inches ſquare, made of oak wood. In theſe pieces are fixed gudgeons of two inches diameter, on which the rollers move, and at four feet one and a half inch aſunder. The four ſhafts are eleven feet long, ſix by three and a half inches ſquare at the hinder ends, through which the centre-bolt paſſes. There are four bars four by one and a half inches ſquare, and three and a half feet long, for bracing the ſhafts together. And two bars eight feet long, and three by eight inches ſquare, with double tenons at each end, for bracing the outſide frames together. In the outer ends of theſe tenons are linchpins for the convenience of taking the machine to pieces. The centre-bolt is made of hammered iron, two and a quarter inches diameter; at one end is a round head, at the other a linchpin. The principal uſe of this bolt is to give the uppermoſt roller inclination forward when working, and the degree of inclination is governed by the breadth of, and the diſtance between the two braces, which reſt upon the ſhafts when the roller is at work, ſo as to make the horſes carry a little weight on their backs, otherwiſe it would be in danger of endeavouring to fall backward. The diſtance between them is twelve or ſix inches from the centre-bolt. This implement is found of vaſt uſe in reducing the ſtubborn ſorts of ſoil to a fine ſtate of mould, or what is termed tilth by farmers. The ingenious inventor remarks, that it affords the farmer a command over dry ſeaſons, and enables him to ſow his ſpring and fallow crops in proper time. It likewiſe, he thinks, furniſhes him with the means of cleaning his tillage lands from weeds, whether of the root or ſeed kind. After paſſing this ſort of roller two or three times over the land, with drag harrowing in the intervals, he ſuppoſes it would be rendered ſufficiently fine for any purpoſe that it may be wanted for. And that when the cloddy ſurface is reduced to ſuch a condition as to be incapable of being longer acted upon by the ſpike roller, the plane roller may be had recourſe to with the dry harrow. It is likewiſe ſtated to be of great advantage in reſtoring ſuch graſs-lands as have the ſward in a degenerated ſtate. See Rolling.

Roller, *Concave.* The bellying or furrow-rollers have been in common uſe ſome length of time, in moſt tillage parts of the country; but the concave ones have perhaps never yet been met with, except about Bradwell, in the county of Eſſex. They are there made the ſmalleſt in the middle, ſwelling out to a large circumference at each end. The whole of the farmers thereabouts highly approve of this kind of roller, having very generally adopted it. It is made of ſuch lengths as to ſuit the differences of the ridges or ſtitches, which are made uſe of in cultivating the ground. And it has a ſcraper attached to it, for taking away the cloggy mould that hangs upon it. The moſt uſual length of the roller part is ſeven feet two inches; to the extremities or outſides of the frame, ſeven feet nine inches; the length of the ends of the frame, four feet three inches; the diameter of the roller at the ends, one foot ten inches; in the concave part in the middle, one foot four inches; the circumference in the ſame place, four feet. A repreſentation of it may be ſeen in the firſt volume of the Agricultural Report of Eſſex.

Roller, *Drill.* This is a roller originally contrived for the purpoſe of forming drills in dry light ſoils, for putting the grain in; but which is likewiſe found uſeful in reducing cloddy rough tillage land into a ſtate of pulverization and fineneſs. The invention of it has by ſome been aſcribed to the Norfolk farmers; but the writer of the Agricultural Survey of that diſtrict ſays, that he has at different periods made many inquiries for the inventor of this tool, but could not aſcertain it thirteen years ago. Mr. Sillis, of Hartford Bridge, near Norwich, was mentioned to him as a perſon who had improved it. It is deſcribed as a cylinder of iron,

about

about ſeven feet in length, around which are fixed cutting wheels of caſt-iron, that each turn independently of the others around the common cylinder, weighing from a ton to a ton and a half, being drawn by four horſes, and is heavy work. It is obſerved, that the cutting wheels, being moveable, may be fixed by waſhers at any diſtance, commonly at four inches. By paſſing over a freſh ploughed layer, the ſoil is cut into little channels, four inches aſunder; the ſeed is then ſown broad-caſt, and the land buſh-harrowed in the direction of the drills: thus the ſeed is depoſited at an equal depth. George, earl of Orford, gave the writer one, but the ſoil was too heavy for it: for breaking clods in a dry ſeaſon, no tool he ever beheld comes near to it. It is ſuppoſed by ſome, that the main object of the practice is to ſave the trouble and expence of dibbling, though it is not near ſo good a practice.

And it is remarked by the author of the above Agricultural Report, that they are much in uſe in Lodden hundred. Mr. Burton, of Langley, puts in a great deal of corn thus, and approves the method ſo much, that hitherto he has drilled little; but thinks dibbling a vaſt improvement. It is, however, added, that the implement was more commonly uſed in the county ten or twelve years ago than it is at preſent; for the drill machine has been adopted by many, who formerly had a good opinion of this tool. It muſt, however, be found beneficial in its original intention, in many caſes, on the very light friable ſoils; and as a pulverizing machine on thoſe of the heavy kind, when uſed in ſuitable ſeaſons.

Roller, *Furrow*. This is a tool of the roller kind, contrived for the purpoſe of rolling the furrows in ſteep hilly ſituations, and other places where the common ſort cannot be employed. It is the invention of Mr. Pinchard, and is an uſeful contrivance for the purpoſe for which it was intended.

Roller, *Graſs*. This is a heavy ſort of roller, made uſe of for the purpoſe of rendering the ſurface of graſs-lands ſmooth and even. It has been ſuggeſted, that the wooden rollers of this ſort, which are frequently employed with great propriety on graſs and paſture lands, are in many caſes made too large to produce that powerful effect which is wanted, without the aid of additional weight being given, If made leſs, and well loaded, it is ſuppoſed that a greater degree of preſſure will be afforded. A medium ſize is probably the moſt effectual in giving the requiſite preſſure in ſuch caſes. A powerful implement of this ſort, which is uſed in the beſt graſs diſtrict of the kingdom, weighs ſomething leſs than half a ton. It is, however, made of wood; but iron or ſtone, where they can be had, are much better materials. It is ſtated in the Norfolk Agricultural Report, that Mr. Coke has the moſt powerful roller for graſs-land that the writer has ſeen: it was caſt at the Carron foundery. It is five feet ſix inches high, and five feet ſix inches long; weighs three and a half tons; is drawn by four horſes, and coſt ſixty pounds. It is obſerved, that it leaves the ſurface of graſs-lands in the order that it ought always to be in.

Roller, *Jointed*, ſuch a one as is made with a joint or joints, in order to conform to the nature of the ridges. Theſe kinds of rollers are conſtructed by ſome farmers in the county of Eſſex. Mr. Tweed has invented one, which he finds of very great uſe. He rolls all his clover-land for drilling wheat with it, and employs it for whatever ſort of tillage-rolling is to be performed. The great object of it is to prevent the horſes from poaching, by their going only in the furrow, two of them at length.

Roller, *Spike*. This ſort of roller is conſtructed much in the ſame way as thoſe of the common kind, only inſtead of being plain, it is ſtudded or ſet with a conſiderable number of ſpikes, by which it is ſuppoſed to break the ſoil more effectually. It is moſtly employed on the heavy, ſtiff, lumpy tillage lands, for the purpoſe of reducing and bringing theſe into a better ſtate of pulverization. In ſome caſes it may be a good implement: it may be connected with the compound roller. When the drill-roller is in uſe, this ſort of roller is unneceſſary.

Roller, in *Gardening*, a very uſeful implement in many different intentions, and for ſeveral different purpoſes. The kinds which are moſt commonly employed in this way are thoſe of ſtone and caſt-iron, for compreſſing the more hard ſurfaces; and thoſe of the ſmaller wood ſort, for removing worm-caſts and other protuberances on ſhort graſs-lawns, and other deſcriptions of pleaſure-grounds, in the ſtate of turf or ſward. They are never required to be of any great weight for theſe uſes, but to be capable of being readily managed by the labourer without difficulty or inconvenience.

No unuſual peculiarity of form is here ever neceſſary, as the main object is conſtantly that of rendering the ſurfaces, over which they may paſs, as ſmooth and even as poſſible.

Moderate or middle-ſized common caſt-iron rollers are now moſt uſually made uſe of, for the purpoſes of gardening.

Roller, in *Inland Navigation*, a term applied to an inclined plane, with rollers on it.

Roller, in *Ornithology*, the common name of a bird of the mag-pie kind, called *garrulus argentoratenſis* by authors, and ſuſpected to be the ſame with the bird deſcribed by Geſner, under the name of the *blue crow, cornix cærulea*, and by Aldrovand under the name of *pica marina*. It is the Coracias *Garrula* of Linnæus; which ſee.

Roller is alſo the name by which ſome call the *ampelis*, or *garrulus Bohemicus*. This, in the Linnæan ſyſtem, is a ſpecies of the *ampelis*. See Garrulus.

Roller, in *Block-making*, a cylindrical pin turning on its own axis, which is uſed in ſome blocks, inſtead of a ſheave.

Rollers, *Cylindrical*, pieces of timber, revolving on an iron axis, and ſo fixed above the deck, either perpendicularly or horizontally, as to prevent the chafing of the meſſenger or cable againſt the jeer and topſail-ſheet bitts, &c. Thoſe fixed forward in the manger are to facilitate the meſſenger to the capſtan.

Rollers, *Friction*, are made of two parallel circular plates of braſs, about a quarter of an inch thick. Four or more ſolid braſs cylinders are placed at equal diſtances round theſe plates, and work upon their own axes, between them, at right angles. Thus any pin working through theſe plates of braſs muſt touch the rolling ſurfaces of the ſolid braſs cylinders, by which the friction is conſiderably leſſened.

Roller, in *Surgery*, a long and broad ligature, uſually of linen cloth, uſed for binding, ſurrounding, and containing, the parts of the human body, and keeping them in, or diſpoſing them, to a ſtate of health.

A roller conſiſts of two parts; the *body*, and the two extremities, which ſome call *heads* or *chiefs*, and others *tails*. There are ſingle-headed rollers, that is, ſuch as are rolled at one head only, double-headed rollers, &c.

Again: ſome are equally rolled and gathered together; as thoſe applied to fractures and diſlocated joints. Others are cut into ſeveral chiefs or heads; as thoſe for the head, chin, &c. Others are compoſed of ſeveral ſwaths, gathered and ſtitched together; as thoſe for the teſticles, &c. Some again

again are broad; as thofe for the breaft, belly, &c. Others narrow; as thofe for lips, fingers, &c.

Guidon directs the roller for the fhoulder to be fix fingers broad; that for the thigh, five; for the leg, four; for the arm, three; and the finger, one. See BANDAGE.

ROLLFELD, in *Geography*, a town of Germany, on the Maine; 2 miles S. of Clingenberg.

ROLLI, PAOLO, in *Biography*, a Roman poet, born in 1687, the fon of an architect. He was a difciple of the celebrated Gravina, who infpired him with the love of poetry and literature. The earl of Burlington having brought him to England, which he commemorates in the dedication of his opera of "Aftarte" to his noble patron, who attached him to the court as mafter of the Tufcan language to the princeffes.

Rolli did not fpend an inactive life in England; for, befides being opera poet to the Royal Academy of Mufic till it was broke up, teaching his language to the royal family, and many of the firft nobility, he publifhed Italian odes, fongs, elegies, endeca fillaba in the manner of Catullus, which were much admired. Befides thefe he publifhed epigrams, and fine editions in London of the Satires of Ariofto, the complete works of Berni, Varchi, &c. 2 vols. 8vo. much efteemed; the Decamerone of Boccaccio, the Lucretius of Marchetti, Odes of Anacreon, and a tranflation of Milton's Paradife Loft, in Italian verfe, folio.

Upon the death of queen Caroline, his royal protectrefs, in 1737, he left England, and returned into Italy, where he died in 1767, leaving behind him a very curious cabinet, and a rich library of well-chofen books.

ROLLIN, CHARLES, an eloquent writer and profeffor, was born at Paris in 1661. He was intended for the fame trade as that of his father, namely, a cutler; but a Benedictine, who had watched the opening of his mind, and clearly perceived in him a genius for learning, procured for him an exhibition at the college of Pleffis; and he was immediately taken under the protection of the principal, M. Charles Gobinet. He went through, with much applaufe, a courfe of claffics and philofophy; and then ftudied theology for three years at the Sorbonne. A way feemed now open to him in the college of Pleffis, and in 1683 Rollin entered that feat of learning. In 1687 he was made profeffor of rhetoric, and in 1688 he obtained the chair of eloquence in the Royal College. He became rector in 1694, and occupied that poft two years. During his adminiftration, he revived the ftudy of the Greek, fubftituted academical exercifes for the reprefentation of tragedies, and introduced the cuftom of obliging the fcholars to get the holy fcriptures by heart. In 1698 he was appointed coadjutor of the college of Beauvais, an office which he held till 1712. In the year 1720 he was again rector of the univerfity; after which he entirely devoted himfelf to the compofition of the works for which his name is particularly celebrated, and of which the following is an enumeration of the principal: "Traité de la Manière d'enfeigner et d'étudier les Belles Lettres par Rapport, à l'Efprit et au Cœur," 4 vols. 12mo., publifhed at different times between the years 1726-8, with a fupplement relative to the ftudies of children, and the education of females. Several editions of this work have been publifhed. "L'Hiftoire Ancienne des Egyptiens, des Carthaginois, des Affyriens, des Babyloniens," &c. 13 vols. 12mo., publifhed between 1730-38. Voltaire fpeaks in terms of high refpect of this work: while he admits that the latter volumes are not written with fo much care as the earlier ones, yet he fays it is the beft hiftorical compilation in any language; becaufe the compilers of fuch works are feldom eloquent, which Rollin always was. It has been thought, and with probability, that Rollin wrote hiftory chiefly for the opportunity of throwing into the narrative abundance of ufeful reflections. He paid too much credit to the exaggerations of the ancient hiftorians, and is in a good meafure void of that critical fagacity, which fhould be characteriftic of the writer of hiftory. This quality could fcarcely be expected from the man who gave implicit creed to the miracles, as they were called, of the abbè de Paris, and who was accuftomed to pray kneeling before his tomb. The other principal work of Rollin was "Hiftoire Romaine depuis la Fondation de Rome jufquà la Bataille d'Actium," 8 vols. 12mo. This was continued by Crevier to the reign of Conftantine. Rollin died with a character univerfally efteemed, at the age of 80, in the year 1741. His writings have been popular both in France and in other countries. Voltaire fays, that he was the firft member of the univerfity who wrote with purity and dignity. He began with eftablifhing his reputation as a claffical fcholar, by a number of Latin harangues and poems, which have been printed; and by an edition of Quinctilian, intended for the ufe of fchools, which he illuftrated with fhort notes, and a preface. This edition of Quinctilian has been feveral times reprinted, in 2 vols. 12mo.; that in our poffeffion was publifhed at Paris in 1774.

ROLLING, ROTATION, in *Mechanics*, a kind of circular motion, in which the moveable turns round its own axis, or centre, and continually applies new parts of its furface to the body it moves upon.

Such is that of a wheel, a fphere, or the like. Such, particularly, are the motions of the earth, the planets, &c.

The motion of rolling is oppofed to that of *fliding;* in which the fame furface is continually applied to the plane it moves along.

It muft be noted, that in a wheel it is only the circumference that properly rolls; the reft proceeds in a compound angular kind of motion, and partly rolls, partly flides. The not diftinguifhing between which two, occafioned the difficulty of that celebrated problem, the *rota Ariftotelica, Ariftotle's wheel.*

The friction of a body in rolling, or the refiftance made to it by the roughnefs of the plane it moves on, is found to be much lefs than the friction in fliding.

Hence, the great ufe of wheels, rolls, &c. in machines; as much of the action as poffible being laid thereon, to make the refiftance the leffer.

For the laws of bodies rolling on inclined planes, fee *Inclined* PLANE and DESCENT. See alfo ROTATION.

ROLLING, in *Gardening*, the work of rendering any furface level by means of the roller. It is practifed equally for the purpofe of bringing the furfaces of the gravel and other kinds of hard walks and roads into an exact and even order, as well as thofe of pleafure-grounds, which are in the condition of fhort or mown grafs. And it is fometimes applicable in other intentions, as thofe of rolling in particular forts of feeds, inftead of putting them in by means of treading the beds by the feet, and the rolling down and rendering more clofe the too loofe and open grounds of gardens, &c.

The rolling down of garden-walks and roads fhould always be done, when poffible, immediately after flight falls of rain, the gravel or other kinds of materials being previoufly put in fuitable order by fweeping and raking with proper rakes for the purpofe. The roller is then to be carefully drawn up on one fide and down the other of them as clofe as poffible to the grafs verges, and afterwards along the middle parts, in a forward and backward direction, which moftly completes the work.

In

In rolling and rendering ſhort-graſs pleaſure-grounds ſmooth and even, it is uſual to go over them, in the firſt place, when they are to be mown, as ſoon as poſſible after a good fall of rain, with a ſmall wooden roller, in order to take up and remove the worm-caſts, and then to follow with the iron one, beginning at one ſide and going on in a regular manner over the whole, in a cloſe up-and-down direction. The rolling, in theſe caſes, is ſometimes alſo performed for the purpoſe of mowing only, which is always done by the wooden roller, as it clears the graſs in the beſt manner; the iron roller being run over afterwards, when the mown graſs has been removed.

Rolling ſhould be frequently practiſed in caſes of this nature, in order that the walks, roads, and lawns, may be kept in a neat, proper condition, and never be ſuffered to run into a ruinous and diſorderly ſtate.

Rolling, in *Huſbandry*, the action or operation of drawing a roller over the ſurface of the ground, with the view of breaking down the clods, rendering it more compact, and bringing it even and level; or for only levelling the ſurface, as in graſs-lands. This is a practice that becomes neceſſary both upon the tillage and graſs-lands, and which is of much utility in both ſorts of huſbandry. In the former caſe, it is made uſe of with different intentions, as for the purpoſe of breaking down and reducing the cloddy and lumpy parts of the ſoil in preparing it for the reception of crops. It is alſo of great uſe in many caſes of light ſoils, in rendering the ſurface more firm, even, and ſolid, after the ſeed is put in. It is likewiſe found beneficial to the young crops in the early ſpring, in various inſtances. And it is ſtated by the author of Practical Agriculture, that in the caſes of ſtiff, heavy, and adheſive ſoils of different kinds, it may frequently be made uſe of with the firſt-mentioned intention with very great advantage; but it ſhould only be employed when ſuch lands are tolerably dry, for when drawn over the ground under the contrary circumſtances, little benefit can be afforded in the way of pulverization, while much miſchief muſt be produced by the poaching of the horſes, and the plaſtering the earth round the implement. But by uſing it in the manner juſt directed, all the lumpy or cloddy parts of the ſurface ſoil may be effectually cruſhed and reduced into a fine powdery ſtate, fit for the reception of the ſeed. And that if, in ſuch ſorts of ſoil, it be applied, in the intervals between the different harrowings, it may contribute much in the ſame way, not merely by reducing a great number of the lumps by the preſſure that it cauſes, but by forcing others ſo much into the ground that they may be acted upon, and further broken down by the fermentation that moſtly takes place in the ſoil after the land has been ſtirred. In all the light and more porous ſorts of ſoil very beneficial conſequences may alſo be derived from this operation by the conſolidation of ſurface that is thus produced, and the more perfect retention of moiſture, by which the ſeed, eſpecially if of the ſmall kind, is enabled to vegetate more equally, as well as in a more expeditious manner than would otherwiſe be the caſe. It is likewiſe ſuppoſed, that, in caſes where lands have been left rough after ploughing, for the purpoſe of more effectually deſtroying weeds, it may be of utility, by being employed before the harrows, to give them more power in laying hold of and reducing the ſoil, and by the pulverization that it affords, and the more perfect retention of moiſture that it cauſes, in conſequence of the ſurface being rendered more cloſe and compact, the ſeed-weeds are produced more abundantly, and more readily deſtroyed. It is likewiſe in theſe laſt methods, Mr. Donaldſon ſays, that it proves ſo highly beneficial in all caſes where graſs-ſeeds are ſown; as well as by the equality and ſmoothneſs of ſurface that are thereby produced; and it is well obſerved by the ſame writer, that if no other benefit were derived from rolling lands in tillage, than ſmoothing the ſurface, even that in harveſt is of material conſequence, more eſpecially where the crops are cut down with the ſcythe, which is general in moſt of the ſouthern diſtricts of the kingdom, and which the increaſing ſcarcity of labourers muſt ſoon, in all probability, introduce into thoſe of the north. It is alſo remarked by Mr. Morley, in the fourth volume of Communications to the Board of Agriculture, that old ſward, or graſs-ſeeds, upon firſt breaking up, ſhould always be rolled before dibbling for either wheat, beans, or peaſe, as it makes the land more ſolid, and the grain, when it vegetates, will form a ſtronger root. Wheat ſhould always be rolled in the ſpring after froſt, as it will make the ſoil adhere more cloſely to the roots of the plants, which very much encourages vegetation, and will cauſe the ſtem to be much ſtronger, and the grain will be brought to greater perfection. Barley and oats ſhould always be rolled when the blades are about an inch above the ground, if the weather permits; and turnips ſhould be rolled at night, ſoon after the plants make their appearance, which will be a means of deſtroying a great number of ſlugs and ſnails, that are very deſtructive to the young plants. And it is ſuppoſed by Mr. Somerville, in his Agricultural Survey of Eaſt Lothian, that rolling, when conducted in a judicious manner, is highly beneficial, and admits of being much extended, eſpecially upon all winter crops after that ſeaſon has been ſevere, and without any regard to ſoils, as both loams and clays, after much naked froſt, have their coheſion ſo much broken as to leave the plants quite looſe, and almoſt without any eſtabliſhment. It has alſo been ſtated, that the rolling of wheat, rye, barley, &c. with a roller of good length, and half the weight of the common ones above deſcribed, may be advantageous in other ways, as it preſſes down the ſoil that has been raiſed by the froſts about the minute ramifications of the attracting veſſels or ducts, and augments the quantity of mould upon them by breaking the little lumps of ſod; which, indeed, were very ſerviceable in winter by affording ſhelter, but in ſpring will ſtill be of greater uſe, by ſuch imminution in filling up the fiſſures, and preventing, in a great meaſure, the ill effects droughts have on light ſoils, by retaining and filtering rain-water; whereby the ſoil imbibes whatever is nutritive, and what is ſuperfluous of the ſimple fluid only eſcapes.

But it is added, that although theſe are ſome of the many advantages rolling produces in agriculture, notwithſtanding it amounts to no more than mere conjecture, that, in general, rolling corn may do more damage than it can good, if ſuch cautions as the following be not carefully attended to; *viz.* never to roll corn but in dry freſh weather; by no means to uſe heavy rollers, nor to roll too early, as before the blades be pretty ſtrong, for the wounds that the blades may receive, the roots, being then tender, will be unable ever to recover; nor too late, as, when the ſtalks are hardened and grown to any height, for the roller will break them, which injury can hardly be repaired, and the crop is thereby greatly hurt; that none but light lands are proper to be rolled with this view, and thoſe which have been manured that or the preceding year with dung only: in ſhort, none but rich, light ſoils, in general, can be improved by rolling in this intention; for in poor lands it oppoſes the moſt active principles, and undoes all that has been done for the crop by ploughing, &c. It is conſequently concluded, that the ſoil, the condition, the growth of the corn, the weather, and the weight of the roller, are all to be moſt ſcrupulouſly regarded: when all coincide, the advantages of rolling may be great; but when they do not, the

the disadvantages may be insuperable. Rolling, then, is neither the least critical, nor the most insignificant piece of the husbandman's profession; therefore ought not to be performed at random and without circumspection, in cases where young crops are concerned.

Mr. Marshall, in his Rural Economy of Norfolk, in speaking of rolling, remarks, that one circumstance requires to be mentioned, which is, that the roller, notwithstanding the lightness of the soil, and its proneness to be injured by dry weather, is never used in Norfolk for the purpose of compression. He never saw one used by a farmer either upon fallow or upon a lay; not even upon the first year of a clover-lay, to smooth the surface for the scythe. The only uses to which he has seen a roller put, in that district, are that of smoothing the surface before sowing, to prevent the seed from running down too low, and that of smoothing it afterwards as a preparation for the scythe; and even this operation is performed with a roller not more perhaps than seven or eight inches in diameter; a circumstance which he confesses he is no way able to account for; nevertheless, it would be rashness to condemn an established practice, unless he could, from his own experience, or from adequate observation on the experience of others, prove it to be ineligible. And it is stated, that there is a sort of land which, when clover is sown upon it, throws out the young plants after a frost. Rolling in the beginning of winter, and immediately after the frost is gone, will, in some measure, prevent this. The first rolling hinders the frost from penetrating so deep as it would otherwise do; and the second makes the land firm, after having been loosened by the change from frost to open weather. In the latter case, or that of grass-land, this is also a process that is of much advantage, especially where such lands are kept under the scythe. And it is probable, that in many cases of pasture lands it may be found of great benefit. In the former it is found beneficial in keeping the surface free from hills, and in a more even state, as well as the grass from becoming in so tussocky a condition, as is often the case where the practice is neglected, or not well understood. And in the latter it may perhaps have a similar effect, and keep the grass more free from tufts, and in a more regular condition, which is a circumstance of great consequence in the practice of grazing. It has been remarked, that the impression of the roller not only renders the surface more level and fine, but at the same time induces the grass plants to spread more laterally, and in that way to form a better and more close sward, which may be highly beneficial in both cases. Its importance on new laid-down grass-lands is therefore extremely obvious, as it must be highly serviceable in these different intentions. And the worm-casts are by this means reduced and brought into order, by which means the mowing can be performed with greater facility, and in a closer manner. Besides, it may be useful in other views, as by pressing the mould, as well as the manure, more closely round the roots of the grass plants; and in consequence of such means, they may not only be better established in the soil, and their vigorous growth more effectually promoted, but, from the moisture being more fully preserved in the ground, be in less danger of injury from the effects of heat in the summer months, and of course better crops be afforded at the period of cutting them down. In order to perform this business in the most complete and effectual manner, a roller of considerable weight is necessary, such as has been already described; and it has been advised, in order to prevent as much as possible the ground from being injured by the feet of the animals that draw it, as may frequently be the case where they follow each other in the same part, it may be the best practice to have them yoked double, as by that means there will be less treading on the same portion of the surface; and that where two horses are sufficient to execute the work, more should never be made use of; but if a third should be found necessary, it may be attached as a leader in the middle, before the other two: a greater number of horses can seldom or ever be of any material advantage in this sort of work. It is also suggested as necessary, to be very careful in executing this operation, to see that every part receives the due impression of the implement. On lands where this sort of work is regularly performed, it will seldom be requisite to pass more than once in a place, but in other cases it may often be done more frequently with benefit; and in particular cases, a more frequent repetition of the operation is absolutely requisite, in order to bring the ground into a proper state. It is necessary, in the execution of this business on grass-lands, to attend in a particular manner to the season, as it cannot be performed with advantage, either when the surface is in too dry or too moist a condition. It is stated, that in these cases the work of rolling may be advantageously performed at different seasons, as in the beginning of the autumn, and in the commencement of the year, or very early spring months; but the latter is the most common period. But in order to its being executed with the greatest possible benefit, a time should always be chosen, if possible, when the ground is in a suitable state for receiving the impression of the implement. In the drier descriptions of land it may frequently be performed in the most beneficial manner, after the land has been rendered a little soft by a moderate fall of rain; but in those of the contrary sort, it may be necessary to wait till the superabundant moisture be so much dried up, as to admit the animals employed in drawing the machine, without poaching or otherwise injuring the surface of the ground while the process is going on. It has been remarked by Mr. Boswell, that the rolling of watered meadows should be executed towards the latter end of February or beginning of the following month, after the land has been left in a dry state for a week or ten days. And that the work should be performed lengthwise of the panes, going up one side of the trenches, and down the other. And in the case of rolling the common hay lands, it is a good mode to proceed up one side the field, and down the other, somewhat in a similar manner, as by that means the work may be the most completely executed, and with the least trouble.

Also a writer, in the Communications to the Board of Agriculture, mentioned above, has remarked, that sward and meadow land should always be rolled in April or the beginning of May, and when the ground is in a moist state, as it causes the grass to be of a more kind nature, and reduces the hills raised by the ants to a proper state of being mown over.

Likewise on such new grass-lands as have been just restored to the state of sward, and which are often thin and patchy, when seeds are sown over such parts, the roller may frequently be run over them in order to force in the seeds; but a better practice is to turn sheep upon the lands, confining them upon such patches by means of hurdles, in order that they may tread them in. In either case, a rather moist time should be chosen for the purpose. In cases of this nature, where there is a degenerate sward, Mr. Amos, in his Minutes on Agriculture, advises the use of his compound roller, which should be run over the ground early in March, when the sward will admit the spikes without being injured by the feet of the horses, the land being previously covered with well-rotted dung, or compost, in the proportion of from about eight or ten tons to the acre. It should be well rolled in different

different directions, till the surface sward is pretty much broken, then sowing the grass-seed over the land, and after letting it be well dressed with the sward-dresser, and all the rubbish collected cleared away, rolling it well down with the plain roller, and admitting no sort of live-stock afterwards upon it. In this method of using the roller, vast improvements may, in many cases of degenerated or worn-out grass-lands, be effected, without incurring any very heavy expences, or much trouble. See SWARD-*Dresser*.

ROLLING-*Bridge* signifies, among *Canal-Makers*, an INCLINED *Plane*; which see.

ROLLING-*Carts*. See CARTS.

ROLLING-*Mill*, in *Metallurgy*, and particularly in the *Iron Manufacture*, is a mill for reducing masses of iron or other metals into even parallel bars, or flat thin plates: this is effected by passing the metal, whilst red-hot, between two cylindrical rollers of iron or steel, which are put in motion by the power of the mill; and being so mounted in a strong metal frame, that they cannot recede from each other, they compress the metal which is passed between them, and reduce it to a thickness equal to the space between their surfaces.

It requires a most enormous power to put in motion the rollers which are employed for laminating iron in the large way; and for this reason, the greatest number of rolling-mills are situated upon the banks of rivers which have the advantage of a sufficient fall to turn the machinery. Of late years, the improvements of steam-engines have been carried to such a high perfection, as to put them on a par with water, for most purposes, and particularly for rolling-mills, as the waste heat of the furnaces used for heating the metal may be employed, in part, to raise steam for the engines which turn the rollers.

Rolling-mills were not very generally used in the iron manufacture till within these sixty years. The old mills which were first used are extremely simple; two separate water-wheels are placed on the opposite sides of the mill, with their axles in the same direction, but at different heights, so that one wheel can be connected with the upper, and the other with the lower roller: it therefore requires the two wheels to have the water delivered at opposite sides, to make them revolve in different directions, in order that the upper surface of the lower roller, and the under surface of the upper roller, may move in the same direction, and pass the iron between them. The construction of the rollers generally used in such mills is shewn at *figs*. 3, 5, and 6, of *Plate* V. *Iron Manufacture*, except that the two rollers, F and G, are there shewn with equal pinions, *d* and *e*, fixed upon the ends of their pivots, to compel the two to revolve equally together; whereas, in the mills with two separate wheels, no provision is made to ensure the equal motion of the two. The gudgeons, or necks, of the lower roller, G, are supported in brasses, fitted into strong carriages of iron E, E, which have holes through their ends, to receive four strong iron bolts, A A, B B; these stand perpendicular, and form the frame, to retain the rollers at the proper distance, being fitted through the carriages E with heads below, so that they cannot draw out. The upper ends of the bolts are cut with screws, upon which nuts, *a*, *a*, are fitted; and these being turned round by iron handles or wrenches, screw down the pieces D, D, and advance the rollers nearer together; or, by a contrary motion, increase the distance between them: *i* (*fig*. 6) is a strong iron bar, extended from one bolt, A, to the other, B, and fixed fast; it supports an iron plate, forming a kind of table before the rollers, to guide the iron through them. The rollers have square heads upon the ends of their gudgeons; and upon these squares, large cast-iron sockets or boxes, as L, are fitted, and these, at the other ends, are fitted upon similar squares on the ends of the water-wheel axis. A little play or looseness is admitted in all these squares, because the upper roller is set at different heights, according to the thickness of the work which is to be rolled between them: this play is required to allow the rollers to move freely, when they are not exactly in the line of the water-wheel axis: it is to accommodate this circumstance that the principal care is required in constructing a rolling-mill. Our readers will gain a good idea of the best proportions of a mill, with two independent water-wheels, from the following directions for building one in Northumberland, which were given by Mr. Smeaton near 40 years ago. The two water-wheels are to be under-shot, and of different sizes, *viz*. 15 ft. 4 in. and 14 ft. 8 in., the mean diameter being 15 ft. The breadths in their float-boards are to be three feet each, the small wheel being laid lower than the other by seven inches; this, with the differences of their diameters, will make the centre of the large wheel 11 inches higher than the other. The different heights of the crowns of the falls or breasts, down which the water descends to act upon the wheels, and the positions of the water-shuttles, are to be so adjusted, that the gates or shuttles being equally drawn up by their starts, the wheels will, as near as possible, revolve in equal times, and with equal power. The rings of the water-wheels are to be made of cast iron, that their weight may act as flies: the ring of the lesser wheel is to be made six inches in thickness by six inches deep, while that of the larger is to be only five by six. The greater quantity of matter in the lesser wheel, therefore, will give it nearly the same momentum as the larger wheel.

The rings of the water-wheels are each to be formed by eight pieces or fellies, the exterior circle of the greater wheel being thirteen feet diameter, and that of the less twelve feet four inches: the length of the fellies is to be about half an inch shorter than their true length, in order to admit an oak wedge of one inch thick to be introduced into every joint after the rings are screwed together by the joint-plates of wrought iron, which unite the fellies. These plates are to lay upon the plain surface of the felly, and not to be let in as the common wooden rings of water-wheels, in order that the oak wedges may completely fill the joints at the ends of the fellies. The wheels are to have wooden arms, and it must be observed, that the mortises through each of the iron fellies, for receiving the ends of the arms of the wheels, are to be about two inches and a half in width, and that they are to be a little dove-tailed, in their length only, so that the mortises being longer on the outside of the ring, and the wood of the arm being spread into them with wedges, will produce firm ties to the centre; but as a farther security, pins are to be put in after the wedging is completed. The mortises in the rings for the starts, which support the float-boards, are to be four inches by two, without dove-tailing, or rather they should be larger outside than inside. The breast or float-boards will fix by nails into the joints and arms, where they fall; but that the breast-boards for the intermediate floats may also have a fastening, holes of about one inch diameter, and about four inches deep, must be cast in the ring, at the places for every other float; these holes, being filled up with pieces of oak, will afford places to drive the nails for securing the boards. The axles of the water-wheel are to be of cast-iron, with flaunches to screw the arms of the wheel against. The total length of each axis is to be seven feet one inch, and the diameter throughout the axis is to be a circle of nine inches. The manner of fixing the arms upon flaunches is to be found in *Plate* XXXIV. *Mechanics*, in our article MILL.

The

The braffes upon which the necks of the water-wheel axles are fupported, are intended to be let into caft-iron ftocks, which are again fupported upon wooden bed-planks, and thofe upon the cap-ftones of the walls, which (under thefe at leaft) are fuppofed to reach all acrofs the thicknefs of the walls, thofe necks being firft truly and fmoothly turned; at each end, beyond the neck, is formed an aftragal or moulding, to keep the wheel in its place from moving endways. The ends of the axis are terminated by an indented head, fhaped fomewhat like a fquare citadel in fortification, and an iron box is fitted upon this to communicate the motion to the rollers, the furface lines of the indented head being formed a little rounding, that the box may not only be certain of taking its bearing in the middle, but likewife be capable of complying with the motion of the rollers: and in order to give ftill more liberty, the end of the box which is fartheft from the water-wheel, is formed into a fquare of eight inches, which is again furrounded by another box, whofe external furface is round. This box is formed at the end of a round fpindle or axis three feet long, and terminated at the other end with a fquare of eight inches, which enters one end of a fquare box, and at its other end receives the fquare of the roller, fuppofed to be of fix inches, but may be of any other fize which is thought neceffary. It is to be noted, that all the fquares are to be made larger than thofe of the rollers, in order that they may wear longer; and all the infertions are to be lefs than thofe at the end of the water-wheel axles, that the axis may not be rendered ufelefs by the wear or failure of the citadel heads which are introduced, as they are expected to laft many years; and if any thing fhould happen to them, the axes are made alike on both fides of the water-wheels, that they may change ends; therefore, there is nothing of confequence likely to fail by wear or breakage, except the fmaller intermediate work between the axis and the rolls, which is eafily replaced. Holes are to be made through the boxes and joint parts for iron bolts to pafs through rather loofely, fo as to prevent the boxes and fquares feparating, but not to confine the joints from yielding to the motion of the rolls. The water-wheels are fuppofed to be clofely adapted to their conduits, and their axes to remain immoveable as to height, at the difference of eleven inches in level, while the rolls are fuppofed to vary in their diameter from twelve inches to nine. This will be allowed for, by the diftance that the fquares upon the rolls are from the end of the axis; for though the houfe is fuppofed no more than ten feet wide between the walls, the diftance between the middle of the citadel heads at the end of the water-wheel axis, and the middle of the fquares of the rolls refpectively, is upwards of four feet; and in that length no lefs than four joints are introduced, every one of which complying a little, a fmall difference in the height of the roll will produce no fenfible difference in the communication of the motion from that of a right line; all the joints being kept oiled or greafed, which will be not lefs proper on that account than to keep the parts from wearing. In order to preferve the directions as near as poffible to a right line, Mr. Smeaton propofes that the lower roll fhall be placed originally half an inch below the centre of the axis which turns it: fuppofe the rolls were firft made of twelve inches diameter, while the difference of the height of the axis is only eleven, the upper roll will be juft half an inch too high, fo that the compliance in each will be equal, and no more than half an inch in four feet length. Thus it appears, that when the rolls are reduced by wearing from twelve inches to eleven each, then the upper roll as well as the lower will be half an inch too low for its axis; ftill neither will need to comply or vacillate more than half an inch. The roll being now of a juft diameter to anfwer the different heights of the axis, let the lower roll be raifed to its juft height, and then both the rolls will work true till they are further reduced; but when they become reduced to ten inches and a half diameter, the upper roll will become half an inch too low; then raife the under roll half an inch above the line, and the upper roll will then be truly in the line; fo that when the upper roll is come down to be half an inch below the line, the rolls will be reduced to ten inches; then raifing the under roll a quarter of an inch more, it will be three quarters above the line, and the upper roll will be a quarter of an inch under the line; and when it comes down to three quarters below the line, the rolls will be reduced to nine inches and a half; therefore, laftly, raife the under roll another quarter, fo as to be an inch above the line, and the upper roll will be reduced to half an inch below it, fo that when it is come down to an inch below it, the rolls will be reduced to nine inches. In this way the departure of the rolls from a right line will never become more than half an inch, while they are reducing from twelve to ten inches; nor more than three quarters, while they are reducing from ten to nine and a half inches; at the worft they will be no more than an inch, while they are reducing from nine and a half to nine inches. The greateft inequality is purpofely made at this place, both becaufe the purchafe of the wheels is then greateft and moft able to overcome an addition of friction, and becaufe the time that they will continue in this ftate is the leaft. If the axles are placed at ten and a half inches diftance inftead of eleven, the vacillation each way will never exceed three quarters of an inch; nor more than one inch to reduce the rolls to eight and a half diameter.

The raifing of the under roll is not to be done by raifing the whole of the bed of the roller-frame; this is to be fet originally half an inch lower than the true line; and when the lower roll requires raifing, it is to be effected by putting iron plates under the carriages of the lower roll gudgeons, fo that they will ftand as much higher than before, and not to make the feveral rifes by additional plates, but to have plates of the different gages, fo that each will lay in one folid piece.

Mills, on this conftruction, are ftill ufed in many iron-works for rolling coarfe iron bars, but are unfit for any better purpofe, from the difficulty of adjufting the two water-wheels to an equal velocity; and if one roller moves quicker than the other, the metal becomes more extended on that fide than upon the other, and is thus rendered convex. Another defect is, the want of proper fly-wheels to regulate the mill; for the caft-iron rims to the water-wheels by no means anfwers the purpofe of fly-wheels, unlefs they are made to revolve fo quickly that the water lofes much of its effect upon the floats. Fly-wheels are, perhaps, more ufeful for rolling than in any other kind of mills, becaufe the refiftance to be overcome is fo variable; being at one moment very great for a large piece of iron, then fmaller whilft it is paffed through a fecond time, becaufe the iron is to be lefs reduced: and in the interval of returning the iron, to put it through again, there is no other refiftance than that of the friction of the machinery. Again, when the iron has been paffed through feveral times, the refiftance is greateft of all, becaufe the metal has become harder, both by the compreffion it has undergone, and from being gradually cooled; alfo, the metal, being thinner, will not yield fo readily to the preffure, as when in a larger mafs. By the proper addition of a heavy fly-wheel, great advantages, in point of power, are gained, as it tends to equalize all these irregularities; and in every interval, when the resistance is removed, the water-wheel gives a rapid motion to the fly, the force of which will be returned when the work is applied: in such a mill, if the workmen have an extraordinary large piece of metal to roll, they suffer the mill to work for a few seconds without any resistance, then putting in the iron, it is carried through at once by the momentum of the fly, though requiring a power far beyond the ordinary force of the water-wheel. The most approved method of applying a fly-wheel to a rolling-mill, is to have a large cog-wheel upon the axis of the water-wheel, to give motion to a pinion, upon the axis of which a heavy iron fly-wheel is fixed: the wheel and pinion are of such a size as to make the fly revolve about three times to one of the water-wheel: at the opposite side of the great cog-wheel another pinion, of about half its size, is placed, and to the extremity of its axis produced, the rollers are connected, the two rollers being made to turn together by means of pinions upon the ends of their gudgeons, in the manner shewn at *d e*, *fig*. 6. *Plate* V. If more than one pair of rollers is to be worked, a cog-wheel is fixed upon the axis which turns the rollers, and works another equal wheel upon the axis of the second pair, placed parallel to the former; in this case the lengths of the two axes must be different, so that the lines in which the bars will come through the different rollers, will not interfere with each other, but leave sufficient room between for the men to work. In most common mills, rollers, such as are represented at *figs*. 3, 5, 6, of *Plate* V. are employed; but to these there are some objections; first, the four nuts *a*, *a*, cannot all be turned at once with such precision as to bring the upper roller exactly parallel to the other; the means the workmen use for this, is to have a small iron wrench, or handle, fitted upon two of the nuts, *a*, *a*, and these they turn round a small quantity every time the metal has passed through, in the interval whilst it is returned to be put through again. The workman who stands in front to introduce the metal between the rollers, turns the nut on his left-hand side which is nearest to him; whilst his comrade, who receives the metal, and hands it back again to him over the roller, turns the nut on the opposite corner of the frame: by this means, as only two, instead of four, of the nuts are turned, the pieces D are constantly put out of the horizontal position, in which alone they can take a proper bearing; also, in these frames there is no support for the weight of the upper roll; but when there is no metal beneath it, it falls down, and rests upon the other; when the metal is suddenly introduced, it lifts the roll up to its bearing with a jerk, which endangers the breaking of some of the parts, and generally causes the nuts to start a little before they settle themselves to the strain. In the modern mills, the frames for the rollers are made of cast-iron, as shewn at *figs*. 1 and 2. *Plate* V. The cheeks, A, are cast in one piece, and form a bed for the reception of the brass of the lower roller H; a piece, C, is fitted upon the top of the cast-iron cheeks, and is held down by two strong wrought-iron bolts, with nuts, *a*, *b*, to screw it down, and regulate the distance between the two rollers, the gudgeon of the upper roller, G, being confined by a brass let into the piece C, but to bear it up from falling: when there is no iron between the two rollers, another brass is placed beneath the gudgeon, G, and suspended by bolts, *d*, *d*, from the piece C; by this means the two rollers are retained always at a proper distance asunder. The two standards A, B, *fig*. 2, at the opposite ends of the rollers, have broad feet at bottom, by means of which they are bolted down to massive ground-sills, which extend all across the mill-house. The rollers E and F are caused to move together equably by means of pinions *a*, *b*, which, that they may work well, are made with accurate teeth, of not more than 1½ or 2 inches pitch, or distance asunder; and, to give the requisite strength, they are made of considerable breadth, as the figure shews. Two large flat iron plates, I and K, are screwed to the two standards, both to strengthen them, and to form a table, upon which the masses to be rolled are laid to be presented to the rollers, and having passed through, are received on that at the opposite side.

The rollers shewn in *figs*. 1 and 2, have a number of grooves in them, which being opposite to each other, leave openings of a determinate figure for the purpose of rolling square bars, with the angles upwards; they do not therefore require to be adjusted in distance, as other plain rollers do, but are always, after the first erection, retained at the same distance; in this case the pinions *a* and *b* serve very well to connect the motions of two rollers together; but when the rollers are required to be adjusted during the working, as in the *Plate Rollers*, *fig*. 6, the pinions must necessarily have very coarse and long cogs, that they may not be so much affected by increasing or diminishing the distance between their centres; in this case they work very indifferently, and frequently break by the awkward manner in which such coarse teeth always meet each other when upon wheels or pinions of small radius, particularly when the proper distance between their centres is not preserved. As a partial remedy for this difficulty, the pinions are, in some mills, made very broad, with fine teeth, and mounted in a separate frame, exactly similar, except in its strength, to that of the rollers; this is placed at a distance of three or four feet from the rollers; then a coupling, or short shaft, being interposed between the squares at the ends of the axis of the pinions, and those of the rollers, they permit the latter to be adjusted without disturbing the pinions; and the length of the shafts will accommodate for the differences between them.

In *Plate* IV. of *Iron Manufacture*, we have given three figures of a very capital rolling-mill in Messrs. Walker's extensive iron-works at Rotherham, in Yorkshire, where they have several mills worked by the same river. The one in question is employed in reducing iron to small rods for nail-making, by first rolling the pieces to flat bars, and then passing them through a pair of slitting rollers, which divides each into several small square rods: it is, therefore, much smaller in its dimensions than the great mills used for rolling thick iron plate; but we have selected it on account of the arrangement of its wheels, which renders it superior to the mills in common use, as it works without the pinions of which we have spoken. A A, in the plan, (*fig*. 1.) is the water-wheel, 17 feet diameter, and five feet six inches broad: it is of the under-shot or rather breast-kind, the water being delivered below the centre, but confined to act upon the wheel by a breast of masonry, curved to correspond with the wheel very exactly. The pivots or gudgeons, *n*, of its axis rest on bearings, supported by the walls N. At one end of the axis a clutch-piece, M, is fixed, to give motion to a second axis *k*, which, being in the same line as that of the water-wheel, may be considered as a continuation thereof. It is carried under the floor of the mill. It has two large cog-wheels, one marked *b*, and another of the same dimensions at the opposite end, which is only seen in *fig*. 2, as it is concealed in *fig*. 1, beneath the wheel *f*, which it turns. The first of these wheels, *b*, gives motion to two wheels, *a* and *c*, which are on the axes I and H, and give motion to the lower of each of the two pair of rollers, situated in the frames at E F and C D. This wheel-work is shewn in

fig.

fig. 3. The wheel at the other end of the ſhaft, *k*, (ſee *fig.* 2.) turns the wheel *f*, ſituated directly above it; and this gives motion to two wheels, *e* and *g*, of the ſame dimenſions as *a* and *c*. Their axles, L and K, are connected with the upper of each pair of the rollers. By the introduction of the wheel *f*, the ſmall wheels, *e* and *g*, are made to revolve in a contrary direction to the wheels *a* and *c*; and, at the ſame time, the centres of the former are raiſed a ſufficient height above the latter, to allow for the difference in height of the centres of the upper and lower rollers of each pair. The coupling-boxes, L K and *pp*, which unite the axles of the wheels to their reſpective rollers, have ſufficient play in the joints to allow for that ſmall deviation which takes place in ſeparating the rollers, to adjuſt them to different thickneſſes of the metal they are intended to roll; though theſe ſhanks ſhould be repreſented longer than the limits of our plate have allowed, the ſpace between the frames for the wheels being in reality eight feet, inſtead of five feet nine inches, as given in the drawing.

By this arrangement of the wheels of the mill, the contrary motions of the two rollers are communicated from the ſame water-wheel, without the intervention of ſmall pinions, which, in works requiring ſuch heavy ſtrains as that of rolling iron, always work with difficulty and enormous friction; ſo that they break and wear out conſtantly, making great interruptions to the work. In the preſent inſtance, the wheels are all of conſiderable ſize, and, therefore, tranſmit the power more equably, at the ſame time that they give the two rollers preciſely the ſame velocity, which is a circumſtance of ſome importance in making good rolling for plates or bars, which will be irregular, if one roller turns faſter than the other, in conſequence of one ſide of the metal being more expanded. The framing of the mill (*Plate* IV.) is very clearly expreſſed by the drawing. The axles H and I, of the wheels *a* and *c*, are ſupported in bearings, ſcrewed down to iron frames, which are ſecurely fixed to the ſolid maſonry. On the other ſide, the iron frame, O O, is erected to ſupport the axles of the wheel L K, and alſo that of the wheel *f*, as ſhewn in *fig.* 2. The main axis *k*, and the wheels upon it, are carried under ground, and ſupported on the walls, as ſhewn by the plan. The roller-frames, C D and E F, (*fig.* 1.) are fixed down upon ſtrong beams, extended acroſs from the frame, O, to the frame on the oppoſite ſide. The poſition of one of theſe beams is ſhewn by dotted lines on the right-hand ſide, in *fig.* 1. The rollers, C, D, are exactly the ſame as ſhewn in *Plate* V. *figs.* 3, 5, and 6, except that the pinions, *d* and *e*, are omitted, being unneceſſary, from the arrangement of the wheels, which we have deſcribed. The other rollers at E F are made on a very different conſtruction, and are called ſlitters, becauſe they ſlit or cut up a bar of iron into ſeveral ſmall ſquare bars, of a ſize proper for nail-makers, or to form hoops for barrels. Theſe ſlitters conſiſt of two ſtrong axles, mounted in a ſimilar frame to the other rollers; but inſtead of carrying plain cylindrical rollers, they have rollers compoſed of ſteel rims or edges, of the ſame breadth as the rods they are to ſlit, and leaving between them deep grooves. The two ſlitters, or cutters, are ſo placed in their frame, that the rims of one roller will enter into the grooves between the rims of the other. This will be underſtood by an examination of *fig.* 4. *Plate* V.; though the rollers there ſhewn are for a totally different purpoſe, ſtill the manner in which the rings of one roller enter the grooves of the other is the ſame as the ſlitters: but the proportion of breadth is different, the ſlitters being made with grooves of half an inch, three quarters, or one inch wide, and many intermediate ſizes, correſponding to the rods to be cut; and they are not made from a ſolid roller, but are formed of ſeparate circular plates of ſteel of the juſt thickneſs, fitted ſide by ſide upon the axis, with circular iron plates of equal thickneſs between them, which form the ſpaces; and being of a leſs diameter than the ſteel plates, or cutters, they leave deep grooves between the edges. A number of crooked guide-bars are extended acroſs the frame, and paſs through the grooves, between the cutters; but lying at the very bottom of the grooves, and not being very thick, they do not fill up the grooves, the circles of the cutters projecting through theſe bars, which appear like a grate, and one is applied to each roller. Thoſe which are called the guides of the ſlitters are intended to prevent the iron adhering in the grooves between the rims, or cutters, when preſſed down into them; for the action of the ſlitters is to divide the iron which is paſſed through them into ſeparate pieces, by the rim of one roller (for inſtance, the lower) forcing one piece of the bar down into the groove of the lower roller, whilſt the adjacent part is forced up, by the rim of the lower roller, into the groove of the upper: the bar is thus divided into as many rods as there are grooves in the width which it covers. The angle at which the circles of the cutters interſect each other, is that in which the edges of a pair of ſhears are found the moſt favourable for cutting; and the ſlitters cut upon the ſame principle, but with ſeveral edges at the ſame time.

A rolling-mill generally contains a pair of ſhears, of a ſufficient ſtrength to clip off the ends of the largeſt iron bars, to reduce them to lengths or pieces of a ſufficient ſize for laminating into thin plates. Theſe are made different from other kinds of ſhears, in the circumſtance that the cutting parts, or edges, are ſituated between the centre pin or joint, and the part or handle where the power is applied: the latter is of great ſtrength, and made exceeding ſtrong in iron. The ſhears are fixed in a vertical poſition, the upper blade being firmly fixed by the framing, and the lower one, which is the long lever, is lifted up by the mill when the cut is to be made; therefore it deſcends when the ſhears are to open, and its own weight is ſufficient for that purpoſe. The frame conſiſts of a very large and thick iron plate, which is ſecurely bolted down to the foundations: at one end is an upright, which has a groove through it, to receive the moving blade, and guide it; alſo the end of the handle of the ſtationary or upper blade is ſupported by the upper end of this upright. The joint-pin of the two blades is ſupported in a ſtrong ſocket, or iron frame, alſo erected from the ſame large plate, which carries the upright guide at its other end. The two blades, therefore, lie ſide by ſide, and having cutters, or blades, of ſteel, let into the adjacent ſides of the iron levers or blades, the edges of theſe paſs by each other when the cut is made, and will thus cut any thing which is interpoſed between them, in the ſame manner as ſhears or ſciſſars; and in this circumſtance is their only reſemblance to thoſe inſtruments. The lower or moving blade, which is a long lever, reſts at the extremity, upon the periphery of an elliptical wheel, or camm, (*figs.* 1, and 3.) fixed upon the axis, I, of the rollers, (or, in other caſes, upon the ſhaft of the water-wheel,) in an excentric manner, ſo that, in turning round, it will lift up the lever, and cloſe the ſhears; but when its oppoſite or ſhorteſt radius comes beneath the lever, it is ſuffered to deſcend, and open the blades. At this moment the workman introduces the end of the iron-bar between the blades, puſhing the end of it up to a ſtop, which regulates the length to be cut off; then as the camm turns, it cloſes the blades, and cuts at once through the bar, although ſome of the largeſt are as much as three inches broad, and an inch thick.

Rollers

Rollers are usually made of cast-iron, and are very exactly turned on their surfaces, and also their necks, that they may turn truly when put in their places. The most common way of turning them is, first to mount the roller in a strong turning lathe, by holes or centre points made in its ends; then to turn the two necks truly cylindrical; and afterwards putting the roller in its proper place in the roller-frame, and placing brasses over the necks, they are held down by blocks, fitted under the pieces which retain the gudgeons of the upper roller: in this situation it is put in motion by the mill, and a bar of iron being fixed up for a rest, the surface of the roll is turned true, in the same manner as if it was in a lathe, and will be certain to be exact, being formed from the same necks on which it is afterwards to work. In casting a roller, the mould should always be placed at a considerable depth beneath the orifice where the metal is poured in, so that the pressure of a column of the fluid metal may be obtained to consolidate the casting, and render it free from those air-holes, or porous places, which will sometimes occur in metals cast without the pressure of a column. The long piece of metal which filled the aperture through which the metal ran, is left adhering to the roller, and is cut off afterwards. This is the same mode of casting that is practised for *cannon* (see that article). Case-hardened rollers must be used when it is required to have a very fair surface; *viz.* for such purposes as rolling iron to make thin plates for tinning; also the large rollers for gold or silver, such as are now used in the Royal Mint; rollers for making tin-foil, steel-plate for saws, and for many other purposes. These rollers are not hardened by a subsequent process, as in case-hardening wrought iron, but are cast in that state. This is effected by employing iron moulds: a cast-iron cylinder of three inches thick, and its diameter equal to that of the roller, is bored out with great accuracy, and fitted with ends proper to form moulds for the necks required at each end of the roller; this is buried in the sand of the foundry, and when the metal is run into it, the rapid transmission of the heat through the iron mould causes the metal which is in contact with it to cool sooner than the other parts of the mass, and renders the surface of the roller very hard. In turning a roller of this kind, the centres must be chosen so that the circumference turns as true as it will admit, and then a very small quantity being taken off, will render it perfect: this care should be taken for two reasons; first, that less will be required to be removed to make it true, which is a difficult operation, as only the best steel tools will cut it; also, that if the metal is unequally reduced, or more on one side than the other, the hardest part will there be cut away, and the roller will have a hard and a soft side, and soon wear out of the circular figure, and require a second turning. The less metal there is turned off a case-hardened roller the better it will be, because the hard part is only a case of slight thickness, and most hard at the surface.

The operation of the rolling-mill is so simple, as scarcely to require any description: the metal is heated in reverberating furnaces when it is in large masses, and for smaller pieces a kind of oven is used, in which the cokes are laid on the bottom or floor of the oven without any grate-bars, and therefore the draft of air being less rapid, it gives a slight, but very regular heat, which rises to a bright red, but no farther, and therefore it does not waste the iron by burning it to scales, as a greater heat and current of air will do. This oven is proper for heating plates, hoops, or small bars, to be rolled a second and third time: but for rolling large masses, a strong welding heat is requisite, that the metal may be consolidated, and all flaws or cracks securely closed. The reverberating furnace is used for this purpose; it is made the same as an air-furnace for melting large quantities of iron, except that the floor is horizontal; indeed it is as near as possible similar to the balling furnace. (See *Plate* II. *Iron Manufacture.*) The furnaces are placed as near as convenient to the rollers.

The iron, being heated in the furnace to the proper degree for the purpose which is intended, is taken out by a pair of pincers, the mill put in motion by drawing the shuttle, and the iron is presented to the rollers, which are previously adjusted to the thickness of the piece which is to be passed. If this is not attended to, and the workmen attempt to reduce the iron too much at one time, there is danger of breaking some of the machinery, or of stopping the mill whilst the iron is only half passed through: this is a disagreeable accident, as it will require four or five men, with an enormous wrench applied to the nuts of the roller, to turn them back sufficiently to relieve the rollers, so forcibly are the screws pressed whilst the iron is passing through: this is indeed evinced by the circumstance of solid cast-iron rollers, of ten inches in diameter, being sometimes broken in the middle; and the necks of eight and nine inches are frequently snapped. When the iron is placed on the shelf or table before them, their motion will draw it through, and as they cannot recede from each other, because of the nuts of the bolts, the metal is reduced to the exact thickness of the space between them, increasing in length, but not at all in breadth: the iron is caught by another workman behind the rollers, and returned over the top roller to the first man, who puts it through again, first giving the handles of the nuts a small turn, to bring the rolls nearer together. In this manner it is repeatedly rolled, till it is reduced to any required length and thickness, but the breadth is not at all increased by rolling; and if it is required to increase the breadth, it is done by putting the iron obliquely through the rollers; or if a great increase is wanted, the iron is put through breadthwise two or three times, till it is extended to the length of a gauge which the workman has marked upon the table in front.

Rolling of black Plate, such as is used for making the boilers of steam-engines, tanks, or other large vessels, in wrought iron. Such plates, when large, and of considerable thickness, are rolled from the blooms, or half blooms, which are made under the forge-hammer. These blooms, which are also called slabs, are nearly the length of the intended plate; their breadth about one-half or one-third as much as their length, and of a thickness to contain as much metal as will make two, three, or four plates. These pieces, when heated to a white heat, are presented breadthwise to the rollers, and passed through several times at the same heat, until what was the breadth of the bloom, being extended two or three times as great, becomes equal to its length. The thick square plate, thus formed, is now cut up by the shears across into two or three pieces, of about the same size as the first, but in a direction which will make what was the length of the first piece to be the breadth of the second. These pieces, being heated and rolled again, become extended to the size of the required plates: the reason of thus dividing the operation is, that the rolling only extends the metal in the direction in which it moves, and not at all in breadth: by this means, the particles of iron being drawn by the sides of one another, acquire something of a fibrous texture, or an approach thereto, which is desirable in bars, rods, and hoops, but not at all in plate, as it should be equally strong in either direction; therefore, by rolling it first one way, and then the other, the grain, as far as it is produced at all, is in both directions. There is no doubt that better plate would be be made, if the ſlabs or original pieces were cut to the proper proportions of length and breadth, and of a thickneſs to form only one piece; then rolling it alternately length and breadth ways every time it is paſſed between the rolls, and continuing this till the plate is finiſhed, at one heat; a better grain or texture will be thus acquired, becauſe in the former method it will be weaker one way, having ſomething of a grain in the direction of the laſt rolling.

Rolling iron Plates which are to be Tinned.—Theſe are made from the beſt Engliſh iron, and ſome of the very thinneſt from foreign iron; the bars are drawn out, by the forge hammer, to five inches broad, and half an inch thick, and are cut into lengths of eleven inches by the ſhears; theſe are heated in an oven, and paſſed breadthways through caſe-hardened rolls: this is repeated till they are extended to twice the length of the intended plates: the pieces are then folded, and ſet on edge in the furnace till properly heated, when they are rolled double, the fold being put in firſt; they are thus extended to twice the length of the folded plate. Now two men, with ſtrong tongs, tear the two leaves aſunder at the fold, and fold each again ſeparately, putting one into the other, like two ſheets of paper; in this ſtate they are heated, and rolled four thickneſſes together, the next time eight, and ſo on, till the plate is reduced to the required thickneſs: in the very thinneſt plate, ſuch as is uſed for tagging laces, fixteen leaves are rolled together. In folding the plates, care is taken every time to put a new ſurface of metal outſide, otherwiſe, thoſe which were conſtantly reduced by the preſſure of the adjacent leaves, would, at length, become grained on the ſurface; but by continually gaining new ſurfaces, which are ſmoothed by the immediate contact of the rollers, thoſe which are laid againſt them are alſo rendered ſmooth. A ſmall quantity of oil is ſprinkled between the leaves, when they are firſt put in, and inſtantly ſpreading over the whole ſurface, prevents any adheſion; the plates are dreſſed ſquare by the ſhears every time before they are folded, to remove thoſe parts which, by projecting over the edges of the other leaves, are not ſo much reduced.

After being finiſhed, dreſſed ſquare, and the ſurface ſcowered, the plates are rolled, ſingly, between a pair of poliſhed caſe-hardened rolls, without being heated; they are therefore extended but little in ſize, though rendered much harder, and more ſtiff. *Tin-foil* is rolled much in the ſame manner as the plates for tinning, but of courſe without heating.

Rolling, or Shingling Iron by Rollers.—This is a modern invention in the manufacturing of bar-iron, the rollers being ſubſtituted for the forge hammer to work the metal, in the proceſs of rendering it malleable. This method is only uſed in conjunction with the *puddling* proceſs, that is, puddling, or converting, caſt-iron into a malleable ſtate, by decarbonating it in a reverberating furnace; in this proceſs the metal becomes divided into grains the ſize of muſtard ſeeds, with a very ſlight coheſion, and full of interſtices between the grains; it therefore requires to be ſtamped, or hammered, at a welding heat, into a ſolid maſs; but rolling will alſo anſwer the purpoſe.

This was firſt diſcovered by the late Mr. Wilkinſon, who had, in his extenſive works at Broſely, in Shropſhire, a pair of enormous rollers, moved by the beam of the ſteam-engine, not with a rotatory, but with a reciprocating motion; they were five feet diameter, near ten feet long, and weighed almoſt five tons each, although caſt hollow, like garden rollers; ſectors were fixed on the ends of the gudgeons, to turn each other, as they did not make above one-third of a revolution, and then moved back again. The circumference of the rolls were grooved with grooves, gradually diminiſhing from one end to the other, in the ſame manner as the rollers ſhewn in *Plate* V. *fig.* 1. The maſs of iron to be rolled was collected into a ball in the furnace, which was taken out, and paſſed through the greateſt of the grooves. When it came through, a workman at the oppoſite ſide removed the ball to the next ſmalleſt groove, and by the returning motion of the rollers, it was carried back again to the front: the front workman then returned it in another groove, and ſo on, paſſing ſucceſſively through the different grooves, until, by gradual conſolidation, it was reduced to an imperfect bar of malleable iron. A number of theſe, being cut into lengths, were made up into faggots, or piles, and by a pair of rotatory rollers finiſhed into bars. Mr. Wilkinſon had a patent for this machine, but it was afterwards found that other rollers would effect the purpoſe better. In *fig.* 1. of *Plate* V. is a view of a pair taken from Mr. Samuel Smith's works, at Sheffield, Yorkſhire, a gentleman who, we believe, was the firſt who brought them into uſe; the two grooves *e* and *f* are very coarſe, and have teeth, that they may, more certainly, draw in the balls. The two next grooves are plain but concave, and the remainder are angular, to form ſquare bars when the ball becomes conſolidated. The uſe of theſe rollers is very ſimilar to thoſe we have juſt deſcribed, the ball of metal being taken from the furnace, and preſented to the rolls. As ſoon as the metal comes through the rollers, a workman behind lifts it over the upper roll to the firſt workman, who puts it between them again: in this manner the metal is rolled ten or twelve times, being put through a ſmaller groove of the rollers at each time, ſo as to compreſs it in a greater degree every time, till at laſt it is reduced to a tolerable ſquare bar; but the laſt groove E, *fig.* 2, has teeth in different parts of the groove, and at ſuch diſtances from each other, that they will indent ſo deeply upon the angles of the bars, at every eight or ten inches of their length, as to render it eaſy to break them into ſhort pieces when they come through. The pieces, thus formed, are piled four together, and put into a ball furnace, and, when heated, they are rolled into bars, by rollers ſhewn at *fig.* 4, which, at the firſt five grooves, *e*, *f*, are ſimilar to the former, but the ſucceeding grooves, *k*, *k*, are made to receive the rings of the oppoſite roll, leaving ſmall rectangular ſpaces, as is ſhewn by the light parts, *fig.* 4, through which the iron, being paſſed, is reduced to a parallel ſmooth bar. The ſucceſſive grooves through which it is paſſed are each made narrower than the preceding, ſo as to reduce the bars to the width and thickneſs intended, in which ſtate they are ſent to market, or if required for the nail rods, or hoops, are cut up by the ſlitters. The rollers are thought to incloſe the impurities in the iron, rather than expel them; but as rollers require much leſs power to give them motion than the hammer, it becomes worth the conſideration of manufacturers to improve their conſtruction, and render them equal in effect to the hammer. At preſent the rolled iron is not always ſo good in quality as the hammered, though this circumſtance ſhould not deter manufacturers from uſing it, as it is ſcarcely poſſible that a newly invented proceſs ſhould be at firſt brought to equal perfection with another which has exerciſed the ingenuity of manufacturers for ages paſt. But in the courſe of practice many improvements may ariſe, which will remain undiſcovered if the proceſs, in its preſent ſtate, is neglected; even in this ſtate the puddled iron, made with rollers, is by no means to be deſpiſed, when its price and quality are compared; it is for iron requiring the fibrous texture that this proceſs is beſt adapted.

Rolling and ſlitting iron for nail rods or ſmall hoops. The iron

iron which is subjected to this process is brought to the mill, *Plate* IV. before described, from the forge hammer, in bars of a size proportionate to the nail rod it is intended to make; these are cut into lengths by the shears, and heated in the furnace, then rolled repeatedly through the rollers, C, D, which are reduced every time it passes, until the bar becomes of the thickness for the square of the intended rod, half an inch for instance, and two, or two and a half, inches wide: it is, in this state, presented to the slitters E, F, and one end being introduced between the guide-bars of the slitters, is drawn in between them by the motion, and, by this means the ring of one roller presses a corresponding breadth of the hot metal into the space between the rings of the other roller; this being performed by both rollers, completely divides the bar into several rods of the same breadth with the rings of the rollers. A small leaden pipe is fixed over the cutters, and being perforated with holes, constantly lets fall a supply of cold water on the rollers, to prevent their becoming hot, and thus losing their hardness, which alone preserves their circular figure under the intense pressure they have to sustain in dividing the iron. The guide-bars are intended to force the iron rods, when cut, out of the grooves between the rings of the collar, which they would not otherwise quit, after being so forcibly pressed into them by the rings of the opposite roller. For making small hoops, the rods, as soon as they are formed, are put through the plain rolls again, and flattened into a hoop.

Rolling of Iron Hoops.—In the country these are made from iron bars, which are reduced in rollers, similar to *fig.* 4, to a size proper to produce the hoops required; these are cut into lengths, heated, and passed through the slitters, which divide them into three or four rods, which are immediately presented to the case-hardened rolls, and flattened out into a proper hoop. The mill shewn in *Plate* IV. is equally adapted for this work as for nail-rod; but for hoops, the addition of a proper fly-wheel would be an improvement, as the work is so much heavier.

In London, where a vast quantity of old hoops is to be procured, they are re-manufactured, and make the very best sort. The victualling-board alone consume many hundred tons annually for the service of the navy: the old hoops are made up into faggots, and shingled, or welded into bloom at one heat, by a forge-hammer, or in small works by rollers like *Plate* V. *fig.* 1. The blooms, being again heated, are rolled out into bars by the bar rollers, *fig.* 4, and these are cut into two or three lengths, according to the sizes of the intended hoops; these pieces are heated a third time, slit into rods as above described, and then formed into hoops by the case-hardened rolls. By successive improvements it has been found, that two heats are sufficient, the first for shingling and forming the bars, and the second for slitting and flattening the hoops; but in either method the grand object is by faggoting and rolling, always in the direction of the length, to gain a fibrous texture to the iron.

Old hoops have been lately made up into new at one operation; by employing a greater power and velocity, and making up a smaller quantity at once, it may be effected at a single heat, instead of two or three. For this purpose the old hoops are cut into short lengths and faggoted in piles, the rivets being first cut out and the pieces straightened, that the piles may be more close and compact: these piles are heated in the usual kind of furnace to a good welding heat, and are rolled between the shingling rollers, being passed through two or three grooves till they are properly reduced to go through the flat-grooved bar rollers: after rolling through the three grooves thereof, they are put through the flat parts, and a guide is used to direct them straight forwards, without care or attention from the workman. The bar is then carried to the cutters, and slit into two or more rods, which are immediately and successively passed between a pair of plain, case-hardened rolls, to finish the hoops.

Vat-hoops, or others above two inches in width, do not require to be slit, but are at once carried from the bar rollers to the plain rollers, which finish them. The piles for shingling must not be made too large, or the hoops will not retain sufficient heat to be found; about 42lbs. will be a proper quantity. The mill for this manufacture must of course have great power, and the rollers should move with a sufficient velocity to enable the iron to be got through the whole process whilst sufficiently hot. The bar and shingling rollers should be placed close together in a line, and must make about 90 revolutions *per* minute; the case-hardened rollers should make 140 *per* minute, and should be placed in such relative situations as will be most convenient to convey the iron in the quickest manner from one pair to the next. A patent has been taken out by some, who pretend to the invention of the above method; but they cannot prevent other manufacturers using it, as it is no new invention, consisting only in taking more care, and using rollers with a greater velocity.

The rolling-mill is not confined to the laminating of iron, but is likewise employed very extensively for reducing brass, copper, tin, lead, as well as gold and silver, into plates and bars. The latter metals are scarcely ever reduced by any other means than rolling; as this method makes no waste, is the most expeditious, and produces better work than hammering, or any other method, particularly when an equality of thickness and an even surface are desired; such, for example, as gold or silver, which is always to receive a polish; in these cases the rollers are made of steel hardened and polished on the surface with the most scrupulous nicety, that they may produce a perfect surface on the matters which have been passed through them.

Rolling-*Press Printing*. See Printing.

Rolling, in *Sea Language*, that motion by which a ship vibrates from side to side. Rolling is, therefore, a sort of revolution about an imaginary axis, passing through the centre of gravity of the ship; so that the nearer the centre of gravity is to the keel, the more violent will be the roll; because the centre about which the vibrations are made is placed so low in the bottom, that the resistance made by the keel to the volume of water which it displaces in rolling, bears very little proportion to the force of the vibration above the centre of gravity, the radius of which extends as high as the mast-heads. But if the centre of gravity is placed higher above the keel, the radius of the vibration will not only be diminished, but such an additional force to oppose the motion of rolling will be communicated to that part of the ship's bottom as may contribute to diminish this movement considerably.

It may be observed, that, with respect to the formation of a ship's body, that shape which approaches nearest to a circle is the most liable to roll; as it is evident, that if this be agitated in the water, it will have nothing to restrain it; because the rolling or rotation about its centre displaces no more water than when it remains upright; and hence it becomes necessary to increase the depth of the hold, the rising of the floors, and dead or rising-wood afore and abaft. See Ship-building.

Rolling *Fork*, in *Geography*, a river of Kentucky, which runs into the Ohio, N. lat. 37° 47'. W. long. 86° 18'.

ROLLO, in *Biography*, the first duke of Normandy, was originally

originally a chieftain or petty prince of Denmark: the king of that country having in vain endeavoured by force to subdue his small territory, lulled him into security by a treaty which he never intended to keep, and then falling perfidiously upon him, killed his brother and many of his officers, and obliged him to take refuge in Scandinavia. Rollo here collected a body of troops, whom he farther attached to his cause by a pretended vision which predicted the certainty of future success; and then he made a bold attempt upon England, in the latter end of Alfred's reign. The order introduced by that prince having completely foiled the designs of the adventurer, he directed his enterprises to France; and sailing up the Seine, committed great ravages, and obtained possession of the city of Rouen. He proved himself so formidable an enemy to Charles the Simple, at that time king of France, that he was glad to make a treaty with Rollo, by which he gave him his daughter in marriage, with that part of Neustria called Normandy, for her dower, on the condition that Rollo should do homage for his territory, and embrace the Christian religion. Rollo very readily submitted to the ceremony of baptism, in which he had Robert duke of France for his sponsor, whose name he assumed. In governing the dukedom which he had gained by his sword, the Dane shewed nothing of the barbarian. He divided the land among his followers upon the feudal tenure, established magistracies in the different districts, and took care that law and justice were exactly administered. He severely punished robbery; treated his French subjects with mildness and equity; founded bishoprics and religious houses; and acted, in all respects, like an enlightened sovereign. Such was the reputation of his government, that the country shortly recovered its population and wealth, and many of his roving countrymen settled in Normandy, and became useful and regular subjects. To him is attributed the institution of the exchequer, or ambulatory parliament, which, at a later period, became stationary at Rouen. He died, worn out with the cares of government, in 932, having, five years before this, abdicated his throne in favour of his son William.

Rollo, in *Geography*, an island in the North sea, near the coast of Lapland. N. lat. 68° 15′.

Rollo's *Head*, a cape on the W. coast of the island of Dominica; three miles S. of Prince Rupert's Hand.

ROLLOCK, Robert, in *Biography*, a learned Scotch divine, was born near Stirling in the year 1556. He studied the classics and belles-lettres under Thomas Buchanan, who has been characterised by Spotswood as learned and wise, and a strong defender of the church's rights, and who then kept a school of considerable reputation. From Buchanan's school Rollock went to the university of St. Andrew's, where he went through a course of philosophy, and, having greatly distinguished himself, he took his degree, and was made regent of his college. In 1580 the magistrates of Edinburgh obtained permission of the king, James VI., to build a college, which being accomplished, Mr. Rollock was, in 1583, chosen the principal, and first theological professor. His high character, though not thirty years of age, brought numerous students to the new university. His reputation extended to foreign countries, where he was greatly respected by the reformed churches. He died in the year 1598, when he had only reached his forty-third year. He was author of many works, among which are the following: "In selectos aliquot Psalmos Davidis Commentarius;" "In Danielem Prophetam Commentarius;" "In Epistolam sec. Sanctum Johannem Comment." He published commentaries on some of the other epistles; also "Analysis Logica in Epistolam ad Hebræos."

ROLPACH, in *Geography*, a town of Thibet, capital of a district; 150 miles N. of Fyzabad. N. lat. 29° 21′. E. long. 82° 5′.

ROLSHUGARDE, a town of Norway; 46 miles S.S.E. of Drontheim.

ROM, an island in the North sea, near the coast of North Jutland, about eight miles long and two wide. N. lat. 55° 9′. E. long. 8° 31′.

Rom, a town of France, in the department of the Vienne; 10 miles S. of Lusignan.

ROMA, an island in the East Indian sea; about 20 miles long, and from 6 to 12 broad. S. lat. 7° 12′. E. long. 127° 12′.

ROMAGNA, a late province of Italy, bounded on the N. by the Ferrarese, on the E. by the Adriatic, on the S. by the duchy of Urbino and Tuscany, and on the W. by Bologna; about 45 miles long and 30 broad. This country, which was part of the ancient Flaminia, fell, in the fifth century, under the dominion of the Ostrogoths; whose king, Theodoric, after having taken the city of Ravenna, in the year 493, made it the place of his usual residence. In the following century, the Goths, being driven out by Belisarius and Narses, generals of the emperors of the East, Ravenna became the residence of the emperor's exarch, till the Lombards made themselves masters of it, and dispossessed the last exarch. In the year 755, Pepin, king of the Franks, having compelled Istulphus, king of the Lombards, to cede the whole exarchate, conferred it on the see of Rome. It now forms the departments of the Amone or Lamone, and the Rubicon, in the kingdom of Italy, being surrendered by the pope in 1797. See Exarch, and Ravenna.

ROMAGNANO, a town of Italy, in the department of the Gogna, on the Sesia; 15 miles N.N.W. of Novara.

ROMAGNE, La, a town of France, in the department of the Mayne and Loire; 6 miles W. of Chollet.

Romagne *sous les Côtes*, a town of France, in the department of the Meuse; 9 miles N.W. of Estain.

ROMAGNO, a town of Italy, in the Feltrin; 6 miles N.E. of Feltri.—Also, a town of the island of Sardinia; 12 miles N.N.E. of Sassari.

ROMAHIE′, a town of the Arabian Irac, on the Euphrates; 100 miles S. of Bagdad. N. lat. 31° 40′. E. long. 44° 15′.

ROMAIN, in *Husbandry*, the name of a plant, cultivated in the fields, in many parts of the world, particularly in France, and called, by our farmers, *French vetches*, or *French tares*. It is an annual plant, but a very quick grower, and is extremely good food for cattle, particularly for horses: they let these creatures feed on it all the former part of the summer, and then cut it for hay in August or September. Its short continuance in the ground makes it less valuable than saint-foin and clover; but it has this advantage over them, that it will grow on poor ground.

Romain, *Cape*, in *Geography*, a cape on the south coast of Madagascar. S. lat. 35° 38′. E. long. 49° 29′.

Romain, *St.*, a town of France, in the department of the Charente; 3 miles N.W. of Aubeterre.—Also, a town of France, in the department of the Lower Seine, and chief place of a canton, in the district of La Havre; 7 miles E. of Montivilliers. The place contains 1200, and the canton 11,569 inhabitants, on a territory of 155 kiliometres, in 28 communes.

Romain *d'Alban*, *St.*, a town of France, in the department of the Drôme; 15 miles N.N.W. of Romans.

Romain *en Jarest*, *St.*, a town of France, in the depart-

 ment

ment of the Rhone and Loire; 12 miles N.N.E. of St. Etienne.

ROMAINE, William, in *Biography*, a very popular divine of the church of England, was born at Durham in 1714, and educated at Hertford college, Oxford; from whence he removed to Chriſt-church, where he took his degrees in arts. On entering into holy orders, he became a frequent preacher before the univerſity, and was noted for his zeal in behalf of what were deemed the orthodox doctrines. He removed to London in 1749, and became lecturer at St. Dunſtan's church, Fleet-ſtreet. He was, for a ſhort time, morning preacher at St. George, Hanover-ſquare, and profeſſor of aſtronomy at Greſham college, which ſituation he ſoon reſigned. In 1764 he was choſen rector of St. Anne, Blackfriars, where, and at St. Dunſtan's, he continued to preach to large and very crowded congregations almoſt to his death, which happened in the year 1795. Towards the cloſe of life his voice was feeble, but his manner was very impreſſive. His works, which are theological, and on the Calviniſtical ſcheme, have been collected in 8 vols. 8vo. He was editor of Calaſio's Concordance to the Hebrew Bible, in 4 vols. folio, in 1749; in which, it is ſaid, he made ſome unwarrantable alterations to ſerve the Hutchinſonian doctrine.

ROMAINMOTIER, in *Geography*, a town of Switzerland, in the canton of Berne, from which a bailiwic derives its name; 11 miles S.W. of Yverdun.

ROMAINVILLE, a town of France, in the department of Paris; 5 miles E. of Paris.

ROMALE, a town of Sweden, in Weſt Gothland; 35 milies W.S.W. of Skara.

ROMAN, a town of European Turkey, in Moldavia, on the Siret, the ſee of a Greek biſhop; 145 miles W. of Bender.

Roman, *Cape*, a cape on the weſt coaſt of Eaſt Florida. N. lat. 25° 40′. W. long. 82° 25′.—Alſo, a cape on the coaſt of Chili, in the South Pacific ocean. S. lat. 48° 20′. W. long. 76° 40′.—Alſo, a cape on the coaſt of South Carolina. N. lat. 33° 5′. W. long. 79° 30′.—Alſo, a cape on the coaſt of Florida, 20½ leagues N.W. by N. from Cape Sable, the S.W. point of the peninſula of Florida.—Alſo, a cape on the north coaſt of Terra Firma, being the north point of the peninſula, which is the eaſt limit of the gulf of Venezuela. Due north of it is the iſland of Orua, or Araba, at eight or nine leagues diſtance, belonging to the Dutch.

Roman *County*, a county of North Carolina, containing 21,543 inhabitants.

Roman, ſomething belonging to the city of Rome.

Roman *Monarchy*. See Monarchy, and Rome, infra.

Roman, or *Romiſh Church*, is that of which the pope is head, ſo called in oppoſition to the reformed churches. See Papists, and Popery. See alſo Church and Reformation.

The Roman law is the civil law, or the written law, as compiled by the emperor Juſtinian.

Roman *Eccleſiaſtical Singing* and *Muſic*, during the middle ages. Theſe were in ſuch general favour throughout Europe, that it was the cuſtom, during the times of the greateſt muſical and mental darkneſs, when reaſon and reflection were the leaſt cultivated, for the prieſts, of almoſt every part of Europe, to viſit Rome, in order to learn canto fermo, and the manner of performing thoſe rites of the church, in which muſic had any concern. Even thoſe hiſtorians who are the leaſt friends to bigotry, and the moſt ready to combat ſuperſtition and papal uſurpations, allow that it was only at the court of Rome that the arts of elegance and refinement were at all cheriſhed, during theſe times. King Pepin, Charlemagne, and Alfred, had applied to the Roman pontiffs for ſinging-maſters to inſtruct their ſubjects.

The learned Juſquin went thither as a ſinger, during the pontificate of Sixtus IV. And before the year 1600, the names of near twenty Spaniſh ſingers and compoſers are recorded, who were employed in the pontifical chapel. Yet all this proves nothing more than that muſicians of great abilities, from whatever part of the world they came, were certain of encouragement there. For more facts to this purpoſe, ſee Italy.

Roman *Games*, *Ludi Romani*, were ſolemn games, held in ancient Rome, thus called by way of eminence, and on account of their antiquity, as having been inſtituted by Romulus.

They were ſometimes alſo called *magni ludi*, from the great pomp and expence of them; and ſometimes *conſualia*, becauſe performed in honour of the god Neptune, who was alſo called *Conſus*, in his quality of god of ſecret counſels.

They alſo bore the denomination of *ludi Circenſes*, becauſe held in the Circus.

This ſolemnity, Halicarnaſſeus obſerves, was originally inſtituted by Evander, in honour of Neptune, under the name of Ἱππιος, whence the feſtival itſelf was called Ἱπποκρατια; and was afterwards renewed by Romulus, in honour of the ſame deity, only under another name.

For Romulus, needing the advice of a god to counſel him in the deſign he had to furniſh his new citizens with wives, applied to the god of ſecret counſel himſelf, Conſus; proclaimed the Conſualia; and invited his neighbours all around to the firſt celebration thereof. The conſequence was the rape of the Sabine women, who came to be ſpectators of it.

The great ceremony, in theſe games, conſiſted in a cavalcade of horſes and aſſes, adorned with garlands; Neptune being reputed the firſt author of riding on horſeback.

Their horſes here were of two kinds; *viz.* πομπικοι, or ſuch as were merely led up and down for ſtate; and δρομικοι, which were for race and exerciſe.

The other diverſions were fencing, and that till one of the combatants was killed on the ſpot; fighting with beaſts, and with the cæſtus, or whirlbats; wreſtling, running, leaping, ſea-fights, horſe-races, chariot-races, &c.

Theſe games, Livy tells us, were improved, and rendered much more magnificent, by Tarquinius Priſcus. Manutius ſays, they were held on the eve of the nones of September; *i. e.* on the 14th day of the month.

Roman *Operas*. In treating of the progreſs of the muſical drama, in that ancient and renowned capital, during the former part of the 17th century, it does not appear that any regular theatre was opened there for the performance of operas; nor, indeed, can we diſcover that any ſecular muſical drama was exhibited there till the year 1632, when "Il Ritorno di Angelica nell' Indie, Drama Muſicale," is recorded by Leo Allacci, in his Drammaturgia, to have been performed in that city; but without informing us where, or by whom ſet to muſic or ſung. Several muſical dramas, however, were performed there at the palaces of ambaſſadors, and other great perſonages, between 1632 and 1661, when "Clearco," ſet by Tenaglia, a Roman maſter, was performed. This compoſer, who had diſtinguiſhed himſelf by his productions for the church, is celebrated by P. Della Valle among great Roman muſicians in 1640.

The firſt public theatre, opened for the exhibition of muſical dramas at Rome, in modern times, was il Torre di Nona, where "Giaſone" was performed, 1671. No other theatre feems to have been ufed for this purpofe in that city till 1679, when the opera of "Dov' è Amore, è Pietà," fet by Bernardo Pafquini, the famous organift, was reprefented Nella Sala de' Signori Capranica. This theatre ftill fubfifts.

ROMANCE, anciently *Romaunt*, and *Romant*, a fabulous relation of certain intrigues and adventures in the way of love and gallantry, invented to entertain and inftruct the readers.

M. Fontenelle calls romances poems in profe; and Boffu is not averfe to their being admitted as poetical pieces, though not written in verfe.

Setting afide the verfification, it is certain an epic poem and a romance are almoft the fame thing. The juft notion, therefore, of a romance is, that it is a difcourfe invented with art to pleafe and improve the mind, and to form or mend the manners, by inftructions, difguifed under the allegory of an action, or feries of actions, related in profe, in a delightful and probable, yet furprifing manner.

A juft romance confifts of two parts: *viz.* a moral, as its foundation, and end; and a fable, or action, as the fuperftructure and means.

It muft alfo have the manners; that is, the characters muft be diftinguifhed, and the manners muft be neceffary; and it muft have all the other qualities of poetical manners.

The incidents muft be delightful, and, to that end, rightly difpofed and furprifing. The fentiments fall under the fame rules as in the drama.

But the diction is allowed to be more lofty and figurative; as being a narration, and not having terror or pity, but admiration for its end.

A romance of chivalry, according to the definition of a late writer, is any fabulous narration, in verfe or profe, in which the principal characters are knights, conducting themfelves, in their feveral fituations and adventures, agreeably to the inftitutions and cuftoms of chivalry.

As compofitions of this kind have a long time been little elfe but hiftories of amorous adventures, and feats of knight-errantry, the origin of romances is referred to that of love-hiftories; and accordingly Dearchus, a difciple of Ariftotle, who firft wrote of thofe matters, is ufually termed the original author of romances. Though Photius is of opinion, that Antonius Diogenes's book on the errors and amours of Dinias and Dercyllis gave birth to moft of the works of this kind. Be this as it will, it is certain the ancients have had their romances as well as we. Such are the amours of Rhodanis and Simonides, defcribed in iambics; fuch is the romance of Leucippe and Clitophon, compofed by Achilles Tatius, a Greek writer, afterwards a bifhop; fuch are the Four Books of Incredible Things, written by Damafcius; fuch are the Ethiopics of Heliodorus, in which he relates the amours of Theagenes and Chariclea. Laftly, under the fame clafs may be ranked the Fables of Parthenius Nicenus, of Athenagoras, Theodorus Prodromus, Euftathius, and Longus.

Indeed antiquity could fcarce be reconciled to fuch pieces, and always looked on them as abufes. Photius, in his Bibliotheca, cod. lxxxvii. gives a frightful account of that of Tatius; and the Ethiopics of Heliodorus, though one of the moft modeft and moft referved pieces of the kind, met with a very fevere treatment. The author was bifhop of Tricca, in Theffalia, in the fourth century. Nicephorus tells us, that a fynod, confidering the danger which might accrue to youth from reading his romance, authorifed as it was by the dignity of its author, propofed it to him, either to fupprefs his book, or renounce his bifhopric; and that he chofe the latter. But this hiftory is a little doubtful.

Be this as it will, Heliodorus has ferved as a model to all the romances written fince; and the marriage of Theagenes and Chariclea has produced a very numerous iffue, even all the romances now extant in the world.

Mr. T. Warton, in his "Differtation on the Origin of Romantic Fiction in Europe," prefixed to the "Hiftory of Englifh Poetry," vol. i. is of opinion, that the peculiar and arbitrary fpecies of fiction, which we call romantic, was entirely unknown to the writers of Greece and Rome; and it appears to have been imported into Europe by a people, whofe modes of thinking, and habits of invention, are not natural to that country. Whatever be their origin, which will be a fubject of inquiry in the fequel of this article, it muft be allowed that the ancient metrical romances were very early fuperfeded by profe works upon the fame fubjects. Thefe laft, although far inferior, in intereft and merit, to the poetical tales which preceded them, claimed and obtained a fuperior degree of credit, founded upon the fiction alleged to be infeparable from metre; upon the degraded ftate of the minftrels, whofe province it was to recite thefe difparaged rhyming legends; and, above all, upon a grave pretext fet up by the author of each profe work, that he had tranflated it *verbatim et literatim* from an ancient Greek or Latin original. As no fuch Greek or Latin original for a romance of chivalry has ever been produced, we may be fafely allowed to doubt whether any fuch ever exifted. But our anceftors received thefe accounts with unhefitating credulity, and gravely read the voluminous romances of Lancelot du Lac, and Palmerin of England, as tranflations from ancient annals, while they rejected with fcorn the rhyming legends of the minftrels on the fame fubjects. Thus the metrical romances were obliged to give way to the profe works, which were, in fact, borrowed from them; and fo complete was the fubftitution of the one fpecies of fable for the other, that the prefs, which was then invented about the period of this revolution in public tafte, groaned under the fplendid folios of the former, while the latter remained in obfcure manufcripts, or were only printed in the meaneft manner, and for the meaneft of the people. Thus the very exiftence of the metrical romance, as a diftinct, feparate, and more ancient kind of compofition, was unknown and unnoticed till the publication of the works of fome modern writers.

Bifhop Percy, the venerable editor of the "Reliques of Ancient Poetry," feems to have been the firft perfon in our country who directed the public attention to this fubject, by an "Effay upon Metrical Romance," prefixed to the third volume of his work, in which the merits and qualities of the poetry and chivalry are critically inveftigated, and a lift given of fuch metrical romances as had come to his knowledge, The learned prelate was followed by Mr. T. Warton; and not to mention the collectors and publifhers of fome of the fhorter and more ancient of our metrical tales of chivalry, both in London and Edinburgh, the firſt comprehenſive and general work upon this intereſting ſubject was undertaken by Mr. Ritſon, which was ſoon ſucceeded by the more popular and elegant performance of Mr. George Ellis, entitled "Specimens of early Engliſh Metrical Romances, chiefly written during the early Part of the 14th Century: to which is prefixed a hiſtorical Introduction, intended to illuſtrate the Riſe and Progreſs of Romantic Compoſition in France and England." Mr. Ritſon's work is a ſelection of "Ancient Engliſh Metrical Romances," containing twelve metrical romances of chivalry; to which is prefixed a long and elaborate diſſertation on Romance and Minſtrelſy.

In imitation of the archbiſhop Turpinus, who paſſed for author of the romance of the Feaſts of Charlemagne and Orlando, a great number of hiſtories, of the like kind, were written in France, during the time of Philip the Fair; the authors of which ſeemed to improve on each other, contending who ſhould go fartheſt in the merveilleux. Theſe books, being intended for polite people, were written in the court language of that age, which was called the *romans*, *romant*, or *romantic;* whence the books themſelves were called by thoſe names: and thus, by degrees, *romans*, &c. became the general name of all books of this kind; whence, at length, our *romance.*

To this purpoſe, Creſcimbeni, reciting the ſeveral opinions reſpecting the name *romanza*, derives it from the word *Roma*, and tells us, that it means that vulgar idiom which, with colonies of Romans, paſſed into Provence, and elſewhere, and was eſteemed, even by the barbarians who inhabited thoſe kingdoms, and called *Romano* and *Romanzo;* and in this they wrote the acts and achievements of knights; which writings were, therefore, ſtyled *romanzi*, or *romances.*

Others derive the word from the Spaniſh *romanſero, I invent;* as intimating romances to be mere fictions. And hence it is that the ancient poets of Provence, who were the firſt great dealers in romances, are called *troubadours*, *q. d.* finders, or inventors.

Creſcimbeni remarks, that the Italians derived from Provence, not only the origin and art of writing romances, but alſo the very ſubjects on which they were founded; and though it is not preciſely known who were the romance writers of Provence, yet many of their romances are found in the Italian libraries; and, indeed, from ſuch a ſource of poetical fiction as the country of Provence appears to have been, nothing leſs could be expected than a vaſt profuſion of romances, and other works of invention. See PROVENÇAL *Poets*, and alſo MINSTRELS, with whoſe hiſtory that of romances, of which they were the compoſers, is nearly connected.

It has been a received opinion amongſt modern critics, that the fictions of romance, borrowed from the Arabians, were communicated to the Weſtern world by means of the Cruſades. Mr. Warton (ubi ſupra) is of opinion, that although theſe expeditions greatly contributed to propagate this mode of fabling in Europe, they were introduced at a much earlier period by the Saracens, or Arabians, who came from the northern coaſts of Africa, and ſettled in Spain, about the beginning of the eighth century. From Spain, he imagines, they found an eaſy paſſage into France and Italy; and the cloſe connection which ſubſiſted for many centuries between the Welſh and their coloniſts, the Armoricans, might have been the means of bringing them from France into this iſland. (See ARMORICA.) A ſtrict intimacy alſo ſubſiſted between Cornwall and Wales; and hence we are able to account for Cornwall's being made the ſcene and the ſubject of ſo many romantic adventures in the French romances. Their language, cuſtoms, and alliances were the ſame; and by Britiſh writers, Cornwall, ſeparated from Wales only by a ſtrait of inconſiderable breadth, is frequently ſtyled Weſt Wales. At the invaſion of the Saxons, both countries became indiſcriminately the receptacle of the fugitive Britons. We find the Welſh and Corniſh, as one people, often uniting themſelves as in a national cauſe againſt the Saxons. They were frequently ſubject to the ſame prince, who ſometimes reſided in Wales, and ſometimes in Cornwall; and the kings or dukes of Cornwall were perpetually celebrated in ſong by the Welſh bards. Traditions about king Arthur are as popular in Cornwall as in Wales; and moſt of the romantic caſtles, rocks, rivers, and caves, of both nations are alike diſtinguiſhed at this day by ſome noble achievements, at leaſt by the name of that celebrated champion.

Arthur and Charlemagne, according to Warton, are the firſt and original heroes of romance. And as Geoffroy's hiſtory is the grand repoſitory of the acts of Arthur, ſo a fabulous hiſtory, aſcribed to Turpin above-mentioned, is the ground-work of all the chimerical legends which have been related concerning the conqueſts of Charlemagne, and his twelve peers. Its ſubject is the expulſion of the Saracens from Spain: and it is filled with fictions evidently congenial with thoſe which characterize Geoffroy's hiſtory. Some have ſuppoſed this romance to have been written by Turpin, a monk of the eighth century, who for his learning, and ſanctity, and gallant exploits againſt the Saracens of Spain, was preferred by Charlemagne to the archbiſhopric of Rheims. Others ſuppoſe it to have been forged under archbiſhop Turpin's name, about that time; others, very ſoon afterwards, in the reign of Charles the Bald, that is, about the year 870. Hiſtorical evidence concurs with numerous internal arguments to prove, that it muſt have been compiled after the cruſades, or about the year 1110. In the two fabulous chronicles now mentioned, the foundations of romance ſeem, in Mr. Warton's opinion, to be laid. The principal characters, the leading ſubjects, and the fundamental features, which have ſupplied ſuch ample matter to this ſingular ſpecies of compoſition, are here firſt diſplayed. And although the long continuance of the cruſades imported innumerable inventions of a ſimilar complexion, and ſubſtituted the achievements of new champions, and the wonders of other countries; yet the tales of Arthur and Charlemagne, diverſified indeed, or enlarged with additional embelliſhments, ſtill continued to prevail, and to be the favourite topics. Upon the whole Mr. Warton concludes, that theſe volumes are the firſt ſpecimens extant in this mode of writing; but he conſiders the Saracens, either at their immigration into Spain, about the ninth century, or at the time of the cruſades, as the firſt authors of romantic fiction among the Europeans.

In examining the hypotheſis of Dr. Percy and Mr. Mallet, who derive theſe fictions, in a lineal deſcent, from the ancient hiſtorical ſongs of the Gothic bards and ſcalds, he allows this opinion to be in ſome meaſure well founded, and that ſo far it is alſo reconcileable with his own ſyſtem.

The ſcaldic inventions, he ſays, had undoubtedly taken deep root in Europe, and prepared the way for the more eaſy admiſſion of the Arabian fabling, about the ninth century, by which they were, however, in a great meaſure ſuperſeded. As a proof of which he obſerves, that the enchantments of the Runic poetry are very different from thoſe in our romances of chivalry. The former chiefly deals in ſpells and charms, ſuch as would preſerve from poiſons, blunt the

weapons

weapons of an enemy, procure victory, allay a tempeſt, cure bodily diſeaſes, or call the dead from their tombs, in uttering a form of myſterious words, or inſcribing Runic characters. The magicians of romance are chiefly employed in forming and conducting a train of deceptions. There is an air of barbaric horror in the incantations of the ſcaldic fablers: the magicians of romance often preſent viſions of pleaſure and delight: and although, not without their alarming terrors, ſometimes lead us through flowery foreſts, and raiſe up palaces glittering with gold and precious ſtones. The Runic magic is more like that of Canidia in Horace, the romantic reſembles that of Armida in Taſſo. The operations of the one are frequently but mere tricks, in compariſon of that ſublime ſolemnity of necromantic machinery which the other ſo awfully diſplays.

He adds, it is alſo remarkable, that in the earlier ſcaldic odes we find but few dragons, giants, and fairies. Theſe were introduced afterwards, and are the progeny of Arabian fancy. Nor, indeed, do theſe imaginary beings often occur in any of the compoſitions which preceded the introduction of that ſpecies of fabling.

That the ideas of chivalry, the appendage and the ſubſtance of romance, ſubſiſted among the Goths, our author readily allows, but not without certain limitations. It was under the feudal eſtabliſhments, which were ſoon afterwards erected in Europe, that it received new vigour, and was inveſted with the formalities of a regular inſtitution.

From the whole of his obſervations, the author deduces the following general concluſion.

Amid the gloom of ſuperſtition, in an age of the groſſeſt ignorance and credulity, a taſte for the wonders of oriental fiction was introduced by the Arabians into Europe, many countries of which were already ſeaſoned to a reception of its extravagancies by means of the poetry of the Gothic ſcalds, who, perhaps, originally derived their ideas from the ſame fruitful region of invention. Theſe fictions, coinciding with the reigning manners, and perpetually kept up and improved in the tales of troubadours and minſtrels, ſeemed to have centered, about the eleventh century, in the ideal hiſtories of Turpin and Geoffrey of Monmouth, which record the ſuppoſititious achievements of Charlemagne and king Arthur, where they formed the ground-work of that ſpecies of fabulous narrative called romance. And from theſe beginnings, or cauſes, afterwards enlarged and enriched by kindred fancies, fetched from the cruſades, that ſingular aud capricious mode of imagination aroſe, which at length compoſed the marvellous machineries of the more ſublime Italian poets, and their diſciple Spenſer.

Hearne imagines, that the old metrical romance, called "Richarde cuer de Lyon," was written by Robert de Brunne. It is probable, however, that the leiſure of monaſtic life produced many rhymers, nor is it at all unlikely, but that the monks often wrote for the minſtrels, and that many of our ancient tales in verſe, containing fictitious adventures, were written, although not invented, in the religious houſes. The romantic hiſtory of "Guy earl of Warwick" is expreſsly ſaid, on good authority, to have been written by Walter of Exeter, a Franciſcan friar of Carocus in Cornwall, about the year 1292. (Carew's Survey of Cornwall, p. 59.) The libraries of the monaſteries were full of romances. Among the many French minſtrels invited into England by Richard I., it is natural to ſuppoſe that ſome of them made their magnificent and heroic patron a principal ſubject of their compoſitions. We have a romance now remaining in Engliſh rhyme (which we have juſt mentioned) that celebrates the achievements of this illuſtrious monarch. It is called "Richard, &c." and was probably tranſlated from the French about this period. That this romance, either in French or Engliſh, exiſted before the year 1300, is evident from its being cited by Robert of Glouceſter, in his relation of Richard's reign, and alſo by Robert de Brunne, who wrote much about the ſame time with Robert of Glouceſter; and hence we may infer that Hearne muſt be miſtaken in ſuppoſing that he was the author of it.

The French, above all other nations, have applied themſelves to this kind of writing; whether it be owing to the natural taſte and genius of the people, or to the freedom, &c. with which they converſe with the women. They appear to have written metrical romances before or about the year 1200. Some of theſe ſeem to have been formed from proſe hiſtories, enlarged and improved with new adventures and embelliſhments from earlier and more ſimple tales in verſe on the ſame ſubject. They began chiefly with romances of chivalry: hence their Amadis, in twenty-four volumes; Palmerin d'Oliva; and of England, king Arthur, &c. of which we have an agreeable critique in Don Quixote.

Chreſtien of Troys wrote "Le Romans du Graal," or the adventures of Sangrale, which included the deeds of king Arthur, ſir Triſtram, Lancelot du Lake, and the reſt of the knights of the round table, before 1191. Chreſtien alſo wrote the romance of "Sir Percival," and left unfiniſhed "La Charette," containing the adventures of Lanucelot. The firſt French writers of romance were the *Troubadours*; which ſee.

The later romances are much more polite; the beſt of which are the Aſtrea of d'Urfe; the Cyrus and Clelie of Mademoiſelle de Scuderi; the Caſſandre and Cleopatre of La Calprenede; Ariane, Francion; and the Adventures of Telemachus, by the late archbiſhop of Cambray, worth all the reſt.

The Germans, too, have their romances; eſpecially Hercules and Herculiſcus, the Aramena, Octavia, Arminius, Otbert, &c.

The Italians have their Eromena, by Biondi; the works of Loredano, Marino, &c. The Spaniards, who, from their temper and conſtitution, were extravagantly fond of chivalrous exerciſes, had their Amadis of Gaul, their Diana, and Don Quixote. Some critics have even ſuppoſed, that Spain, having learned the art of romance-writing from their naturalized gueſts the Arabians, communicated it at an early period to the reſt of Europe. The Engliſh, their Arcadia, &c. And in modern times, the number has been ſo great, that our circulating libraries are full of them.

The Argenis of Barclay is rather a ſatire than a romance.

Although we owe to the Norman minſtrels the greater part of the romances now extant, which were avowedly tranſlated into Engliſh, as ſoon as that language ſuperſeded the French; yet ſome few were moſt probably originally compoſed in Engliſh for the uſe of the Scottiſh court, where French was never excluſively ſpoken, and afterwards imitated or tranſlated by French minſtrels. Hence it is curious to obſerve, that as the earlieſt French romances were written in England, ſo the earlieſt Engliſh romances were compoſed in Scotland.

Mr. Ellis makes an arrangement of romances into claſſes, introducing each with appropriate remarks. The firſt claſs comprehends romances relating to king Arthur; which were probably the earlieſt in order, and were moſt popular and numerous. The next claſs included what he has ventured to call Saxon romances, that is, romances referring to Saxon ſubjects, and claiming, perhaps, ſome foundation in the hiſtory of that people. Guy of Warwick and Bevis of of Hamptoun occupy this station entirely. These two, notwithstanding their demerits, equalled, or excelled in popularity, almost all the romances of the middle ages. The next is entitled an Anglo-Norman romance, and recites the adventures of no less a person than Richard Cœur de Lion. The next class of romances comprehend such as relate to Charlemagne and his Paladins. Under this head Mr. Ellis has enumerated three, *viz.* Roland and Ferragus, Sir Otuel, and Sir Ferumbras. The next romance is of oriental origin, being the earliest tradition of the Seven Wise Masters, long known among the school-boys of this country. To this he has added ten miscellaneous romances, which we must content ourselves to pass over without mentioning their names. The importance of the ancient metrical romances in an historical point of view must be acknowledged. They hold out to us, like Shakspeare's plays, the abstract and brief chronicles of the time, and demand the consideration of every historian. Even in a literary point of view, their merit is not contemptible. It is true, the story is generally rambling and desultory, utterly incapable consequently of exciting the pleasure arising from a well-conducted plan, all the parts of which depend upon each other, and tend, each in due degree, to bring on the catastrophe. So far is this from being the case, that in a long romance, the adventures usually are all separated and insulated; only connected with each other, by their having happened to the same hero; just as a necklace of beads is combined by the thread on which they are strung. This arrangement, in fact, best suited the reciters, whose narration was to be proportioned to the time and patience of their audience; and whom this loose structure of story permitted to use freedom of compression or dilatation as best suited their purpose, since any single adventure might be inserted without impropriety, or left out without being missed. The same cause accounts for the loose and often tedious style in which the minstrels indulged. It was of consequence that their stanza should be so simple, as to be easily recollected, and their diction so copious, as not to suffer by any occasional deficiency of memory. For these reasons, Robert de Brunne tells us, that the common minstrels were unable to repeat tales written in a concise style and complicated stanza, and that such became *naught* in their imperfect recitation. To these faults, we have often to add those of extreme awkwardness of contrivance and improbability of incident; but which neither offended the taste, nor shocked the faith of our plain and hardy ancestors. On the other hand, there is a sort of *keeping* in these ancient tales, which did not depend upon the minstrel's inclination, and from which he could not have departed, if he had a mind to do so. This arises from his painting the manners of his own time, as they passed before his eyes, and thus giving a truth and unity to the chivalrous events he relates, which the modern labourers in the vineyard of romance are utterly unable to imitate. With all the pains these last can use to deck their champions in the antique taste, they are perpetually confounding the past time with the present, and are guilty of anachronisms almost as gross as his who introduced a tea-table scene into the history of John of Gaunt. Neither is the language in which these legends are told altogether unworthy of our applause. There often occur passages, which, from the spirit of the poet rising with the situation, may justly claim a rank among the higher and more masculine orders of poetry. And although, as we have already noticed, the general conduct of the story is desultory and slightly put together, yet many of the individual adventures, of which each long romance is composed, are happily conceived and artfully executed. The gloom of superstition likewise added a wild and dismal effect to the wonders of the minstrel; and occasionally his description of supernatural events amounts nearly to sublimity. See Warton, Ritson, Ellis, ubi supra, and Edinb. Review, N° XIV.

ROMANCHE, La, in *Geography*, a river of France, which runs into the Drac, a little above Grenoble.

ROMANENGO, a town of Italy, in the department of the Upper Po; 4 miles E. of Crema.

ROMANIA, a province of European Turkey, containing the territory anciently denominated "Thrace," and deriving its present name from New Rome, by which Constantinople was distinguished. The Turks call it "Rumelia" or "Rumili," and "Icella;" and it is also denominated "Romelia." This province is bounded on the N. by Bulgaria, on the E. by the Black sea, on the S. by the sea of Marmora and the Archipelago, and on the W. by Macedonia. It is upon the whole a level country, though famous for some of its mountains: such are mount Hæmus, which separates it on the N. from Bulgaria; Rhodope, celebrated among the ancients for the catastrophe of Orpheus; and mount Pangæus, which divides this country from Macedonia. The two former are long ridges of mountains, that extend from the frontiers of Macedonia to the Black sea. The territories that lie among the mountains are cold and barren; but those near the sea are pleasant and fertile, producing all kinds of grain, and particularly rice of good quality. This country was anciently divided into several independent kingdoms: and the Thracian Chersonesus was also governed by its own kings. The present inhabitants are Greeks, descended from the ancient Thracians, interspersed with Turks. Thrace (which see) was formerly distinguished by the cultivation of the sciences and fine arts: but the present state of Romania is very different, being wholly destitute of persons of literature. It is governed by three Sangiaks, and divided into as many districts under the denomination Sangiacates. The capital is *Constantinople*, which see.

Romania, *Cape*, a cape on the S.E. point of Malacca. N. lat. 1° 18′. E. long. 104° 15′.

ROMANO, Giulio, in *Biography*, the cognomen of Giulio Pippi, the most renowned among the immediate scholars of Raphael d'Urbino, his heir, and the continuator of his works. He was born at Rome in the year 1492. While a pupil, he followed less his master's delicacy than energy of character, and chiefly signalized himself in subjects of war and battles, which he represented with equal spirit and erudition. As a designer, he commands the whole mechanism of the human body; and, without fear of error, turns and winds it about to serve his purposes, but sometimes oversteps the modesty of nature. Vasari, who visited him at Mantua, prefers his drawings to his pictures, as being more full of that original fire which distinguishes his conception, and was apt to evaporate in the longer process of finish: some have, with better evidence, objected to the character of his physiognomies, as more sagacious than enamoured, less simple than vulgar, and often dismal and horrid, without being terrible. In colour, whether fresco or oil, his hand was as expeditious, and his touch, especially in the former, as decided, as his eye and choice were congenial. Bricky lights, violet demi-teints, and black shades, compose in general the raw, opaque tone of his oil pictures; far different from that characteristic tone which signalizes the Battle of Constantine, painted by him from the design and after the death of Raphael, and which was by Poussin admired as being most happily adapted to the subject. The style of his draperies is classic, but the arrangement of the folds generally arbitrary and mannered; the hair and head-dresses of his women are always fanciful and luxurious, but not

not always arranged by taste; whilst those of his men frequently border on the grotesque.

After he had completed the Hall of Constantine in the Vatican from the design of his master Raphael, he went to Mantua, where the increased practice and authority, derived from the superintendance of the great works he had just completed, established his reliance on himself; and the patronage of the Gonzaghi roused that loftiness of conception, and gave birth to those magnificent plans, from which Mantua and the palace *del T.*, as from enchantment, rose. To the stores of antique treasures belonging to this great family, of which the statues, busts, and basso-relievos at present in the academy are but insignificant remains, he added his own; rich in designs of Raphael, and in studies and plans from the antique. No designer ever possessed such industry with so much fire, so much consideration with such fecundity, or combined with equal rapidity such correctness, with great recondite knowledge in mythology and history, and that popularity and care in treating it.

The palace *del T.* furnishes specimens in every class of picturesque imagery. Whatever be the dimension, the subject, or the scenery, minute or colossal, simple or complex, terrible or pleasing, we trace a mind bent to surprise or to dazzle by poetic splendour; but sure to strike by the originality of his conception, he often neglects propriety in conducting his subjects, considered as a series: and in the arrangement or choice of the connecting parts, hurried into extremes by the torrent of a fancy more lyric than epic, he disdains to fill the intermediate chasms, and too often leaves the task of connection to the spectator.

In this palace, Giulio adopted the method of his master. He prepared the cartoons, and the pictures were executed by his pupils; but he retouched, corrected, and gave the last finish to them: unfortunately, his master-strokes have been covered again by modern pencils; and the fable of Psyche, the Allegories of Human Life, the Giants storming Heaven, exhibit now indeed his composition and design, but not his hand: this is better preserved in the paintings of the old palace, or, as it is now called, the Corte of Mantua; which are in fresco, and relate chiefly the histories of the Trojan war. They have the same beauties and defects as those of the palace *del T.*: each singly considered is a proof of the poetic spirit and the practical powers of the master; as a cyclus they want connection and evidence. Helen sleeping, Vulcan forging Arms for Achilles, are beautiful; and Minerva in the act of slaying Ajax, the son of Oileus, sublime. Nor is his versatility less admirable in the Bacchic or amorous subjects; the *capricci* and grotesque conceits with which he decorated the small cabinets of the same palace.

The altar-pieces of Giulio are not numerous. He did not live to finish those which he had begun for the cathedral of Mantua. The most remarkable of those which he finished with his own hand, are the three frescoes at St. Marco; and in the church of St. Cristofero, the athletic figure of that saint, groaning under the weight of the divine Infant on his shoulders. They are, however, far inferior, for genuine pathos and classic execution, to the Martyrdom of St. Stephen, on the head altar of the church of St. Stephen at Genoa.

Of Giulio's scholars and assistants, the most celebrated were F. Primaticcio, chiefly employed in the stuccoes and ornaments of the palace *del T.*; Benedetto Pagni of Pescia, who accompanied Giulio from Rome to Mantua; and Rinaldo Mantovano, the most expert of the three, and in the opinion of Vasari, who laments the shortness of his life, the greatest painter that Mantua ever produced; the altar-piece of Sta. Agostina alla Trinita has a grandeur of style above his age, and has by some been suspected to be the design of Giulio. To these may be added Fermo Guisoni, who coloured in the cathedral the Call of St. Peter and St. Andrew, from the most studied and most beautiful cartoon of the master; and Theodore Ghigi, or as he subscribes himself, Theodore Mantovano, a great designer, and so practised in the style of Giulio, that after his death he was selected by the prince to finish several of his works.

In addition to his powers as a painter, Giulio Romano possessed a very considerable knowledge of the principles of architecture; and was employed in plans for several of the palaces at Rome and Mantua. His last architectural exertion was the erection of a splendid mansion for himself at Mantua. Vasari relates, that upon the death of San Gallo, the architect of St. Peter's, Guilio was selected by the pope for his successor, but was prevented leaving Mantua by the interest of the cardinal Duke, and the entreaties of his wife and her immediate friends and relations; and whilst he was endeavouring to surmount these difficulties, and enjoy the proffered honour and emolument, he was seized with illness, and borne to the grave in the year 1546, and in the 54th of his age. He left a son, called, after his respected master, Raphael, of whom nothing remains, but the tradition that he possessed talents worthy of his father. He died in 1560, at the age of 30. Fuseli's Pilkington.

ROMANO, in *Geography*, a town of Italy, in the department of the Adda and Oglio; 11 miles S.S.E. of Bergamo.

ROMANO, or *Ramano Cayo*, a small island off the N. shore of the island of Cuba; it is long and narrow, and lies at the E. extremity of the cluster of isles called the King's Garden.

ROMANO, *St.*, a town of Italy, in the department of the Panaro; 18 miles S.W. of Modena.

ROMANOV, a town of Russia, in the government of Jaroslavl, on the Volga; 16 miles W.N.W. of Jaroslavl. N. lat. 57° 46′. E. long. 39° 40′.

ROMANOVA, a town of Russia, in the government of Irkutsk, on the Angara; 60 miles W.S.W. of Ilimsk.—Also, a town of Russia, in the government of Tambov, on the Olonetz; 16 miles S. of Lipetzk.

ROMANOVKA, a town of Russia, in the country of the Cossacks, on the Don; 116 miles E.N.E. of Azoph.—Also, a town of Russia, in the government of Upha; 64 miles N.E. of Orenburg.

ROMANOW, a town of Russian Poland, in the palatinate of Kiev; 8 miles N.E. of Zytomiers.—Also, a town of Austrian Poland, in Galicia; 33 miles W. of Przemyl.—Also, a town of Lithuania, called also Romanowo, in the palatinate of Novogrodek; 18 miles N. of Sluck.

ROMANS, a town of France, in the department of the Drôme, and chief place of a canton, seated on the Isere; two posts N.E. of Valence. The place contains 6173, and the canton 15,180 inhabitants, on a territory of 225 kiliometres, in 11 communes. N. lat. 45° 2′. E. long. 5° 8′.

ROMANS, *Romant*, *Romanic*, or *Romance*, the polite language formerly spoken at the court of France; in contradistinction to the *Waloon*, or ancient Gaulish, spoken by the common people.

The Romans having subdued the Gauls, introduced part of their language among them; and a mixture of half Latin, half Gaulish, or Celtic, constituted the Romans; of which the modern French is only an improvement.

Hence, to *enromance* was to write in romance, &c. See ROMANCE.

Covarruvias, a learned Spanish writer, observes, that the name romance is generical, and belongs alike to the Tuscan, French, and Spanish; inasmuch as all these were derived from the purity of the Latin tongue, which the Romans, being conquerors, introduced into these provinces, and which, at first, the nobles spoke and wrote. He further says, that the Latin tongue, being admitted into Spain, was spoken as in Rome, and that there were men well skilled in it, who spoke and wrote it with greater refinement than the vulgar; but upon the irruption of the Goths it was remarkably corrupted: that which was before *Roman* was converted into *Romance*, which is equivalent to its being derived from the Romans. And it farther appears, that the name *Romance* was given to the Spanish language, to distinguish it from the Gothic.

Mr. Planta, in his elaborate account of the Romansh language (Phil. Transf. vol. lxvi. part i. p. 129, &c.), which is now spoken in the most mountainous parts of the country of the Grisons, near the sources of the Rhine and the En, informs us, that this language consists of two principal dialects; which, though partaking of the same general name, differ so widely as to constitute in a manner two distinct languages. One dialect, he says, which is spoken in the Engadine, a valley extending from the source of the En to the frontiers of the Tyrolese, is by the inhabitants called *Ladin*. And he observes, that the Romansh has never been used in any regular composition in writing, till the sixteenth century, nor affected by any foreign invasion, or intimate connection: but that it is at present the identical language that was spoken two hundred years ago.

This learned writer observes, that notwithstanding the variety of conjectures and controversies, which have occurred with regard to the Gallic Romance, it is agreed on all hands, that the vocabulary of the Roman, and the idiom of the Celtic, have chiefly contributed to its formation; and, therefore, that it partakes of a common origin with that of the Grisons. He adds, that there are incontestible proofs that this language was once universal through France, and that this, and not immediately the Latin, hath been the parent of the Provençal, and afterwards of the modern French, the Italian, and the Spanish.

From a comparison of the two Romances, as well as from the similarity of their origin, Mr. Planta infers, that they are one and the same language.

However, whilst the Grisons neglected to improve their language, or had no opportunity for this purpose, the taste and fertile genius of the troubadours, fostered by the countenance and elegance of the brilliant courts and splendid nobility of Provence, did not leave theirs long in the rude state in which we find it in the ninth century. But the change being gradual, and almost imperceptible, the French historians have fixed no epocha for the transition of the Romance into the Provençal. Nevertheless, it appears, that the former language had received no considerable alteration in the twelfth century, and it still bore the same name. But after this era, though the name occurs, the language distinguished by it is very different from the Romance of the ninth century. Allowing, however, the universal use of the Romance all over France till the twelfth century, and that what the writers of those times say of the Gallic, is to be understood of the Romance, of which there is sufficient evidence, it follows, says Mr. Planta, that the language introduced into England under Alfred, and afterwards more universally established by Edward the Confessor, and William the Conqueror, must have been an emanation of the Romance, very near akin to that which is now spoken in the Alps.

According to Du-Cange, the Romance had also penetrated into Scotland before the twelfth century. The same corruption, or coalescence, which gave rise to the Gallic Romance, and that of the Grisons, must also have produced, in Italy, a language much resembling, if not perfectly similar, to those two idioms. It appears also, from what has been already said, that the language of the Romans penetrated very early into Spain, and that the Romance was very common in that kingdom. The universality of the Romance in the French dominions, during the eleventh century, accounts for its introduction into Palestine, and many other parts of the Levant, by Godfrey de Bouillon, and other adventurers, who engaged under him in the crusades.

This writer farther adds, that the heroic achievements and gallantry of the knights of the Cross gave rise to a swarm of fabulous narrations, which, though not an invention of those days, were yet, from the name of the language in which they were written, ever after distinguished by the appellation of Romances. And he presumes, that the Romance hath been preserved so near its primitive state, not only in the country of the Grisons, but in several other remote and unfrequented parts.

Mr. Berington, in his "Literary History of the Middle Ages," recently published, observes, that the language afterwards known by the name of French, was divided into two dialects, both of which bore the name of "Romane," or Romance, because each was formed on the basis of the Roman: that to the north being adulterated by a mixture of Frankish and Norman words; whilst the dialect of the south was vitiated by words transferred from the language of the Ostrogoths, Visigoths, and Alani. The river Loire, not rigidly taken, was their common boundary. The first might be called the "French Romane," the latter the "Provençal," because it was spoken by the subjects of Raimond, count of Provence, well known in the armies of the crusaders. The characters of these dialects, however, though owning a common source, were marked by strong lines of difference. The Provençal, from a milder climate, from a more constant intercourse with strangers, and from a closer affinity to the mother tongue, was soft and harmonious: the French more harsh, as retaining more of its northern mixture. But if we mention the countries in which these languages were current in the 13th century, it will be seen that the Provençal was confined within the limits above assigned it; while the French Romane, overflowing its natural boundaries, became familiar to distant nations. It passed with the conquerors into England, where it was previously fashionable. The Norman settlers rendered it familiar at Naples and in Sicily; though here it was soon vanquished by the superior fascination of the Italian dialect. The crusaders carried it into the East, and planted it in Syria, in Palestine, in Cyprus, and at Constantinople, where it was at least as permanent as the conquests which they had made.

ROMANTRINO, in *Geography*, a town of Italy, in the Novarese; 4 miles E.N.E. of Novara.

ROMANUS I., Lecapenus, in *Biography*, emperor of the East, rose from an obscure origin to various employments under Leo the philosopher, and was, at one time, possessed of the command of the naval armies. Having rendered himself all-powerful at court, he persuaded the prince Constantine to marry his daughter, banished the empress-mother Zoe to a monastery, and in 919 caused himself to be crowned emperor by the patriarch. He associated his three sons in the imperial authority, and ordered their names, with his own, to be placed in all edicts before that of the lawful emperor Constantine. The adherents of the latter made some attempts to free him from this servitude, but they were

were fruftrated and punifhed. During thefe inteftine difturbances, Simeon, king of Bulgaria, renewed his inroads on the empire, and penetrated to the gates of Conftantinople. Romanus brought him to accede to terms of peace, and the Roman admiral, about this time, entirely deftroyed a Saracen fleet in the harbour of Lemnos. Simeon dying in 927, his fon Peter refumed hoftilities, and broke into the Conftantinopolitan territory, but peace was concluded, and a marriage entered into with the emperor's grand-daughter to the Bulgarian king. An invafion of the Roman dominions in Afia by the Syrian Saracens was repulfed by the imperial general; and the commanders of the armies of Romanus had equal fuccefs againft the Ruffians, who had ravaged the empire with a numerous fleet. In the mean time, Romanus loft his eldeft fon Chriftopher, and the two remaining brothers quarrelled with each other, and with their father. The youngeft fon of Romanus formed a confpiracy for his father's dethronement, and in December 944, his apartment was entered by night, and he was conveyed to an ifland of the Propontis. He there affumed the religious habit and life, and died in 946 in this retreat, a true penitent for the injuftice which he had inflicted upon Conftantine. Previoufly to his deceafe, his two fons were banifhed to the fame ifland, whom he reproached, when he met them on the beach, for their ingratitude and unkindnefs to him, neverthelefs he very readily allowed them to fhare of his water and vegetable diet. Lecapenus does not appear, fays Gibbon, to have poffeffed either the virtues or vices of a tyrant. The fpirit and activity of his private life diffolved away in the fun-fhine of the throne; and in his licentious pleafures, he forgot the fafety both of the republic and of his family. Of a mild and religious character, he refpected the fanctity, the innocence of youth, the memory of his parents, and the attachment of the people. Univer Hift. Gibbon.

Romanus II., called *the Young*, fucceeded his father, Conftantine Porphyrogenitus, in 959. He had married Theophano, a woman of mean origin, who was charged with having been chiefly inftrumental in the alleged crime of poifoning his father. Romanus was fuppofed to poffefs confiderable talents, but he was habitually attached to frivolous amufements and diffolute pleafures, and refigned all care of the ftate to his chief chamberlain. In the morning, this luxurious emperor vifited the circus; at noon he feafted the fenators; the greateft part of the afternoon he fpent in the tennis-court, the only theatre of his victories; from thence he paffed over to the Afiatic fide of the Bofphorus, hunted and killed four wild boars of the largeft fize, and returned to the palace, proudly content with the labours of the day. He banifhed from court his mother Helena, and his two fifters, who were reduced to a ftate of great indigence.

During the fhort reign of this emperor, the two brothers, Nicephorus Phocas and Leo, obtained great fucceffes againft the Saracens in Crete and the Eaft, while the emperor was wafting his time in indolence. According to fome hiftorians, debauchery, but according to others, the evil practices of Theophano, brought his life to a clofe in the year 963, at the age of twenty-four, and in the fourth year of his reign. Univer. Hift. Gibbon, vol. ix.

Romanus III., named *Argyrus*, a patrician of an ancient family, was nearly related to Conftantine IX. During the laft illnefs of that emperor, he was offered his daughter Zoe for a wife, with the title of Cæfar. He would readily have declined the high honour intended for him, but was told the lofs of his eyes or his life muft be the confequence of his refufal. His wife, devoted to his welfare, as well as ardently attached to his perfon, made way for a new marriage, by retiring herfelf to a convent, and in 1028 Romanus efpoufed the princefs Zoe. On the death of Conftantine he fucceeded to the imperial throne, and began his reign by eafing the people of fome of their taxes, and performing other popular acts. In the fecond year of his reign, the Saracens having invaded Syria, the emperor refolved to march in perfon againft them, but he was defeated, with the lofs of his baggage, and a great part of his army. After his return, feveral public calamities in the empire followed, which occafioned him entirely to apply his mind to works of piety. In the mean time the emprefs Zoe, who, at an advanced age, continued to follow a licentious courfe of life, attached herfelf to a new lover of mean birth, whom fhe wifhed to raife to the purple, and fhe juftified the Roman maxim, that every adulterefs is capable of poifoning her hufband. To effect her purpofe, fhe caufed the deadly cup to be adminiftered to her hufband; and finding it too flow in its operation, fhe employed an affaffin, who fuffocated him in the bath. He died in 1034, after a reign of five years and a half. Gibbon. Univer. Hift.

Romanus IV., named *Diogenes*, a defcendant of Romanus Argyrus, in the regency of Eudocia, widow of Conftantine Ducas, engaged in a confpiracy for raifing himfelf to the throne, for which he was tried and condemned to death. This punifhment, on account of his fine perfon, was commuted for a fhort exile, after which the imperial widow nominated him to the command of her armies, and in 1067 fhe married him, and he was proclaimed emperor. He had not occupied the throne more than two months, before he put himfelf at the head of the few troops he could affemble, and croffed the Hellefpont to attack the Turkifh fultan, who had made incurfions into his territories. He came up with the Turks, who were retiring loaded with rich fpoils. He attacked and routed them with great flaughter, and purfuing his blow, recovered Aleppo and Hierapolis. In the two following campaigns, Romanus difplayed his military talents to great advantage, and finally drove the Turks acrofs the Euphrates. In the fourth campaign he led a numerous army to the deliverance of Armenia. After this he fhared in defeat, and was, in a general engagement, left alone, almoft in the midft of his enemies, and was taken prifoner by the Turkifh fultan, who obliged him to fign an humiliating treaty, and then fet him at liberty. During his misfortunes, a revolution was effected at Conftantinople: Eudocia had been driven from the throne, and fhut up in a monaftery; and her eldeft fon, Michael Ducas, had been proclaimed emperor. Romanus was dethroned, and his eyes torn out with circumftances of fo much cruelty that he foon died. This happened in 1071, after a reign of three years and eight months. Univer. Hift.

Romanus, pope, was elected to that dignity in the year 897, upon the expulfion of Stephen VI. and VII. Little is recorded of him: he is faid by Platina to have annulled the acts of his predeceffor, and, in particular, to have declared his proceedings againft the corpfe and memory of pope Formofus unjuft and illegal. Romanus' dignity was of very fhort duration; he died before he had been in poffeffion of it quite four months. Bower.

ROMAON, St., in *Geography*, a town of Portugal, in the province of Beira; 19 miles S.S.E. of Vifeu.

ROMBACH, a town of the duchy of Wurzburg; 2 miles N. of Hasfurt.

ROMBLON, or Romblino, one of the fmaller of the Philippine iflands, about 30 miles in circumference. N. lat. 12° 40′. E. long. 121° 58′.

ROMBOUTS, Theodore, in *Biography*, a native of Antwerp, and born in 1597, was a painter of very confiderable merit. At firft he ftudied under Abraham Janfens; but

but in his 20th year he went to Italy, and there began his career as an historical painter. He was patronized by the duke of Tuscany, and painted several large compositions for that prince, who honoured and rewarded him handsomely. On his return to Antwerp he found Rubens in possession of full fame; and soon perceived how difficult it was for him to meet with that degree of estimation at home which he had received abroad. A noble emulation, however, stimulated him to enter the lists with that great master; and though he certainly was not adequate to the combat, yet he exhibited considerable prowess, which even Rubens acknowledged.

As he died at the age of 40, his works are not numerous. The principal ones, among those executed after his return from Italy, were painted for the court-house of Ghent.

He likewise painted pictures of low subjects, such as mountebanks and their attendants, soldiers playing at cards, &c. &c.; which he did as pastime, or merely to acquire money, but they are not among his best performances. On the historical pictures he produced, his reputation rests for support, and is upheld to a considerable rank.

ROME, ROMAN EMPIRE, *&c.* in *Geography* and *History.* The ancient city of Rome, situated on the river Tiber, in east longitude 13°, and about 41¾° of north latitude, though in its origin one of the most humble of cities, was destined to become the capital of the largest empire in the ancient world. In modern history it has been famous for being the centre of an ecclesiastical tyranny, under which, for many centuries, the greater part of what may be denominated the civilized world was held in subjection. The city of Rome, without dispute, was founded by Romulus; but we may trace the origin of its inhabitants, that is, of the ancient Romans, to Æneas, the hero celebrated in Trojan story. When the Greeks became masters of Troy, Æneas, with the forces under his command, retired into the fortress, which, for some time, they defended with great bravery; but being at length compelled to yield, he conveyed away his gods, his father, wife, and children, and fled, with a numerous crowd of Trojans attached to him, to the strong places of mount Ida. Here, however, his enemies followed him, and he was obliged to negociate a peace, the terms of which forced him to quit the Trojan territories altogether: the Greeks, on their part, engaged not to molest him in his retreat. Æneas accordingly equipped a fleet, in order to seek a settlement in some foreign land. The Trojan having crossed the Hellespont, arrived in the peninsula of Pallene, where he built a city, calling it, from himself, Æneia, and left in it a part of his followers. From thence he sailed to Delos, and thence to Cythera, where he erected a temple to Venus. He built another, to the same goddess, in Zacynthus, and in this island he instituted games, named "the races of Venus and Æneas." Wherever the Trojan hero went he left memorials of himself, and in the time of Dionysius these were still existing in the places already mentioned, and in many others, as at Leucas, Actium, Dodona, &c. which were accordingly regarded as indisputable proofs of the reality of Æneas' voyage to Epirus: and "that he came into Italy," says Dionysius, "we have the concurrent testimony of all the Romans; the ceremonies they observe in their sacrifices and festivals bear witness to it; also the Sibylline books, the Pythian oracles, and many other things that nobody can reasonably reject as fable."

Æneas first landed in Italy, after crossing the Ionian sea, at Cape Minerva, in Japygia; from thence he went to Drepanum in Sicily, to which place Elymus and Ægystus, who had escaped from Troy a little before him, had brought a Trojan colony. Æneas augmented this colony, by leaving a part of his own followers; and then crossing the Tyrrhenian sea, he bent his course for Italy. He gave the name of Palinurus to the cape at which he first landed, from one of his pilots, who died there. From this place he sailed to several other parts, till at length the Trojan prince, and his faithful attendants, finished their long voyages on the coast of Latium, a small territory on the east side of the river Tiber, which now contains a part of the present Campagna di Roma. Latinus was the king of the country, and the people of it were called Latins. Here Æneas and his followers undertook to raise a second Troy, hoping that they had arrived at the end of their adventures.

When Æneas arrived in Italy, Latinus was engaged in a war with the Rutuli, but his success was very doubtful: he accordingly assigned to Æneas and his followers a track of land for their settlement, upon condition that they should join their arms to his against the Rutuli, who were to be considered as their common enemy. Æneas accepted the conditions offered, and complied with his engagement so faithfully, that Latinus reposed in him the most unbounded confidence, and gave him in marriage his only daughter, Lavinia, thus securing to him the succession to the throne of Latium; hence Æneas changed the name of his camp from Troy, and called it Lavinium, in honour of his wife. The Trojans followed the example of their leader, by making alliances with Latin families; so that in a very short time they became one nation, united by the closest bonds.

There was, however, a cause for considerable strife excited by this union: Turnus, nearly related to the queen, and who had been brought up by Latinus, had entertained hopes of having Lavinia for his wife; when, therefore, he saw that princess given to Æneas, he instantly joined the Rutuli; but in the first battle after this confederacy, both Turnus and Latinus were slain: the consequence of this was, that Æneas came into quiet possession of the kingdom of Latium, which he governed with great wisdom, and transmitted to posterity. His reign was, however, short; but during that period he established the worship of the gods of his own country, and to the religion of the Latins he added that of Troy. The two palladiums, which had been the protectors of that city, became the tutelary deities of Lavinium, and, in after ages, of the whole Roman empire. He introduced, likewise, the worship of Vesta, and appointed certain virgins, called, from her, Vestals, to keep a fire burning in honour of the goddess. Many other deities, who had been reverenced in Troy, became probably known to the Latins by means of Æneas, which might be the occasion of his being designated by the appellation of the *pious* Æneas. This hero was, at length, obliged to head the united forces of the Latins and Trojans against the Rutuli, who had formed an alliance with Mezentius, king of the Tyrrhenians. A battle ensued, which lasted till night, when Æneas, being pushed to the banks of the Numicus, which was a boundary of Lavinium, and being forced into that river, was unfortunately drowned. The Trojans had, however, address enough not only to conceal his body, but to pretend that, instead of his having been drowned, he was suddenly taken up to heaven, where, in the character of a deity, he was overlooking the conduct of his subjects: who, in honour of the newly-formed god, erected to him a temple, under the title of "Jupiter Indiges."

Upon the death of Æneas, he was succeeded by his son Euryleon, named also Ascanius and Iulus, who contended with Mezentius, and in the end obliged him to sue for peace, which was granted, upon condition that for the future the river Tiber should be the boundary between the Latin and

and Etrurian territories. Afcanius was the fon of Æneas by his firft wife, and of him Lavinia, who was left pregnant by Æneas, began to be jealous, and retired to the woods, where fhe was delivered of a fon, which, from the place of his birth, fhe named Silvius. Afcanius after a time difcovered the place of Lavinia's retreat, and perfuaded her to return; from this time he treated Silvius not only as a brother, but refigned to him the kingdom as his rightful inheritance, and built for himfelf a capital to a new ftate, which he called *Alba Longa*. After he had reigned twelve years in his new kingdom, Afcanius died, leaving a fon, named Iulus, between whom and Silvius the right of fucceffion lay, the latter being the fon, and the former the grandfon of Æneas. At length the two kingdoms were united under Silvius; and as a compenfation to Iulus, he was appointed to fovereign power in matters relating to religion, a power which thenceforward continued in his family. Silvius was fucceeded by thirteen kings of the fame race, who reigned, it is faid, though with no great probability, during a fpace of 400 years. Of thefe little certain can be known; one of them, it appears, was named Tiberinus, who engaged in a war which proved fatal to him; for, in a battle which was fought on the banks of the Albula, he was forced into that river and drowned, whence the river was afterwards named the Tiber, which appellation it has borne ever fince. Agrippa fucceeded Tiberinus, and after him Alladius reigned, who was followed by Aventinus, who left his name to a certain hill, in which he was interred. Procas, the fucceffor of Aventinus, was father of Numitor and Amulius, and at his death he bequeathed the throne to Numitor. This prince was driven from the government by Amulius, who, to fecure it for himfelf, murdered Ægeftus, Numitor's only fon, and forced his daughter, Rhea Sylvia, to devote herfelf to the worfhip of Vefta, by which fhe was obliged to perpetual virginity. Her virtue, it was feigned, was violated by the god Mars; the confequence of which was, that fhe was delivered of two fons, who were placed in a wooden trough, and fent floating down the Tiber. From this dangerous fituation they were refcued by Fauftulus, the king's fhepherd, and fuckled by his wife Acca Laurentia, who, for her want of good conduct, was named *Lupa*, a circumftance that gave rife to the fable of the twins having been fuckled by a fhe-wolf.

Great care was taken of their education, and as they grew up they exhibited fomething in their appearance and behaviour, that denoted them to be above the common race of fhepherds: and at length Fauftulus difclofed to them their real defcent, which infpired them with the ambition of doing fomething worthy of their high birth. They had already obtained the names of Romulus and Remus, and before they had arrived at the age of manhood they had taken part in a quarrel between Amulius and Numitor, in which the former was depofed and killed, and the latter placed on the throne of Alba. Numitor, in gratitude for their fervice, advifed them to undertake the founding of a new colony; and to affift them in the project, he beftowed upon them thofe lands near the Tiber where they had been brought up, fupplied them with all kinds of inplements for breaking up the ground, and with flaves and cattle, and granted full liberty to his fubjects to join them.

For the more fpeedily carrying on their work, it was thought proper to divide thofe who were employed in it into two companies, one under each brother; a circumftance which, however well intended, gave birth to two rival factions, which openly manifefted themfelves when the choice was to be made of a place for the building of their new city, the one being for the mount Aventine, and the other for the Palatine mountain: difputes on the fubject came at laft to open hoftilities, and Remus was killed. By what means his death happened is not certain; but according to Livy he was killed by the hand of his brother.

Regal State of Rome.—Romulus, being now at the head of the colony, applied all his talents to the rearing of the new city, which he propofed to call after his own name. He fixed upon mount Palatine for its fituation, and performed all thofe ceremonies which were connected with the fuperftition of the Etrurians. As to the exact year of the foundation of Rome, there is a confiderable difagreement among chronologers, but it is generally referred to 753 before the birth of Chrift. When the city was finifhed, which probably confifted of about a thoufand houfes, or rude huts, the people, being affembled to make choice of a government moft agreeable to their wifhes, determined upon a monarchy, and refolved to take Romulus as their king. Being, unqueftionably, a man of a vigorous mind, he immediately applied himfelf to the eftablifhment of good order, and to the formation of certain rules or laws by which his fubjects were to be bound. He affumed a habit of diftinction for himfelf, appointed twelve lictors to attend him as guards, and divided his fubjects into different ranks. The lands he diftributed into three portions, one for the fupport of government; another for the maintenance of religion; and the third he divided into equal portions of two acres to each Roman citizen. After this he formed a fenate, confifting of a hundred perfons, afterwards increafed to 200, chofen from among the fuperior clafs of the people, and from whom the Patrician families were defcended. This affembly were not only to be judges in matters of fmall importance, but to debate and refolve upon fuch public affairs as the king propofed, and to determine them by a plurality of voices. The people at large were allowed to create magiftrates, enact laws, and refolve upon any war in which the king fhould propofe to engage. Romulus next proceeded to fettle the religious affairs of his people, and he added many of the Trojan deities to thofe whom the aborigines, or Italian natives, already worfhipped. He chofe priefts, inftituted feftivals, and laid the foundation of a regular fyftem of religion.

After all that has been attributed to the political fagacity and talents of Romulus, it is probable that the great outlines of the firft conftitution had a natural foundation in the ufages of barbarous nations; though many of his inftitutions, it will be readily admitted, bear the traces of a difcerning and active mind.

The Sabines were the moft formidable enemies of the early Romans; but after the death of Romulus, who reigned 37 years, Numa, a Sabine, was elected king. He was, in his own nature, formed for pacific meafures, and a worfhipper of the gods; he endeavoured to give his people the fame character. To increafe his influence, and render his government more powerful, he pretended to divine infpiration. As we have feen in fome preceding articles, fee CALENDAR, NUMA, &c. he reformed the calendar, divided the year into twelve months, following the courfe of the moon; and diftinguifhed the days into thofe in which civil occupations might be carried on, and thofe that were to be devoted to religious purpofes. The bufinefs of agriculture was lawful on the latter, as a religious duty. This wife prince reigned forty-three years; and was fucceeded by

Tullius Hoftilius, whofe reign commenced in the year 670 B.C. His difpofition was the reverfe of that of Numa. He made frequent wars upon his neighbours; and alienated the

the Sabines from the Romans, who became the moft powerful of their enemies. Tullius reigned thirty-three years.

Ancus Martius, the fourth king of Rome, grandfon to Numa, inherited his virtues, to which he joined the talents of a warrior. He greatly increafed the population of Rome, by naturalizing the conquered ftates; and he built the port of Oftia, at the mouth of the Tiber. His reign continued twenty-four years. See ANCUS.

The fifth king of Rome, Tarquinius Prifcus, a citizen of Corinth, noted for his great liberality and vaft wealth, was victorious in his wars, and he adorned the city with works of utility and magnificence. Such were the CIRCUS, the CAPITOL, and the CLOACÆ, thofe immenfe common fewers which led to the belief that Rome had been built on the ruins of an ancient city of much greater magnitude. This king was affaffinated in the 38th year of his reign; and was fucceeded by

Servius Tullius, his fon-in-law, who very much improved the city with ufeful edifices, and by extending its boundaries. He alfo made fome new arrangements in the divifion of the citizens; of which we fhall have occafion to fay more under the biographical article SERVIUS *Tullius*. This king was affaffinated, after a reign of forty-four years, by his own daughter Tullia, who had married Tarquinius, the grandfon of Prifcus, and who thus paved the way for her hufband to afcend the vacant throne.

The government of this Tarquin was fyftematically tyrannical, and from his haughtinefs he obtained the furname of *Proud*. By his ill conduct he at length roufed the vengeance of the people againft him, and they not only expelled the tyrant, but at one blow abolifhed the regal government at Rome. See TARQUINIUS.

The regal form of government fubfifted 244 years, during which there were only feven kings, of whom two died violent deaths, and one was depofed. Thefe circumftances throw a confiderable degree of doubt on the authenticity of the Roman hiftory, as the reigns of monarchs who die in the common courfe of nature cannot be averaged fo high as thirty years, whereas, notwithftanding the violent deaths and depofition of three of the kings, the average length of their reigns is more than thirty-four years each. Befides, it is admitted that for the firft five centuries after the building of Rome, there were no hiftorians, and, according to Livy, almoft all the ancient records were deftroyed when Rome was taken by the Gauls.

At the period of the abolition of the regal government, the territory of the Romans was extremely limited. The chief ufe which they made of their victories was to naturalize the inhabitants of fome of the conquered ftates, and fo increafe their population; thus their ftrength being always fuperior to their enterprizes, they laid a folid foundation of their empire.

Confular State of Rome.—When the regal government was abolifhed, it was agreed to commit the fupreme authority to two magiftrates, who fhould be annually elected by the people from the Patrician order. To thefe officers they gave the title of confuls, a name, as it has been faid, that was intended to defignate the counfellors of the republic, rather than its fovereigns, though, in point of fact, their authority differed fcarcely in any thing from that of kings. They had the fupreme adminiftration of juftice, the difpofal of the public money, the power of convoking the fenate and affembling the people, raifing the armies, and the right of making peace and war. Their authority was, however, limited to a year. The firft confuls were Brutus and Collatinus, the hufband of that Lucretia whofe death had occafioned the revolution which deftroyed the regal power. Tarquin was, at this time, in Etruria, where he got two of the moft powerful cities, Veii and Tarquinii, to efpoufe his caufe. He had alfo numerous and powerful partizans at Rome, and a plot was contrived to open the gates to admit him. The confpiracy was difcovered, and Brutus had the mortification to find his two fons in the number of confpirators. He felt it his duty to forget the affection of the parent, and to confider their cafes as conful; he accordingly condemned them to be beheaded in his prefence. This act of fevere juftice ftruck fuch terror into the Romans, that fcarcely any perfon ventured to oppofe the conful; and the efforts that were made to bring back monarchy, proved unfuccefsful. To fecure themfelves againft the affaults of every invader, the Romans formed an alliance with the Carthaginians, which fubfifted 250 years. All precautions, however, that were ufed for the prefervation of the tranquillity of the ftate, could not guard the people againft the oppreffion of the nobility. The former foon found that they had only changed their mafters, and embraced the mere fhadow of liberty. They made heavy complaints; thefe were followed by acts of rebellion, which occurred about the year B.C. 498. Peace was reftored by the creation of a dictator, a magiftrate who was elected for the period of fix months, and who was invefted with abfolute and unlimited authority. Lartius, nominated to this office, armed the lictors with axes, fummoned the whole people to the public affemblies, and calling over the names, enrolled all fuch as he judged moft fit for the fervice of his country, inflicting, without hefitation, capital punifhment upon thofe who dared to refift the order.

The fpirit of the people, though checked for a time, was not fubdued; they again complained, remonftrated, and even rebelled; and Rome, for fome years, was the fcene of anarchy and fedition. At length the fenate, alarmed by the idea of a general revolt, abated their former rigour, in fome meafure eafed the burdens of the people, and fecured their future interefts by the creation of five new magiftrates, called tribunes, who were to be elected annually by the people, whofe perfons were to be facred, whofe bufinefs it was to defend the oppreffed, to pardon offences, to arraign the enemies of the people; and, when they judged it neceffary, to ftop, by their fiat, the whole machine of government.

The tribunes demanded, and obtained, two other magiftrates to affift them, who were named Ediles, from the charge of the public buildings of the city being committed to them. From this era, which was about 493 years before the birth of Chrift, the commencement of the popular conftitution of the Roman republic may be dated.

The power of the tribunes foon rofe to an unexpected height, and proved the fource of perpetual diffentions in Rome. The nobles and patricians had ftill in view an ariftocratical form of government, while the tribunes aimed at nothing fhort of a complete democracy, hoping thereby to increafe their own power and influence. The tribunes prevailed, and Coriolanus, a patrician of inflexible virtue, was, in the year 491 B.C., banifhed. Encouraged by the fuccefs of the tribunes, Spurius Caffius Vifcellinus, an ambitious patrician, afpired to the fupreme power. To accomplifh his purpofe, he flattered the people by propofing the Agrarian law, which caufed the moft violent commotions in the ftate. His ambition was, in the end, punifhed with death, and from this time perpetual contentions and difcords fubfifted between the tribunes and patricians. The number of the former was increafed to ten, and the people procured the right of electing them in an affembly convened by the tribes. From this period the fupreme authority in the

the Roman republic may be conſidered as having paſſed completely from the higher order into the hands of the people.

Hitherto the Romans had no written laws. So long as the monarchy ſubſiſted, the will of their kings was to them inſtead of laws: while the ancient uſages, the deciſions of the conſuls and of the ſenate were founded, or ſuppoſed to be founded, on the principles of natural equity. To ſupply this defect in the government, the tribunes propoſed an eſtabliſhment of laws, to which, but with great reluctance, the ſenate aſſented. Commiſſioners were accordingly appointed to bring from Athens the laws of Solon, that ſuch of them might be adopted as were ſuited to the exiſting conſtitution of the Roman republic. Ten perſons were choſen out of the ſenatorial order to compoſe a code of laws from thoſe of Greece, and from the ancient uſages of Rome. This ſyſtem was divided into twelve tables, fragments of which are ſtill to be found in the hiſtory of that early period, and which are the baſis of the great ſtructure of the Roman juriſprudence. An acquaintance therefore with theſe ancient laws is deemed of importance. Even in the moſt flouriſhing times of the republic, they continued to be of the higheſt authority. Cicero paſſed upon them a very high encomium, and from him we learn, that to commit theſe laws to memory was an eſſential part of a liberal education. From the twelve tables the juriſconſulti compoſed a ſyſtem of judicial forms for the regulation of the different tribunals. The Decemviri were inveſted with all the powers of government; each decemvir preſided in his turn a ſingle day, and was during that period inveſted with ſovereign authority, with its inſignia the faſces. The other nine officiated ſolely as judges in the determination of law-ſuits, and the correction of abuſes. An abuſe, however, of the moſt flagrant nature, committed by Appius Claudius, (ſee his article,) the chief of their number, was deſtined to bring their office to an end. Prompted alſo by the ambition and artifices of this man, the whole body conſpired againſt the public liberty, and even bound themſelves by an oath to endeavour to make the government perpetual. The ſenators, the ſoldiers, and the people, rouſed by the tyranny of theſe uſurpers, inflicted the puniſhment which their crimes ſo juſtly merited, and at the ſame time reſtored the conſular and tribunitian power. This was in the year 449 B.C.

The ſcale of the people was daily acquiring weight at the expence of that of the higheſt order. There were however two barriers, which ſtill ſeparated the patricians and plebeians; the one a law, which prevented their intermarriage, and the other, the limitation of all the higher offices to the order of patricians. It was the object of the people to remove theſe reſtraints, becauſe then the patricians and plebeians would be on an equality. The firſt, after a long conteſt, was agreed to by the ſenate. This conceſſion ſtimulated the people to inflexible perſeverance in their ſtruggle for the latter. The ſenate ſought a palliative by the creation of ſix military tribunes inſtead of conſuls, of whom three were to be patricians, and three plebeians. This meaſure ſatisfied the people for a ſhort time: the conſuls were, however, ſoon reſtored. The diſorders of the republic, and the frequent wars in which the country was engaged, had interrupted the regular ſurvey of the citizens. This was remedied by the creation of two officers, under the title of Cenſors, 437 B.C. whoſe buſineſs was not only to make the cenſus every five years, but to inſpect the morals, and regulate the duties of the people. The diſſentions continued with but little variation, and the people uniformly, as their laſt reſource, refuſed to enrol themſelves, till overawed by the ſupreme authority of a dictator. To obviate the frequent neceſſity of this meaſure, which enforced but an unwilling obedience, the ſenate had recourſe to the expedient of paying the ſoldiery, who before had ſerved without hire, as was uſual in other countries under the feudal ſyſtem. To defray this expence, a tax was levied from every perſon in proportion to his means, and thus a fund was eſtabliſhed for the maintenance of the army. The Roman ſyſtem of warfare now aſſumed a new aſpect. The ſenate always found ſoldiers at command, and the army was under its controul: the enterprizes of the republic were more extenſive, and its ſucceſſes more ſignal and important.

One of the early effects of the new ſyſtem was a war declared againſt the Veii, the proud rival of Rome, and its equal in extent and population. After a ſiege of ſeveral years their capital was taken by Camillus, and the Veian territory was added to the Roman empire, in the year B.C. 396. Their dominions, till now confined to the territory of a few leagues, was at this period rapidly extended, and the Romans were, from this circumſtance, an overmatch for all their neighbours.

The glory, and other good effects of the conqueſt over the Veii, were more than overbalanced by the ſubſequent fatal cataſtrophe in a war with the Gauls, who, under the command of Brennus, invaded Italy, plundered Rome, and actually burnt it to the ground, B.C. 390. They then retired to their own country loaded with ſpoils. To the burning of the city, on this occaſion, as we have before obſerved, the Roman writers attribute the loſs of all the records and monuments of their early hiſtory. The city was ſpeedily rebuilt, but the effects of this calamitous event were long felt. The neighbouring ſtates combined to prevent the Romans from recovering their former power; "but," ſays the hiſtorian, "neither the united efforts of foreign enemies, nor inteſtine diviſions, could ruin a city deſtined to be the miſtreſs of the world." The Gauls in 367 returned to Italy, but they were no longer ſucceſsful, and were forced to retreat with the utmoſt precipitation. About the ſame time a plebeian was raiſed to the conſulſhip, and the offices of Prætor and Edile were created; the one to adminiſter juſtice, and the other to inſpect the temples and public places. In the mean time hoſtilities were carried on by the Romans againſt thoſe provinces that refuſed to ſubmit to their power, or who made the leaſt attempt at revolt. The war with the Samnites, a hardy nation, who inhabited a large track of ſouthern Italy, which began about this period, was continued for half a century: but its ſucceſsful termination was ſpeedily followed by the reduction of all the Italian ſtates. In the courſe of this important war, the Tarentines, allies of the Samnites, ſought the aid of Pyrrhus, king of Epirus, one of the moſt illuſtrious generals of his age. Pyrrhus landed in Italy with 30,000 men and a train of elephants, about the year 280 B.C. For a few years he was ſucceſsful, but ſo ſoon as the Romans underſtood his mode of warfare, they became more than a match for him; and when he was making a laſt effort near Beneventum, he was totally defeated with the loſs of 26,000 men. He then abandoned all further views to Italy, and returned with precipitation to his own country, 274 B.C. The hoſtile ſtates ſubmitted to the victorious power, and Rome, 480 years from its foundation, was now ſovereign of all Italy. It may be obſerved, that the extent of their conqueſts was as much the effect of wiſe policy, as of power. They removed to Rome all the leading men of the principal conquered cities, admitting them into their tribes, and thus, in a meaſure, ſoothed the pride of the vanquiſhed, by giving them an apparent ſhare in their own domeſtic government; while, in arranging the conſtitution of the cities themſelves, they filled their magiſtracies with illuſtrious Romans, whoſe abilities and influence were fitted to command allegiance, reſpect, and attachment to the Roman government.

The command of the continent did not ſatisfy the Roman ambition. The Carthaginian ſtate excited their jealouſy, and the aid which it had granted to the Tarentines was the pretext for commencing hoſtilities. Sicily had long been conſidered as the granary of Italy, and in that iſland the Carthaginians poſſeſſed conſiderable ſettlements, and they were ambitious of acquiring its entire dominion. An obvious policy led the Romans to diſpute with them this important acquiſition, which gave riſe to the Punic wars. Sicily was at firſt the theatre of war between theſe two nations, which was afterwards removed into Africa, and thence into Spain and Italy. We have however, under the words CARTHAGE and CARTHAGINIANS, entered ſo much at large into this ſubject, as to preclude the neceſſity of doing here more than adding a few lines to render the Roman hiſtory connected. For ſome time the event was doubtful, but in the year 242 B.C. the Carthaginians were conſtrained to ſue for peace, which they obtained on hard and ignominious terms. Rankling under the diſgrace, they ſoon repaired their loſſes, collected a numerous army, and entruſted the ſupreme command to HANNIBAL; ſee his article. In 218 the war was renewed and proſecuted with vigour. The Romans were defeated in ſeveral battles, and Rome itſelf threatened with inſtant deſtruction. The prudent and cautious Fabius, then appointed dictator, averted the impending blow. In the courſe of this ſecond Punic war Maſſiniſſa declared in favour of the Romans; and Syphax, king of Numidia, took up arms againſt them. Scipio, the celebrated Roman general, who carried the war into Africa, defeated the combined forces of Aſdrubal and Syphax in ſeveral battles, and Carthage in its turn trembled for its ſafety. Hannibal was recalled from Italy, and defeated with prodigious loſs in the year B.C. 202, and peace was concluded between the Romans and Carthaginians in the following year.

Elated with ſucceſs the moſt complete, the Roman ambition now exceeded all limits, and aſpired at the domination of the whole world. War was proclaimed againſt Philip of Macedon, who was defeated by Flaminius in Theſſaly in the year 197 B.C. and obtained peace by agreeing to pay a tribute. The ſubjection of Macedon portended the ruin of all the Grecian ſtates.

Antiochus, king of Syria, ſurnamed the Great, by the perſuaſion of Hannibal, declared war againſt the Romans, but after three years he was under the neceſſity of imploring peace, and to accept of terms the moſt rigorous. The Aſiatic war, however, in the event proved fatal to the Romans, whoſe habits and manners were corrupted by the vices which accompanied the luxury of the Eaſt. Previouſly to this, Perſeus, the Macedonian monarch, refuſing to ſubmit to the conditions that had been impoſed on his father, was attacked and defeated by Paulus Æmilius, and his kingdom, which had ſubſiſted ſeven centuries, was reduced to the form of a Roman province.

The moſt frivolous pretexts were aſſigned as the cauſes of the third Punic war, in the year 149 B.C., which ended in the deſtruction of Carthage, long renowned for arts, opulence, and extent of dominion. Conſcious of their utter inability to reſiſt this formidable power, the Carthaginians, after a ſhort conteſt, offered every ſubmiſſion to ſave their city, but the Romans inſiſted that Carthage ſhould be razed to its very foundation. Deſpair inſpired this miſerable people with courage: they determined to make one effort at leaſt, and then, if neceſſary, to die in the defence of their altars and gods. The effort was in vain, and Carthage, in 146, was taken by ſtorm, its inhabitants cruelly maſſacred, and the city burnt to the ground. In the ſame year, the ruin of Corinth, and of the Grecian ſtates, was effected. Greece became a Roman province under the name of Achaia. Many other kingdoms ſhared the ſame fate, among which were Numantia and Luſitania. Thus, in the ſpace of about a century, the Romans extended their conqueſts in Europe, Aſia, and Africa.

"This," ſays Mr. Tytler, "was the era of the dawn of luxury and taſte at Rome, the natural fruit of foreign wealth, and an acquaintance with foreign manners. In the unequal diſtribution of this imported wealth, the vices to which it gave riſe, the corruption and venality of which it became the inſtrument, we ſee the remoter cauſes of thoſe fatal diſorders to which the republic owed its diſſolution."

All diſſentions between the ſenate and the people had been ſuſpended during their victories and triumphs, but when they had no foreign enemy to contend with, they turned their weapons againſt themſelves. Sentiments of honour and virtue among the great maſs of the people were well nigh extinguiſhed; and pride, luxury, and ſelf-intereſt, ſucceeded to temperance, ſeverity of life, and public ſpirit. Tiberius and Caius GRACCHUS, (ſee their articles,) beheld, with concern, the univerſal corruption of the ſtate, and attempted to introduce thoſe reforms that might bring back the people to the former habits of moral diſcipline. They, however, both fell victims to their zeal for the public good. The tumults which attended, or were ſubſequent to the exertions of theſe noble youths, were but the prelude to thoſe civil diſorders which followed in quick ſucceſſion. The Numidian war, which commenced in the year 111 B.C., and which laſted five years, afforded many inſtances of the injuſtice, inſolence, and venality of the Roman people. In this, JUGURTHA, (ſee his article,) who ſought to uſurp the crown of Numidia by the moſt cruel means, obtained the friendſhip and aid of the Roman ſenate, who having been bribed for the purpoſe, declared him innocent of every crime of which he was charged, and decreed to him the ſovereignty of half the kingdom.

About this time, 105 B.C. an immenſe body of fierce barbarians ruſhed, like a mighty torrent, from the northern regions of Europe, and threatened all before them with utter ruin and deſolation. Marius alone was able to avert the impending deſtruction. He defeated the barbarians with great ſlaughter: but he fought and triumphed merely with a view of furthering his own ambition, which was ſoon proved to be unbounded. Sylla, an artful and aſpiring patrician, jealous of the glory and popularity which Marius had acquired, boldly ſtood forward to oppoſe him. Factions were formed, and preparations made for the doubtful conteſt. The effects, however, of domeſtic animoſities were ſuſpended by the *Social* war, which was occaſioned by the anxiety of the allied ſtates of Italy to attain the rights of citizenſhip; but the immediate cauſe of the war was the murder of Druſius the tribune. This war, which ended in the conceſſion of thoſe rights to ſuch of the confederates as ſhould return peaceably to their allegiance, was followed by the more dreadful conteſt between the oppoſing factions of Sylla and Marius. Sylla, commanding in a war againſt Mithridates, the moſt powerful monarch of the Eaſt, was ſuperſeded, and recalled from Aſia. He refuſed to ſubmit to the order, and having ſounded his army, found it well diſpoſed to ſupport him

him in all his meaſures. "Let us march to Rome," they exclaimed with one voice; "lead us on to avenge the cauſe of oppreſſed liberty." Sylla readily liſtened to the cry, and led his conquering army towards Rome: they entered the city ſword in hand; Marius and his partiſans fled with precipitation, and Sylla ruled for a time triumphant. He ſullied the glory of his victories by many acts of cruelty and barbarity; aſſumed the title and power of perpetual dictator in the year 82; and after maſſacring many thouſands in cold blood, returned to the ſtation of a private man. It ſhould, however, be obſerved, that previouſly to this he had engaged perſonally in the Mithridatic war, and that during his abſence, Marius returned to Italy, and joining his forces to thoſe of Cinna, laid ſiege to Rome, and compelled the city to abſolute ſubmiſſion. After a tremendous and unſparing maſſacre of all whom they regarded as their enemies, Marius and Cinna proclaimed themſelves conſuls, without the formality of an election, but Marius died within a very few days after this had happened.

The death of theſe rivals did not give peace to Rome: Lepidus aſpired to ſucceed Sylla in his power, and Pompey, who was, by much, his ſuperior in talents, cheriſhed the ſame ambition. While Pompey was employed in the reduction of the revolted provinces of Aſia, the conſpiracy of Catiline threatened the entire deſtruction of Rome. It was, however, extinguiſhed by the prudence, foreſight, and patriotic zeal of Cicero. The next conſiderable candidate for popularity and ſovereign power was Julius Cæſar, who in the reign of Sylla had been numbered among the proſcribed. From the danger attached to his ſituation he had learned prudence; and while Pompey and Craſſus were contending for the command of the republic, Cæſar, who, by attaching himſelf to either rival, would infallibly make the other his enemy, ſhewed his talents and wiſdom by reconciling them, and thus acquiring the favour and friendſhip of both. They accordingly agreed to a partition of power, and hence the firſt triumvirate was formed. Cæſar was elected conſul: and he had the command of four legions, and the government of Tranſalpine Gaul and Illyria. The death of Craſſus, in an expedition againſt the Parthians, diſſolved the triumvirate, and the others, Pompey and Cæſar, aſpired, as rivals, to an undivided dominion. The term of Cæſar's government was near expiring, but to ſecure to himſelf that power which was the object of his ambition, he procured a propoſal to be made in the ſenate by one of his friends, which had the appearance of moderation and juſtice, namely, that Cæſar and Pompey ſhould either both continue in their governments, or both be deprived of them, as they were equally capable of endangering public liberty by an abuſe of power. The motion paſſed, and Cæſar offered to reſign, but Pompey refuſed, and reſolved to maintain his right by force of arms; a civil war was the neceſſary conſequence. The ſenate were chiefly attached to Pompey, but Cæſar had on his ſide a victorious army, conſiſting of ten legions, and the great body of the Roman citizens, whom he had won to his intereſt by his liberality. Mark Antony and Caſſius, at that time tribunes of the people, left Rome for Cæſar's camp. The ſenate, apprehenſive of his deſigns, and dreading the effects of his power and popularity, paſſed a decree, branding with the crime of parricide any commander who ſhould dare to paſs the Rubicon, a river which was the boundary between Italy and the Gauls, with a ſingle cohort without their permiſſion. Cæſar ſet at defiance their decree, and marched direct to Rome. Pompey, to whom the ſenate had committed the defence of the ſtate, was without an army. He quitted Rome, followed by the conſuls and a part of the ſenate, and endeavoured haſtily to levy troops over all Italy and Greece, while Cæſar had triumphantly entered the city, amidſt the acclamations of the people, ſeized the public treaſury, and poſſeſſed himſelf of ſupreme authority without any oppoſition. Having ſecured the capital, he ſet out to meet the lieutenants of Pompey, who had poſſeſſion of Spain. He defeated them, and ſubdued the whole country in the ſpace of forty days. On his return, he found he had, during his abſence, been nominated dictator; and in the ſucceeding election he was choſen conſul, and thus inveſted by a double title, with the right of acting in the name of the republic. Pompey had now raiſed a uumerous army, and in the field of Pharſalia the rival armies met: Cæſar was victorious, leaving 15,000 of his enemies dead, while 24,000 ſurrendered themſelves as his priſoners. The battle of Pharſalia, for ſo it has been named, which happened in the year B.C. 48, decided the fate of the rival chiefs, and that of the empire.

In the ſpace of two years Cæſar gave law to the known world; but his ſucceſs accelerated his ruin. He took part with Cleopatra againſt Ptolemy: a war enſued, in which Ptolemy was killed, and Egypt was ſubdued by the Roman arms. In this war the famous library at Alexandria was burnt to aſhes. A revolt of the Aſiatic provinces, under Pharnaces, the ſon of Mithridates, was ſignally chaſtiſed; and the report of the conqueror to the Roman ſenate was conveyed in three words, *veni, vidi, vici*. Cæſar having added Mauritania to the number of the Roman provinces, returned to Rome abſolute maſter of the empire. It is, however, much to his credit, that from this moment his attention was directed ſolely to the proſperity and happineſs of the people. He remembered no longer that there had been oppoſite parties: he was beneficent alike to the friends of Pompey as to thoſe attached to himſelf. He laboured to reform every ſpecies of abuſe and grievance: and in return he was hailed "the father of his country"—was created conſul for ten years, and perpetual dictator. His perſon was declared ſacred, and he had the title of *Imperator* beſtowed upon him. Thus the Roman republic finally, by its own acts, reſigned its liberties. A conſpiracy was formed againſt him by ſixty of the ſenators, at the head of whom were Brutus and Caſſius, and the dictator was ſtabbed, in the year 44, at the foot of Pompey's ſtatue. Mark Antony improved this favourable opportunity, and became maſter of the commonwealth: he found, however, a formidable competitor in Octavius, the grand nephew and adopted heir of Cæſar, who, at this critical moment, arrived in Rome, and who gained the ſenate to his intereſt. The conteſt terminated in a civil war, in the courſe of which Octavius and Antony were reconciled, and they ſtrengthened their hands by admitting Lepidus into their aſſociation. Thus was formed the ſecond triumvirate, the effects of whoſe union were beyond meaſure deſtructive. They divided among themſelves the provinces, and cemented their union by a deliberate ſacrifice, made by each, of his friends to the vengeance of his aſſociates. Antony gave up his uncle Lucius to death; Lepidus his brother Paulus; and Octavius his guardian Toranius and his friend Cicero. Beſides theſe illuſtrious characters, 300 ſenators and 3000 knights were put to death. A conſpiracy was excited againſt the triumvirs. Octavius and Antony marched againſt them; an engagement enſued at Philippi, which decided the fate of the empire: the republican party was annihilated. Antony now ſought a recompence for his troops by the plunder of the Eaſt. He became the willing conqueſt of Cleopatra, for whom he abandoned, and even forgot, glory, ambition, and fame. Octavius ſaw this phrenzy with delight, and contemplated in it his rival's ruin; and from Lepidus he had nothing to dread,

dread, whose insignificant character drew on him the contempt of his own friends, and whose folly, in attempting an invasion of the province of his colleague, was punished by his deposition and banishment. Antony had lavished the provinces of the empire, in gifts to his paramour and her children. At these enormities the Roman people were justly indignant, and the divorce of his wife Octavia, the sister of his colleague, was the signal of declared hostility between them. An immense armament, chiefly naval, came to a decisive conflict near Actium, on the coast of Epirus. Fortune was favourable to Octavius, and the battle of Actium gave him the empire of the world.

Thus have we traced the history of Rome from its commencement, through all its revolutions, till the final extinction of the republic: before we come to an account of the emperors, we shall notice some particulars relating to the character of the ancient Romans, beginning with the mode of their education, upon which almost every thing depends, with regard to character, in the largest extent of the word.

Roman Education and Literature.—A rigid severity of manners was the characteristic of the Romans under their kings, and in the first ages of the republic. The private life of the citizens, which was frugal, temperate, and laborious, had its influence on their public character. The head of every family had sovereign authority over all the members that composed it, and this power, there is every reason to believe, was seldom, if ever, abused. The Roman laws did not prescribe a system and rules for the education of the young, but the manners of the people supplied this want, and the utmost attention was bestowed on the early formation of mind and character. The Roman matrons did not abandon their infants to mercenary nurses. They esteemed those duties connected with the nurture of their offspring and the rudiments of their education as the highest points of female merit. A remarkable degree of attention was paid to the language of children, and to the attainment of correctness and purity of expression; thus, the Gracchi, the sons of the virtuous and excellent Cornelia, were said to be educated "non tam in græmio, quam in sermone matris." This was the more necessary, because it was by eloquence more than by the exercise of any other talent that the young Roman could rise to the highest offices and dignities of the state. The exercises of the body were likewise particularly attended to, and whatever had a tendency to harden the temperament, and to confer strength and agility, was regarded as of prime importance. At seventeen a youth was consigned to the care of a master in rhetoric, whom he attended constantly to the forum, or to the courts of justice, for it was necessary to be an orator, to be regarded as an accomplished gentleman.

Before the intercourse with Greece, which took place after the Punic wars, the Roman people were rude and illiterate, and it was not till five hundred years had elapsed, that the regular drama was introduced at Rome, and the earliest Roman plays were, no doubt, translations from the Greek. Of the early Roman drama, Ennius was a great ornament, and from his time the art made a rapid advancement. The comedies of Plautus, the contemporary of Ennius, display much knowledge of human nature, and are still read with pleasure. Cæcilius improved so much on the comedies of Plautus, that he is mentioned by Cicero as, perhaps, the best of the Roman comic writers, but none of his compositions remain. The "Andria" of Terence, the first of his comedies, was performed in the year 587 from the building of the city. The comedies of this writer are chiefly borrowed from the Greek of Menander and Apollodorus, and their merit lies in that nature and simplicity which are observable in the structure of the fable; in the delineation of the characters, and in the delicacy and purity of the sentiments. The Roman comedy was of four different species; the *first* admitted serious scenes and personages; the *second* was a representation of ordinary life and manners; the *third* was where the dialogue was not committed to writing, but the subject of the scene was prescribed, and the dialogue was filled up by the talents of the actors: and the *last* included pieces of comedy of the lowest species; farces, or entertainments of buffoonery. The Roman tragedy kept pace in its advancement with comedy; of the best, namely, of Actius and Pacuvius, there are no remains; those under the name of Seneca are probably the work of different hands.

The most perfect era of Roman literature was the age of Cicero, comprehending all, of the preceding times, whom Cicero might have seen, and all, of the succeeding, who might have seen him. These will include, among others, Sallust, Cæsar, Livy, and Tacitus, as historians. Among the poets were Lucretius, Catullus, Virgil, Horace, Ovid, Tibullus, and Martial. See the several articles in the alphabetical arrangement of the New Cyclopædia.

State of Philosophy and the Arts among the Romans.—In the earlier periods of the republic, the Romans had little leisure to bestow on the cultivation of the sciences, and had no conception of philosophical speculation. It was not till the interval between the war with Perseus and the third Punic war, that philosophy made its appearance at Rome. Some learned Achaians, banished from their country, had settled in various parts of Italy, and applied themselves to the cultivation of literature, and the education of youth, diffusing a taste for those studies hitherto unknown to the Romans. Jealous of the introduction of foreign manners with foreign studies, the senate banished the Greek philosophers from Rome. But Carneades and Critolaus came afterwards in the train of an Athenian embassy, who revived the taste for the Greek philosophy, and left behind them many able disciples who publicly taught their doctrines. As the Roman manners had still a tincture of their ancient severity, the Stoical system prevailed. The philosophy of Aristotle was little known in Rome till the age of Cicero, and even then the great orator complains that Peripatetic philosophy was but little understood at Rome, and, on that account, he sent his son to study its doctrines in the schools of Athens. Lucullus, whose residence in Greece gave him an opportunity of being acquainted with all the different sects, disseminated, on his return to Rome, a very general taste for philosophy. The old and new academy had each their partisans; of the former, the most illustrious disciples were Marcus Brutus and Terentius Varro. Cicero, who must be deemed the most eminent of all the Roman philosophers, is usually classed among the supporters of the new school.

The cultivation of physics, or natural philosophy, seems to have been but little attended to, either by the Greeks or Romans. The natural history of Pliny is the most valuable storehouse of the knowledge of the ancients in physics, economics, and the arts and sciences. The Romans had no natural taste in the fine arts. On the conquest of Greece, an immense field opened at once to their eyes, and they were almost instantly surrounded with the master-pieces of art; but their minds were not sufficiently cultivated to appreciate their excellencies.

The Romans seem to have invented or perfected no art, but that of war. The rest they had from Egypt, Greece, Sicily, and Etruria. In our articles, therefore, concerning the

the *Music of the Ancients*, and *Musical Instruments* of the Greeks, (see MUSIC, and INSTRUMENT, in *Music*,) those of the Romans are generally included. They, indeed, imitated and adopted many customs, religious rites and ceremonies of the Etrurians; and Plutarch (Vita Romuli) mentions it as a prevailing opinion, that the Greek language, which was spoken by the Romans in the time of Romulus, was not corrupted by Italian words. From these accounts it appears that the Romans had not only vocal and instrumental music as well as other arts and sciences from Greece, but even their alphabet, language, religion, and all the learning of which they were possessed during the time of their kings, and the first ages of their republic, these having been originally Greek, though the Romans had them through Etruscan strainers.

The first Roman triumph, according to Dionysius (lib. ii.), was that of Romulus over the Cæninenses; in which, clad in a purple robe, he was drawn in a chariot by four horses. The rest of the army, both horse and foot, followed, ranged in three several divisions, hymning their gods in songs of their country, and celebrating their general with extemporary verses: this account affords a very venerable origin to the improvisatori of Italy; as the event happened in the fourth year of Rome, 749 years before Christ, and the fourth year of the seventh olympiad.

Indeed the Romans were later in cultivating arts and sciences than any other great and powerful people; and none of them seem to have been the natural growth of the soil, except the military art; all others were brought in by conquest.

During the reign of Augustus, except Vitruvius, it does not appear that the Romans had one architect, sculptor, painter, or musician; those who have been celebrated in the arts at Rome, having been Asiatics, or European Greeks, who came to exercise such arts among the Latins, as the Latins had not among themselves; this custom was continued under the successors of Augustus, and those Romans who were prevented by more important concerns from going into Greece, contrived in a manner to bring Greece to Rome, by receiving into their service the most able professors of Greece and Asia, in all the arts. We find too, not only that each of the best Roman writers was an imitator of some great Grecian model, but are certain that the finest remains in painting, sculpture, and architecture, which still subsist in Italy, were either brought thither from Greece, or were the works of Greek artists, who had left their own ruined and oppressed country, to bask in the warm sun-shine of power and affluence at Rome.

Vitruvius, in his Treatise on Architecture, has inserted a chapter on music, in which he has given the harmonical system of Aristoxenus; but he introduces it with a complaint of the unavoidable obscurity of musical literature, on account of the deficiency of terms in the Latin tongue, to explain his ideas. "The science of music, in itself obscure," says he, "is particularly so to such as understand not the Greek language." This writer, therefore, who seems to have been the first that had treated of music in the Roman language, confesses the necessity he was under of using Greek appellatives, not only for the notes, but for other parts of the art; which shews, if not the low state of music at Rome when he wrote, which was in the Augustan age, at least whence their music came; and *borrowing* implies *inferiority*. Indeed, the writings of Cicero shew that philosophy, and all the arts and sciences, were wholly furnished to the Romans from Greece, even in the most enlightened times.

Music was, however, in great favour at Rome during the latter end of the republic, and the voluptuous times of the emperors; the stage then flourished; the temples were crowded; festivals frequent; and banquets splendid; so that we may suppose it to have been very much used both upon public and private occasions, in so rich, populous, and flourishing a city as Rome, the mistress of the world. But this music must have differed as little from that of the Greeks, as the descriptions of it in Horace and Virgil differ from those to be found in Homer, and the Greek lyric poets.

Notwithstanding the Romans had the Greeks, Etrurians, and Sicilians to imitate in the polite arts, they never advanced so far in them as the modern Italians have done; who, without any foreign help, have greatly surpassed not only their forefathers the ancient Romans, but even the Greeks themselves, in several of the arts, and in no one so much as that of music, in which every people of Europe have, at different times, consented to become their scholars.

From the success which attended the arms of the Romans, and that dominion which they acquired over the greatest part of the known world, it is natural to conclude that they must have carried the military art to a higher degree of perfection than any other nation of that period. It is the discipline of an army that makes the multitude act as one man; it moreover increases the courage of troops, because each individual confides in the steady co-operation of his associates. From the constant practice of athletic exercises, the Romans were inured from infancy to hardiness and fatigue, and bred to that species of life which a soldier leads in the most active campaign.

Among the ancient nations there were usually but two different arrangements of the troops in order of battle. The one the Phalanx, or close arrangement in parallelograms, intersected only by great divisions; the other the Quincunx, consisting of small companies or platoons, disposed in three straight lines, with alternate spaces between them equal to the space occupied by each company. The military tactics of the Romans are supposed to have been at their highest pitch of excellence during the Punic wars. Hannibal was a master in the science, and the Romans understood how to profit from the instructions of an enemy. The art of intrenchment was carried to great perfection by the Romans, particularly by Julius Cæsar. Their intrenchments consisted of a ditch from nine to fifteen feet in depth and width, fenced on the inside by the mound of excavated earth, and on the outside by strong stakes with pointed branches.

In besieging a town, several camps were formed around the place, joined to each other by lines of circumvallation and countervallation. A mound of earth was raised, gradually rising in elevation as it approached the city. The front, where workmen were employed, was defended by a curtain of hides. On this mound the engines of attack were advanced, till they played on the very spot which the besiegers wished to assail. The same machines were used by the besieged for annoying the enemy. When the batteries from the terrace had silenced those on the walls, the battering ram was brought up, and if it once reached the walls, it was generally decisive of the fate of the town. The great object, therefore, of the besieged, was to prevent its approach by every power of annoyance.

The naval military art was utterly unknown among the Romans till the first Punic war. A Carthaginian galley was the first model; and in the space of two months they equipped a fleet of 100 gallies of five banks of oars, and 20 with three banks. In the times of the empire, which we are going, very briefly, to describe, the Romans maintained their different conquests, not by their armies, but by their fleets, which were moored in the large rivers and bays,

and

and generally preferved a fixed ftation, as well as the legions.

Rome under the Emperors.—The battle of Actium, as we have already obferved, decided the fate of the commonwealth, and Octavius, now having affumed the name of Auguftus, was mafter of the Roman empire. This emperor new-modelled the ftate, flattered the people, and rendered monarchy fupportable to republicans. Auguftus poffeffed the talent of difcerning what character was beft fitted for gaining the affections of the people he governed, and verfatility of temper and genius to affume it. His virtues, though the refult of policy, not of nature, were certainly favourable to the happinefs, and even the liberties, of his fubjects. The fate of Cæfar might, and probably did, warn him of the infecurity of an ufurped dominion; and, therefore, while he ftudioufly imitated what was excellent in his predeceffor, he affected a much higher degree of moderation and refpect for the rights of the people. Long peace, in which the temple of Janus was fhut, which had been open nearly two centuries, fince the beginning of the fecond Punic war; an uniform and temperate government, and prevailing luxury, introduced a flow poifon into the vitals of the empire. The national character was changed. The outward form remained; but the animating fpirit and vigour had vanifhed. The Romans thought themfelves free, becaufe they had no longer to fight for their liberty. The fovereign kept up the delufion, by maintaining the ancient forms of the republican conftitution, in the election of magiftrates, &c. though they were nothing more than mere forms. He even pretended to confider his own functions as temporary, exerted for the benefits of the people, and depending upon their will. Five times, in the courfe of his protracted reign, did he fubmit to a fort of election. The emperor repofed the moft unlimited confidence in Mecænas, by whofe counfels all public affairs were conducted, and the moft falutary laws enacted for the remedy of public grievances, and even the correction of the morals of the people. By his influence and wife inftructions, Auguftus affumed thofe virtues to which his heart was a ftranger; and which, in their tendency to the happinefs of his fubjects, were equally effectual as if they had been the genuine fruits of his nature. On the death of Marcellus, the nephew and fon-in-law of the emperor, he beftowed his chief favour on Marcus Agrippa, who married Julia, the widow of Marcellus; and on his deceafe, Julia took Tiberius for her third hufband, who became the emperor's fon-in-law by a double tie, for Auguftus had previoufly married his mother, Livia. On the death of the emperor, in the 14th year of the Chriftian era, and in the 44th of his reign, Tiberius fucceeded to the throne.

The government eftablifhed by Auguftus, founded, as it unqueftionably was, on the power of the fword, not on the confent of the fenate and people, degenerated in proportion as the army became corrupted. This prince had refolved to confine the boundaries of the empire to the limits which, he affumed, Nature had pointed out, *viz.* on the weft the Atlantic ocean; the Rhine and Danube on the north; the Euphrates on the eaft; and towards the fouth, the fandy deferts of Arabia and Africa. His immediate fucceffors adopted this refolution. Britain and Dacia were the fole acceffions to the empire during the firft century of the Chriftian era. A military fpirit was, in fome degree, preferved and cherifhed, when almoft every virtue was extinguifhed; but the difcipline of the legions was greatly corrupted by the ambition, or relaxed by the weaknefs, of the emperors, who confided in the army, and particularly in the ftrength and fidelity of the Prætorian guards, which had been formed by Auguftus, and were kept up for the protection of the emperor's perfon. The foldiers were, however, foon roufed to a fenfe of their own power, and of the impotency of the civil authority.

Tiberius, the fecond emperor, was an unfeeling tyrant, and he took for his counfellor Sejanus, prefect of the Prætorian guards, a man ftill more cruel and tyrannical than himfelf. Sejanus conceived the project of placing himfelf on the throne: for the furtherance of his plans, he caufed Drufus, the fon of the emperor, to be poifoned, and removed from the fight of the people the fons of Germanicus, who were the natural heirs to the crown. He even perfuaded Tiberius himfelf, under the pretence of a difcovery of plots for his affaffination, to retire from Rome to the ifle of Capreæ, and devolve the government upon himfelf. He had but one ftep more to the attainment of the object of his ambition: he was on the point of affaffinating his mafter when he was detected, and inftantly executed. Tiberius now became negligent of the cares of government, and the imperial power was difplayed only in fcenes of cruelty and rapine. At length he fell fick, and was ftrangled in his bed by Macro, the præfect of the Prætorian guards, in the 78th year of his age, and the 23d of his reign.

Caligula, the fon of Germanicus, who was Tiberius's nephew, was the third emperor of Rome. The commencement of his reign was fignalized by a few acts of clemency and good policy. But tyrannical and cruel by nature, he fubftituted military execution for legal punifhment. The provinces were loaded with the moft oppreffive taxes, and daily confifcations filled the imperial coffers. He was affaffinated in the 4th year of his reign, and was fucceeded by his uncle

Claudius, the fon of Octavia, the fifter of Auguftus, whofe fhort reign, though he was a man of weak intellects, and of little education, was marked by an enterprife of importance. He undertook the reduction of Britain, and after vifiting the ifland in perfon, left his generals, Plautius and Vefpafian, to profecute a war, which was carried on for feveral years with various fuccefs. The inhabitants of Wales, then denominated the Silures, under their king Caractacus, made a noble refiftance, but were finally defeated, and Caractacus was led captive to Rome. The civil adminiftration of Claudius was weak and contemptible; he was the flave even of his domeftics, and the dupe of his abandoned wives Meffalina and Agrippina. Claudius was put to death in the 15th year of his reign.

Nero, the fcourge of mankind, fucceeded his father Claudius, and for the firft five years he reigned with great applaufe, whence Trajan, faid "cunctos principes longè abeffe a Neronis quinquennio;" but when his character began to unfold itfelf, he was found to be a compound of every thing that was bafe and inhuman. (See his article.) He perifhed in the 30th year of his age, and the 14th of his reign.

The two fucceeding emperors, Galba and Otho, did not reign a year between them; the former was murdered by the foldiers, and the latter died by his own hand.

The reign of Vitellius, the next emperor, was of eight months' duration. He is faid to have propofed Nero for his model, and it was juft that he fhould refemble him in his fate. Vefpafian, who had obtained from Nero the charge of the war againft the Jews, which he had conducted with ability and fuccefs, was proclaimed emperor by his troops in the Eaft, and a great part of Italy fubmitting to his generals, Vitellius capitulated to fave his life; but as foon as Rome was taken, the depofed emperor was feized, maffacred, and his body thrown into the Tiber.

Vefpafian reigned with great popularity for ten years. He the *Music of the Ancients*, and *Musical Instruments* of the Greeks, (see MUSIC, and INSTRUMENT, in *Music*,) those of the Romans are generally included. They, indeed, imitated and adopted many customs, religious rites and ceremonies of the Etrurians; and Plutarch (Vita Romuli) mentions it as a prevailing opinion, that the Greek language, which was spoken by the Romans in the time of Romulus, was not corrupted by Italian words. From these accounts it appears that the Romans had not only vocal and instrumental music as well as other arts and sciences from Greece, but even their alphabet, language, religion, and all the learning of which they were possessed during the time of their kings, and the first ages of their republic, these having been originally Greek, though the Romans had them through Etruscan strainers.

The first Roman triumph, according to Dionysius (lib. ii.), was that of Romulus over the Cæninenses; in which, clad in a purple robe, he was drawn in a chariot by four horses. The rest of the army, both horse and foot, followed, ranged in three several divisions, hymning their gods in songs of their country, and celebrating their general with extemporary verses: this account affords a very venerable origin to the improvisatori of Italy; as the event happened in the fourth year of Rome, 749 years before Christ, and the fourth year of the seventh olympiad.

Indeed the Romans were later in cultivating arts and sciences than any other great and powerful people; and none of them seem to have been the natural growth of the soil, except the military art; all others were brought in by conquest.

During the reign of Augustus, except Vitruvius, it does not appear that the Romans had one architect, sculptor, painter, or musician; those who have been celebrated in the arts at Rome, having been Asiatics, or European Greeks, who came to exercise such arts among the Latins, as the Latins had not among themselves; this custom was continued under the successors of Augustus, and those Romans who were prevented by more important concerns from going into Greece, contrived in a manner to bring Greece to Rome, by receiving into their service the most able professors of Greece and Asia, in all the arts. We find too, not only that each of the best Roman writers was an imitator of some great Grecian model, but are certain that the finest remains in painting, sculpture, and architecture, which still subsist in Italy, were either brought thither from Greece, or were the works of Greek artists, who had left their own ruined and oppressed country, to bask in the warm sun-shine of power and affluence at Rome.

Vitruvius, in his Treatise on Architecture, has inserted a chapter on music, in which he has given the harmonical system of Aristoxenus; but he introduces it with a complaint of the unavoidable obscurity of musical literature, on account of the deficiency of terms in the Latin tongue, to explain his ideas. "The science of music, in itself obscure," says he, "is particularly so to such as understand not the Greek language." This writer, therefore, who seems to have been the first that had treated of music in the Roman language, confesses the necessity he was under of using Greek appellatives, not only for the notes, but for other parts of the art; which shews, if not the low state of music at Rome when he wrote, which was in the Augustan age, at least whence their music came; and *borrowing* implies *inferiority*. Indeed, the writings of Cicero shew that philosophy, and all the arts and sciences, were wholly furnished to the Romans from Greece, even in the most enlightened times.

Music was, however, in great favour at Rome during the latter end of the republic, and the voluptuous times of the emperors; the stage then flourished; the temples were crowded; festivals frequent; and banquets splendid; so that we may suppose it to have been very much used both upon public and private occasions, in so rich, populous, and flourishing a city as Rome, the mistress of the world. But this music must have differed as little from that of the Greeks, as the descriptions of it in Horace and Virgil differ from those to be found in Homer, and the Greek lyric poets.

Notwithstanding the Romans had the Greeks, Etrurians, and Sicilians to imitate in the polite arts, they never advanced so far in them as the modern Italians have done; who, without any foreign help, have greatly surpassed not only their forefathers the ancient Romans, but even the Greeks themselves, in several of the arts, and in no one so much as that of music, in which every people of Europe have, at different times, consented to become their scholars.

From the success which attended the arms of the Romans, and that dominion which they acquired over the greatest part of the known world, it is natural to conclude that they must have carried the military art to a higher degree of perfection than any other nation of that period. It is the discipline of an army that makes the multitude act as one man; it moreover increases the courage of troops, because each individual confides in the steady co-operation of his associates. From the constant practice of athletic exercises, the Romans were inured from infancy to hardiness and fatigue, and bred to that species of life which a soldier leads in the most active campaign.

Among the ancient nations there were usually but two different arrangements of the troops in order of battle. The one the Phalanx, or close arrangement in parallelograms, intersected only by great divisions; the other the Quincunx, consisting of small companies or platoons, disposed in three straight lines, with alternate spaces between them equal to the space occupied by each company. The military tactics of the Romans are supposed to have been at their highest pitch of excellence during the Punic wars. Hannibal was a master in the science, and the Romans understood how to profit from the instructions of an enemy. The art of intrenchment was carried to great perfection by the Romans, particularly by Julius Cæsar. Their intrenchments consisted of a ditch from nine to fifteen feet in depth and width, fenced on the inside by the mound of excavated earth, and on the outside by strong stakes with pointed branches.

In besieging a town, several camps were formed around the place, joined to each other by lines of circumvallation and countervallation. A mound of earth was raised, gradually rising in elevation as it approached the city. The front, where workmen were employed, was defended by a curtain of hides. On this mound the engines of attack were advanced, till they played on the very spot which the besiegers wished to assail. The same machines were used by the besieged for annoying the enemy. When the batteries from the terrace had silenced those on the walls, the battering ram was brought up, and if it once reached the walls, it was generally decisive of the fate of the town. The great object, therefore, of the besieged, was to prevent its approach by every power of annoyance.

The naval military art was utterly unknown among the Romans till the first Punic war. A Carthaginian galley was the first model; and in the space of two months they equipped a fleet of 100 gallies of five banks of oars, and 20 with three banks. In the times of the empire, which we are going, very briefly, to describe, the Romans maintained their different conquests, not by their armies, but by their fleets, which were moored in the large rivers and bays, and

and generally preserved a fixed station, as well as the legions.

Rome under the Emperors.—The battle of Actium, as we have already observed, decided the fate of the commonwealth, and Octavius, now having assumed the name of Augustus, was master of the Roman empire. This emperor new-modelled the state, flattered the people, and rendered monarchy supportable to republicans. Augustus possessed the talent of discerning what character was best fitted for gaining the affections of the people he governed, and versatility of temper and genius to assume it. His virtues, though the result of policy, not of nature, were certainly favourable to the happiness, and even the liberties, of his subjects. The fate of Cæsar might, and probably did, warn him of the insecurity of an usurped dominion; and, therefore, while he studiously imitated what was excellent in his predecessor, he affected a much higher degree of moderation and respect for the rights of the people. Long peace, in which the temple of Janus was shut, which had been open nearly two centuries, since the beginning of the second Punic war; an uniform and temperate government, and prevailing luxury, introduced a slow poison into the vitals of the empire. The national character was changed. The outward form remained; but the animating spirit and vigour had vanished. The Romans thought themselves free, because they had no longer to fight for their liberty. The sovereign kept up the delusion, by maintaining the ancient forms of the republican constitution, in the election of magistrates, &c. though they were nothing more than mere forms. He even pretended to consider his own functions as temporary, exerted for the benefits of the people, and depending upon their will. Five times, in the course of his protracted reign, did he submit to a sort of election. The emperor reposed the most unlimited confidence in Mecænas, by whose counsels all public affairs were conducted, and the most salutary laws enacted for the remedy of public grievances, and even the correction of the morals of the people. By his influence and wise instructions, Augustus assumed those virtues to which his heart was a stranger; and which, in their tendency to the happiness of his subjects, were equally effectual as if they had been the genuine fruits of his nature. On the death of Marcellus, the nephew and son-in-law of the emperor, he bestowed his chief favour on Marcus Agrippa, who married Julia, the widow of Marcellus; and on his decease, Julia took Tiberius for her third husband, who became the emperor's son-in-law by a double tie, for Augustus had previously married his mother, Livia. On the death of the emperor, in the 14th year of the Christian era, and in the 44th of his reign, Tiberius succeeded to the throne.

The government established by Augustus, founded, as it unquestionably was, on the power of the sword, not on the consent of the senate and people, degenerated in proportion as the army became corrupted. This prince had resolved to confine the boundaries of the empire to the limits which, he assumed, Nature had pointed out, *viz.* on the west the Atlantic ocean; the Rhine and Danube on the north; the Euphrates on the east; and towards the south, the sandy deserts of Arabia and Africa. His immediate successors adopted this resolution. Britain and Dacia were the sole accessions to the empire during the first century of the Christian era. A military spirit was, in some degree, preserved and cherished, when almost every virtue was extinguished; but the discipline of the legions was greatly corrupted by the ambition, or relaxed by the weakness, of the emperors, who confided in the army, and particularly in the strength and fidelity of the Prætorian guards, which had been formed by Augustus, and were kept up for the protection of the emperor's person. The soldiers were, however, soon roused to a sense of their own power, and of the impotency of the civil authority.

Tiberius, the second emperor, was an unfeeling tyrant, and he took for his counsellor Sejanus, prefect of the Prætorian guards, a man still more cruel and tyrannical than himself. Sejanus conceived the project of placing himself on the throne: for the furtherance of his plans, he caused Drusus, the son of the emperor, to be poisoned, and removed from the sight of the people the sons of Germanicus, who were the natural heirs to the crown. He even persuaded Tiberius himself, under the pretence of a discovery of plots for his assassination, to retire from Rome to the isle of Capreæ, and devolve the government upon himself. He had but one step more to the attainment of the object of his ambition: he was on the point of assassinating his master when he was detected, and instantly executed. Tiberius now became negligent of the cares of government, and the imperial power was displayed only in scenes of cruelty and rapine. At length he fell sick, and was strangled in his bed by Macro, the præfect of the Prætorian guards, in the 78th year of his age, and the 23d of his reign.

Caligula, the son of Germanicus, who was Tiberius's nephew, was the third emperor of Rome. The commencement of his reign was signalized by a few acts of clemency and good policy. But tyrannical and cruel by nature, he substituted military execution for legal punishment. The provinces were loaded with the most oppressive taxes, and daily confiscations filled the imperial coffers. He was assassinated in the 4th year of his reign, and was succeeded by his uncle

Claudius, the son of Octavia, the sister of Augustus, whose short reign, though he was a man of weak intellects, and of little education, was marked by an enterprise of importance. He undertook the reduction of Britain, and after visiting the island in person, left his generals, Plautius and Vespasian, to prosecute a war, which was carried on for several years with various success. The inhabitants of Wales, then denominated the Silures, under their king Caractacus, made a noble resistance, but were finally defeated, and Caractacus was led captive to Rome. The civil administration of Claudius was weak and contemptible; he was the slave even of his domestics, and the dupe of his abandoned wives Messalina and Agrippina. Claudius was put to death in the 15th year of his reign.

Nero, the scourge of mankind, succeeded his father Claudius, and for the first five years he reigned with great applause, whence Trajan, said "cunctos principes longè abesse a Neronis quinquennio;" but when his character began to unfold itself, he was found to be a compound of every thing that was base and inhuman. (See his article.) He perished in the 30th year of his age, and the 14th of his reign.

The two succeeding emperors, Galba and Otho, did not reign a year between them; the former was murdered by the soldiers, and the latter died by his own hand.

The reign of Vitellius, the next emperor, was of eight months' duration. He is said to have proposed Nero for his model, and it was just that he should resemble him in his fate. Vespasian, who had obtained from Nero the charge of the war against the Jews, which he had conducted with ability and success, was proclaimed emperor by his troops in the East, and a great part of Italy submitting to his generals, Vitellius capitulated to save his life; but as soon as Rome was taken, the deposed emperor was seized, massacred, and his body thrown into the Tiber.

Vespasian reigned with great popularity for ten years. He the *Mufic of the Ancients*, and *Mufical Inftruments* of the Greeks, (fee Music, and Instrument, in *Mufic*,) thofe of the Romans are generally included. They, indeed, imitated and adopted many cuftoms, religious rites and ceremonies of the Etrurians; and Plutarch (Vita Romuli) mentions it as a prevailing opinion, that the Greek language, which was fpoken by the Romans in the time of Romulus, was not corrupted by Italian words. From thefe accounts it appears that the Romans had not only vocal and inftrumental mufic as well as other arts and fciences from Greece, but even their alphabet, language, religion, and all the learning of which they were poffeffed during the time of their kings, and the firft ages of their republic, thefe having been originally Greek, though the Romans had them through Etrufcan ftrainers.

The firft Roman triumph, according to Dionyfius (lib. ii.), was that of Romulus over the Cæninenfes; in which, clad in a purple robe, he was drawn in a chariot by four horfes. The reft of the army, both horfe and foot, followed, ranged in three feveral divifions, hymning their gods in fongs of their country, and celebrating their general with extemporary verfes: this account affords a very venerable origin to the improvifatori of Italy; as the event happened in the fourth year of Rome, 749 years before Chrift, and the fourth year of the feventh olympiad.

Indeed the Romans were later in cultivating arts and fciences than any other great and powerful people; and none of them feem to have been the natural growth of the foil, except the military art; all others were brought in by conqueft.

During the reign of Auguftus, except Vitruvius, it does not appear that the Romans had one architect, fculptor, painter, or mufician; thofe who have been celebrated in the arts at Rome, having been Afiatics, or European Greeks, who came to exercife fuch arts among the Latins, as the Latins had not among themfelves; this cuftom was continued under the fucceffors of Auguftus, and thofe Romans who were prevented by more important concerns from going into Greece, contrived in a manner to bring Greece to Rome, by receiving into their fervice the moft able profeffors of Greece and Afia, in all the arts. We find too, not only that each of the beft Roman writers was an imitator of fome great Grecian model, but are certain that the fineft remains in painting, fculpture, and architecture, which ftill fubfift in Italy, were either brought thither from Greece, or were the works of Greek artifts, who had left their own ruined and oppreffed country, to bafk in the warm fun-fhine of power and affluence at Rome.

Vitruvius, in his Treatife on Architecture, has inferted a chapter on mufic, in which he has given the harmonical fyftem of Ariftoxenus; but he introduces it with a complaint of the unavoidable obfcurity of mufical literature, on account of the deficiency of terms in the Latin tongue, to explain his ideas. "The fcience of mufic, in itfelf obfcure," fays he, "is particularly fo to fuch as underftand not the Greek language." This writer, therefore, who feems to have been the firft that had treated of mufic in the Roman language, confeffes the neceffity he was under of ufing Greek appellatives, not only for the notes, but for other parts of the art; which fhews, if not the low ftate of mufic at Rome when he wrote, which was in the Auguftan age, at leaft whence their mufic came; and *borrowing* implies *inferiority*. Indeed, the writings of Cicero fhew that philofophy, and all the arts and fciences, were wholly furnifhed to the Romans from Greece, even in the moft enlightened times.

Mufic was, however, in great favour at Rome during the latter end of the republic, and the voluptuous times of the emperors; the ftage then flourifhed; the temples were crowded; feftivals frequent; and banquets fplendid; fo that we may fuppofe it to have been very much ufed both upon public and private occafions, in fo rich, populous, and flourifhing a city as Rome, the miftrefs of the world. But this mufic muft have differed as little from that of the Greeks, as the defcriptions of it in Horace and Virgil differ from thofe to be found in Homer, and the Greek lyric poets.

Notwithftanding the Romans had the Greeks, Etrurians, and Sicilians to imitate in the polite arts, they never advanced fo far in them as the modern Italians have done; who, without any foreign help, have greatly furpaffed not only their forefathers the ancient Romans, but even the Greeks themfelves, in feveral of the arts, and in no one fo much as that of mufic, in which every people of Europe have, at different times, confented to become their fcholars.

From the fuccefs which attended the arms of the Romans, and that dominion which they acquired over the greateft part of the known world, it is natural to conclude that they muft have carried the military art to a higher degree of perfection than any other nation of that period. It is the difcipline of an army that makes the multitude act as one man; it moreover increafes the courage of troops, becaufe each individual confides in the fteady co-operation of his affociates. From the conftant practice of athletic exercifes, the Romans were inured from infancy to hardinefs and fatigue, and bred to that fpecies of life which a foldier leads in the moft active campaign.

Among the ancient nations there were ufually but two different arrangements of the troops in order of battle. The one the Phalanx, or clofe arrangement in parallelograms, interfected only by great divifions; the other the Quincunx, confifting of fmall companies or platoons, difpofed in three ftraight lines, with alternate fpaces between them equal to the fpace occupied by each company. The military tactics of the Romans are fuppofed to have been at their higheft pitch of excellence during the Punic wars. Hannibal was a mafter in the fcience, and the Romans underftood how to profit from the inftructions of an enemy. The art of intrenchment was carried to great perfection by the Romans, particularly by Julius Cæfar. Their intrenchments confifted of a ditch from nine to fifteen feet in depth and width, fenced on the infide by the mound of excavated earth, and on the outfide by ftrong ftakes with pointed branches.

In befieging a town, feveral camps were formed around the place, joined to each other by lines of circumvallation and countervallation. A mound of earth was raifed, gradually rifing in elevation as it approached the city. The front, where workmen were employed, was defended by a curtain of hides. On this mound the engines of attack were advanced, till they played on the very fpot which the befiegers wifhed to affail. The fame machines were ufed by the befieged for annoying the enemy. When the batteries from the terrace had filenced thofe on the walls, the battering ram was brought up, and if it once reached the walls, it was generally decifive of the fate of the town. The great object, therefore, of the befieged, was to prevent its approach by every power of annoyance.

The naval military art was utterly unknown among the Romans till the firft Punic war. A Carthaginian galley was the firft model; and in the fpace of two months they equipped a fleet of 100 gallies of five banks of oars, and 20 with three banks. In the times of the empire, which we are going, very briefly, to defcribe, the Romans maintained their different conquefts, not by their armies, but by their fleets, which were moored in the large rivers and bays, and

and generally preferved a fixed ftation, as well as the legions.

Rome under the Emperors.—The battle of Actium, as we have already obferved, decided the fate of the commonwealth, and Octavius, now having affumed the name of Auguftus, was mafter of the Roman empire. This emperor new-modelled the ftate, flattered the people, and rendered monarchy fupportable to republicans. Auguftus poffeffed the talent of difcerning what character was beft fitted for gaining the affections of the people he governed, and verfatility of temper and genius to affume it. His virtues, though the refult of policy, not of nature, were certainly favourable to the happinefs, and even the liberties, of his fubjects. The fate of Cæfar might, and probably did, warn him of the infecurity of an ufurped dominion; and, therefore, while he ftudioufly imitated what was excellent in his predeceffor, he affected a much higher degree of moderation and refpect for the rights of the people. Long peace, in which the temple of Janus was fhut, which had been open nearly two centuries, fince the beginning of the fecond Punic war; an uniform and temperate government, and prevailing luxury, introduced a flow poifon into the vitals of the empire. The national character was changed. The outward form remained; but the animating fpirit and vigour had vanifhed. The Romans thought themfelves free, becaufe they had no longer to fight for their liberty. The fovereign kept up the delufion, by maintaining the ancient forms of the republican conftitution, in the election of magiftrates, &c. though they were nothing more than mere forms. He even pretended to confider his own functions as temporary, exerted for the benefits of the people, and depending upon their will. Five times, in the courfe of his protracted reign, did he fubmit to a fort of election. The emperor repofed the moft unlimited confidence in Mecænas, by whofe counfels all public affairs were conducted, and the moft falutary laws enacted for the remedy of public grievances, and even the correction of the morals of the people. By his influence and wife inftructions, Auguftus affumed thofe virtues to which his heart was a ftranger; and which, in their tendency to the happinefs of his fubjects, were equally effectual as if they had been the genuine fruits of his nature. On the death of Marcellus, the nephew and fon-in-law of the emperor, he beftowed his chief favour on Marcus Agrippa, who married Julia, the widow of Marcellus; and on his deceafe, Julia took Tiberius for her third hufband, who became the emperor's fon-in-law by a double tie, for Auguftus had previoufly married his mother, Livia. On the death of the emperor, in the 14th year of the Chriftian era, and in the 44th of his reign, Tiberius fucceeded to the throne.

The government eftablifhed by Auguftus, founded, as it unqueftionably was, on the power of the fword, not on the confent of the fenate and people, degenerated in proportion as the army became corrupted. This prince had refolved to confine the boundaries of the empire to the limits which, he affumed, Nature had pointed out, *viz.* on the weft the Atlantic ocean; the Rhine and Danube on the north; the Euphrates on the eaft; and towards the fouth, the fandy deferts of Arabia and Africa. His immediate fucceffors adopted this refolution. Britain and Dacia were the fole acceffions to the empire during the firft century of the Chriftian era. A military fpirit was, in fome degree, preferved and cherifhed, when almoft every virtue was extinguifhed; but the difcipline of the legions was greatly corrupted by the ambition, or relaxed by the weaknefs, of the emperors, who confided in the army, and particularly in the ftrength and fidelity of the Prætorian guards, which had been formed by Auguftus, and were kept up for the protection of the emperor's perfon. The foldiers were, however, foon roufed to a fenfe of their own power, and of the impotency of the civil authority.

Tiberius, the fecond emperor, was an unfeeling tyrant, and he took for his counfellor Sejanus, prefect of the Prætorian guards, a man ftill more cruel and tyrannical than himfelf. Sejanus conceived the project of placing himfelf on the throne: for the furtherance of his plans, he caufed Drufus, the fon of the emperor, to be poifoned, and removed from the fight of the people the fons of Germanicus, who were the natural heirs to the crown. He even perfuaded Tiberius himfelf, under the pretence of a difcovery of plots for his affaffination, to retire from Rome to the ifle of Capreæ, and devolve the government upon himfelf. He had but one ftep more to the attainment of the object of his ambition: he was on the point of affaffinating his mafter when he was detected, and inftantly executed. Tiberius now became negligent of the cares of government, and the imperial power was difplayed only in fcenes of cruelty and rapine. At length he fell fick, and was ftrangled in his bed by Macro, the præfect of the Prætorian guards, in the 78th year of his age, and the 23d of his reign.

Caligula, the fon of Germanicus, who was Tiberius's nephew, was the third emperor of Rome. The commencement of his reign was fignalized by a few acts of clemency and good policy. But tyrannical and cruel by nature, he fubftituted military execution for legal punifhment. The provinces were loaded with the moft oppreffive taxes, and daily confifcations filled the imperial coffers. He was affaffinated in the 4th year of his reign, and was fucceeded by his uncle

Claudius, the fon of Octavia, the fifter of Auguftus, whofe fhort reign, though he was a man of weak intellects, and of little education, was marked by an enterprife of importance. He undertook the reduction of Britain, and after vifiting the ifland in perfon, left his generals, Plautius and Vefpafian, to profecute a war, which was carried on for feveral years with various fuccefs. The inhabitants of Wales, then denominated the Silures, under their king Caractacus, made a noble refiftance, but were finally defeated, and Caractacus was led captive to Rome. The civil adminiftration of Claudius was weak and contemptible; he was the flave even of his domeftics, and the dupe of his abandoned wives Meffalina and Agrippina. Claudius was put to death in the 15th year of his reign.

Nero, the fcourge of mankind, fucceeded his father Claudius, and for the firft five years he reigned with great applaufe, whence Trajan, faid "cunctos principes longè abeffe a Neronis quinquennio;" but when his character began to unfold itfelf, he was found to be a compound of every thing that was bafe and inhuman. (See his article.) He perifhed in the 30th year of his age, and the 14th of his reign.

The two fucceeding emperors, Galba and Otho, did not reign a year between them; the former was murdered by the foldiers, and the latter died by his own hand.

The reign of Vitellius, the next emperor, was of eight months' duration. He is faid to have propofed Nero for his model, and it was juft that he fhould refemble him in his fate. Vefpafian, who had obtained from Nero the charge of the war againft the Jews, which he had conducted with ability and fuccefs, was proclaimed emperor by his troops in the Eaft, and a great part of Italy fubmitting to his generals, Vitellius capitulated to fave his life; but as foon as Rome was taken, the depofed emperor was feized, maffacred, and his body thrown into the Tiber.

Vefpafian reigned with great popularity for ten years.

He

He respected the ancient forms of the constitution, restored the senate to its deliberative rights, and acted by its authority in the administration of all public affairs. Under his reign, and by the arms of his son Titus, was terminated the war against the Jews. They had been brought under the yoke of Rome by Pompey, who took Jerusalem. Under Augustus, they were governed for some time by Herod as viceroy; but the tyranny of his son Archelaus was the cause of his banishment, and also of the reduction of Judæa into the ordinary condition of a Roman province. In the reign of Vespasian, Jerusalem was besieged, and after a blockade of six months, taken by storm, the temple burnt to ashes, and the city buried in ruins. Vespasian associated Titus in the imperial dignity, and soon after died, at the age of 69, in the year 79 of the Christian era.

In elective monarchies, the vacancy of the throne is a moment big with danger and mischief. The Roman emperors, desirous to spare the legions that interval of suspence, and the temptation of an irregular choice, invested their designed successor with so large a share of present power, as should enable him, after their decease, to assume the remainder, without suffering, as it were, the empire to perceive the change of masters. Thus Augustus, after all his fair prospects had been snatched from him by untimely deaths, rested his last hopes on Tiberius, and obtained a law, by which the future prince was invested with an authority equal to his own over the provinces and the armies. Thus, also, Vespasian subdued the generous mind of his eldest son. Titus was adored by the eastern legions; his power was dreaded; but as his virtues were clouded by the intemperance of youth, his designs were liable to be suspected. Instead of listening to such unworthy suspicions, the prudent monarch associated, as we have seen, Titus to the full powers of the imperial dignity: and the grateful son ever approved himself the humble and faithful minister of so indulgent a father.

Vespasian had embraced every measure that might confirm his recent and precarious elevation. The military oath, and the fidelity of troops, had been consecrated by the habits of an hundred years to the name and family of the Cæsars; and although that family had been continued only by the fictitious rite of adoption, the Romans still revered, in the person of Nero, the grandson of Germanicus, and the lineal successor of Augustus. It was not without reluctance and remorse that the Prætorian guards were persuaded to abandon the cause of the tyrant. The rapid downfall of Galba, Otho, and Vitellius, taught the armies to consider the emperors as the creatures of their will, and the instruments of their licence. The birth of Vespasian was very mean: his own merit had raised him, in an advanced age, to the empire. "Such a prince," then, says Gibbon, "consulted his true interest by the association of a son, whose more splendid and amiable character might turn the public attention from the obscure origin, to the future glories, of the Flavian house. Under the mild administration of Titus, the Roman world enjoyed a transient felicity. His character was humane, munificent, dignified, and splendid. In his reign happened that dreadful eruption of Vesuvius, which overwhelmed the cities of Herculaneum and Pompeii; and the public losses from these calamities he repaired by the sacrifice of his fortune and revenues. He died in the third year of his reign, and obtained the most exalted epithet, 'Deliciæ humani generis.'"

Domitian, the brother of Titus, and suspected of murdering him by poison, succeeded to the empire A.D. 81. He was a most cruel tyrant. A rebellion in Germany gave him an opportunity to signalize the barbarity of his disposition; and its consequences were long felt in the sanguinary punishments inflicted under the pretence of justice. In this reign, the successes of Agricola in Britain threw a lustre on the Roman arms; nevertheless Domitian treated this brave commander with the basest ingratitude. The emperor was assassinated in the sixteenth year of his reign.

It may not be amiss, before we proceed, to notice, in a geographical sense, the different divisions of the empire under Augustus, and which continued during the reigns of the twelve Cæsars, to that of Adrian. When Augustus made himself master of the Roman empire, its possessions extended almost to all the then known world. He did not, as we have seen, make any attempts to extend the limits of the empire, but took every means, that his great talents could suggest, to preserve his own authority, without rendering the senate and people his enemies. He appeared to surrender to them their ancient authority and rights, and only to attend to those parts of the government which were most laborious and difficult. He even seemed to divide the provinces of the empire between himself and the nation, which provinces he arranged into twenty-six dioceses or departments. Of these he granted twelve to the senate and people, reserving to himself the other fourteen. He had taken care, in this division of the empire, that not only the most considerable provinces should fall to his own share, but that they should be so situated, as to give him a decided pre-eminence over the others. With respect to the departments under the controul of the senate and people, two were governed by proconsuls, and ten by pretors.

I. The two departments governed by proconsuls comprehended Africa, including Africa proper, Numidia, and part of Libya.

II. The ten departments under the government of prætors comprehended that part of Spain denominated Bœtica; Gallia Narbonensis; Sicily; Sardinia, and Corsica; Illyria, and part of Epirus; Macedonia, and part of Greece; Achaia; Bœotia, Acarnania, and part of Epirus; the island of Crete; Cyrenaica, an ancient kingdom of Africa, including the present kingdom and desart of Barca and Tripoli; the island of Cyprus; Bithynia; Paphlagonia; the countries about the Propontis and Pontus.

III. The fourteen dioceses or departments under the immediate authority of the emperor were as follow: Hispania; Lusitania; Celtiberia; Aquitania; the most important parts of Gallia and Belgica; Nerica, Vindelicia, and Rhætia; Mœsia, comprehending Dardania, Dacia, and Thrace; Dalmatia, and part of Illyria; the Maritime Alps; Cilicia, Isauria, and Lycaonia; Galatia, Pamphylia, and Pisidia; Syria, Little Armenia, Mesopotamia, and all the eastern parts of the empire; Egypt, and part of Arabia; Italy, from the island of Sicily to the Alps.

Nerva, who succeeded Domitian, had scarcely accepted the sovereign power from the murderers of that emperor, before he discovered that he was too aged and infirm to stem the torrent of public disorders, which had multiplied to an alarming degree under the long tyranny of his predecessor. His mild disposition was highly respected by the virtuous, but was treated with great contempt by the guilty. Though he had relations of his own, yet he adopted for his successor a stranger, Trajan, who had commanded with wisdom and success a powerful army in Lower Germany, and immediately, by a decree of the senate, declared him his colleague and successor in the empire. Nerva died in sixteen months after his elevation to the throne.

Trajan possessed every talent and every virtue that can adorn a sovereign. As a warrior, he raised the Roman arms to their ancient splendour, and greatly enlarged the boundaries of the empire. He subdued the Dacians, conquered the Parthians, and brought under subjection Assyria, Mesopotamia, and Arabia Felix. Nor was he less eminent in promoting the happiness of his subjects, and the internal prosperity of the empire. He was illustrious in every connection, and in every station of life, and obtained the epithet *Optimus*. He died after a glorious reign of nineteen years. Of this emperor Gibbon remarks, "It is sincerely to be lamented, that while we are fatigued with the disgustful relation of Nero's crimes and follies, we are reduced to collect the actions of Trajan from the glimmering of an abridgment, or the doubtful light of a panegyric. Above two hundred and fifty years after the death of Trajan, the senate, in pouring out the customary acclamations on the accession of a new emperor, wished that he might surpass the felicity of Augustus and the virtue of Trajan."

Adrian, the nephew of Trajan, was nominated to the throne, in the last moments of his predecessor, and his title was peaceably acknowledged. Under his reign the empire flourished: he encouraged the arts, reformed the laws, asserted strict military discipline, and visited all his provinces in person. He adopted a policy very different from that of his predecessor, and judging the limits of the empire too extensive, abandoned all the conquests of Trajan, bounding the eastern provinces by the Euphrates. To his talents as an able politician, he joined an excellent taste in the liberal arts. In the last year of his life he adopted, and declared for his immediate successor, Titus Aurelius Antoninus, and substituting Annius Verus, the son of Ælius Verus, in case of the other's death. Adrian died A.D. 138, at the age of 62.

The emperor Adrian suppressed the departments established by Augustus, and divided the whole empire into eleven parts, as follow.

I. Italy, including two provinces, of which the first comprehends all the country from Picenum to Sicily; and the second from Picenum to the Alps, with the two Rhætias.

II. Africa, comprehending the proconsular part of that country; Numidia, and Mauritania.

III. Hispania, including Hispania Tarraconensis; Bœtica, and Lusitania.

IV. Gallia, comprehending Gallia Belgica; Gallia Lugdunensis; Gallia Aquitanica, and Gallia Narbonensis.

V. Britanny, comprehending the upper and lower countries of that name.

VI. Illyria, containing seventeen provinces, *viz.* the two Noricas; the Upper and Lower Pannonia, and their appendages; Dalmatia; Mœsia Prima; the Superior and Inferior Dacia; Macedonia; Thessaly; Achaia; the two Epiri, and the island of Crete.

VII. Egypt, including Egypt Proper; Thebais; Libya, and Pentapolis.

VIII. The eastern part of the empire comprehended Palestine; Phœnicia; Cœlo-Syria; Syria; the two Cicilias; Isauria; Mesopotamia; Arabia, and the island of Cyprus,

IX. Thrace comprehended Thrace Proper; the Lower Mœsia; Scythia, and the adjoining countries.

X. Pontus included Pontus Proper; Galatia; Bithynia; the two Cappadocias; Paphlagonia, and Armenia.

XI. The Asiatic division comprehended the proconsular part of Asia; Pamphylia; the countries about the Hellespont; Lydia; Pisidia; Lycaonia; the two Phrygias; Lycia; Caria; and several islands, of which Rhodes was the chief.

The Age of the Antonines.—This has by historians been regarded as an era in the Roman empire. Adrian, says the historian, was resolved to deserve the thanks of posterity, by placing the most exalted merit on the Roman throne. His discerning eye easily discovered a senator about 50 years of age, blameless in all the offices of life; and a youth of about 17, whose riper years opened the fair prospect of every virtue. The elder of these, as we have seen, was declared the son and successor of Adrian, on condition that he himself should immediately adopt the younger. The two Antonines, for so they have been denominated, governed the Roman world 42 years, with the invariable spirit of wisdom and virtue. The former has, on account of his many excellent qualities, been surnamed Pius; the latter, Annius Verus, on his accession, assumed the name of Marcus Aurelius Antoninus. Titus Antoninus Pius has been denominated a second Numa. The same love of justice and peace was the distinguishing characteristic of both princes: but the situation of the latter opened a much wider field for the exercise of those virtues. The wisdom of the former could benefit but a few villages; but Antoninus diffused order and tranquillity over the greatest part of the earth. "His reign," says Gibbon, "is marked by the rare advantage of furnishing very few materials for history; which is, indeed, little more than the register of the crimes, follies, and misfortunes of mankind." In private life, he was an amiable as well as a good man; and he enjoyed with moderation the advantages of his good fortune. He died after a reign of 22 years.

The virtue of Marcus Aurelius Antoninns was of a severer and more laborious kind. At the age of twelve he embraced, from a conviction of its utility, the rigid system of the Stoics, which taught him to subject his body to his mind, his passions to his reason; to consider virtue as the only good, and vice as the only evil. His "Meditations," composed in the midst of a camp, are not only extant, but still read with delight and advantage; and he even gave lessons of philosophy to the Roman people, as he had before done in several cities of Greece and Asia. War he detested, as the disgrace and calamity of human nature; but when the necessity of a just defence called upon him to take up arms, he readily exposed his person to eight winter campaigns on the frozen banks of the Danube, the severity of which was at last fatal to the weakness of his constitution. Having appeared like a benevolent deity, diffusing around him peace and happiness, he died in Pannonia, in the 19th year of his reign, A.D. 180. His memory was revered by a grateful posterity; and above a century after his death, many persons preserved the image of Marcus Antoninus among those of their household gods.

"If a man," says the historian of these times, "were called on to fix the period in the history of the world, during which the condition of the human race was most happy and prosperous, he would, without hesitation, name that which elapsed from the death of Domitian to the accession of Commodus. The vast extent of the Roman empire was governed by absolute power, under the guidance of virtue and wisdom. The armies were restrained by the firm and gentle hand of five successive emperors, whose characters and authority commanded an involuntary respect. The forms of the civil administration were carefully preserved by Nerva, Trajan, Adrian, and the Antonines, who delighted in the image of liberty, and were pleased with considering themselves as accountable ministers of the laws. Such princes deserved the honour of restoring the republic, had the Romans of their days been capable of enjoying a rational freedom. The labours of these monarchs were overpaid by the immense reward that inseparably waited on their success; by the honest pride of virtue, and by the exquisite delight

delight of beholding the general happinefs, of which they were the authors."

Commodus fucceeded to the empire on the death of his father. The meafures of this reign were as unimportant as the character of the fovereign was contemptible. Commodus had an averfion from every rational and liberal purfuit, and was in many refpects very like Nero. To his other crimes, which he had in common with preceding tyrants, may be added, that he entered the lifts as a public gladiator, and actually received a ftipend for the flaughter of his helplefs antagonifts. The concubine and fome of the chief officers of this emperor prevented their own deftruction, by affaffinating him in the thirteenth year of his reign, A.D. 193.

Publius Helvius Pertinax was the next emperor, a man of mean birth, but who had rifen to efteem by his virtues and military talents. He difappointed the army of a promifed reward for his elevation, and, after a reign of 86 days, was murdered in the imperial palace by the fame hands which had raifed him to the throne. The empire was now put up to auction by the Prætorians, and was purchafed by Didius Julianus; but not paying the ftipulated price for his elevation, he was depofed and put to death.

Septimius Severus fucceeded, whofe intention was to erect the fabric of abfolute monarchy, and all his inftitutions operated to that end. He poffeffed eminent military talents, and it was his boaft, that, having received the empire oppreffed with foreign and domeftic wars, he left it in profound, univerfal, and honourable peace. He carried with him into Britain his two fons, Caracalla and Geta; and died at York, in the 66th year of his age, after a reign of eighteen years, A.D. 211. He was fucceeded by the two fons juft named, whofe former mutual hatred of each other was increafed by their affociation in the empire; and Caracalla, with brutal inhumanity, caufed his brother to be openly murdered in the arms of his mother. His reign, which was of fix years' duration, and full of atrocities, was at length terminated by affaffination, A.D. 217.

As it would not be confiftent with the limits affigned to this article, neither is it at all neceffary, to advance ftep by ftep through the fucceeding reigns; it will be fufficient to tranfcribe, with very trifling additions, the names of feveral of the emperors who followed Caracalla.

The diforders in the Roman empire, which began with Commodus, continued nearly a century, till the acceffion of Diocletian: and this interval was filled by the reigns of Macrinus and Heliogabalus, who were both flain by the foldiers. Alexander Severus was a juft prince and a lover of learning; he was fuccefsful in his war againft Artaxerxes, the new king of Perfia, and after that, was flain by fome of his foldiers in an expedition into Germany.

Maximin, Maximus and Balbinus, Gordian, and Philip the Arabian, with his fon, in whofe reign were inftituted the fecular games, were all raifed to the throne by the prætorian bands, and by them killed. Decius, a fevere perfecutor of the Chriftians, was drowned while fighting againft the barbarians. After this Gallus was flain by the army, at the end of a reign of two years. The life of Valerianus was devoted to the reformation of the manners of his people; but in a war with Sapor, king of Perfia, he was captured and flead alive. Gallienus, the fon of Valerianus, was loft in luxury and debauchery, and fuffered the empire to be torn from him on all fides by barbarians and tyrants. Hence the 30 tyrants, as they are called, though hiftory records the names of 19 only, rofe up againft him. Among thefe was Zenobia, wife to Odenatus, prince of Palmyra, a woman of martial fpirit, who fpread her conquering arms far over the Eaftern world.

After Gallienus were Claudius II., who died of the plague: Aurelian, who carried Zenobia a captive in triumph, and who was murdered by his foldiers: Claudius Tacitus, Probus, and Carus followed in fucceffion. Probus was killed by the foldiers, and Carus was ftruck dead with lightning.

Diocletian began his reign A.D. 284, and introduced a new fyftem of adminiftration, dividing the empire into four governments, under as many princes. Maximian fhared with him the title of Auguftus, and Galerius and Conftantius were declared Cæfars, or their fucceffors. Each had his feparate department or province, all nominally fupreme, but in reality under the direction of the fuperior talents and authority of Diocletian. The two emperors, trufting to a continuance of that order in the empire which their vigour had eftablifhed, retired from fovereignty, and left the government in the hands of the Cæfars; but Conftantius died foon after in Britain, and he was fucceeded by his fon Conftantine, who was proclaimed emperor at York, though Galerius, at firft, refufed to acknowledge his title. Maximian, however, having once more refumed the purple, beftowed on Conftantine his daughter in marriage, and thus he invefted him with a double title to the empire. On the death of Maximian and Galerius, Conftantine had no other competitor than Maxentius, the fon of Maximian, and the conteft between them was decided by the fword. Maxentius fell in battle, and Conftantine remained fole mafter of the empire: this was the time in which the crofs is faid to have appeared in the heavens, in vifion, to the emperor, with this infcription, "in hoc figno vinces."

Conftantine made a confiderable change in the diftribution of the provinces which had not fuffered much alteration fince the arrangement of Adrian. He fubjected the whole empire to the dominion of four prefects of the palace; of whom one was placed over Gallia, one over Italia, one over Illyria, and the other over the Eaftern provinces. Thefe prefects had under them *proconfuls* in fome of the provinces; in others, *magiftrates*, called *confuls*, *prefidents*, and *correctors*; and a certain number of provinces over which thefe were placed being united, formed a vicariat. The *prefect of the palace*, under Auguftus, was a military officer, in the order of knights. Tiberius increafed the importance of the office; but Antoninus was the firft who made ufe of that officer to promulgate, in his name, the laws of the empire. Hence the prefect of the palace became chief judge, who had authority over all other tribunals. In him were united the feveral offices of conftable, chancellor, and fuperintendant of the finances. Conftantine fuppreffed this office, as held by an individual, and created four prefects of the palace, who had under them *vicars*, whofe power extended over a certain number of countries, forming a diocefe or department. Thefe officers had the moft confiderable influence in their departments, and when they quitted the capital, they left their children with the emperor, as pledges of their fidelity.

Under Auguftus, and after him, the proconfuls were magiftrates fent by the fenate to correct the exifting abufes of the departments: but they had neither the command of troops, nor the adminiftration of the provinces.

The *conful*, called alfo rector of the province, had only the name and the enfigns of that office, not the power. Auguftus governed the departments of the empire, which he had referved to himfelf, by means of his prætors and confuls.

The *correctors* were officers who were charged to reform the abufes which had crept into the provinces.

The

The *presidents* were cloathed with a much greater power than that possessed by the proconsuls. They were military officers, and had the power of life and death over the army. It was to one of these officers that the provinces of the empire were subjected in each of the great prefectures: thus,

The prefecture of the Gauls, comprehending twenty-nine provinces, was divided into three vicariats, *viz.* Hispania, Gallia, and Britanny.

I. The vicariat of Hispania included seven provinces, of which three were under consuls, and four under presidents.

II. The vicariat of the Gauls included seventeen provinces; six under consuls, and eleven under presidents.

III. The vicariat of Britanny comprised five provinces; two under consuls, and three under presidents.

The prefecture of Italy included likewise twenty-nine provinces, divided into the proconsulship of Africa, and the vicariats of Rome, Italy, Africa, and Illyria. The vicariat of ROME was under consuls, correctors, and presidents; that of ITALY was under consuls and presidents; that of AFRICA was under consuls and presidents; and that of ILLYRIA under one consul, one corrector, and four presidents.

The prefecture of Illyria included eleven provinces; one under the proconsul of Achaia; the vicariat of Macedonia comprehended five provinces, two under consuls, and three under presidents; the vicariat of Dacia was under one consul, and four presidents.

The prefecture of the East included forty-eight provinces; *viz.* three under the proconsul of Asia; fifteen under the count of the East, a companion to the emperor; six under the prefect of Egypt; seven under the vicariat of Asia; eleven under the vicariat of Pontus; and six under the vicariat of Thrace.

We are now arrived to that state of the Roman empire in which it was governed by Christian emperors, and which may be divided into three distinct periods. The *first* will contain the whole time that the Roman world was governed by one emperor only. The *second* commences with the division of the empire, after the death of Theodosius the Great, and goes down to the extinction of the Western empire under Augustulus. The *third* reaches from the fall of the Western empire to the capture of Constantinople, and the destruction of the whole empire.

Of the Christian Roman Emperors before the Division of the Empire.—The administration of Constantine was, in the early part of his reign, mild, equitable, and politic. Though strongly attached to the Christian faith, he made no great innovations on the religion of the state. He introduced order and economy into the civil government, and repressed every species of oppression and corruption. But his natural temper was severe and cruel, and the latter part of his reign was deformed by rancour and a most sanguinary rigour. From this unfavourable change of character he lost the affections of his subjects; and from a feeling, probably of reciprocal disgust, he removed the seat of the Roman empire to Byzantium, where a new city was raised; from his name it was called CONSTANTINOPLE; see the article. The court followed the sovereign: the opulent proprietors were attended by their slaves and retainers. Rome was in a few years depopulated, and the new capital swelled almost at once to an enormous magnitude. In an expedition against the Persians, Constantine died at Nicomedia, in the 30th year of his reign, A.D. 337. During this reign the Goths had made several irruptions on the empire, and though repulsed and weakened, they began gradually to encroach on the provinces.

Before we proceed with the monarchs, we may just notice some particulars relating to the state of the Roman empire at this period; for which we shall be chiefly indebted to Mr. Tytler's Elements, already quoted and referred to.

Instead of the ancient republican distinctions, which were founded chiefly on personal merit, a rigid subordination of rank and office now went through all the orders of the state. The magistrates were divided into three classes, distinguished by the unmeaning titles of, 1, the Illustrious; 2, the Respectable; and 3, the Clarissimi. The epithet of *Illustrious* was conferred on, 1, the consuls and patricians; 2, the prætorian prefects of Rome and Constantinople; 3, the masters-general of the cavalry and infantry; and 4, the seven ministers of the palace.

The consuls were created by the sole authority of the emperor; their dignity was inefficient, and their names served only to give the legal date of the year. The dignity of patrician was not hereditary, but was bestowed as a title of honour by the emperor on his favourites. The prætorian prefects were the civil governors of the four departments of the empire. These were the East, Illyria, Italy, and the Gauls: to them was committed the supreme administration of justice, and of the finances.

The *Respectables* were the proconsuls of Asia, Achaia, and Africa; and the military *comites* and *duces*, generals of the imperial armies. The *Clarissimi* included the inferior governors and magistrates of the provinces, responsible to the prefects and their deputies.

The intercourse between the court and the provinces was maintained by the construction of roads, and the institution of regular posts or couriers; under which denomination were ranked the numberless spies of government, whose duty was to convey all kinds of intelligence to the seat of empire. Taxes were levied by the sole authority of the emperor, and subsidies were exacted from all the cities, under the name of free gifts, on various occasions of public concern, as the accession of an emperor, the birth of a prince, &c.

An impolitic distinction was made between the troops stationed in distant provinces, and those in the heart of the empire. The latter, denominated *Palatines*, enjoyed a higher pay, and more particular favour, and having less employment, spent their time in idleness and luxury; while the former, called *Borderers*, who, in truth, had the care of the empire, and were exposed to perpetual hard service, had, with an inferior reward, the mortification of feeling themselves regarded as of a meaner rank than their fellow-soldiers. Constantine also debased the body of the army by the intermixture of Scythians, Goths, and Germans. This mass of heterogeneous parts, which internally laboured with the seeds of dissolution and corruption, was kept together for some time by the vigorous exercise of despotic authority.

Constantine had divided the empire among five princes, three of them his sons, and two nephews; but Constantius, the youngest of the sons, finally freed himself from all his competitors, and ruled the empire alone. During his reign, the Franks, Saxons, Alemanni, and Sarmatians, laid waste all the fine countries on the banks of the Rhine, and the Persians made the most destructive incursions on the provinces of the East. Constantius wasted his time in theological controversies; but before his death, he appointed his cousin Julian to the dignity of Cæsar. He died A.D. 361.

Julian possessed many heroic qualities, and his mind was formed by nature for the sovereignty of a great people; but having been educated under the philosophers at Athens, he had unfortunately conceived a rooted antipathy to the doctrines of Christianity. The reformation of civil abuses delight of beholding the general happineſs, of which they were the authors."

Commodus ſucceeded to the empire on the death of his father. The meaſures of this reign were as unimportant as the character of the ſovereign was contemptible. Commodus had an averſion from every rational and liberal purſuit, and was in many reſpects very like Nero. To his other crimes, which he had in common with preceding tyrants, may be added, that he entered the liſts as a public gladiator, and actually received a ſtipend for the ſlaughter of his helpleſs antagoniſts. The concubine and ſome of the chief officers of this emperor prevented their own deſtruction, by aſſaſſinating him in the thirteenth year of his reign, A.D. 193.

Publius Helvius Pertinax was the next emperor, a man of mean birth, but who had riſen to eſteem by his virtues and military talents. He diſappointed the army of a promiſed reward for his elevation, and, after a reign of 86 days, was murdered in the imperial palace by the ſame hands which had raiſed him to the throne. The empire was now put up to auction by the Prætorians, and was purchaſed by Didius Julianus; but not paying the ſtipulated price for his elevation, he was depoſed and put to death.

Septimius Severus ſucceeded, whoſe intention was to erect the fabric of abſolute monarchy, and all his inſtitutions operated to that end. He poſſeſſed eminent military talents, and it was his boaſt, that, having received the empire oppreſſed with foreign and domeſtic wars, he left it in profound, univerſal, and honourable peace. He carried with him into Britain his two ſons, Caracalla and Geta; and died at York, in the 66th year of his age, after a reign of eighteen years, A.D. 211. He was ſucceeded by the two ſons juſt named, whoſe former mutual hatred of each other was increaſed by their aſſociation in the empire; and Caracalla, with brutal inhumanity, cauſed his brother to be openly murdered in the arms of his mother. His reign, which was of ſix years' duration, and full of atrocities, was at length terminated by aſſaſſination, A.D. 217.

As it would not be conſiſtent with the limits aſſigned to this article, neither is it at all neceſſary, to advance ſtep by ſtep through the ſucceeding reigns; it will be ſufficient to tranſcribe, with very trifling additions, the names of ſeveral of the emperors who followed Caracalla.

The diſorders in the Roman empire, which began with Commodus, continued nearly a century, till the acceſſion of Diocletian: and this interval was filled by the reigns of Macrinus and Heliogabalus, who were both ſlain by the ſoldiers. Alexander Severus was a juſt prince and a lover of learning; he was ſucceſsful in his war againſt Artaxerxes, the new king of Perſia, and after that, was ſlain by ſome of his ſoldiers in an expedition into Germany.

Maximin, Maximus and Balbinus, Gordian, and Philip the Arabian, with his ſon, in whoſe reign were inſtituted the ſecular games, were all raiſed to the throne by the prætorian bands, and by them killed. Decius, a ſevere perſecutor of the Chriſtians, was drowned while fighting againſt the barbarians. After this Gallus was ſlain by the army, at the end of a reign of two years. The life of Valerianus was devoted to the reformation of the manners of his people; but in a war with Sapor, king of Perſia, he was captured and flead alive. Gallienus, the ſon of Valerianus, was loſt in luxury and debauchery, and ſuffered the empire to be torn from him on all ſides by barbarians and tyrants. Hence the 30 tyrants, as they are called, though hiſtory records the names of 19 only, roſe up againſt him. Among theſe was Zenobia, wife to Odenatus, prince of Palmyra, a woman of martial ſpirit, who ſpread her conquering arms far over the Eaſtern world.

After Gallienus were Claudius II., who died of the plague: Aurelian, who carried Zenobia a captive in triumph, and who was murdered by his ſoldiers: Claudius Tacitus, Probus, and Carus followed in ſucceſſion. Probus was killed by the ſoldiers, and Carus was ſtruck dead with lightning.

Diocletian began his reign A.D. 284, and introduced a new ſyſtem of adminiſtration, dividing the empire into four governments, under as many princes. Maximian ſhared with him the title of Auguſtus, and Galerius and Conſtantius were declared Cæſars, or their ſucceſſors. Each had his ſeparate department or province, all nominally ſupreme, but in reality under the direction of the ſuperior talents and authority of Diocletian. The two emperors, truſting to a continuance of that order in the empire which their vigour had eſtabliſhed, retired from ſovereignty, and left the government in the hands of the Cæſars; but Conſtantius died ſoon after in Britain, and he was ſucceeded by his ſon Conſtantine, who was proclaimed emperor at York, though Galerius, at firſt, refuſed to acknowledge his title. Maximian, however, having once more reſumed the purple, beſtowed on Conſtantine his daughter in marriage, and thus he inveſted him with a double title to the empire. On the death of Maximian and Galerius, Conſtantine had no other competitor than Maxentius, the ſon of Maximian, and the conteſt between them was decided by the ſword. Maxentius fell in battle, and Conſtantine remained ſole maſter of the empire: this was the time in which the croſs is ſaid to have appeared in the heavens, in viſion, to the emperor, with this inſcription, "in hoc ſigno vinces."

Conſtantine made a conſiderable change in the diſtribution of the provinces which had not ſuffered much alteration ſince the arrangement of Adrian. He ſubjected the whole empire to the dominion of four prefects of the palace; of whom one was placed over Gallia, one over Italia, one over Illyria, and the other over the Eaſtern provinces. Theſe prefects had under them *proconſuls* in ſome of the provinces; in others, *magiſtrates,* called *conſuls, preſidents,* and *correctors;* and a certain number of provinces over which theſe were placed being united, formed a vicariat. The *prefect of the palace,* under Auguſtus, was a military officer, in the order of knights. Tiberius increaſed the importance of the office; but Antoninus was the firſt who made uſe of that officer to promulgate, in his name, the laws of the empire. Hence the prefect of the palace became chief judge, who had authority over all other tribunals. In him were united the ſeveral offices of conſtable, chancellor, and ſuperintendant of the finances. Conſtantine ſuppreſſed this office, as held by an individual, and created four prefects of the palace, who had under them *vicars,* whoſe power extended over a certain number of countries, forming a dioceſe or department. Theſe officers had the moſt conſiderable influence in their departments, and when they quitted the capital, they left their children with the emperor, as pledges of their fidelity.

Under Auguſtus, and after him, the proconſuls were magiſtrates ſent by the ſenate to correct the exiſting abuſes of the departments: but they had neither the command of troops, nor the adminiſtration of the provinces.

The *conſul,* called alſo rector of the province, had only the name and the enſigns of that office, not the power. Auguſtus governed the departments of the empire, which he had reſerved to himſelf, by means of his prætors and conſuls.

The *correctors* were officers who were charged to reform the abuſes which had crept into the provinces.

The

The *prefidents* were cloathed with a much greater power than that poffeffed by the proconfuls. They were military officers, and had the power of life and death over the army. It was to one of thefe officers that the provinces of the empire were fubjected in each of the great prefectures: thus,

The prefecture of the Gauls, comprehending twenty-nine provinces, was divided into three vicariats, *viz.* Hifpania, Gallia, and Britanny.

I. The vicariat of Hifpania included feven provinces, of which three were under confuls, and four under prefidents.

II. The vicariat of the Gauls included feventeen provinces; fix under confuls, and eleven under prefidents.

III. The vicariat of Britanny comprifed five provinces; two under confuls, and three under prefidents.

The prefecture of Italy included likewife twenty-nine provinces, divided into the proconfulfhip of Africa, and the vicariats of Rome, Italy, Africa, and Illyria. The vicariat of ROME was under confuls, correctors, and prefidents; that of ITALY was under confuls and prefidents; that of AFRICA was under confuls and prefidents; and that of ILLYRIA under one conful, one corrector, and four prefidents.

The prefecture of Illyria included eleven provinces; one under the proconful of Achaia; the vicariat of Macedonia comprehended five provinces, two under confuls, and three under prefidents; the vicariat of Dacia was under one conful, and four prefidents.

The prefecture of the Eaft included forty-eight provinces; *viz.* three under the proconful of Afia; fifteen under the count of the Eaft, a companion to the emperor; fix under the prefect of Egypt; feven under the vicariat of Afia; eleven under the vicariat of Pontus; and fix under the vicariat of Thrace.

We are now arrived to that ftate of the Roman empire in which it was governed by Chriftian emperors, and which may be divided into three diftinct periods. The *firft* will contain the whole time that the Roman world was governed by one emperor only. The *fecond* commences with the divifion of the empire, after the death of Theodofius the Great, and goes down to the extinction of the Weftern empire under Auguftulus. The *third* reaches from the fall of the Weftern empire to the capture of Conftantinople, and the deftruction of the whole empire.

Of the Chriftian Roman Emperors before the Divifion of the Empire.—The adminiftration of Conftantine was, in the early part of his reign, mild, equitable, and politic. Though ftrongly attached to the Chriftian faith, he made no great innovations on the religion of the ftate. He introduced order and economy into the civil government, and repreffed every fpecies of oppreffion and corruption. But his natural temper was fevere and cruel, and the latter part of his reign was deformed by rancour and a moft fanguinary rigour. From this unfavourable change of character he loft the affections of his fubjects; and from a feeling, probably of reciprocal difguft, he removed the feat of the Roman empire to Byzantium, where a new city was raifed; from his name it was called CONSTANTINOPLE; fee the article. The court followed the fovereign: the opulent proprietors were attended by their flaves and retainers. Rome was in a few years depopulated, and the new capital fwelled almoft at once to an enormous magnitude. In an expedition againft the Perfians, Conftantine died at Nicomedia, in the 30th year of his reign, A.D. 337. During this reign the Goths had made feveral irruptions on the empire, and though repulfed and weakened, they began gradually to encroach on the provinces.

Before we proceed with the monarchs, we may juft notice fome particulars relating to the ftate of the Roman empire at this period; for which we fhall be chiefly indebted to Mr. Tytler's Elements, already quoted and referred to.

Inftead of the ancient republican diftinctions, which were founded chiefly on perfonal merit, a rigid fubordination of rank and office now went through all the orders of the ftate. The magiftrates were divided into three claffes, diftinguifhed by the unmeaning titles of, 1, the Illuftrious; 2, the Refpectable; and 3, the Clariffimi. The epithet of *Illuftrious* was conferred on, 1, the confuls and patricians; 2, the prætorian prefects of Rome and Conftantinople; 3, the mafters-general of the cavalry and infantry; and 4, the feven minifters of the palace.

The confuls were created by the fole authority of the emperor; their dignity was inefficient, and their names ferved only to give the legal date of the year. The dignity of patrician was not hereditary, but was beftowed as a title of honour by the emperor on his favourites. The prætorian prefects were the civil governors of the four departments of the empire. Thefe were the Eaft, Illyria, Italy, and the Gauls: to them was committed the fupreme adminiftration of juftice, and of the finances.

The *Refpectables* were the proconfuls of Afia, Achaia, and Africa; and the military *comites* and *duces*, generals of the imperial armies. The *Clariffimi* included the inferior governors and magiftrates of the provinces, refponfible to the prefects and their deputies.

The intercourfe between the court and the provinces was maintained by the conftruction of roads, and the inftitution of regular pofts or couriers; under which denomination were ranked the numberlefs fpies of government, whofe duty was to convey all kinds of intelligence to the feat of empire. Taxes were levied by the fole authority of the emperor, and fubfidies were exacted from all the cities, under the name of free gifts, on various occafions of public concern, as the acceffion of an emperor, the birth of a prince, &c.

An impolitic diftinction was made between the troops ftationed in diftant provinces, and thofe in the heart of the empire. The latter, denominated *Palatines*, enjoyed a higher pay, and more particular favour, and having lefs employment, fpent their time in idlenefs and luxury; while the former, called *Borderers*, who, in truth, had the care of the empire, and were expofed to perpetual hard fervice, had, with an inferior reward, the mortification of feeling themfelves regarded as of a meaner rank than their fellow-foldiers. Conftantine alfo debafed the body of the army by the intermixture of Scythians, Goths, and Germans. This mafs of heterogeneous parts, which internally laboured with the feeds of diffolution and corruption, was kept together for fome time by the vigorous exercife of defpotic authority.

Conftantine had divided the empire among five princes, three of them his fons, and two nephews; but Conftantius, the youngeft of the fons, finally freed himfelf from all his competitors, and ruled the empire alone. During his reign, the Franks, Saxons, Alemanni, and Sarmatians, laid wafte all the fine countries on the banks of the Rhine, and the Perfians made the moft deftructive incurfions on the provinces of the Eaft. Conftantius wafted his time in theological controverfies; but before his death, he appointed his coufin Julian to the dignity of Cæfar. He died A.D. 361.

Julian poffeffed many heroic qualities, and his mind was formed by nature for the fovereignty of a great people; but having been educated under the philofophers at Athens, he had unfortunately conceived a rooted antipathy to the doctrines of Chriftianity. The reformation of civil abufes formed

formed the first object of his attention, after which he endeavoured, but without persecution, to undermine and extinguish the Christian religion. To avenge the injuries which the empire had sustained from the Persians, Julian marched into the heart of Asia, and in an engagement, though crowned with victory, he was slain at the age of thirty-one, after a reign of three years.

Jovian, a captain of the guards, was chosen to succeed Julian, who purchased his safe retreat by the ignominious surrender of five provinces. His reign, of seven months only, was mild and equitable, and he restored the Christians to all their privileges as subjects.

Valentinian was chosen emperor by the army on the death of Jovian, who associated with himself in the empire his brother Valens, to whom he gave the dominion of the Eastern provinces, reserving to himself the Western. Valentinian favoured the Christian faith, but did not persecute its adversaries, which was very unlike the conduct of Valens, who, intemperately supporting the Arian doctrine, set whole provinces in a flame, and drew upon the empire a swarm of invaders, in the disguise of friends and allies, but who, in the end, entirely subverted it. These were the Goths, who, migrating from Scandinavia, had, in the second century, settled on the banks of the Palus Mæotis, and thence gradually extended their territory. In the reign of Valens they possessed themselves of Dacia, and were known by the distinct appellation of Ostrogoths and Visigoths, or Eastern and Western Goths. Valentinian died on an expedition against the Alemanni, and was succeeded in the empire of the West by Gratian, his eldest son, a youth of sixteen years of age. Valens was the scourge of his people. The Huns, of Tartar or Siberian origin, now poured down on the provinces both of the East and West. The Goths fled before them. The Visigoths were allowed by Valens to settle in Thrace; the Ostrogoths asked the like liberty, and, being refused, forced their way into the same province. Valens gave them battle at Adrianople; his army was defeated, and he himself slain in the engagement. The Goths, unresisted, ravaged Achaia and Pannonia, and were several times within sight of the walls of Constantinople.

Gratian took Theodosius as his colleague, who, on the early death of his associate, and minority of his son Valentinian II., governed with great ability both the Eastern and Western empire. Theodosius obtained the surname of Great, and having reigned till A.D. 395, he died, leaving two sons, Arcadius and Honorius, assigning to them separate sovereignties. Arcadius was proclaimed emperor of the East, and Honorius emperor of the West. The Eastern empire comprehended Asia Minor, Arabia, Syria, Egypt, Libya, and the several regions on the Danube. The Western empire included Italy, Spain, France, Britain, Germany, Pannonia, and Africa. The Eastern empire subsisted many ages, but the Western soon became the prey of barbarians.

It may be observed, that the reign of Theodosius was signalised by the downfall of Paganism, and the full establishment of the Christian religion in the Roman empire: for, from the time of Numa to that of Gratian, the Romans preserved the regular succession of the several sacerdotal colleges, the pontiffs, augurs, vestals, flamens, &c. whose authority, though weakened in the latter ages, was still protected by the laws. Even the Christian emperors held, like their Pagan predecessors, the office of pontifex maximus. Gratian was the first who refused that ancient dignity as a profanation. In the time of Theodosius, the cause of Christianity and Paganism was solemnly debated in the Roman senate; Christianity was triumphant, and the senate issued a decree for the abolition of Paganism, the destruction of which in the capital was soon followed by its extinction in the provinces.

Of the Western Empire.—In the reigns of Arcadius and Honorius, the sons and successors of Theodosius, the barbarian nations established themselves in the frontier provinces both of the East and West. Theodosius had committed the government to Rufinus and Stilicho during the minority of his sons: of their fatal dissentions the enemies of the empire took every advantage. The Huns overspread Armenia, Cappadocia, and Syria. The Goths, under Alaric, ravaged the borders of Italy, and laid waste Achaia to the Peloponnesus. Arcadius purchased an ignominious peace, by ceding to Alaric the whole of Greece. This prince, now styled king of the Visigoths, prepared to add Italy to his new dominions. He passed the Alps, and was carrying all before him, when he was defeated by Stilicho, then at the head of the armies of Honorius. In the course of a few months, a torrent of Goths breaking down upon Germany, forced the nations whom they dispossessed, *viz.* the Suevi, Alani, and Vandals, to hasten out of Italy. They joined their arms to those of Alaric, who, being thus suddenly reinforced, determined to overwhelm Rome. Stilicho to ward off the threatened danger, promised him, if he would retire, 4000 pounds weight of gold, which engagement Honorius would not ratify. Alaric was not to be trifled with, and he took ample revenge by the sack and plunder of the city. He was anxious to spare the lives of the vanquished, and to preserve the ancient edifice from destruction. This event happened in August 410. Alaric had, as we have seen, ravaged Greece, some time before; and Arcadius, more wise than his brother, was contented to purchase his friendship, by investing him with the master-generalship of the Eastern Illyricum. He died within a week of the capture of Rome, and was succeeded by Ataulfus, or Adolphus, to whom Honorius gave his sister Placidia in marriage, and, with her, ceded to his brother-in-law a large portion of Spain. With these concessions Adolphus was contented, and, having concluded a peace, he retired into Gaul, A.D. 412. A great part of what remained of Spain had before been occupied by the Vandals. Honorius allowed, soon after, to the Burgundians a just title to their conquests in Gaul. Thus the Western empire was by degrees mouldering from under the dominion of its ancient masters.

In the East, Arcadius died in 408, leaving that empire to his infant son, Theodosius II., whose sister, Pulcheria, swayed the sceptre with prudence and talent during a government of 40 years. Honorius died A.D. 423. The laws of Arcadius and Honorius are, with very few exceptions, remarkable for their wisdom and equity; a singular circumstance, considering the personal character of those princes, and evincing at least that they employed able ministers.

In the reign of Valentinian III., the hordes from the north of Europe again abandoned their own forests and mountains, in quest of new settlements. Under the command of ATTILA (see his article), they defeated the Roman armies, A.D. 452, and threatened total destruction to the empire. He was for a time ably opposed by Ætius, Valentinian's general; the emperor himself being shut up in Rome by the armies of the barbarian, and at length compelled to purchase a peace. On the death of Attila, his dominions were dismembered by his sons, whose dissentions gave a temporary relief to the declining empire. Valentinian was put to death by the guards of his general Ætius, A.D. 455. He was succeeded by Maximus, who had excited the death of Valentinian, and who now married his widow Eudoxia. Within three months of this event he

was

was deprived of his kingdom by Genſeric, king of the Vandals, who was invited by Eudoxia to revenge the murder of her firſt huſband, and deliver her from the power of the tyrant. Maximus fled, but being taken, he was killed, and his body thrown into the Tiber. Genſeric carried Eudoxia and her two daughters into Italy, one of whom he married to his ſon Hunneric, the other he ſent back to Conſtantinople, and married the mother himſelf.

After Maximus, we have a ſucceſſion of ſeven or eight princes, but the events of their ſeveral reigns merit no detail. In the reign of Romulus, ſurnamed Auguſtulus, the empire of the Weſt came to a final period. Odoacer, prince of the Heruli, ſubdued Italy, but ſpared the life of Auguſtulus, on the condition of his reſigning the throne. This occurred A.D. 476. Odoacer retained the poſſeſſion of Italy during 14 years. In this period, the eſtates of the Roman ſenators were divided among his countrymen and ſoldiers. At the extinction of the Roman empire in the Weſt, Rome and Italy came into the poſſeſſion of the Oſtrogoths. Africa was ſeized by the Vandals; Pannonia by the Huns; Spain by the Goths, Alans, and Suevi; Gaul by the Franks; and Great Britain by the Saxons. Hence we ſee the origin of thoſe nations, many of which have proved ſo illuſtrious in hiſtory.

We cannot cloſe this portion of the hiſtory, without ſome reflections relating to the riſe and fall of Rome. The foundations of the greatneſs of this vaſt empire have been enumerated as follow. The fidelity of the citizens to each other, and to the ſtate, was confirmed by the habits of education, and the prejudices of religion. Honour, as well as virtue, was the principle of the republic. The ambitious citizens laboured to deſerve the ſolemn glories of a triumph; and the ardour of the Roman youth was kindled into active emulation, as often as they beheld the domeſtic images of their anceſtors. The temperate ſtruggles of the patricians and plebeians had finally eſtabliſhed the firm and equal balance of the conſtitution; which united the popular aſſemblies with the authority and wiſdom of the ſenate, and the executive powers of a regal magiſtrate. When the conſul diſplayed the ſtandard of the republic, each citizen bound himſelf by the obligation of an oath, to draw his ſword in the cauſe of his country, till he had diſcharged the ſacred duty by a military ſervice of ten years. This wiſe inſtitution continually poured into the field the riſing generation of freemen and ſoldiers; and their numbers were reinforced by the warlike and populous ſtates of Italy, who had yielded to the valour, and embraced the alliance of the Romans. From their inſtitutions of peace and war, Polybius had deduced the ſpirit and ſucceſs of a people, incapable of fear, and impatient of repoſe. The ambitious deſign of conqueſt was attempted and achieved, and the perpetual violation of juſtice was maintained by the political virtues of prudence and courage. The arms of the republic, ſometimes vanquiſhed in battle, always victorious in war, advanced with rapid ſteps to the Euphrates, the Danube, the Rhine, and the ocean; "and the images of gold, or ſilver, or braſs, that might ſerve to repreſent the various nations, and their kings, were ſucceſſively broken by the iron monarchy of Rome."

The riſe of a city, which ſwelled to an empire, may deſerve, as a ſingular prodigy, the reflection of a philoſophic mind: but the decline of Rome was from the natural and inevitable effect of immoderate greatneſs. Proſperity ripened the principles of decay; the cauſes of deſtruction multiplied with the extent of conqueſt; and as ſoon as time or accident had removed the artificial ſupports, the ſtupendous fabric yielded to the preſſure of its own weight. "The ſtory of its ruin," ſays Gibbon, "is ſimple and obvious; and inſtead of inquiring why the Roman empire was deſtroyed, we ſhould rather be ſurpriſed that it ſubſiſted ſo long. The victorious legions, who, in diſtant wars, acquired the vices of ſtrangers and mercenaries, firſt oppreſſed the freedom of the republic, and afterwards violated the majeſty of the purple. The emperors, anxious for their perſonal ſafety, and the public peace, were reduced to the baſe expedient of corrupting the diſcipline, which rendered them alike formidable to their ſovereign and to the enemy. The rigour of the military government was relaxed, and finally diſſolved, by the partial inſtitutions of Conſtantine; and the Roman world was overwhelmed by a deluge of barbarians."

The decay of Rome has often been aſcribed to the tranſlation of the ſeat of empire; but the powers of government were divided, rather than removed. The court of Conſtantinople was erected in the Eaſt; while the Weſt was ſtill poſſeſſed by a ſeries of emperors, who held their reſidence in Italy, and claimed an equal inheritance of the legions and provinces. This impaired the ſtrength, and fomented the vices of a double reign; the inſtruments of an oppreſſive and arbitrary ſyſtem were multiplied; and a vain emulation of luxury was introduced and ſupported between the ſucceſſors of Theodoſius. Extreme diſtreſs, which unites the virtue of a free people, embitters the factions of a declining monarchy. The hoſtile favourites of Arcadius and Honorius betrayed the republic to its common enemies; and the Byzantine court beheld with indifference, or pleaſure, the diſgrace of Rome, the misfortunes of Italy, and the loſs of the Weſt. Under the ſucceeding reigns, the alliance of the two empires was reſtored; but the aid of the Oriental Romans was tardy, doubtful, and ineffectual; and the national ſchiſm of the Greeks and Latins was enlarged by the perpetual difference of language and manners, of intereſt, and even of religion. Yet the event juſtified and did credit to the deciſion of Conſtantine. During a long period, as we ſhall ſee, his impregnable city repelled the victorious arms of barbarians, protected the wealth of Aſia, and commanded, both in peace and war, the important ſtreights which connect the Euxine and Mediterranean ſeas. The foundation, therefore, of Conſtantinople ſeems to have more eſſentially contributed to the preſervation of the Eaſt, than to the ruin of the Weſt.

On the decline or ruin of the Roman empire, great ignorance and darkneſs, as to letters and the uſeful arts of life, began to overſhadow the Weſtern world. A barbarous people, untaught in letters, poured themſelves into the Weſtern provinces of the Roman empire, and gave the firſt blow to learning. Academies were ruined, libraries burnt, and the learned compelled to ſhut up their ſchools and books too. Nor were thoſe, who in that age were denominated Chriſtian prieſts, leſs concerned in the deſtruction of letters; for as they had been loaded with contempt and injuries, when Paganiſm prevailed, by the philoſophers, they not only armed themſelves againſt thoſe teachers, but endeavoured to forbid their writings, as containing tenets the moſt dangerous and pernicious to young perſons. Both haſtened the deſtruction of letters: nevertheleſs the age was not deſtitute of learned men, of whom the following have, among others, been enumerated. Thoſe profeſſing Chriſtianity are Sulpicius Severus, Cyril of Alexandria, Socrates, Sozomen, Theodoret, Iſidore, Sidonius Apollinarius; and among the Pagans, Zoſimus and Olympiodorus were of the greateſt note.

For the Roman ſenate, their magiſtracy, conſuls, ſoldiery, tribes, courts, names, weights, meaſures, coins, and other matters relating to the antiquities of that people, their policy, religion, law, cuſtoms, &c. ſee the reſpective articles in this work.

Of the Eaſtern Empire.—The emperors who reigned in the Eaſt, previouſly to the ruin of the Weſtern empire, were Arcadius, Theodoſius II., of whom we have ſpoken, Marcian, who married Pulcheria, the ſiſter of Theodoſius, and Leo the Thracian, who reigned 17 years, and died in 474. He was ſucceeded by his grandſon, Leo, the boy who died in his cradle. His father, Zeno, followed, who, in 475, was driven from the throne by Baſiliſcus, an uſurper; but in the following year he recovered it.

The period in which the emperors reigned ſingly, after the deſtruction of the Weſtern empire, includes almoſt a thouſand years, extending from 476 to the year 1453; in which year Conſtantinople was taken by Mohammed II. We ſhall only notice ſome of the moſt celebrated, beginning with Zeno, who, as we have juſt obſerved, had been, after a ſhort rebellion, reſtored to the throne.

Auguſtulus, at the command of Odoacer, ſignified his reſignation to the ſtill exiſting aſſembly of the Weſtern empire; and that aſſembly, in their laſt act of obedience to the Roman prince, ſtill affected the ſpirit of freedom, and the forms of the conſtitution. An epiſtle was addreſſed to Zeno, in which they ſolemnly diſclaim the neceſſity, or even wiſh, of continuing any longer the imperial ſucceſſion of Italy; ſince, they ſay, that it is their opinion, the majeſty of a ſole monarch is ſufficient to pervade and protect the Eaſt and the Weſt. They, therefore, in their own name, and in the name of the people, conſent that the ſeat of univerſal empire ſhall be transferred from Rome to Conſtantinople: they renounce the right of chooſing their maſter, the only veſtige that yet remained of the authority which had given laws to the world; and they add, that the republic might ſafely be confided in the civil and military virtues of Odoacer, and humbly requeſt that the emperor Zeno would inveſt him with the title of patrician, and the adminiſtration of the dioceſe of Italy. The deputies of the ſenate were received at Conſtantinople with ſome marks of diſpleaſure and indignation; and when they were admitted to the audience of Zeno, he at firſt reproached them with the ill uſage of ſome of their emperors, particularly of Anthemius and Nepos. The firſt, ſaid he, you have murdered, and the ſecond you have expelled; but while he lives, he is your lawful ſovereign. Zeno, notwithſtanding his harangue, very ſoon abandoned the cauſe of his abdicated colleague. His vanity was gratified by the title of ſole emperor, and by the ſtatues erected to his honour in the ſeveral quarters of Rome. He entertained a friendly correſpondence with Odoacer; and he gratefully accepted the imperial enſigns, the ſacred ornaments of the throne and palace, which the barbarian monarch was not unwilling to remove from the ſight of the people. Zeno died in the year 495, and was ſaid to have been entombed while he was in one of his drunken fits, and before he was dead. He was ſucceeded by

Anaſtaſius I. who married Adriadne, Zeno's widow, and by her influence was raiſed to the throne. See ANASTASIUS.

Juſtin, of whom we have, in the alphabetical order, given a full account, followed Anaſtaſius, and after a reign of nine years he died, leaving his power to JUSTINIAN, ſee his article, who deſtroyed the kingdom of the Vandals in Africa by means of his general Beliſarius, and that of the Oſtrogoths by Narſes. He is particularly famous in having built the church of St. Sophia, and in having aboliſhed the conſulſhip, long ſince only a name without power. He died A.D. 565, and was ſucceeded by Juſtin II., who eſtabliſhed the exarchate of Italy, and who died mad in the year 578. He was followed by Tiberius, one of the captains in Juſtin's guards, who died in about four years, having firſt appointed his own great captain Mauritius as a ſucceſſor. Mauritius, and all his family, were murdered by Phocas, who exerciſed the ſame cruelty in his government, as he had in his way to it. He was dethroned by Heraclius in 611, who ſucceeded him. During the reign of Heraclius, the Perſians made very deſtructive ravages in the empire; this was the period, alſo, in which Mohammed, prince of the Arabians, founded the Mohammedan religion and power. This new power quickly weakened the empire, by depriving it of almoſt all its provinces in Aſia and Africa. Heraclius died of a dropſy, after a reign of about 30 years. In the courſe of a few months, Conſtantine, Heracleonas, and Conſtans, all aſcended the throne; the two firſt were cut off in a few months. The latter attempted to fix the ſeat of empire at Rome, but changing his plans, he went to Sicily, where he was killed, leaving three ſons to ſucceed him, who held the government during the remainder of the ſeventh century. In the eighth, we have Leo Iſauricus, or Iconomachus, ſo called from the perſecutions which he inſtituted againſt the worſhippers of images; alſo the empreſs Irene, who reſtored image worſhip, and who cruelly put out the eyes of her own ſon Conſtantine, for preſuming to take the government into his own hands when he was of age.

In the ninth century, the chief among the Eaſtern emperors were Nicephorus, who dethroned Irene, and who acknowledged Charles the Great, king of France, to be the emperor of the Weſt. Alſo, Leo VI., ſurnamed Philoſophus, the author of the conſtitutions that bear his name.

In the tenth century flouriſhed, among many other emperors, Conſtantine IX., ſon of Leo VI., who took poſſeſſion of the kingdom of Naples, after driving out the Saracens; and Romanus, the ſon of Conſtantine IX., who was likewiſe ſucceſsful againſt the Saracens, but he died of debauchery. Nicephorus Phocas, a general of Romanus, married his widow, and aſſumed the government in prejudice to the ſons of his late maſter. Nicephorus conquered the Saracens, and took Antioch; but he loſt Apulia and Calabria, which were taken by Otho the Great, the emperor of Germany. Nicephorus was at length aſſaſſinated by his ſucceſſor, John Zimiſces, who aſſociated with himſelf on the throne Baſilius and Conſtantine, the two ſons of Romanus. Zimiſces was poiſoned by his chamberlain; Baſilius and Conſtantine recovered Apulia and Calabria, and they reigned together fifty years.

In the 12th century, Apulia was loſt by Romanus Argyropulus, and in the ſame period we have Alexius Comnenus, under whom the Cruſades took their riſe; and John Comnenus, the ſon of Alexius, whoſe excellent diſpoſition obtained for him the name of Colojoannes. In his wars with the Turks he was mortally wounded, and was ſucceeded by his ſecond ſon, Manuel Comnenus, who has been characterized for his great perfidy. He has been charged with poiſoning the proviſions which he had engaged to furniſh for the army of the emperor Conrad, and at the ſame time betrayed his deſigns to the Turks, againſt whom he was marching. He was ſucceeded by Alexius II., his ſon, whoſe eyes were torn out, and himſelf depoſed and murdered by his couſin Andronicus, who had previouſly to this aſſaſſinated the empreſs mother. Andronicus ordered a general maſſacre of all the

the Latins at Constantinople, and his cruelties not being confined to them, he was at length torn to pieces by his own people. The territories of his successor, Isaac Angelus Comnenus, were ravaged by the emperor Barbarossa; the emperor himself dethroned, and his eyes put out by his brother Alexius the tyrant, who seized on the reins of government, but was himself soon detested, as well on account of his conduct towards Angelus, as for the debaucheries and cruelties of which he was guilty. The crusaders, wishing to free the people from this tyrant, laid siege to the city, and took it. Alexius was glad to escape with his life, and young Alexius, the son of Isaac, was placed on the throne. This young prince, with the assistance of the Latins, restored his father. His coadjutors, in this act of piety, not receiving the price stipulated for their services, plundered Constantinople, and set it on fire. Upon this the Greeks revolted, and chose Alexius Ducas for their leader, who having caused the young Alexius to be strangled, was himself declared emperor. He was, however, deposed by the Latins, in the year 1204, and this was the commencement of what has been called the

Latin Empire.—Baldwin, earl of Flanders, was the first monarch of this dynasty. This prince was killed in a war with the Bulgarians. About the year 1206, David Comnenus, grandson of Andronicus, made himself master of Trebisond, a city of Asiatic Turkey, on the Black sea, which was afterwards considered as the capital of the Greek empire, and continued so till 1462, when it was taken by Mohammed II., and the reigning emperor, with his family, were carried prisoners to Constantinople, where they were mostly put to death.

Baldwin was succeeded, in the Latin empire, by Henry, at the same time that Theodore Lascaris was acknowledged emperor of the Greeks. These two princes made peace. But Henry was afterwards poisoned at Thessalonica, and was succeeded by Peter de Courtenay, a grandson of Lewis le Gros, who was hailed emperor while he was at Auxerre, of which he was the count. He was murdered by Theodore Angelus Comnenus, and was succeeded, in 1220, by Robert, the second son of Peter, the eldest having refused the crown. This Latin emperor made peace with Theodore Lascaris, in order that he might revenge the death of his father, by turning his arms against Theodore Angelus; but Lascaris dying, and being succeeded, in 1222, by John Ducas, Robert found employment in defending himself and his own rights. Under John Ducas the Latin empire was restrained within very narrow limits, and on the death of its emperor, Robert, in 1228, Baldwin II. Robert's brother, was raised to the throne. Baldwin was but eleven years old when he came to the crown. During his reign the Bulgarians laid siege to Constantinople, but were obliged, by the efforts of the Genoese and Venetians, to raise it. Baldwin went into the West to seek succours against his enemies; in the mean time John Ducas died, and was succeeded, in 1255, by Theodore Lascaris II., whose reign was short; and he was succeeded, on the Greek throne, by Michael Paleologus in the year 1260, who, in the following year, attacked and took Constantinople, and thus put an end to the Latin empire, after it had subsisted about fifty-seven years.

New Empire of the Greeks.—Michael Paleologus having obtained the sovereignty of both empires, endeavoured by all the means in his power to unite the Greek and Latin churches, but without effect. His whole reign, which lasted almost twenty-four years, was greatly agitated by dissentions from within his kingdom, as well as by external enemies. He was succeeded by

Andronicus Paleologus in 1283, who, during a long reign of 46 years, conducted himself extremely ill, suffering himself to be led into every fault by ambitious and designing persons; of these the chief actors were the clergy, to whom he was ever subservient. During his government the Turks made dreadful ravages on the empire. He was at last dethroned by his grandson,

Andronicus II. who had been associated in the government with the late emperor. In this reign also the Turks made great progress, notwithstanding the efforts of Andronicus to oppose them. After a reign of about 17 years he was succeeded by his son,

John Paleologus, who was very young when he came to the throne, and during his minority the government was committed to John Cantacuzenus, who, for some time, performed all the duties connected with his high station on principles of wisdom, united to great moderation. But in 1345 he assumed the imperial title in Thrace, and in 1347 took Constantinople, compelling the lawful prince, John, who had married his daughter, to retire to Salonica. But the exiled emperor, with the aid of the Genoese, obtained his rights, and compelled the usurper to quit the throne and capital; see his article. During the reign of John, the Turks were continually making inroads on the empire, and were often at the very gates of Constantinople. The eldest son of the emperor conspired against his father, but was defeated in his rebellions. During this reign the Genoese made themselves masters of Lesbos, and Amurath I. took the city of Adrianople. John died in 1391, and was succeeded by his second son,

Manuel, who, on the death of his father, was at the court of Bajazet: he made his escape, and came to Constantinople, where he was crowned. He was successful in his wars upon the Turks, took Bajazet prisoner, and afterwards defeated the son, so that the Turks were driven entirely from Constantinople. He was embroiled in a contest with the sultan Amurath: this prince laid siege to Constantinople, on which occasion cannon were, for the first time, employed in the armies of the East. At length the Turks and the Greeks made peace, and in a very short time after Manuel died, and was succeeded by

John II. in the year 1425, who made a most disgraceful peace with Amurath. In a short time he perceived his error, and sought on all sides for assistance. To obtain the requisite aid from the princes in the West, who had refused him succours on account of the schism of the Greeks, he laboured hard to reunite the two churches. While he was losing his time at the council of Ferrara, the Turks were making great progress. After this, Amurath was defeated by the celebrated Huniades, king of Hungary. At length John made peace with Amurath, and ended his days in peace. His brother,

Constantine Dragases, succeeded him in 1448, and upon the death of sultan Amurath, the empire of the Turks fell to Mohammed II. With this high-minded prince Constantine had the temerity to embroil himself, of which he had ample occasion to repent, for Mohammed laid siege to Constantinople, which he took, after the most extraordinary efforts of courage, as well on the part of the besieged, as on that of the besiegers. This event took place on the 29th of May, 1453. Constantine, not being able to save his capital, refused to survive its hard fate, and was killed in attempting to defend it. Mohammed did every thing in his power to stop the carnage, and afterwards caused the city to be the capital of his empire. Such was the end of the Greek empire, which had succeeded to the Latin empire.

Thus have we traced the progrefs of the Eaftern empire, till it no longer exifted; yet for fome ages, as we have feen, it not only firmly but proudly lifted up its head, confcious of its vaft fuperiority over the other exifting governments of the world, particularly in the reign of Juftinian, who overturned the Vandals in Africa, and the Goths in Italy; but in procefs of time, as has been fhewn, it declined in its power, and was difmembered of its parts one after another. As in almoft all other cafes, the mifconduct of the emperors not only haftened the ruin of the empire, but was the primary and leading caufe of it. The Bulgarians claimed and obtained a part of the empire; as did the Saracens, who poffeffed themfelves of Syria, Paleftine, Egypt, Cilicia, and all the adjacent regions; and after that, overruning the reft of the Roman world, laid fiege to Conftantinople. Thefe were the followers of the prophet Mohammed, who, believing the whole world was deftined for them as an inheritance, attacked the neighbouring nations with a fury, that, in many cafes, was abfolutely irrefiftible. It was in this ftate of things, when the empire could fcarcely defend itfelf againft thefe Saracens, that Conftantinople, as we have feen, was taken by Baldwin, earl of Flanders. It was at this period that another emperor took his ftation at Trebifond, that city and the regions round it being torn from the reft of the Roman empire. At laft the Turks totally deftroyed that empire. They firft, in the reign of Heraclius, paffing through the Cafpian ftraits, wandered over divers countries in the Eaft, embraced the Mohammedan religion, and were divided into feveral principalities. But the other tribes becoming extinct, the pofterity of Othoman alone took the lead, and ever fince the Turkifh fovereigns have affumed the name and title of Othomans, or Ottomans. Thefe, having fubdued the greateft part of the provinces which had been poffeffed by the Saracens, fwallowed up the reft of the Roman empire. Conftantinople, fince its capture in 1453, has been the feat of the Turkifh emperors; of courfe it claims no longer our notice in this article.

Affairs of Rome after the Ruin of the Weftern Empire.— We have already obferved, that Italy was fubdued by the Heruli, whofe prince, Odoacer, out of contempt to Rome, fixed his feat at Ravenna. Thefe Heruli were, however, foon driven out of Italy by the Oftrogoths, whofe king, Theodoric, erected a new kingdom in Italy, and chofe Verona to be the royal feat for him and his pofterity. This kingdom lafted from the year 493 to 553; but in 541 Totila fucceeded to the throne of the Goths, who in the courfe of his reign captured the city of Rome, and abandoned it to his foldiers, intending in the end to have razed it to the ground, but was prevented from executing his plan by Belifarius. Teia, the fucceffor of Totila, and the laft king of the Oftrogoths, was defeated and flain by Narfes, who fucceeded Belifarius as general of the armies of Juftinian. By this general the kingdom of the Goths in Italy was totally deftroyed. Soon after the Longobards erected another kingdom in Italy, and claimed, under their king Alboin, that part of Italy which is ftill called Lombardy. Their royal feat was Ticinum or Pavia, and their kingdom flourifhed from 568 to 774, when Charlemagne having taken their capital, carried their laft prince, Defiderius, with his family, into France. While the Lombards ruled in Italy, the other parts of that country were in fubjection to exarchs or prefects, who were ufually fent by the emperor to Conftantinople. Thefe, in fome meafure, refifting the Lombards, defended the remains of the empire there, and fixed their feat at Ravenna. This exarchate lafted 185 years, *viz.* from 568 to 752, in which year Aiftulphus, king of the Lombards, took Ravenna by force. The kingdom of the Lombards being extinct, all Italy, which had been comprehended under the exarchate and kingdom of the Lombards, fell to the kings of France. Charlemagne was firft proclaimed patrician, and foon after emperor, of the Roman people. As the people were prompted to this act by the bifhop of Rome, Charles gave a large part of the exarchate and other lands to the bifhops of Rome, who became the temporal as well as the fpiritual fathers of the people. They contrived at this period a peculiar kind of dominion, which received great ftrength and advantage from the general ignorance that then prevailed in the Weft. The bifhops of Rome claimed to be the vicars of Chrift, and fucceffors to Peter, chief of the apoftles, and had therefore a right to prefcribe laws to all the Chriftian world. Formerly, on account of the pre-eminence of the city of Rome, only the bifhops of that city claimed a fuperiority in matters of religion. But when they faw that the bifhops of Conftantinople affumed to themfelves, becaufe the feat of empire had been transferred to that city, the title of oecumenical or univerfal patriarchs, then the bifhops of Rome pretended they had a right to the primacy as fucceffors to the apoftle Peter; and at length they were not fatisfied with their fupremacy in matters of religion, but arrogated to themfelves the power of difpoffeffing princes of their kingdoms. Gregory VII. laid the foundation of this claim, a man, whofe ambition, it has been well faid, was fcarcely to be fatisfied by the poffeffion of a world. The other bifhops were not all equal in power, but he who dwelt in the metropolis took the lead of the other bifhops in that province. At firft he was called metropolitan, and in the eighth century he took the name of archbifhop. The moft eminent of thefe metropolitans were thofe of Rome, Conftantinople, Antioch, and Alexandria, becaufe thefe were the principal cities of the Roman empire. And next to thefe, on account of the fuppofed fanctity of his city, was the bifhop of Jerufalem. The others vigoroufly defended their privileges againft the bifhop of Rome, and the controverfies that arofe thereupon, gave occafion at length to the fchifm between the Greek and Roman churches, to which we have had occafion to refer.

The fee of Rome maintained its authority without much interruption till the 14th century, when it began to totter, on account of the fchifms that arofe among the Roman pontiffs, which lafted nearly half a century, there being two popes at a time, the one at Rome, the other at Avignon. But this fchifm being terminated the popes recovered their former ftrength. It was about this fame period that Nicholas Gabrini di Rienzi, (fee Gabrini,) without rank, without money, without friends, alliances or military force, led on by ambition, and fupported by his eloquence alone, obtained for a fhort time the fovereignty of Rome; and though he could not, as he propofed, make her the miftrefs of the world, he, however, protected fome, and awed other fovereigns, and was admitted an arbiter of kingdoms.

In the fifteenth century the pontiff's authority was again fhaken, as well by difputes between the emperor and the popes, three of whom were depofed by the council of Conftans, two others by the council of Pifa, and one by the council of Bafil, as by the intrepidity of a fecond Gabrini, in the character of Stephen Porcaro, of whom, his name having efcaped us in the alphabetical order, we fhall fay a few words. He was of noble birth; his reputation was fpotlefs; his tongue was armed with eloquence; his mind was enlightened with learning; and he afpired to free his country and immortalize his name by the glory of his deeds.

deeds. "The dominion of priests," says Gibbon, "is most odious to a liberal spirit." Petrarch was now the oracle of the Italians, and as often as Porcaro revolved the ode, which describes the patriot and hero of Rome, he applied to himself the visions of the prophetic bard. His first trial of the people's feelings was at the funeral of Eugenius IV. In an elaborate speech he called the Romans to liberty and arms. For this act he had, by the existing laws of the state, forfeited his life; but the benevolence of the new pontiff, who viewed his character with pity and esteem, attempted by an honourable office to convert the patriot into a friend. He was again guilty of the same offence, and was a second time pardoned. The humane pontiff now removed him from the scene of temptation to Bologna, with a liberal allowance for his support, and the easy obligation of presenting himself each day before the governor of the city. But he formed a party at Rome, and a new conspiracy was excited. His nephew, a daring youth, assembled a band of volunteers, and on the appointed evening a feast was prepared at his house for the friends of the republic. Their leader, who had escaped from Bologna, appeared among them in a robe of purple and gold: his voice, his countenance, his gestures, bespoke the man who had devoted his life to the glorious cause. In a studied oration, he expatiated on the motives and the means of their enterprize; the name and liberties of Rome; the sloth and pride of their ecclesiastical tyrant; the active or passive consent of their fellow citizens; three hundred soldiers and four hundred exiles, long exercised in arms or in brooding over their wrongs; the licence of revenge to edge their swords, and a million of ducats to reward their victory. "It would be easy," he said, "on the next day, the festival of Epiphany, to seize the pope and the cardinals before the doors, or at the altar, of St. Peter; to lead them in chains under the walls of St. Angelo; to extort, by the threat of instant death, a surrender of the castle; to ascend the vacant Capitol; to ring the alarm-bell, and to restore in a popular assembly the ancient republic of Rome. While he was triumphing in his own mind, he was already betrayed. The senate, with a strong guard, invested the house; the nephew of Porcaro cut his way through the crowd, but the unfortunate Stephen was drawn from a chest, lamenting that his enemies had anticipated by three hours the execution of his design. After such manifest and repeated guilt, the pope, though still inclined rather to pity than punishment, could say nothing in his favour. Porcaro, and nine of his accomplices, were hanged; and amidst the fears and invectives of the papal court, the Romans pitied, and almost applauded, these martyrs of their country. "But," says the eloquent historian of the Decline and Fall of the Roman Empire, "their applause was mute, their pity ineffectual, their liberty for ever extinct; and, if they have since risen in a vacancy of the throne or a scarcity of bread, such accidental tumults may be found in the bosom of the most abject servitude." Of the struggles of the people of Rome we have, therefore, nothing more to record.

But the independence of the nobles, which was fomented by discord, survived the freedom of the commons, which must be founded in union. Rapine and oppression were long maintained by the barons of Rome; their houses were a fortress and a sanctuary: and the criminals whom they protected from the law, repaid the hospitality with the service of their swords and daggers. The private interests of the pontiffs, or their nephews, sometimes involved them in these domestic feuds. Under the reign of Sixtus IV. Rome was distracted by the battles and sieges of the rival houses; after the conflagration of his palace, the prothonotary Colonna was tortured and beheaded; and Savelli, his captive friend, was murdered on the spot, for refusing to join in the acclamations of the victorious Ursini. But the popes no longer trembled on their throne: they had strength to command, if they had resolution to claim, the obedience of their subjects; and the strangers who observed these partial disorders, admired the easy taxes and wise administration of the ecclesiastical state.

The spiritual thunders of the Vatican depend on the force of opinion; and if that opinion be supplanted by reason or passion, the sound may idly waste itself in the air, and the helpless priest will be exposed to the brutal violence of a noble or plebeian adversary. But after their return from Avignon, the keys of St. Peter were guarded by the sword of St. Paul. Rome was commanded by an impregnable citadel; the use of cannon is a powerful engine against popular seditions; a regular force of cavalry and infantry was enlisted under the banners of the pope; his ample revenues supplied the resources of the war; and, from the extent of his domain, he could bring down upon a rebellious city an army of hostile neighbours and loyal subjects. Since the union of the duchies of Ferraro and Urbino, the ecclesiastical power extends from the Mediterranean to the Adriatic, and from the confines of Naples to the banks of the Po; and as early as the sixteenth century, the greater part of that spacious and fruitful country acknowledged the lawful claims and temporary sovereignty of the Roman pontiffs. For the successive changes that have occurred in Italy from that time to the year 1811, we refer our readers to the article ITALY, in the New Cyclopædia; and we shall, probably, by the time we come to the article STATE, *Holy Roman*, be able to give a farther account of the subject, to the general peace, we earnestly hope, of 1815.

In the mean time, we shall lay before our readers an account of Rome as it appeared in the fifteenth century to an accurate and feeling mind, and then conclude the article with some account of the present state of the city.

View of Rome in the Fifteenth Century.—In the last days of pope Eugenius IV. two of his attendants, the learned Poggio and a friend, ascended the Capitoline; reposed themselves among the ruins of columns and temples; and from that commanding spot, they viewed the wide and various prospect of desolation. The place and the object gave ample scope for moralizing on the vicissitudes of fortune, which spares neither man nor the proudest of his works, which buries empires and cities in a common grave; and it would naturally be inferred, that in proportion to her former greatness, the fall of Rome was the more awful and deplorable. The description of Poggio, who was one of the first that raised his eyes from the monuments of legendary, to those of classic superstition, is as follows:

1. Besides a bridge, an arch, a sepulchre, and the pyramid of Cestius, he could discern, of the age of the republic, a double row of vaults in the salt-office of the Capitol, which were inscribed with the name and munificence of Catullus. 2. Eleven temples were visible in some degree, from the perfect form of the Pantheon, to the three arches, and a marble column of the temple of Peace, which Vespasian erected after the civil wars of the Jewish triumph. 3. Of the number, which he rashly defines, of seven thermæ or public baths, none were sufficiently entire to represent the use and distribution of the several parts; but those of Diocletian and Antoninus Caracalla still retained the titles of the founders, and astonished the curious spectator, who, in observing their solidity and extent, the variety of marbles, the size and multitude of the columns, compared the labour and expence with the use and importance. Of the baths of

of Conſtantine, of Alexander, of Domitian, or rather of Titus, ſome veſtige might yet be found. 4. The triumphal arches of Titus, Severus, and Conſtantine, were entire, both the ſtructure and the inſcriptions; a falling fragment was honoured with the name of Trajan; and two arches then extant, in the Flaminian way, have been aſcribed to the baſer memory of Fauſtina and Gallienus. 5. After the wonder of the Coliſeum, Poggius might have overlooked a ſmall amphitheatre of brick, moſt probably for the uſe of the Prætorian camp: the theatres of Marcellus and Pompey were occupied in a great meaſure by public and private buildings; and in the circus Agonalis and Maximus, little more than the ſituation and the form could be inveſtigated. 6. The columns of Trajan and Antonine were ſtill erect; but the Egyptian obeliſks were broken, or buried. A profile of gods and heroes, the workmanſhip of art, was reduced to one equeſtrian figure of gilt braſs, and to five marble ſtatues, of which the moſt conſpicuous were the two horſes of Phidias and Praxiteles. 7. The two mauſoleums or ſepulchres of Auguſtus and Adrian could not totally be loſt; but the former was only viſible as a mound of earth; and the latter, the caſtle of St. Angelo, had acquired the name and appearance of a modern fortreſs. With the addition of ſome ſeparate and nameleſs columns, ſuch were the remains of the ancient city: for the marks of a more recent ſtructure might be detected in the walls, which formed a circumference of ten miles, included three hundred and ſeventy-nine turrets, and opened into the country by thirteen gates.

Of the Government of Rome under the Popes.—For this part of our article we ſhall be chiefly indebted to the juſtly denominated "Claſſical Tour through Italy," by the Rev. I. C. Euſtace, whoſe partiality for whatever is papal, may render him, perhaps, ſomewhat partial as an hiſtorian. In ſpeaking of this government, as it exiſted previouſly to the ravages of the French at the cloſe of the laſt century, he ſays, though deſpotic above all controul, it is exerciſed by the pontiff with mildneſs, and ſubmitted to by the people with reſpect. The ſacred character of the biſhop influences both the ſovereign and the ſubject. The government is elective; promotion depends in a great degree upon talents and virtues; and, conſequently, there is a ſtimulus to exertion and a ſcope for honourable ambition. As for the origin of the temporal ſovereignty of the popes, it may be moſt honourably and firmly eſtabliſhed on the conſent of the people. After the expulſion of the Goths, when the arms of the Eaſtern emperors had re-conquered, but were incapable of protecting Italy; when the incurſions and menaces of the Lombards kept the city in conſtant alarm, and peſtilence and famine had preyed upon it; the Romans naturally turned their eyes to their biſhops, and found in them the ſupport which they had vainly ſolicited from their ſovereigns. The pontiffs had till that period been as eminent for their virtues as for their ſtation, and when forced by public diſtreſs to take a conſiderable ſhare in the adminiſtration of the ſtate, they diſplayed a prudence equal to their ſanctity, and a benevolence as extenſive as the poſſeſſions of the Roman church. "We ſee them," ſays Mr. Euſtace, "in the ſeventh, eighth, and ninth centuries, protecting Rome on one ſide againſt the attacks of the Lombards, and ſecuring it on the other from the rapacity and treachery of the exarchs, repairing its walls, feeding its inhabitants, engaging diſtant princes in its intereſts, and finally reſtoring the majeſty of its name in the new empire. Rome, indeed, ſeems to owe her exiſtence to her pontiffs; and had not the chair of St. Peter replaced the throne of the Cæſars, and the ſeat of empire become the ſanctuary of religion, Rome would probably have ſunk into a heap of uninhabited ruins, and left to poſterity nothing more than the *whiſtling of a mighty name.*"

From the re-eſtabliſhment of the Weſtern empire to the tenth century, the popes employed their influence in oppoſing the growing power of the Saracens, and in protecting the coaſts of Italy, and the capital itſelf, againſt the predatory incurſions of thoſe barbarians. Shortly after commenced their conteſts with the German Cæſars: but however much the popes may be cenſured, as eccleſiaſtics, in thoſe deſtructive quarrels; as princes and as Romans they may claim indulgence, as they ſtruggled againſt foreign influence, and finally ſucceeded in freeing Italy from the yoke of a German, a barbarian, and an abſentee ruler. The diſputes of the popes with the barons and the Roman people were founded on the juſt oppoſition of a firm government, to the arrogance and tyranny of an ariſtocratic body on the one ſide, and to the licentiouſneſs of a turbulent populace on the other. But Rome has juſt cauſe to deplore and condemn the folly and the perverſity of her paſtors, when they forſook her venerable walls, and ſubmitted to voluntary exile, alternately the inſtruments and victims of French intrigue and ambition. Of all the diſaſters that befel Rome in the long ſeries of her eventful hiſtory, this, perhaps, was the moſt pernicious both in its immediate effects and diſtant conſequences, and to it may be aſcribed the degradation of the nobleſt monuments, the depopulation of the capital and its neighbourhood, and the evils that anarchy and tyranny never fail to bring in their train. Theſe evils continued to operate long after their efficient cauſes had ceaſed to exiſt, and the popes, during many ages after their re-eſtabliſhment in Rome, had to ſtruggle with the reſtleſs and unbridled paſſions excited by the guilt or the folly of their abſentee predeceſſors. Sixtus Quintus ſucceeded in breaking the ſpirit of the barons, and having brought the people to ſubmiſſion, he reſtored order, peace, and induſtry, to the Roman ſtates.

From this period Rome rapidly increaſed in proſperity, riches, and population, and became the ſeat of the arts and ſciences, the centre of political negociation, and not unfrequently of courtly intrigue. Moſt of the ſucceeding popes took an active part in the public tranſactions of the times, ſometimes as mediators, but too frequently as parties concerned, with a view to national intereſts, or to family aggrandizement. Their conduct, in this reſpect, though little conformable to the principles of their profeſſion, was advantageous to their territories, as it brought wealth to the inhabitants, and reflected luſtre on a city, at the ſame time the metropolis of the Chriſtian world, and the capital of an extenſive and flouriſhing country.

The reformation produced at the time little or no diminution of the temporal greatneſs and conſideration of the popes: ſo little indeed, that in the century following that event, Rome ſeems to have enjoyed a ſplendour and proſperity not witneſſed within her walls ſince the fall of the empire. Hence it has been obſerved, "that if Pyrrhus's ambaſſador could with propriety call the Roman ſenate in his time a congreſs of kings, a ſimilar appellation might with equal veracity be applied to the modern ſenate of Rome, the college of cardinals, during the ſeventeenth century. That aſſembly was, ſtrictly ſpeaking, compoſed of princes, the ſons, nephews, brothers, or uncles of the firſt ſovereigns in Europe; men who not unfrequently, as ſtateſmen and miniſters, had held the reins of empire at home, or as ambaſſadors, repreſented their royal relatives abroad. They either generally reſided or frequently aſſembled at Rome, not only to diſcharge their duties about the perſon of the pontiff,

tiff, but to fupport the interefts of their refpective courts; and in order to attain this object the more effectually, they difplayed a fplendour and a magnificence nearly royal. The officers of their houfehold were often nobles of high rank; their fecretaries and chaplains were men of talents and bufinefs; a long train of guards, fervants, and retainers, attended their perfons when they appeared in public, and the blaze of the purple, in itfelf fo dazzling, was heightened by all the adventitious circumftances of birth, power, and opulence. The union of fo many illuftrious perfonages, vyeing with each other in talents and magnificence, gave Rome the appearance of an univerfal court, where all the fovereigns of Europe were affembled to difcufs the general interefts of Chriftendom, and to difplay their rival glories in peace and fecurity."

From this epoch the character of the pontiffs became more epifcopal and pacific, and they have chiefly been occupied with the government of the Catholic church over which they prefide, and with the civil adminiftration of their own territories, which, as we have feen, are fufficiently extenfive to engrofs their utmoft attention. The arts and fciences have at all times, but particularly in the latter centuries, met with fpecial encouragement from the popes; and Rome, enlivened by their conftant prefence, embellifhed by their munificence, and fed by the produce of feveral extenfive, populous, and well-cultivated provinces, had gradually refumed her robes of glory, and began to promife herfelf once more the return of her former dignity and profperity. "She had," fays Mr. Euftace, "been great even in her fall, and venerable in her difafters. She had ceafed to be the miftrefs of the world in arms, but fhe ftill remained the miftrefs of the world in arts; fhe was no longer the capital, but fhe was the metropolis of Europe; not the refidence of the firft fovereign, but the fee of the firft paftor. She had not been fubjected to flavery as Athens; fhe had not been reduced to a heap of ruins, as Babylon. She ftill reigned widowed, but independent; and ftill claimed and enjoyed the veneration of kings and of nations. Without fleets or armies fhe repofed in fearlefs tranquillity: public reverence, more mighty than military power, covered her head with an invifible ægis, guarded her frontiers, and fecured her repofe. Even the nations which had forfaken her communion, and in days of irritation had defied the thunders of her fulminating pontiffs, now looked towards her with refpect, and beheld with affection and reverence the benevolence, the fanctity, and the humility of her paftors. Such was the ftate of Rome during the eighteenth century; a ftate happy in the enjoyment of peace, plenty, and increafing improvement, and big with the hopes of future and accumulating profperity. The French invafion clofed the fcene. See ITALY.

Of the Prefent State of Rome.—The modern city poffeffes many features of ancient Rome. The fame roads lead to her gates—the fame aqueducts pour the fame ftreams into her fountains—the fame great churches that received the mafters of the world under the emperors, are ftill open to their defcendants—the fame venerable walls that inclofed fo many temples and palaces in the reign of Aurelian, ftill exift. Modern Rome lies extended principally on the plain, and is fcattered thinly over the hills, bordered by villas, gardens, and vineyards. Its population is fuppofed to amount to 200,000 fouls. The ftreets are well built and paved, narrower, in general, than thofe in London, and wider than thofe in Paris: the houfes being low, the ftreets are light and airy: they are many of them very long and ftraight, and not unfrequently terminated by an obelifk, a fountain, or a church. The houfes are of ftone, but plaftered or ftuccoed, as at Vienna, Berlin, &c. This city contains 46 fquares, 5 monumental pillars, 10 obelifks, 13 fountains, 22 maufoleums, 150 palaces, and 346 churches.

Of the fquares, the moft remarkable is the Piazza Navona, which gradually rofe on the ruins of the Circus Agonalis. It is adorned by the handfome church of St. Agnes, and refrefhed by three fountains decorated with ftatues. One of thefe fountains is an object of great admiration, and is thus defcribed. Four figures, reprefenting four rivers, recline on a craggy rock: on its top ftands an Egyptian obelifk; from its hollow fides rufhes a perpetual ftream. Thefe three fountains are fo managed during the heats of Auguft, as to inundate the whole fquare on Saturdays and Sundays, and afford a very refrefhing exhibition to the Roman gentry, who parade along in their carriages, and to the common people, who always collect in crowds to behold the enlivening fcene. Modern Rome is ten miles in circumference, but this extent comprehends gardens and uninhabited places, and it is defended by the caftle of St. Angelo. In the Rione di Monte is the church of St. Giovanni in Laterano, dedicated to St. John in the feventh century, and raifed on the ruins of a palace built by Conftantine, in the year 324. Near this church is the baptiftery of Conftantine, celebrated for its ornaments, its antiquities, paintings, columns, and ftatues. Before the church is an obelifk, conftructed at Thebes, in Upper Egypt, and brought down the Nile to Alexandria, from whence, by order of Conftantius, it was conveyed to Rome. The church of St. Stephen, found alfo in this part of Rome, called the *round*, from its form, is an ancient temple of Faunus; it is fupported by fixty pillars of granite or marble of the ifland of Paros. The church of the holy crofs of Jerufalem was built by Conftantine, and is celebrated for its relics, its columns, and its paintings. The ruins of a temple, dedicated to Venus and Cupid: the monaftery of St. Eufebius, built on the ruins of the baths and palace of Gordianus: Trajan's pillar, one of the moft beautiful monuments of ancient Rome: the remains of the baths of Titus, of temples dedicated to Concord, to Peace, to Jupiter Tonans, to Jupiter Stator, with many other churches, palaces, and monuments of antiquity, are to be found in this quarter of Rome.

In the Rione di Trevi is found the church of the Twelve Apoftles, firft built in the reign of Conftantine, and rebuilt by Clement XI. This ward likewife contains a church, dedicated to our Lady of Loretto, adorned with Corinthian pillars and the moft beautiful ftatues; the church of St. Mary in Trivio, built or repaired by Belifarius; the churches of St. Vincent, of Anaftafius, and many fuperb palaces. The Rione di Colonna contains, befides churches, the Piazza di Colonna, of which the buildings are handfome: in this fquare is a fountain, and a marble column of Antoninus, conftructed in the time of Commodus, and all of marble: in this ward is the great hall of Juftice; the houfe of the miffionaries, whither all ecclefiaftics of Rome retire for ten days before they receive holy orders, with feveral palaces and monuments of antiquity. The Rione di Campo di Marzo contains the ancient Campus Martius; in this are found feveral beautiful churches and magnificent palaces; among other buildings is the Clementine college, founded by pope Clement VIII. The Rione di Ponte takes its name from the bridge of St. Angelo; in it are found a college for one hundred ftudents, Hungarians and Germans. The Rione della Regola, near the Tiber, contains the Farnefe palace, in which is feen the celebrated coloffal ftatue of Hercules, and many others: this palace was built by Michael Angelo, with the ftone taken from Vefpafian's amphitheatre;

theatre; the gallery was painted by Hannibal Caracci; and the Monte della Pieta, eftablifhed in the year 1539, for the purpofe of lending money on pledges without intereft. The Rione di St. Euftachio contains the beautiful church of St. Charles aux Catinari, in which, among many others, is a beautiful picture reprefenting the death of St. Anne; the church of St. Andre de la Valle, which contains fome excellent paintings; the college de Sapienza is, perhaps, the moft celebrated in the univerfe; this magnificent building was begun under Leo X. from the defign of Michael Angelo; the palace of Juftiniani, adorned with a great number of bas reliefs, and antique ftatues; many of them found on the fpot on which were the baths of Nero, and the palace is now erected: the Theatre d'Argentina, and many other palaces, antiquities, and churches. The Rione della Pigna contains the Piazza della Rotondo, in which is a beautiful fountain of white marble, ornamented with an obelifk and dolphins, which fpout out the water. The Roman college is a vaft and fuperb edifice, built in the time of Gregory XIV. for the ftudy of the languages and fciences; here is kept the mufæum of father Kircher, and the library is well furnifhed: the church of St. Maria della Sopra Minerva, fo called from a temple of Minerva which anciently ftood there. The ward of the Rione di Campitelli, or Du Capitole, contains the Capitolinus mountain, the Palatine, and part of mount Cœlius; the church of St. Mary in Campitelli, rebuilt in the year 1656, by the people of Rome. Here are found many beautiful ftatues and pictures, by the moft celebrated mafters; the Tarpeian rock, now called Monte Caprino; the remains of the temple of Jupiter Tonans; and the church of St. Peter in Carcere; part of the prifon conftructed by Ancus Martius; the ruins of a temple of Concord; the church of our Lady of Confolation; the church of St. Sebaftian, built in the ancient Hippodrome. In this ward is found likewife the Colifeum, a fuperb building, conftructed at the command of Vefpafian, by the Jews brought from Jerufalem, and deftined for the combats of gladiators and public fpectacles. In the Rione di St. Angelo is the church of St. Angelo, which gives name to the ward, was built in the eighth century; near it is the theatre of Marcellus, built by Auguftus, and capable of holding 30,000 fpectators; the palace of Savelli, and the palace of Mattei, celebrated for the pictures and ftatues which they contain; and many others. The ward of the Rione di Ripa, on the fide of the river, includes the Aventine mountain, and the ifland of St. Bartholomew, inhabited at the time of the expulfion of the Tarquins, and then called Tiberina and Lycania; the church of St. Bartholomew was founded on the ruins of an ancient temple of Efculapius. This ifland is joined to the reft of the city by two bridges. The church of St. Nicholas in Carcere is built near the common prifon; St. George in Valebro; the arches of Septimius Severus and Janus; St. Mary in Cofmedin, built by the earlieft Chriftians, on the ruins of a temple of Modefty; St. Paul without the walls is a patriarchal church, and, next to St. Peter, one of the largeft in Rome, built by Conftantine; the immenfe ruins of the baths of Caracalla, in which it is faid 3000 perfons might bathe at one time; the grand circus; the tomb of Ceftius; the catacombs or vaults dug in the ftone or folid earth, and ufed for depofiting of the dead in this ward. The Rione di Tranftevere is on the other fide of the Tiber, and includes the mountain Janiculus; in the church of St. Peter in Montorio is the celebrated picture of the Transfiguration, by Raphael, by fome thought to be the moft perfect painting that exifts; the baths of Severus; the Naumachium of Auguftus; and the temple of Fortune. The Rione di Borgo, or Rione del Vatican; this, too, is beyond the Tiber, and is joined to the reft of the city by means of the bridge of St. Angelo, anciently Pons Œlius; in it is the caftle of St. Angelo, anciently called Moles Adriani, from its founder; it is circular, and exceedingly ftrong: here the papal crown is kept, and prifoners of ftate are confined; it communicates with the Vatican by a long covered gallery. The church of St. Peter is the chêf-d'œuvre of Italy, the largeft and moft beautiful church in the world. It was projected by Nicholas V.; Julius II. laid the firft ftone in the year 1506; but the whole building was not finifhed till the next century: it is faid to cover 20 acres, and to have coft upwards of one million fterling. The original artift was Bramante, but the greater part was from the plan of Michael Angelo, who raifed the cupola; Maderni finifhed it in the year 1621. The pavilion of the great altar of this church, and the four wreathed pillars of Corinthian brafs which fupport it, were formed out of the fpoils of the Pantheon. The Pantheon, originally dedicated to the honour of all the gods, is now a Chriftian temple, and is ftill the moft perfect of the Roman temples that now remain, and notwithftanding the depredations it has fuftained from Goths, Vandals, and Popes, is ftill a beautiful monument of Roman tafte.

The pope has three fine palaces, of which the principal is the VATICAN, which fee. The library of this palace is the largeft and moft complete in the world, rich, efpecially in manufcripts, in all languages, and all ages. In Rome, the lover of the fine arts will, after all the depredations of the French, meet with innumerable paintings by the moft celebrated mafters in the world, and with the fineft works of fculpture. Befides the univerfity, which confifts of feveral noble colleges, there are numerous academies and literary focieties.

The relative fituation of Rome, with regard to other European capitals, is as follows: it is 380 miles from Vienna, 560 from Paris, 740 from Amfterdam, 810 from London, and 900 from Madrid. It ftands within 10 miles of the Tufcan fea. Univerfal Hiftory. Holberg's Introduction. Tytler's Elements of General Hiftory. Playfair's Chronology. Gibbon's Hiftory of the Rife, &c. Encyclopédie Méthodique. Euftace's Claffical Tour, 2d edition.

ROME, *Citizen of*, at firft, was only a citizen of Rome: at length, the right of citizenfhip was given to other cities and people, both in Italy and the provinces. It was thus St. Paul was a Roman citizen, Acts, xvi. 21. 37, 38. xxii. 25, 26, 27. xxiii. 26; the city of Tarfus, in Cilicia, a native of which he was, having the right of Roman citizens. See MUNICIPAL *Cities*, and PAUL.

ROME DE L'ISLE, JOHN BAPTIST LOUIS, in *Biography*, was born, in 1736, at Gray, in Franche-Comtè. He applied himfelf, from a very early period, with earneftnefs to the ftudy of natural hiftory and mineralogy; and by his difcoveries and writings he acquired a confiderable reputation. In 1766 he publifhed "A Letter to M. Bertrand on Frefh-Water Polypes." He drew up defcriptive catalogues of many rich collections of minerals and madrepores, of which the moft diftinguifhed was that of Davila, in 3 vols. 8vo. 1767. In 1779 and 1781 he publifhed a work, entitled "L'Action de Feu central banni de la Surface du Globe, et le Soleil retabli dans fes Droits." In 1783 he publifhed that work by which he is beft known, entitled "Chriftallographie ou Defcription des Formes propres à tous les Corps du Regne minerale," 4 vols. In this elaborate performance, the author gives a defcription of the forms proper to every fubftance of the mineral kingdom, in a faline, ftony, and metallic combination; with figures of all the known cryftals, arranged according to the number and dif- pofition position of their angles. He asserts, which is generally admitted, that every species in the mineral kingdom always takes a polyhedral form, which is regular, constant, and peculiar to itself. Besides the works already mentioned, he published "Caractères extèrieurs des Mineraux," 8vo. 1784; and "Metrologie ou Tables pour servir a l'Intelligence des Poids et des Mésures des Anciens d'àpres leur Rapport avec les Poids et les Mésures de la France," 8vo. 1789. This philosopher died at Paris, in 1790.

ROMÉ, in *Geography*, a town of Brasil, in the government of Goyas; 85 miles E. of Villa Boa.

ROME, a post-town of America, in the county of Oneida, and state of New York, situated on the Mohawk river; 8 miles W. of Whitestown. This town was taken from Stauban, and incorporated in 1796. N. lat. 43° 12'. W. long. 75° 30'.

ROME *du Tarn, St.*, a town of France, in the department of the Aveiron, on the Tarn; 4 miles N. of St. Afrique.

ROME *Scot.*
ROME *Peny.* } See PETER-*Pence*.

ROMELIA, in *Geography*. See ROMANIA.

ROMELSO, a clutter of small islands on the west side of the gulf of Bothnia. N. lat. 64° 55'. E. long. 21°.

ROMENAY, a town of France, in the department of the Saone and Loire; 15 miles N.N.E. of Macon.

ROMENO, a town of the county of Tyrol; 13 miles S.W. of Bolzano.

ROMERSBERG, a mountain of Bavaria, in the principality of Aichstatt; 5 miles W. of Aichstatt.

ROMERSGEHAG, a town of Germany, in the bishopric of Fulda; 14 miles S. of Fulda.

ROMERSTADT, or ROMAROW, a town of Moravia, in the circle of Olmutz, near which are some iron mines; 20 miles E.N.E. of Olmutz. N. lat. 49° 50'. E. long. 17° 9'.

ROMESCAMPS, a town of France, in the department of the Oise; 6 miles N.W. of Grand Villiers.

ROMETTA, a town of Sicily, in the valley of Demona; 5 miles N.W. of Messina.

ROMFORD, a market-town and parish in the liberty of Havering-atté-Bower, county of Essex, England, is situated at the distance of 17 miles S.W. from the county town of Chelmsford, and 12 miles E.N.E. from London. This town is supposed by Stukeley to occupy the scite of the Roman station Durolitum. The same author conjectures that its present name is a contraction for Romanford; and in this opinion he is supported by Mr. Lethieullier. Lysons, however, derives it from the Saxon words *Rom* and *Ford*, which signify the Broad-Ford, in allusion to an ancient passage through a rivulet which flows past the western extremity of the town. Romford is first mentioned in record in the Red Book of the Exchequer; where it is said that, in 1166, Roger Bigod, duke of Norfolk, held "the wood of Romford by serjeancy, and payment of five shillings a-year." It is next noticed in 1277, at which time the manor formed part of the possessions of Adam de Cretinge. It afterwards passed to Thomas de Brotherton, earl of Norfolk, from whom it descended by marriage to the Mowbrays, dukes of Norfolk; but on the death of John, the fourth duke, without male issue, in 1477, it became vested in James, lord Berkeley. Since that period it has belonged to different families, and is now the property of a gentleman named Newman.

Romford is governed by a bailiff and wardens, who, though forming no corporation, are empowered by letters patent to hold a weekly court, for the trial of all causes, whether civil or criminal, high treason not excepted. In ecclesiastical jurisdiction, however, it is subordinate to Hornchurch, except so far as concerns the maintenance of the poor; in which particular it was recognised as a separate parish, in the year 1786. The privilege of holding a weekly market was first granted to the inhabitants by king Henry III.; but at present here are three: one on Monday, for the sale of calves; another on Tuesday, for hogs; and a third on Wednesday, for corn and cattle. There is likewise an annual fair on the 24th of June. The church or chapel of Romford is an ancient structure, and was probably erected about the commencement of the 15th century, when the inhabitants obtained a bull from the pope, authorising them to consecrate a cemetery adjoining the town, for the burial of their dead, who had, previously to that time, been carried to Hornchurch burying-ground. In this chapel were, in Catholic times, a guild and a chantry; the former of which was valued at 4*l.* 10*s.* 2*d.*, and the latter at 13*l.* annual revenue, at the era of the dissolution. The principal monuments here are those of sir George Hervey, knight, lieutenant of the Tower, who died in 1605, and his lady, both of whom are represented kneeling; and of sir Anthony Cook of Gidea-Hall, and his lady, whose effigies are exhibited in similar positions. On the latter tomb are several inscriptions in Latin, said to have been written by the daughters of the deceased, who were the most learned females of the age. Not far from the church is a charity-school for forty boys, and another for twenty girls, which were founded and endowed in 1728; and at a short distance from the western end of the town are barracks for the accommodation of a regiment of cavalry, erected in 1795. According to the population census of 1811, the parish of Romford, including the Town ward, Collier-row ward, Harold's-wood ward, and Noah-hill ward, contains 620 houses, and 3244 inhabitants.

The district called Havering-atté ward, which comprehends the three adjacent parishes of Hornchurch, Romford, and Havering, anciently constituted part of the demesnes of Saxon kings; and even to this day it possesses peculiar privileges, both as prescriptive rights, and by charter, granted by Henry IV., and since confirmed by several of his successors. Near the village of Havering-atté-Bower was formerly a palace, which tradition ascribes to king Edward the Confessor, and which subsequently became the occasional residence of more than one monarch of the Norman line. The situation of this palace is very fine, and commands extensive views over parts of Essex, Hertfordshire, Kent, Middlesex, and Surrey, as well as of the river Thames. The surrounding park, now the property of the crown, but let on lease, exceeds a thousand acres in extent. To the westward of this park, about two miles, lies Hainault-Forest, in which is a very remarkable tree, called Fairlop-oak, which Gilpin informs us, in his "Remarks on Forest Scenery," is traced by tradition "half way up the Christian era." It is generally said to be the largest tree in this kingdom, measuring 36 feet in girt near the base or root, and spreading its branches over a circumference of 300 feet. At Hempstead, in Essex, is a tree of much larger dimensions. Round the Fairlop-oak, on the first Friday in July, is held an annual fair, which appears to have originated from a gentleman, named Day, who commenced the practice of dining with his friends annually under its shade.

About a mile to the eastward of Romford is Gidea-Hall, an ancient seat of the Cook family; and near it stands Hare-Hall, a mansion formerly belonging to John Arnold Wallenger, esq. The house was built under the direction of Mr. Payne, in 1769, and is constructed of Portland stone;

ſtone; it conſiſts of a centre, with two wings, connected by colonnades. A ſmall villa in this neighbourhood, at Hare-ſtreet, is the reſidence of Humphrey Repton, eſq., diſtinguiſhed for his taſte and talents as a landſcape-gardener. He is alſo author of two or three elegant volumes on picturesque ſcenery, and the principles of taſte, as diſplayed in the embelliſhment of parks and gentlemen's manſions. His ſon, John Adey Repton, is alſo juſtly celebrated for his intimate knowledge of the principles and hiſtory of the ancient architecture of England. Four miles to the eaſtward is the village of Brentwood, or Burnt-wood, which was anciently a market-town; but this privilege is now loſt. Its former importance, however, may be conjectured from the fact of the county aſſizes having been held here for many years. The remains of the town-hall and priſon are ſtill diſcernible in the main ſtreet, which ſtretches itſelf along the Harwich road, and abounds with inns and public houſes for the accommodation of travellers. Here is a grammar-ſchool, founded in 1537 by ſir Anthony Brown. Camden ſuppoſed the Roman ſtation of Cæſaromagus to have been ſituated at or near Brentwood; but this opinion is not ſupported by any facts, or even probability.

Five miles weſtward from Romford is Wanſtead-Houſe, the ſeat of William Pole Tilney Long Welleſley, eſq., M.P., who acquired it by marriage with Miſs Tilney Long, eldeſt daughter and co-heireſs of the late ſir James Tilney Long. It is a very ſpacious and magnificent building, meaſuring 260 feet in front, and nearly 80 feet in depth. In the centre of the principal front is a grand portico, ſupported on ſix Corinthian columns, and having on each ſide a flight of ſteps, and in the tympanum the arms of the Tilney family, finely ſculptured. The houſe is divided into two ſtories, the uppermoſt of which contains the ball-room and principal apartments. Several of the rooms contain a collection of fine paintings by eminent artiſts. The gardens and pleaſure-grounds were laid out by Richard Child, previouſly to the erection of the houſe; but latterly great alterations and improvements have been made in the former, under the direction of Mr. Repton, who has very properly revived part of an old and almoſt exploded faſhion, in decorating the lawn immediately adjoining the houſe with flowers, beautiful ſhrubs, &c. to regale and "delight the ſenſes of ſeeing and ſmelling." At the ſplendid manſion of Longleat, Wiltſhire, this has been adopted on a large ſcale, and with ſingular beauty. (See WARMINSTER.) Oppoſite the back front is an eaſy aſcent, through an agreeable viſta, to the river Roding, which is formed into canals, and has near it a curious grotto, conſtructed by the ſecond earl Tilney, at an expence of 2000*l.*, excluſive of its coſtly materials. Within the park, on its ſouthern ſide, a teſſellated Roman pavement was diſcovered in the year 1735. It was about 20 feet long, and was conjectured by Mr. Lethieullier to have been the pavement of a banquetting-room. In the centre was the figure of a man, and around him a great variety of ornaments. The Hiſtory and Antiquities of the County of Eſſex, by Philip Morant, M.A., 2 vols. folio, Lond. 1767. Lyſons's Environs of London, 4to. 1796. Beauties of England and Wales, vol. v. by John Britton and E. W. Brayley, 8vo. Lond. 1803.

ROMHILD, a town of Germany, in the county of Henneberg; eight miles S.E. of Meinungen. N. lat. 50° 26′. E. long. 10° 42′.

ROMI, a town of Aſiatic Turkey, in the province of Diarbekir; 45 miles S. of Kerkiſieh.

ROMIEU, M. of Montpellier, in *Biography*, publiſhed in 1743 and 1751, what he called "A New Diſcovery of the grave Harmonics," meaning the third ſound, reſulting from the coincident vibrations of two acute ſimultaneous ſounds; a phenomenon which Tartini had diſcovered in 1714, and upon which he afterwards built his ſyſtem, or "Trattato di Muſica," publiſhed in 1754.

This diſcovery of Tartini excited the envy, not only of Romieu, but of d'Alembert, Serre of Geneva, the abbé Rouſſier, Laborde, &c. The firſt attempt was to rob him of the honour of the *diſcovery*, and then to depreciate his explanations, and the *conſequences* which he derived from the phenomenon. But it appears to us, on the moſt careful and minute enquiry, that they have egregiouſly failed in both. With reſpect to his *diſcovery*, Tartini himſelf, and his zealous diſciple count Taxis, of Venice, have clearly authenticated his title to it. (Riſpoſta di Tartini alla critica del di lui Tratt. di Muſ. Ven. 1767—et Riſpoſta di un Anonimo al Sigr. Rouſſeau circa al ſuo ſentimento in propoſito d'ahcune propoſ. del Giuſ. Tartini, Ven. 1769.)

And the long extracts given from Romieu's laboured memoir on the ſubject of his diſcovery of the *terzo ſuono*, by Laborde, in his "Eſſai ſur la Muſique," have ſo much puzzled the cauſe, that he may be truly ſaid to "explain the thing till all men doubt it," &c.

Tartini himſelf, by his notation of each *third ſound*, produced, as is ſuppoſed, by the coincident vibrations of any two ſimultaneous intervals, is clear and evident. Stillingfleet's commentary of Tartini's "Trattato di Muſica," and Rouſſeau's analyſis of his ſyſtem, do juſtice to his ingenuity and profound harmonical knowledge, without concealing his defects.

Perhaps we have no right to imagine ourſelves unprejudiced in this diſcuſſion; having been ſo long accuſtomed to regard Tartini as a great practical muſician, and an exquiſite compoſer, we may have been inſenſibly inclined to reſpect his theory, and, indeed, whatever he has produced; for what more can ſcience do for any muſician in the practice of his art, than it has done for Tartini? Has it taught his mathematical opponents, of the old French ſchool, to compoſe elegant, graceful, ſpirited, or fanciful muſic? or even informed them in what good muſic conſiſts? See TARTINI and TERZO SUONO.

ROMIEU, *La*, in *Geography*, a town of France, in the department of the Gers; five miles E. of Condom.

ROMILLY, a town of France, in the department of the Aube, and chief place of a canton, in the diſtrict of Nogent ſur Seine; nine miles E.N.E. of it. The place contains 2175, and the canton 6888 inhabitants, on a territory of 267½ kiliometres, in 15 communes.

ROMISHORN, a town of Switzerland, in the canton of Zurich; nine miles E.S.E. of Conſtance.

ROMKALA, a town of Aſiatic Turkey, in the government of Maraſch, on the right bank of the Euphrates, where the river Simeren joins it. This town has a caſtle, much ruined, which was the work of the Greek emperors, and which is ſituated at the N. end of a chain of mountains over the river. It ſtands on a path, ſeparated from the mountains, to the ſouth, by a deep foſſée cut in the rock, and originally intended, as it is ſaid, to be made ſo deep that it might be ſupplied with water by the river Simeren, and thus the place be inſulated. On the W. ſide is the aſcent, having four terraces cut in the rock, and ſituated above one another, each having a gate-way, and connected by ſteps. In the caſtle are two churches; 50 miles N. of Aleppo. N. lat. 36° 35′. E. long. 37° 45′.

ROMKERA, a town of Hindooſtan, in Viſiapour; 28 miles N.E. of Poonah.

ROMKINT, a town of Asia, in the country of Karasm; 230 miles N.W. of Samarcand.

ROMMEN, a town of Prussia, in the palatinate of Culm; eight miles S.E. of Lautenburg.

ROMMENDAL, a town of Norway; 24 miles N. of Berga.

ROMNA, a town of Russia, in the government of Tchernigov; 88 miles N.E. of Tchernigov. N. lat. 50° 36′. E. long. 33° 24′.

ROMNEY, George, in *Biography*, was born at Dalton, in Lancashire, in December 1734. His father was a native of the same place, where, upon a small patrimonial estate, he followed the threefold occupation of merchant, builder, and farmer; but as his family was large, the joint profits of his triple concerns barely afforded the means for its maintenance. At the age of 12, George was taken from the village school, where he had imbibed the rudiments of learning, and engaged by his father to superintend the workmen. He employed his leisure hours in carving, and being fond of music, made a violin for himself, which he preserved till his death.

He was first tempted to draw, from seeing some ordinary prints in a periodical magazine, which he imitated with considerable success; and his first attempt at drawing a portrait was from memory, when endeavouring to describe the features of a stranger whom he had seen at church. When he was about 15, his mind was led astray from the occupations in which his father had engaged him, by the society and conversation of a peculiar, but ingenious man, named Wilkinson, who resided at Dalton. He was afterwards placed under the care of a Mr. Wright, a cabinet-maker at Lancaster; but he, soon perceiving the turn of Romney's mind for drawing, advised his father to leave him at liberty to indulge his propensity, and become a painter. At the same time he recommended an artist of the name of Steele, as a preceptor for the youth; and with him he continued to study and practise for a short time only, in which, however, he acquired, to a certain extent, the knowledge and use of the materials of the art.

When he left Steele, and had begun to practise portrait painting as a means of subsistence, he became anxious to visit, and tempt his fate in the metropolis. He laboured therefore very hard, painting portraits at low prices, and occasionally producing pictures of historical subjects, which he disposed of by way of raffle at Lancaster. By these means he acquired a sum of nearly a hundred guineas; of which taking thirty pounds to pay his travelling expences, and leaving the remainder with his wife, he set out to put his long intended project into execution, in the year 1762.

He first resided in the city, where he painted portraits at five guineas a head, and acquired considerable practice through the friendly assistance of Mr. Braithwaite, then of the post-office. In 1764 he visited France, in company with Mr. Greene, of Gray's Inn. There he was introduced to Vernet, and, by his friendly assistance, obtained admittance to the gallery of the duke of Orleans, the Luxembourg, and other repositories of art. On his return, he took up a residence in Gray's Inn, to be near his travelling companion; and, by a picture of judge Yates, obtained favour among gentlemen of the robe, and afterwards produced many excellent pictures of persons eminent in that profession. In 1765 he obtained a prize from the Society for the Encouragement of Arts and Sciences, for an historical picture, the subject of which was the death of king Edmund. In 1768 he quitted Gray's Inn, and went to live in Great Newport-street, where he continued to advance in reputation and practice; exhibiting with the incorporated society of artists in Pall Mall, and in Spring Gardens.

Though thus rapidly gaining public respect as an artist, Romney was himself so conscious of his want of style, and the necessity of cultivating his taste by seeing the great models of antiquity, that he nobly resolved upon relinquishing, for a time, the pecuniary advantages his talents acquired him, (which now amounted to 1200*l.* a-year,) and visit Italy, where alone he could, at that time, attain the object of his desire. He accordingly arranged a plan of travel with Mr. Ozias Humphrey, a miniature painter of celebrity, and on the 20th March 1773, they set forward on their journey, through France, to Rome. There, and at other places, where the best works of art were to be found, he remained two years; leading a life recluse and studious, and making some few copies.

On his return, in July 1775, he took the house in Cavendish-square, where he resided till he retired, in 1798, from public practice, to live at Hampstead, in a house he had built; and where he hoped to recruit a weakened constitution by tranquil enjoyment, and the beneficial effects of purer air. During the preceding 20 years, Romney had enjoyed uninterrupted success in the practice of his profession, to which he was so ardently attached, that his whole delight was in it. His talents, in return, were highly esteemed, and encouraged by an immense influx of employment. He, in measure, divided the attention of the town with Reynolds, and indeed by numbers was preferred before him; but he wanted the suavity of mind and manners which his accomplished rival enjoyed. Timid and reserved, and, at the same time, ardent and enterprising, his imagination was tremblingly alive to those irritating circumstances, by which vulgarity and ignorance constantly wound the mind of the portrait painter, and subject him to mortification and disgust. The slightest appearance of coldness in a friend, or of hostility in a critic, was often sufficient to obstruct the exertions of his faculties. This timidity and reserve were the reasons that, amidst the immense crowd of persons to whom, of course, by his professional practice, he was known, there were few with whom he lived in friendly intercourse. His mind dwelt constantly on the art he delighted and excelled in, and among those only who sympathized with his peculiarities, was he happy to associate.

Romney was subject to occasional depression of spirits, which the kind attentions of his friend Hayley, and the invigorating air of the Sussex Downs, among which that friend resided, and where our painter usually spent his summer months, often partially removed. On the approach of age, he was less able to cope effectually with attacks of that nature, and they gained strength upon him to an alarming degree. In 1797 he felt a slight paralytic stroke, which affected his eye and his hand, and prevented him from continuing his professional labours. He then retired, as we have said, to Hampstead, but finding his health still decline, he, in 1799, revisited his native country; and at Kendal received from a wife, whom, though deserted for so long a space of time, he had supported, and protected from poverty, a kind and affectionate attention till his death, (which occurred in Nov. 1802,) having unhappily survived the loss of that faculty which is the distinguishing glory of man, and relapsed to the helpless state of infancy.

Of Romney, as an artist, it is by no means easy to appreciate the just character. That he possessed genius and talents in an eminent degree, no one can deny. The learned editor of Pilkington's Dictionary has said, "that he was made for the times, and the times for him." It had perhaps been more just to have observed, that Romney was made for better times than thofe in which he lived. His perception of art was far purer than moft of his contemporaries, at leaft in this country, were capable of enjoying; and it muft be remembered, that no one ever fet forth in the career of an artift under greater difadvantages than he did. The tafte he imbibed for fimplicity and grandeur, on feeing, at an advanced period of his life, the works of the ancient artifts, prove what might have been fairly expected of him, had he happily been born under more favourable circumftances; and early initiated, under good inftructors, in the myfteries of the art he cultivated with fo much fuccefs without thofe aids. Till the time he was twenty-two he had feen no better painting than the fign of a public houfe, in the place where he was born; but to his active, enterprifing fpirit, all nature was a fchool; and at an age when others are employed in laying by ftores of ideas from books, and thence forming regulations to guide their future progrefs in art, he was induftrioufly obferving and reflecting upon the grand fcenery around him, and the various characters of the objects among which he lived. Thus, the little learning he had imbibed from the few literary works he had feen was called into immediate action, and his progrefs in real knowledge became equal to what is ufually obtained in the ordinary way, with greater affiftance from books and mafters.

The purfuit of painting, however, requires a knowledge of certain rules in the arrangement of lines; of the beauty and power of contraft in light and fhade, and in form and colour; as well as of the fpeedieft and moft efficient modes of execution. This fcience, being the refult of repeated obfervations upon the principles by which Nature produces her moft agreeable and fublime effects, is moft readily obtained, by a careful infpection of good works of art wherein it is exemplified. Such advantage was not Romney's. He had to feparate for himfelf the partial, from the general effects of nature; and the inequality with which he, in this point, met the rivalry of more fortunate artifts, is too evident in moft of his productions. Frequently, his chiarofcuro is ill conducted, and his harmony of forms and colours imperfect; even in pictures produced when enjoying the height of his intellectual power, and at the happieft period of his executive fkill: at the fame time they exhibit great fertility of invention, with fweetnefs and delicacy of fentiment.

He was happily endowed with an inquifitive mind, that delighted in fcience, and purfued it warmly, with the beft means he had: and he poffeffed a verfatility of genius, which is exemplified by the variety of fubjects he chofe for reprefentation. Both the comic and ferious impreffions of the mind had charms for him. Early in life he painted two pictures from Triftram Shandy; one, of the arrival of Dr. Slop at Shandy-hall, after the unlucky cataftrophe he met with on the road; which afforded fcope for fentimental comic humour; the other from the affecting ftory of the death of Le Fevre: both of them were highly approved for truth and propriety of feeling and expreffion, though differing fo widely in their effects upon the mind. His journey to Italy expanded his view of art: new fcenes, and new fources of information, were prefented to him, of which he did not neglect to avail himfelf. The works of fancy he produced after his return home exemplify the ufe he made of the two years he fpent among the unrivalled productions of art he there met with. The purity and perfection of ancient fculpture appear to have made the deepeft impreffion upon his mind: and he afterwards affiduoufly cherifhed the tafte he then imbibed, by procuring a collection of cafts from the beft models of ancient ftatues, groups, baffo-relievos, &c. which he would fit by the hour to contemplate; examining their appearances under all changes of fun-fhine, and common day-light; and with lamps, prepared on purpofe, he would try their effects in various modes of illumination, with rapturous delight. Hence, grandeur and fimplicity became the principal objects of his ambition; he perceived thefe qualities diftinctly, and employed them judicioufly; even whilft imitating nature in his moft ufual occupation,—portrait painting. To prefent his figure, or tell his ftory, with fimple undifturbed effect, rejecting all unneceffary minutiæ, was the point he aimed at and obtained.

On his return from the continent, his zeal for hiftorical painting revived, or rather became ftrengthened. In feveral epiftles to Mr. Hayley, he laments his confinement to portraits: in one he fays, "this curfed portrait painting, how I am fhackled with it! I am determined to live frugally, and cut it fhort as foon as I can." In another, he mentions his "wifh to be retired, in order to compofe with more effect and propriety." And whenever he returned to London from Eaftham, the hofpitable retreat of his admiring correfpondent and friend, whofe playfulnefs of fancy was a conftant and ufeful ftimulus to Romney's dejected and defponding mind, he felt it a weight of drudgery again to fall into the trammels of portraiture: yet from the enjoyment he by nature found in the practice of his profeffion, a fhort time inured him afrefh to it, and ftill he felt pleafure in tracing the features of each new face that prefented itfelf; till again his exhaufted frame required the exhilaration of retirement, and the refrefhment afforded by pure uncontaminated air, free from the grofs vapours that hover in the region of a great and populous city. It is not a little furprifing, that amidft his continual labours in that branch of the art he more immediately profeffed, he fhould have found time to produce fo great a number of fancy pictures as he left behind him. He alfo frequently fpent his evenings in making large cartoons in charcoal, of fubjects which fuited his fancy;—generally of a fublime caft. Amongft thefe, was one of the dream of Attoffa, from the Perfian of Æfchylus, which was conducted with the tafte and feeling of the ancient Greek artifts.

He was in general fortunate in the choice of his hiftorical fubjects; and certainly, in this refpect, had far the advantage of his great rival, fir Jofhua Reynolds: and no lefs fo in the power of expreffion, which he fcarcely ever failed to obtain: whilft the latter, in his hiftorical pictures, has rarely been fo happy. Reynolds gave beauty and grace to his figures: Romney imparted foul. The former delights the eye with the harmony and richnefs of colour, and beauty of effect; the latter thrills and gratifies the heart with truth and force of expreffion, in action and countenance; wrought with more fimplicity, but with lefs art. His picture of Ophelia feated upon a branch of a tree, the breaking of which threatens her deftruction in the ftream below, whilft the melancholy diftraction vifible in her lovely face accounts for her apparent infenfibility to danger, is a fufficient proof of this affertion. His compofition alfo of "Titania and her Indian Votarefs," in the poffeffion of Mr. Beckford; "Titania, Puck, and the Changeling," at fir John Leicefter's, and others of his works of the like playful and interefting kind, might be brought forward to fupport it. In portraiture, however, the juftly exalted prefident of the Royal Academy ftood alone, and Romney was not able to cope with him. In the compofition of his figures, our artift exhibited the tafte he had acquired by the ftudy of the antique; and he admirably varied the characters of his heads. The arrangement of drapery which he adopted, partook largely of the fame ftyle; and being well underftood, was painted with great dexterity;

dexterity; though it muſt be confeſſed, that in form, it was not unfrequently better adapted to ſculpture than to painting. His ſtyle of colouring was ſimple and broad. In that of his fleſh he was very ſucceſsful; exhibiting a great variety of complexion, with much warmth and richneſs. It was not always, however, that his pictures were comp!... in the general tone; but crude diſcordant colours were ſometimes introduced in the back-grounds, which not being blended or broken into uniſon with the hue of the principal figures, interrupted the harmony of the whole. The executive part of his works was free, learned, and preciſe, without being trifling or minute, poſſeſſing great ſimplicity, and exhibiting a purity of feeling conſonant with the ſtyle of his compoſitions. He aimed at the beſt of all principles in the imitation of nature, *viz.* to generalize its effects; he even carried it ſo far as to ſubject himſelf to the charge of negligence in the completion of his forms: but the truth of his imitation is ſufficiently perfect to ſatisfy the minds of thoſe who regard nature ſyſtematically, and not individually, or too minutely. In a word, every lover of art who knows how to appreciate truly what is moſt valuable in painting, will hold the name of Romney in increaſing eſtimation, the more frequently and impartially he examines his productions.

ROMNEY, *New*, in *Geography*, one of the Cinque-ports, locally ſituated, partly within the liberty of Romney Marſh, partly within the level of Walland Marſh, and partly in the lower half hundred of St. Martin's Pountney, lathe of Shepway, county of Kent, England. It is diſtant 37 miles S.E. from Maidſtone, and 71 miles S.E. by E. from London. This town is deſcribed as having riſen from the ruins of Old Romney, at leaſt a century previous to the Norman conqueſt. Subſequent to that event, it was beſtowed by king William I. on Odo, biſhop of Baieux, and earl of Kent, and was declared to be privileged as one of the Cinque-ports, having Old Romney, Lydd, Dengemarſh, and Oſwardeſtone, and part of Promhill pariſh, annexed to it as members, which were to ſend out jointly five veſſels of war, with twenty-one men and one boy to each of them. At this period, and for many years afterwards, New Romney was a very flouriſhing place. It was divided into twelve wards, and contained within its liberty five pariſh churches, a priory, and an hoſpital for the ſick. In the reign of Edward I., however, a great part of it was deſtroyed by a dreadful tempeſt and convulſion of nature, which likewiſe choaked up its haven, and thereby prevented its revival as a commercial and ſhipping town. When Henry VIII. aſcended the throne, the ſea had retired from it nearly two miles, and all its churches were demoliſhed, except that of St. Nicholas, which is ſtill ſtanding. Henry therefore united the whole liberty into one pariſh, as it continues at the preſent day.

In very early times the Cinque-ports were enfranchiſed with various privileges and cuſtoms, though of what antiquity they are, or when ſo enfranchiſed, has not been determined with any certainty; they are held therefore to enjoy their privileges by preſcription, though theſe were confirmed by Magna Charta, and ſince by a charter of king Edward I. New Romney, as one of theſe ports, is conſequently a corporation by preſcription; but in Edward III.'s time it was incorporated by charter, firſt by the ſtyle of "barons of the town and port of New Romney," and afterwards by that of "jurats and commonaltie of the town and port of New Romney." Queen Elizabeth again incorporated this town, and under her charter the corporation now conſiſts of a mayor, twelve jurats, a chamberlain, recorder, town-clerk, and twenty-ſix common council-men. The mayor, who is coroner by virtue of his office, is choſen on Lady-day, yearly; and together with the jurats, who are the excluſive juſtices within the liberty, hold a court of general ſeſſions of the peace and gaol delivery, and alſo a court of record. Romney returns two members to parliament, who are uſually ſtyled barons, and are elected by the mayor, jurats, and freemen. The firſt return mentioned on record, is in the forty-ſecond year of Edward III. ſoon after its ſeparate incorporation.

The town of Romney ſtands on elevated ground in the centre of a marſhy country. It conſiſts principally of one broad well-paved ſtreet, interſected by a ſecond, in which the hall or brotherhood houſe is ſituated, where the mayors, jurats, and commons of the Cinque-ports, and of the two ancient towns of Rye and Winchelſea, uſually keep their court, called the brotherhood; but as it is too ſmall for the purpoſe, the court called the Gueſtling, or Geſling, is held in the church. The market-houſe ſtands in the main ſtreet, and is a modern ſtructure. The day on which the market is held is Saturday, weekly; beſides which there is an annual fair on the 22d of Auguſt. The church of St. Nicholas is an ancient ſtructure, and conſiſts of three aiſles and three chancels, with a ſquare tower at its weſtern extremity. The columns ſeparating the aiſles are maſſive, and ſupport circular arches with zigzag and billeted mouldings. The weſt door-way under the tower is likewiſe formed by a circular arch, ſimilarly ornamented. Within this edifice is a great variety of monumental erections, chiefly in memory of perſons who have been mayors and jurats of the town. Anciently the church of New Romney belonged to the abbot and convent of Pontiniac, in France, who had a cell or priory here, which was ſuppreſſed by king Henry V. Here was alſo an hoſpital for lepers, founded and endowed by Adam de Cherryng in the time of king Henry II. There was likewiſe a houſe called St. John's houſe in this town previous to the reign of Edward IV. The only charitable inſtitution now in the pariſh is an hoſpital and ſchool-houſe for the reſidence of a ſchoolmaſter and four poor perſons. According to the population cenſus of 1811, New Romney pariſh contained 159 houſes, and 841 inhabitants.

Old Romney is ſituated two miles to the weſtward of New Romney, of which it is a member. This place is ſaid to have been anciently of much importance, and to have conſtituted one of the original Cinque-ports. Here, in the times of the Romans and of the Saxons, was a commodious haven for ſhipping, but the ſea deſerting it occaſioned the decay of the town. Somner conjectures, that the Portus Lemanis of Antoninus was ſituated either at Old or at New Romney; but this opinion is contradicted by later antiquaries, who fix that ſtation near Stutfal caſtle, at the baſe of Limne hill. Old Romney now conſiſts only of about twenty houſes, with a church, which is an ancient building in the maſſive circular ſtyle. In the north chancel is a very old tomb, with a vault underneath, but there is no inſcription to identify its poſſeſſor. The font is rudely ſculptured, and is ſupported on four ſtone pillars.

Romney Marſh is an extenſive level of the richeſt paſture land in England, ſituated between the upland hills and the ſea-ſhore. This diſtrict meaſures about ten miles in length and five in breadth. It comprehends four diviſions, all under different juriſdictions and conſtitutions, *viz.* Romney Marſh, ſtrictly ſo called; Walland Marſh; Dengemarſh, with Southbrooks; and Guildford Marſh, part of which is within Suſſex. Vaſt flocks of ſheep and herds of black cattle are paſtured here. The bullocks of this Marſh are reckoned the largeſt in England, and the ſheep equal to thoſe of Leiceſterſhire and Lincolnſhire. So careful

were

were our ancient monarchs of this fertile diſtrict, that they granted to the inhabitants various important privileges. Edward IV. incorporated the towns of Lydd and Romney, with nineteen pariſhes, by the title of the bailiff, twenty-four jurats, and the commonalty of Romney Marſh; but the inhabitants exerciſed many privileges for ſeveral centuries anterior to that era. Under the above charter the bailiff, jurats, and commonalty, are empowered to hold a court every three weeks, and to decide on all pleas of action real and perſonal, civil and criminal. They are likewiſe empowered to chooſe four juſtices of the peace of their own, yearly, beſides the bailiff, who poſſeſſes ſimilar authority *ex officio*. They have nothing, however, to do with the ſuperintendence or management of the embankments and drainage, which by ancient cuſtom is veſted in the lords of twenty-three neighbouring manors, who appoint a bailiff as chief ſupervifor of the works, who is commonly, though not always, the ſame perſon with the bailiff under king Edward's charter. The courts are held in a new hall, in Dimchurch; and at a general one holden on Whit-Thurſday, all ſcots and levies, which on an average of years amount to two ſhillings annually, are paid. Romney Marſh is protected from encroachments of the ſea by a wall of great ſtrength, called Dimchurch wall, which extends ſomewhat more than three miles in length. This wall forms the only highway for carriages along its whole extent, on the road between Hithe and Romney. It meaſures from twelve to twenty feet in height above the level of the Marſh; and from fifteen to thirty feet in breadth at its ſummit. "The drainage," ſays Marſhall, in his Rural Economy of the Southern Counties, "is effected by arched ſluices paſſing under the bank; each having two pair of flood-gates, one on the outſide, the other on the inſide, to provide againſt accidents to the outer pair. Theſe gates permit the interior waters to paſs off when the tide is low; and prevent thoſe of the ſea from entering at high tide." The Hiſtory and Topographical Survey of the County of Kent, by Edward Haſted, eſq. F.R.S. and S.A. 8vo. edit. Canterbury, vol. viii. A New Topographical, Hiſtorical, and Commercial Survey of the Cities, &c. of Kent, by Charles Seymour, 8vo. Canterbury, 1776. Beauties of England and Wales, vol. viii. by E. W. Brayley, 1807.

Romney, a poſt-town of America, the capital of Hampſhire county, in Virginia, ſituated on the W. bank of the S.W. branch of the river Patowmac; 50 miles W. by N. from Wincheſter. It contains about 30 houſes, a brick court-houſe, and a ſtone gaol.

ROMONT, a town of Switzerland, in the canton of Friburg, and capital of an extenſive bailiwick, which was formerly a county; nine miles N.W. of Friburg.

ROMOPOCK, a town, or rather village, of Bergen county, in New Jerſey, on a river of the ſame name, 15 or 20 miles N. of Patterſon.

ROMORANTIN, a town of France, and principal place of a diſtrict, in the department of the Loire and Cher; ſeven miles S.S.E. of Blois. The town contains 5730, and the canton 10,276 inhabitants, on a territory of 330 kiliometres, in 10 communes. Its manufactures conſiſt of fine cloths and ſerges. N. lat. 47° 22′. E. long. 1° 49′.

ROMORSWALDE, a town of Pruſſia, in the province of Ermeland; five miles N.N.W. of Heilſberg.

ROMPEE, or Rompu, in *Heraldry*, is applied to ordinaries that are repreſented as broken; and to chevrons whoſe upper points are cut off. He beareth a chevron rompee, between three mullets, argent, by the name of Sault.

ROMPION, or Rampion, in *Botany*. See Campanula *Rapunculus*.

ROMPNEY, in *Geography*. See Remney.

ROMPONESCO, a town of Italy, on the Po; 20 miles S. of Mantua.

ROMRA, a town on the W. coaſt of the iſland of Lombock. S. lat. 8° 15′. E. long. 115° 54′.

ROMROD, or Rumroth, a town, with a caſtle, of Weſtphalia, in the principality of Heſſe; 16 miles E. of Marburg.

ROMSDAL, a town of Norway, and capital of a diſtrict or provoſtſhip, in the dioceſe of Drontheim; 100 miles S.S.W. of Drontheim. N. lat. 62° 28′. E. long. 7° 54′.

Romsdal *Bay*, a bay or river of the North ſea, on the coaſt of Norway, 20 miles long, with ſeveral branches. N. lat. 62° 40′. E. long. 7° 45′.

ROMSEY, or Rumsey, a market-town and pariſh in the lower half hundred of King's Sombourne, Andover diviſion of the county of Southampton, England, is ſeated in a flat diſtrict, watered by the river Teſt, or Anton, at the diſtance of 8 miles S.W. from the town of Southampton, and 73 miles S.W. by W. from London. The town is of conſiderable antiquity, and probably derived its origin, as it certainly did its early importance, from an abbey founded here by Edward the Elder, and afterwards filled with Benedictine nuns by his ſucceſſor, king Edgar. The firſt abbeſs of this monaſtery was Elfleda, the daughter of a Saxon nobleman, named Ethelwold, who had greatly contributed to its original eſtabliſhment, and whom ſome authors, therefore, deſignate as its founder. This lady was afterwards canonized, and conſtituted one of the patron ſaints of the abbey. She was ſucceeded in her office by ſeveral females of royal birth, and diſtinguiſhed for the ſanctity of their lives. In the year 992, Romſey and its monaſtery were plundered by the Danes; but the nuns and moſt of their valuables had been previouſly removed to Wincheſter, by order of the abbeſs Elwina. The buildings were ſoon reſtored, and the nuns replaced. In 1085, Chriſtina, couſin to king Edward the Confeſſor, took the veil here, and was ſubſequently entruſted with the education of Matilda, daughter of Malcolm, king of Scotland, afterwards conſort to Henry I. Mary, daughter to king Stephen, likewiſe became a nun in this abbey; but afterwards renounced the veil, and married Matthew, younger ſon of Theodoric, earl of Flanders; an event which called forth all the thunders of the Vatican againſt herſelf and her huſband. The benefactors to this monaſtery were numerous; and previouſly to the diſſolution, its revenues were eſtimated, according to Dugdale, at the annual value of 339*l.* 10*s.* 10$\frac{1}{2}$*d.*; but Speed ſtates their amount at 528*l.* 8*s.* 10$\frac{1}{4}$*d.* Of the buildings which belonged to it ſcarcely a veſtige remains, except the church, which is ſtill uſed for divine ſervice.

Romſey is governed by a corporation, conſiſting of a mayor, recorder, ſix aldermen, and twelve burgeſſes, beſides inferior officers. The petty ſeſſions for Romſey diviſion of the hundred are held here. The market-day is Saturday, weekly; and there are fairs on Eaſter Monday, every Tueſday fortnight after 31ſt July until Chriſtmas, 26th Auguſt, and 8th November. Formerly this town poſſeſſed a conſiderable woollen trade, but that is now greatly diminiſhed, and is in part ſupplied by paper-works, and a ſacking manufactory. The chief public buildings here are the audit-houſe, which is a large ſquare building, ſtanding on piers, near the centre of the town; a town-hall; the pariſh church; and a large meeting-houſe for Preſbyterians, built about ten years ago. The church, which alone de-

ſerves

ſerves particular notice, was formerly annexed to the abbey. The whole preſents a ſeries of intereſting ſtudies and details to the architectural antiquary. It conſiſts of a nave, with aiſles, a north and ſouth tranſept, a choir, or chancel, with aiſles, three ſmall chapels or oratorios at the eaſt end, where is alſo an aiſle, two ſmall ſemicircular chapels at the angles of the tranſepts with the choir, and a low tower riſing on four lofty arches, at the interſection of the tranſepts with the nave and choir. The eaſtern part of the church is certainly the moſt ancient, and is ſaid by Dr. Latham to have been erected anterior to the Norman conqueſt. At the weſt end are ſome arches of a later age, probably about the era of king Stephen. In the ſouth tranſept is an ancient ſtatue of a female, probably one of the nuns. Near the ſouth door is a crucifixion in bold baſſo relievo, cloſe to which is a ſquare niche, or cupboard, in the wall. At the eaſt end of the north and ſouth aiſles of this church are two pillars, the ſculptures on the capitals of which form the ſubject of ſome papers in the 14th and 15th volumes of the "Archæologia." That in the north aiſle exhibits four human figures, beſides two birds, a horſe, and ſeveral mutilated bodies, &c.; the whole repreſenting a field of battle. Two of the human figures are crowned, and one of them holds the other by the beard. Both have ſwords in their right hands, and ſeem in the act of ſtriking with them; but each is reſtrained by a winged figure ſeizing his ſword. To the right, at bottom, is a horſe ſaddled; and in each corner, above, a bird of prey, loaded with mangled limbs, many of which are likewiſe diſperſed in various places. The oppoſite pillar to this repreſents a more peaceable ſcene. In the centre ſtands a crowned perſonage in a looſe robe. On the left is another crowned man, ſitting bare-legged, and ſupporting one ſide of an angular label, the other ſide of which is held by a winged figure; and on the right is a ſimilar label, held by two ſitting figures habited in mantles. The legend on the firſt label is "Robert me-fec';" and that on the ſecond, "Robert tute conſule + D.S." Dr. Latham makes the former refer to the battle and conſequent peace between king Alfred and Guthrum, the Daniſh chief, who oppoſed him; and the latter to the foundation of the monaſtery. The figures of the two kings he ſuppoſes to repreſent Edward and Edgar; and the legend to mark the name of the conſularius, or maſter maſon of the buildings. Other capitals in this church are alſo ornamented with ſculptured figures, &c. (See Carter's "Ancient Sculpture and Painting," folio.) Some ancient tomb-ſtones commemorate the names of abbeſſes buried beneath; and there is alſo a flat ſtone in remembrance of the celebrated ſir William Petty, author of "A Treatiſe on Taxes and Contributions," "A Survey of Ireland," and ſeveral other works, who died in 1687. He was the ſon of a clothier at Romſey, and anceſtor to the preſent marquis of Landſdown. Another eminent native of this town was Mr. Giles Jacob, author of Jacob's Law Dictionary, and of a work, entitled "Lives and Characters of Engliſh Dramatic Poets." According to the parliamentary returns of 1811, Romſey pariſh, including Romſey Infra et Extra, contained 933 houſes, and 4297 inhabitants.

About half a mile to the ſouth-weſt of Romſey is Broadlands, the ſeat of lord viſcount Palmerſton, whoſe father, the late lord, purchaſed it from the family of St. Barbe, which had poſſeſſed it for more than two centuries. The houſe is embelliſhed with a fine collection of paintings, by the moſt eminent maſters. Paultons, a ſeat of lord viſcount Mendip, is ſituated about three miles to the ſouth-eaſt. The houſe is not remarkable, but the grounds, which extend five miles in circumference, diſplay the taſte and ſkill of the celebrated Brown. Near this manſion is Tatchbury Mount, which tradition reports to have been the ſcite of a royal hunting ſeat; but it appears more probable that it has been an ancient military ſtation. The vallations are ſtill clearly diſcernible on the declivity of the hill. Beauties of England and Wales, vol. vi. 8vo., by John Britton and E. W. Brayley. Archæologia, vols. xiv. xv.

ROMSOE, a ſmall iſland of Denmark, in the Great Belt, near the coaſt of Funen. N. lat. 55° 30′. E. long. 10° 48′.

ROMULEA, in *Botany*, a name given by Maratti, in honour of the founder of Rome, to the Linnæan *Ixia Bulbocodium;* which Mr. Ker, in ſeparating with other ſpecies, from *Ixia*, has thought proper to call *Trichonema;* nor ſhall we, by any means, contend for the above, though the original appellation of this genus. See Trichonema.

ROMULUS, in *Biography*, founder and firſt king of Rome. See Rome.

Romulus, in *Geography*, a military townſhip in the ſtate of New York, in Cayoga county, between Seneca and Cayoga lakes. Its northern part is croſſed by the road to the ferry at Cayoga lake. The townſhip was incorporated in 1794, and comprehends, within its juriſdiction, the townſhips of Janus and Galen, and that part of the lands reſerved to the Cayoga nation of Indians, W. of Cayoga lake. Its number of inhabitants is 1025.

ROMUNDA, a mountain of Carinthia; 6 miles S. of Mautten.

RON, a ſmall rocky iſland of Denmark, in the Little Belt. N. lat. 55° 7′. E. long. 9° 55′.

Ron, *Lynder*, a cluſter of ſmall iſlands in the Categat; 12 miles S. from the iſland of Leſoe.

RONA, one of the weſtern iſlands of Scotland, is ſituated about ſixteen leagues N.W. from the Butt of Lewis, and is ſuppoſed to lie fartheſt to the N.W. of any land in Europe. It is about a mile in length, and half a mile in breadth; and is included in the pariſh of Barvas, in the iſle of Lewis. In this iſland is an ancient chapel, which is fenced round with a ſtone wall, and is kept clean and in good repair by the inhabitants. On the altar lies a large plank of wood about ten feet long, having as many holes in it, each pegged with a ſtone, to which the natives aſcribe many virtues, particularly the promotion of ſpeedy delivery to a woman in travail. The products of Rona are a few cows and ſheep, and a ſmall quantity of barley and oats. The cuſtom of walking round a perſon ſunways, to whom it is intended to expreſs high eſteem, is yet practiſed by the natives of Rona, all of whom are employed as ſervants by the tackſman of the iſland, which was let on leaſe about fifteen years ago for the annual rent of four pounds. A Deſcription of the Weſtern Iſlands of Scotland, by M. Martin, 1716, 8vo. Carliſle's Topographical Dictionary of Scotland, 4to. 1813. The Statiſtical Account of Scotland, &c. by ſir John Sinclair, bart. vol. xix. Edin. 8vo. 1797.

RONABEA, in *Botany*, an unexplained name, Aubl. Guian. v. 1. 154. t. 59. Juſſ. 205. Lamarck Illuſtr. t. 166. This ſuppoſed genus appears, as Juſſieu points out, ſo very near Pæderia, ſee that article, that we cannot conſider them as diſtinct. Still, without examination of ſpecimens, we durſt not poſitively treat of it under that head. Aublet deſcribes two ſpecies, *R. latifolia* and *erecta;* ſhrubby plants of Guiana, of no remarkable properties, the firſt with a twining *ſtem*, the other erect. The *flowers* are ſmall and axillary.

RONALDSAY, North, in *Geography*, the moſt northerly of the Orkney iſlands, Scotland, is ſo called to diſtinguiſh it from South Ronaldſay, the ſubject of the next article, to which, however, it bears no ſort of reſemblance.

It

It is ſeparated from the iſle of Sanday by a rapid and dangerous frith, two miles in breadth, and contains an area of four ſquare miles in extent, which ſupports about 500 inhabitants. The whole iſland is flat, and little raiſed above the level of the ocean, which rendered it peculiarly dangerous to navigators, previous to the erection of a lighthouſe on its north-eaſtern extremity. It is nevertheleſs dry and healthy, and produces both corn and graſs of excellent quality, and ſufficient to ſupply the home conſumption. The inhabitants are ſober, honeſt, and induſtrious, beyond the generality of the Orkney iſlanders. In winter, their chief occupation is the care of their cattle and crops, and fiſhing, when the weather will permit their venturing to ſea. In ſpring they are employed on the land, as in other places; and when ſummer arrives, almoſt every individual is actively engaged in the manufacture of kelp, of which they make about 120 tons every year. Near the centre of the iſland is a ſingle ſtone monument, ten feet high, and four broad, round which it is cuſtomary for the inhabitants to aſſemble annually, on the firſt day of January, to uſher in the new year with the ſong and the dance. Tumuli are numerous, one of which, on being opened, "was found to contain a building of nine feet in diameter, circular on the outſide, and ſquare and hollow within, in the bottom of which was a well, and in the upper part the ſkeleton of a man in nearly an upright attitude." Hiſtory of the Orkney Iſlands, by the Rev. Dr. Barry; ſecond edition, by the Rev. James Headrick, 4to. Lond. 1808.

Ronaldsay, *South*, one of the Orkney iſlands, Scotland, is ſituated to the ſouthward of the Mainland of Orkney, at the diſtance of ſeven miles from Duncanſby Head, in Caithneſs. In ſuperficial extent it contains about eighteen ſquare miles; and its inhabitants amounted to 1631 in the year 1811. The greater part of this iſland is very well cultivated; and is equally fit for corn and paſture. Of the former, a larger quantity is raiſed than can be conſumed at home, and hence a conſiderable exportation takes place to the Mainland. The bowels of the earth contain lead ore, of which a very promiſing vein has been diſcovered at Grimneſs Head, and another at Widewall. The ſhores abound with kelp, which is a ſource of great wealth to the inhabitants; and the ſea affords fiſh in vaſt numbers, and of the beſt quality. An Engliſh company employs about twenty veſſels in carrying cod-fiſh and lobſters to the London market. This iſland is excellently furniſhed with harbours: for, beſides ſeveral places where ſhips may anchor for a time, it has the ſafe and commodious road of St. Margaret's Hope on the north, and the bay of Widewall on the ſouth. Here are alſo ſome intereſting objects of antiquity. On the ſummit of a hill, near Stow's Head, are the remains of a monument compoſed of three upright ſtones, placed in a triangular form, but only one of them is now ſtanding. Another ſtone monument is ſituated in the beautiful vale of Paplay. It conſiſts of a ſingle block of ſtone, ſixteen feet high, and deſtitute of all marks of human art, by which to diſcriminate its uſe. Similar ſtones of ſmaller dimenſions may be ſeen in other parts of the iſland, which likewiſe affords a number of tumuli, and ſeveral of thoſe buildings uſually called Picts-houſes; alſo the ruins of ſome Catholic chapels and chantries. Hiſtory of the Orkney Iſlands.

RONAY, one of the weſtern iſles of Scotland, is ſituated between the Mainland and the Iſle of Skye. It is about four miles in length, and two in breadth; and has a more level ſurface, and greater fertility of ſoil, than moſt iſlands of the Hebrides; but its cultivation is much neglected. On the weſtern ſide of the iſland is an excellent harbour for ſhipping; and round the coaſt the ſea has hollowed out ſeveral caves, ſome of which afford fine ſpecimens of ſtalactites. Carliſle's Topographical Dictionary of Scotland, 4to. 1813. Sinclair's Statiſtical Account of Scotland, vol. xvi. 8vo.

RONCA *de Scaglia*, a town of Italy, in the department of the Panaro; 20 miles S. of Modena.

RONCADOR, an iſland in the Caribbean ſea. N. lat. 13° 45'. W. long. 79° 30'.

Roncador, or *Rum Key*, one of the ſmaller Bahama iſlands. N. lat. 23° 26'. W. long. 75° 3'.

RONCAGLIA, Francesco, in *Biography*, an Italian opera ſinger, with a ſoprano voice, who arrived in England in 1777 as firſt man in our lyric theatre, when Sacchini was here, and the Danzi, afterwards madame Le Brun, was firſt woman.

Roncaglia had a beautiful face, and elegant figure; a ſweet-toned voice; a chaſte and well-diſciplined ſtyle of ſinging; hazarded nothing, and was always in tune. The beſt part of his voice, which was a ſoprano, was from D to A; he ſometimes went to C, but not eaſily. Both his voice and ſhake were feeble; and of the three great requiſites of a complete ſtage ſinger, pathos, grace, and execution, which the Italians call *cantabile*, *grazioſa*, and *bravura*, he was in perfect poſſeſſion of only the ſecond. As his voice, though of an exquiſite quality, was by no means powerful, and little more than a *voce di camera* (more ſuited to a room than a ſpacious theatre), his ſinging at concerts, when confined to the *grazioſa* ſtyle, left nothing for an audience to wiſh. He was of the Bologna ſchool, formed by Piſtocco and Bernacchi, and reminded his hearers of one of their beſt ſcholars, Guarducci.

Roncaglia remained here two ſeaſons, and was ſucceeded by Pacchierotti.

Roncaglia, in *Geography*, a town of Italy, in the duchy of Piacenza; 8 miles E. of Piacenza.—Alſo, a town of the county of Tyrol; 14 miles N.E. of Trent.

RONCARUOLO, a town in the duchy of Piacenza; 4 miles E.N.E. of Piacenza.

RONCAU, a town of the iſland of Dominica.

RONCEVALLOS, a town of Spain, in Navarre, ſituated in a valley of the ſame name, between Pamplona and St. Jean Pie de Porte. This valley has been celebrated in romance for the defeat of the emperor Charlemagne, and the death of Roland; 14 miles N.N.E. of Pamplona.

RONCHAMPS, a town of France, in the department of the Upper Saone; 5 miles E. of Eure.

RONCHAUX, a town of France, in the department of the Doubs; 3 miles S. of Quingey.

RONCIGLIONE, a town of Italy, and capital of a county, to which it gives name, in the Patrimonio; 10 miles S. of Viterbo. N. lat. 42°. E. long. 12° 8'.

RONCINA, a town of Auſtria, in the county of Goritz; 5 miles N. of Goritz.

RONCO, a town of the Ligurian republic; 15 miles N. of Genoa.

RONCOFERRATO, a town of Italy, in the department of the Mincio; 7 miles E. of Mantua.

RONCOFREDDO, a town of Italy, in the department of the Rubicon; 9 miles W. of Rimini.

RONDA, a town of Spain, in the province of Grenada, ſituated on a fertile ſpot, which ſupplies Cadiz with all kinds of fruit and vegetables. The ſoil, which is of a reddiſh colour, abounds with pebbles, and reſiſts the action of fire; and it is therefore uſed in furnaces for fuſing iron. The adjacent country is famous among other curioſities for that ſpecies of Viverra, called Genette (ſee Viverra); and alſo for wild bulls, wolves, and other ferocious animals: its rocks ſerve alſo as a retreat for eagles, oſpreys, and kites; 35 miles W. of Malaga. N. lat. 36° 45'. W. long. 5° 15'.

RONDE, or Rhonds, a ſmall iſland of the Weſt Indies, near the north coaſt of the iſland of Grenada. It has about 500 acres of excellent land, employed in paſturage, and the cultivation of cotton.

Ronde *Haye, La*, a town of France, in the department of the Channel; 6 miles N. of Coutances.

Ronde, Fr., in *Muſic*, a ſemibreve. See Time-table, and *Muſical* Characters.

Ronde *de Table*, Fr. a kind of *chanſon à boire*, or drinking ſong, with a *refrain*, or burden to it, and generally mixed with ſentiments of gallantry, compoſed of different ſtanzas, which are ſung by turns at table, and in which all the gueſts join chorus in the refrain.

RONDEAU, Fr., an air of two or more ſtrains, always returning to, and finiſhing with the firſt. In order to do this in an artful, pleaſing manner, the modulation ſhould paſs into ſome key relative to that of the firſt ſtrain.

Rouſſeau has very juſtly cenſured the writing and ſetting vocal rondeaus, in which the thought is begun in one ſtrain, and continued or ended in another; or begins with a ſimile, of which the application is made in the ſecond ſtrain.

The term *rondeau*, derived from *rondel*, is of great antiquity in France. In old Engliſh it was called a *roundelay*.

But Rouſſeau, after pointing out poetical and muſical defects in the compoſition of rondeaux, indicates the means of avoiding both. "Whenever a ſentiment, expreſſed in the firſt ſtrain, ſuggeſts a reflexion which confirms and enforces it in the ſecond; whenever a deſcription of the ſinger's ſtate of mind is the ſubject of the firſt ſtrain, and illuſtrates a ſimile in the ſecond; whenever an affirmation in the firſt ſtrain, contains its proof and confirmation in the ſecond; every time, in ſhort, that the firſt ſtrain contains a propoſition to perform ſome action, and a reaſon for it is given in the ſecond; in theſe, and ſimilar caſes, a rondeau will be always well placed."

RONDEL, in *Fortification*, a round tower, ſometimes erected at the foot of a baſtion.

RONDELETIA, in *Botany*, was ſo named by Plumier, in memory of William Rondelet, a phyſician of Montpellier, who died chancellor of that univerſity in 1566, aged fifty-nine. He is moſt celebrated for his work on Fiſhes; but his ſtudies were much directed to Botany, ſo far as concerned the Materia Medica; and he is ſaid to have deeply inveſtigated the writings of Dioſcorides.—Plum. Gen. 15. t. 12. Linn. Gen. 90. Schreb. 120. Willd. Sp. Pl. v. 1. 930. Mart. Mill. Dict. v. 4. Ait. Hort. Kew. v. 1. 366. Swartz Obſ. 66. t. 10. f. 2. Juſſ. 201. Lamarck Illuſtr. t. 162. (Lightfootia; Schreb. 122.)—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Stellatæ*, Linn. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, in five deep, acute, permanent ſegments. *Cor.* of one petal, funnel-ſhaped; tube cylindrical, longer than the calyx, very ſlightly inflated at the ſummit; limb flat, ſomewhat reflexed, in five deep roundiſh ſegments. Nectary a crenate ring in the orifice. *Stam.* Filaments five, awl-ſhaped, inſerted into the middle of the tube; anthers ſimple. *Piſt.* Germen roundiſh, inferior; ſtyle thread-ſhaped, as long as the corolla; ſtigma cloven. *Peric.* Capſule roundiſh, crowned with the calyx, of two cells. *Seeds* two or more in each cell, rarely ſolitary.

Eſſ. Ch. Corolla funnel-ſhaped, nectariferous at the mouth. Capſule of two cells, with ſeveral ſeeds, roundiſh, inferior, crowned with the calyx.

A genus of Weſt Indian, ſimple and entire-leaved, ſhrubs, to which the diſcoveries of Swartz have added ſeveral ſpecies. Three only are mentioned in the Hortus Kewenſis, nor are any of them in general cultivation, though ſome poſſeſs fragrance as well as elegance. Two have four-cleft tetrandrous flowers. Juſſieu terms the fruit a berry, which ſeems incorrect. *Rondeletia aſiatica*, Linn. Sp. Pl. 244, is perhaps an *Ixora*, or *Pavetta*.

1. R. *americana*. Corymboſe Rondeletia. Linn. Sp. Pl. 243. Willd. n. 1. Ait. n. 1. (R. arboreſcens, tini facie; Plum. Ic. 237. t. 242. f. 1.)—Leaves elliptic-lanceolate, acute. Panicles repeatedly forked, on long ſtalks, riſing above the ſtem.—Native of the Weſt Indies. Cultivated by Miller, before the year 1752. Mr. Aiton ſays it flowers in the ſtove in Auguſt. We have ſeen no ſpecimen, neither had Linnæus. His deſcription is taken from Plumier's figure, as follows. "A *ſhrub*, with oppoſite, ſeſſile, lanceolate *leaves*. *Common flower-ſtalks* ſolitary, very long, naked, forming at the top a forked *corymbus*, in each of whoſe ſubdiviſions is a ſeſſile *flower*, with a two-leaved *involucrum*;" more properly a pair of *bracteas*. The *flowers* are very numerous, about an inch long. *Leaves* not quite ſeſſile, ſomewhat deflexed, entire, two or three inches long, and one or one and a half broad.

2. R. *odorata*. Fragrant Rondeletia. Jacq. Amer. 59. t. 42. Linn. Sp. Pl. 1671. Willd. n. 2. Swartz Obſ. 67. (R. obovata, by an error of tranſcription; Linn. Syſt. Nat. ed. 12. v. 2. 163.)—Leaves ovate, bluntiſh, rough; ſomewhat heart-ſhaped at the baſe; on ſhort ſtalks. Flower-ſtalks cymoſe, three-cleft, terminal. Native of the Weſt Indies, but rare. *Swartz.* Jacquin found it in rocky places, near the ſea, at the Havannah, bearing flowers, as well as ripe ſeeds, in January. The habit of this *ſhrub* is inelegant and ſtraggling; its height ſix feet; the young *ſhoots* villous. *Flowers* in terminal tufts, each tuft about two inches broad; their ſmell very ſweet, reſembling violets. The *corolla* has often ſix ſegments, though the *ſtamens* are never more than five; its colour is vermilion, with an orange nectariferous ring.

3. R. *hirta*. Hairy Rondeletia. Ait. Hort. Kew. ed. 1. v. 1. 227. ed. 2. n. 3. Willd. n. 13. Swartz Ind. Occ. v. 1. 373.—Leaves oblong, pointed, hairy, rigid; ribbed beneath. Flower-ſtalks axillary, three-forked, erect.—Native of Jamaica, from whence it was imported about the year 1776, by John Blackburne, eſq. of Orford, Lancaſhire. It blooms in the ſtove in ſummer. This is ſaid in Hort. Kew. to be very nearly akin to *R. odorata*, differing merely in its axillary *infloreſcence*; larger, more acute, *leaves*, not rough on their upper ſurface, nor ſcarcely heart-ſhaped at the baſe; and longer *footſtalks*. The tube of the *corolla* is but twice the length of the *calyx*. *Style* prominent beyond the mouth. *Stigmas* erect, converging. *Corolla* reddiſh-yellow. Swartz ſays there are only two *ſeeds* perfected, of a hemiſpherical figure, and that the *footſtalks* are ſhort and hairy. His deſcription agrees in other reſpects with Mr. Aiton's.

4. R. *lævigata*. Smooth-leaved Rondeletia. Ait. n. 2.—Leaves ſtalked, elliptical, acute, very ſmooth, except the rib underneath. Stipulas elliptical, membranous, ſmooth. Panicles three-forked, axillary, ſomewhat hairy.—Native of the Weſt Indies, flowering in our ſtoves in ſpring or ſummer. It was introduced, in 1790, by Mr. William Anderſon. The *ſtem* is ſhrubby, ſpreading, with forked round *branches*, ſlightly hairy when young. *Leaves* two or three inches long, acute at each end, rather fleſhy; very ſmooth above; paler beneath, with a reddiſh, ſometimes hairy, rib and veins. *Stipulas* very large, elliptical, obtuſe, reddiſh. *Flowers* reddiſh, ſmall, their tube ſcarcely longer than the limb. Baſe of the *calyx* clothed with long hairs.

5. R. *trifoliata*. Three-leaved Rondeletia. Linn. Sp. Pl.

Pl. 1671. Willd. n. 3. (R. trifolia; Jacq. Amer. 60. t. 43. "R. arborefcens, tini facie; Ehret Pict. t. 15.")—Leaves on long hairy ftalks, whorled, lanceolate, acute; fomewhat downy beneath. Stipulas pointed. Panicles axillary, compound, hairy.—Native of Jamaica, flowering in February.—An upright *tree*, twelve feet high. Young *branches* obtufely triangular, hairy. *Leaves* three in a whorl, lanceolate, acute, entire, three inches long; fmooth above; flightly downy beneath; with hairy *footftalks*. *Stipulas* roundifh, pointed, ternate, alternate with the leaves. *Clufters* axillary, one inch and a half or more in length, hairy, unequal, branched. *Flowers* inodorous, fmall, reddifh, feffile or ftalked. *Fruit* not examined. *Jacquin*.—On comparing Browne's fpecimen of his *Petefia*, t. 2. f. 3, with Jacquin's plate and defcription of this *Rondeletia*, we are perfuaded they muft be the fame thing. Confequently the *Ixora americana* of Linnæus, an ambiguous and obfcure plant, ought to be expunged, and referred hither. (See Ixora, n. 11.) Swartz quotes this fynonym of Browne for his *racemofa*, (fee the following); but a comparifon of fpecimens fhews them to be diftinct, though very nearly akin.

6. R. *racemofa*. Smooth Racemofe Rondeletia. Swartz Ind. Occ. v. 1. 360. Willd. n. 7, excluding Browne's fynonym.—Leaves on long fmooth ftalks, ovato-lanceolate, pointed, fmooth on both fides. Stipulas abrupt, pointed. Clufters axillary, three-forked, fpreading, fmooth.—Native of uncultivated hills in Jamaica. Like the laft in habit, but the *leaves* are oppofite, more coriaceous, and quite fmooth, as well as the *footftalks* and *flower-ftalks*. The *ftipulas* are fringed, like the *bracteas* and *calyx*. *Corolla* externally finely downy, as in Browne's fpecimen juft alluded to under *R. trifoliata*.

7. R. *virgata*. Long-branched Rondeletia. Swartz Ind. Occ. 354. Willd. n. 4.—"Leaves heart-fhaped, roundifh. Branches fpreading, thread-fhaped. Flower-ftalks three-cleft. Flowers three together, crowded. Stamens four."—Gathered by Swartz in bufhy places, near the fea, in the northern part of Hifpaniola, flowering and fruiting in December.—A *fhrub* about fix feet high, with very long, fpreading, alternate, rough-barked twigs. *Leaves* half an inch long, on fhort *ftalks*, fomewhat reflexed, very fmooth. *Stipulas* minute, acute. *Flower-ftalks* axillary and terminal, oppofite, elongated and erect, refembling branches, and often bearing a pair or two of leaves, three-cleft; the terminal ones leaflefs, and bearing but three flowers. *Flowers* terminal, brownifh-purple, filky at the outfide; four-cleft, with four very fhort *ftamens*. *Seeds* feveral, minute, compreffed.

8. R. *pilofa*. Hoary Rondeletia. Swartz Ind. Occ. v. 1. 356. Willd. n. 5. (R. triflora; Vahl. Symb. v. 3. 34. t. 54.)—Leaves ovato-lanceolate, hairy on both fides. Flower-ftalks axillary, fhorter than the leaves, three-flowered. ftamens four.—Native of the Weft India iflands, of Santa Cruz, and Montferrat. A *fhrub*, whofe young *branches*, *leaves*, *ftalks*, *calyx*, and outfide of the *corolla*, are clothed with fine, foft, hoary pubefcence. *Leaves* on ftill more hairy *footftalks*, elliptic-lanceolate, with a fmall acute point, two or three inches long, ribbed; paler, or glaucous, beneath. *Flower-ftalks* oppofite, axillary, rather fhorter than the leaves, hairy, each bearing three *flowers*, of which the middlemoft has the fhorteft partial ftalk. *Bracteas*, and fegments of the *calyx*, long, awl-fhaped. *Corolla* four-cleft; fomewhat downy within, but moft without. We have no account of the colour, as Swartz feems not to have gathered this fpecies himfelf. The dried *flowers* are brown, with fome indication of a tawny hue.

9. R. *thyrfoidea*. Tufted Rondeletia. Swartz Ind. Occ. v. 1. 358. Willd. n. 6.—Leaves oblong, acute, membranous; downy beneath. Stipulas ovate, acute, fmooth. Clufters axillary, denfe, many-flowered.—Native of dry barren hills, in the weftern part of Jamaica, flowering in May. A fmooth, branching *fhrub*, fix feet high, with long, fpreading, bluntly quadrangular twigs. *Leaves* three inches long, acute at each end, ribbed, veiny; fmooth above. *Footftalks* an inch long, ftriated. *Stipulas* clofe-preffed, broad, ovate, acute, fmooth, rigid. *Clufters* denfe, oblong, fhorter than the leaves, on fmooth ftalks, their branches oppofite, croffing each other, fubdivided; the laft ufually three-flowered. *Flowers* fmall, yellowifh-white, or rufty-coloured, highly fragrant at night. *Bracteas* minute, awl-fhaped. *Calyx* very minute, five-toothed. *Corolla* five-cleft, with five *ftamens*. *Seeds* two in each cell, rounded, fomewhat angular, ftriated.

10. R. *laurifolia*. Laurel-leaved Rondeletia. Swartz Ind. Occ. v. 1. 363. Willd. n. 8, excluding Browne's fynonym.—"Leaves lanceolate-oblong, acute, fmooth on both fides. Stipulas deltoid. Clufters axillary, compound, erect. Tube of the corolla very fhort."—Grows in bufhy places in Jamaica.—*Branches* round, fmooth. *Leaves* laurel-like, three or four inches long, ribbed, veiny; paler beneath. *Footftalks* an inch long, fmooth, flat on the upper fide. *Stipulas* broad, combined, deltoid, pointed, fpreading, rigid, downy at the edge. *Clufters* often as long as the leaves, compound, their ultimate divifions moftly three-flowered. *Bracteas* very minute. *Flowers* fmall, brownifh-yellow, five-cleft. *Seeds* in an early ftate numerous, membranous, but two only arrive at maturity, which are hemifpherical.—We cannot but diffent from our learned friend profeffor Swartz, in his citation of Browne's t. 2. f. 2, and confequent remarks. That plate certainly reprefents the *Petefia ftipularis* of Linnæus, which was defcribed from Browne's own fpecimen, and the *leaves* are, on both fides, finely downy, though no fuch character is expreffed in the engraving. The *inflorefcence* is thyrfoid, and not half fo long as the leaves. See the next fpecies.

11. R. *tomentofa*. Downy-leaved Rondeletia. Swartz Ind. Occ. v. 1. 365. Willd. n. 9. (Petefia ftipularis; Linn. Sp. Pl. 160. P. fruticofa, foliis ovatis oppofitis, &c.; Browne Jam. 143. t. 2. f. 2.)—Leaves elliptic-lanceolate, pointed, downy. Flower-ftalks three-forked, axillary, much fhorter than the leaves.—Native of ftony hills in Jamaica, near the fhady road called Sixteen-mile walk, not far from Spanifhtown. *Swartz*. A fpecimen from the author fhews this to be precifely the above plant of Linnæus and Browne, as Swartz fufpected. We refer the reader to Petesia for its defcription, and for remarks on the uncertainty of that genus, which perhaps muft hereafter be funk in *Rondeletia*.

12. R. *umbellulata*. Umbellate Rondeletia. Swartz Ind. Occ. v. 1. 367. Willd. n. 10.—Leaves elliptic-lanceolate, acute, fomewhat hairy. Stipulas ovate, pointed, membranous, hairy. Flower-ftalks axillary, three-forked. Flowers fomewhat umbellate.—Native of rocky banks of rivers in Jamaica, flowering in April. *Swartz*. That author fufpects his plant may be the fame with Browne's third *Petefia*, which we have adopted by the name of *villofa*, n. 4. This may poffibly be the cafe; but having no fpecimen of what Browne intended, we cannot determine the point. Swartz's plant, communicated by himfelf, is a branching upright fhrub, two feet or more in height; the *branches* fmooth, fomewhat compreffed; hairy and leafy at the fummit. *Leaves* about three inches long, clothed with fhort fcattered hairs, and fupported by hairy *ftalks*, half

an

an inch in length. *Stipulas* large, concave, moft hairy within, with a taper reflexed point. *Flower-ftalks* not half the length of the leaves. *Flowers* collected into a fort of round head. *Bracteas*, and fegments of the *calyx*, lanceolate, hairy. *Corolla* larger than in fome of the foregoing, brownifh-yellow. Two *feeds* are perfected in each cell.

13. R. *incana.* Silvery-cupped Rondeletia. Swartz Ind. Occ. v. 1. 369. Willd. n. 11.—Leaves ovato-lanceolate; rough and hoary beneath. Stalks axillary, fimple, three-flowered. Segments of the calyx ovate, filky on both fides.—Found by profeffor Swartz, from whom we have a fpecimen, on calcareous rocky mountains of Jamaica, but rarely. A *fhrub*, two or three feet high, with round, rigid, rough *branches*. *Leaves* about the extremities of the branches, three inches long, fomewhat coriaceous; fmooth and fhining above; palifh and hairy or downy beneath, with a prominent hairy rib and veins. *Footftalks* ftout, filky, three-quarters of an inch long. *Stipulas* very fhort, fringed. *Flower-ftalks* axillary, oppofite, twice the length of the footftalks, filky, each bearing three large, nearly feffile, *flowers*, whofe globular *germen*, and large ovate fegments of the *calyx*, are entirely clothed with long, denfe, filky hairs; as are alfo the lanceolate *bracteas*.

14. R. *hirfuta.* Rough Rondeletia. Swartz Ind. Occ. v. 1. 371. Willd. n. 12.—"Leaves oblong, acute, hairy. Stalks axillary, three-forked, lax. Flowers hairy."—Native of bufhy hills, in the fouth part of Jamaica, bloffoming in January. A *fhrub* fix feet high, with a fmooth *ftem*, and rough, lax, flightly compreffed *branches*. *Leaves* on fhort, hairy, reddifh ftalks, oblong, broadifh in the middle, ribbed, veiny, hairy on both fides, pale beneath. *Stipulas* broad, ovato-lanceolate, long and hairy. *Flower-ftalks* oppofite, flender, about the length of the leaves, twice three-cleft, lax, hairy. *Flowers* ftalked, yellowifh, externally hairy. *Bracteas* minute, linear, acute, hairy. Differs from *hirta*, n. 3, in having lefs rigid *leaves*, with lax, not ftiff, *branches* and *flower-ftalks*. *Swartz.* We have feen no authentic fpecimen; for one marked *hirfuta*, by the younger Linnæus in his herbarium, feems rather to be Swartz's *hirta*. The defcriptions of thefe two fpecies are not at all well contrafted.

The divifion of this genus into two fections, by the number of the feeds, is better omitted, as it feparates fpecies moft nearly akin, and is befides very uncertain. All have the rudiments of feveral feeds in each cell of the germen, though a greater or lefs number is perfected in fome than in others, or rather perhaps, according to circumftances, in the fame.

Rondeletia, in *Gardening*, contains plants of the woody, exotic, ftove kind, of which the fpecies cultivated is the American rondeletia (R. americana).

Method of Culture.—This plant may be increafed by fowing the feeds on a moderate hot-bed in the early fpring, and when the plants have attained a little growth they fhould be removed into feparate pots, being plunged in the bark-bed of the ftove, where they are to remain and be managed as other tender exotic plants of a fimilar kind. They afford variety in ftove collections.

RONDENCHE, in *Geography*, a town of Ruffia, in the government of Riga; 28 miles S.W. of Narva.

RONDERO Bay, a bay on the N.E. coaft of Antigua. N. lat. 17° 15′. W. long. 61° 26′.

RONDINE, in *Ichthyology*, a name by which fome authors have called the *milvus*, or flying-fifh.

Rondine *Pefce*, a name by which fome have called the *hirundo pifcis*, or fwallow-fifh, called by others *mugil alatus*.

RONE, in *Geography*, a fmall ifland near the W. coaft of Scotland. N. lat. 58° 26′. W. long. 4° 55′.

RONEBY, a town of Sweden, in the province of Blekingen; 10 miles W. of Carlfcrona.

RONES, a cape on the W. coaft of the ifland of Jerfey; 6 miles N.N.W. of St. Helice.

RONGOS, or Pongos, trumpets, or rather French horns, of the kingdom of Loango, in Africa. Thefe inftruments are made of ivory, and refemble hunting-horns of the ancients: their wideft diameter at the mouth is an inch and a half, or two inches; they are of various kinds, and probably ferve for treble and bafe to each other. It is pretended, that many rongos united produce a very *harmonious* effect. (Supplement to the folio Encyclopédie.) The editor of the article forgot that, out of Europe, treble and bafe performing together, except in octaves, is unknown, and that harmonious effects can be no otherwife produced.

RONNE, in *Geography*, a river of France, which rifes about a league N. of Leuze, and runs into the Scheldt, between Tournay and Oudenarde.

Ronne, or *Ronde*, a fea-port town of Denmark, in the ifland of Bornholm, the refidence of the governor. The harbour is not deep, but well fortified.

RONNEBURG, a town of Saxony, in the principality of Altenburg; 12 miles S.W. of Altenburg. N. lat. 50° 48′. E. long. 12° 5′.

RONNEBY. See Rotneby.

RONNEN, a fmall ifland of Denmark, near the N.W. coaft of the ifland of Laland. N. lat. 56° 5′. E. long. 11° 15′.

RONNSKAR, a fmall ifland on the W. fide of the gulf of Bothnia. N. lat. 65° 3′. E. long. 18° 24′.—Alfo, a fmall ifland on the E. fide of the fame gulf. N. lat. 63° 29′. E. long. 22° 2′.

RONO, a fmall ifland on the W. fide of the gulf of Bothnia. N. lat. 63° 5′. E. long. 18° 24′.

RONOBO, a river of the ifland of Celebes, which runs into Sewa bay, N. lat. 1° 33′. E. long. 120° 46′.

RONOUMENA, a river of Madagafcar, which runs into the fea at Port St. James.

RONSARD, Peter de, in *Biography*, a French poet of confiderable celebrity, was born in the year 1524, of a noble family, in the Vendomois. He was educated at the college of Navarre in Paris; but he quitted his ftudies at an early age, and entered into the fervice of the duke of Orleans. From the fervice of this prince he was transferred to that of James V. of Scotland, who had married Magdalen of France. With this fovereign he paffed two years, partly in Scotland, and partly in England; and then returning to France, was again taken into the employment of the duke of Orleans. He accompanied Lazare du Baif to the diet of Spire, who infpired him with fuch a tafte for the belles lettres, that he applied himfelf with affiduity to the Greek language. He at length entirely devoted himfelf to poetry, by which he obtained the title of the prince of the poets of his time. He obtained the firft prize at the floral games of Touloufe, and the ordinary recompence being thought unequal to his merit, he was prefented by the city with a Minerva of maffy filver. He was patronized by five fucceffive kings of France, efpecially Charles IX., who maintained a poetical correfpondence with him. Mary, queen of Scots, who greatly efteemed him, made him a rich prefent. He had fome benefices conferred upon him, though he was not in prieft's orders; and he difplayed great zeal in oppofing thofe of the reformed religion, againft whom he fought, in 1562, at the head of the Vendomois. Like many religious zealots, he made his faith ftand inftead ſtead of morals, being deeply addicted to licentious pleaſures, by which he brought on a premature old age. In the latter years of his life he was a penitent, and felt deep contrition for the licentiouſneſs of his muſe at an earlier period, and reſolved for the future to confine himſelf to ſacred ſubjects. He died in 1585, at the age of 61, and his memory was honoured by eulogies from many of the literary characters of the time. The compoſitions of Ronſard were odes, eclogues, epigrams, ſonnets, hymns, and a poem, entitled "La Franciade." Ronſard had a very bad taſte, which rendered him pedantic, and often obſcure; but he poſſeſſed many excellent qualities as a poet, having warmth of temper, a vivid imagination, and great quickneſs of invention. Very few of his works remain; but three of the beſt have frequently been reprinted, *viz.* "La Promeſſe," "Hymne à l'Eternité," and "Les Quatre Saiſons de l'Année."

Ronſard was praiſed by all the poets of his time, and ſtill merits a part of their encomiums. Scaliger dedicated to him a work, as the firſt poet in France. He was handſome in perſon, well made, loved muſic paſſionately, ſung agreeably, and was very liberal. He had a public and magnificent funeral; the ſervice was ſet in florid or figurative counterpoint, animated by all kinds of inſtruments: it was ſung by the children of the chapel-royal by order of the king, who regretted extremely the death of ſo eminent a perſonage, the ornament of his kingdom. After his interment, Duperon pronounced his funeral oration. All that were great and illuſtrious at court and in the city attended; and the crowd was ſo great, that cardinal Bourbon, and many other princes and nobles, were obliged to return without being able to gain admiſſion into the chapel of the college of Boncourt at Paris.

RONSBERG, in *Geography*, a town of Bohemia, in the circle of Pilſen; 8 miles W. of Teinitz.

RONSDORF, or Rheinsdorf, a town of the duchy of Berg; 12 miles S.S.E. of Duſſeldorf.

RONSE. See Renay.

RONSEL, a town of Germany, in the county of Mentz; 7 miles S.W. of Lunſchede.

RONSENAC, a town of France, in the department of the Charente; 18 miles E. of Angouleſme.

ROO, in *Agriculture*, a provincial term ſignifying rough or coarſe, in the way of paſtures, or the crops on other ſorts of land.

ROOAC, in *Rural Economy*, a provincial word uſed to ſignify a fog or miſt. See Roak.

ROOAH, in *Geography*. See Rewah.

ROOAHOAGA. See Riou's *Iſland*.

ROOD, a quantity of land, equal to the fourth part of an acre; and containing 40 ſquare perches, or poles.

This is the ſtatute rood by which land is uſually at preſent meaſured; but there are local meaſures in many diſtricts, in which both the rood and acre are conſiderably larger. See Measures.

In Scotland, the rood contains 40 ſquare falls. See Fall.

ROODAUN, in *Geography*, a town of Hindooſtan, in Oude; 22 miles N.W. of Allahabad.

ROODE, or Waveren, an extenſive tranſmontane diviſion of the diſtrict of Stellenboſch and Drakenſtein, in Southern Africa, in the Cape diſtrict, lying behind the mountains of Drakenſtein, and producing abundance of grain, pulſe, fruits, and wine. The paſs of Roode Sand is the only waggon-road in this diviſion, and is diſtant from Cape town about 70 miles. In this diviſion there is a ſmall neat church, and a very comfortable parſonage-houſe, with extenſive vineyards, orchards, garden, and arable land; and contiguous to the church is a row of houſes, the number of which has lately increaſed.

ROODLOFT, the gallery over the entrance into the choir, in our ancient cathedral and abbey churches; in the front of which, looking towards the weſt window, a large rood, or crucifix, was uſually placed.

ROOE, Little, in *Geography*, a ſmall iſland among the Shetlands. N. lat. 60° 43′. W. long. 1° 35′.

ROOF, in *Architecture*, is that part of a building generally conſiſting of two ſloping ſides, which protects its contents or inhabitants from inclement ſeaſons or weather.

The ſlope of the roof muſt be directed by the nature of the climate. The ancient Egyptians, Babylonians, Perſians, as well as other Eaſtern nations, made their roofs quite flat. The Greeks, it would appear, were the firſt people who made roofs with a declination each way from the middle to the edges; and this was very gentle, the height from the ridge to the level of the walls not exceeding one-ninth or one-eighth part of the ſpan, as may be ſeen by many ancient temples now remaining. But in northern climates, ſubject to rain and ſnow, the height of the ridge muſt be very conſiderable. In moſt old buildings in Britain, the equilateral triangle ſeems to have been conſidered as the ſtandard, both in private and public edifices; and this pitch ſeems to have continued for ſeveral centuries, until the extinction of Gothic architecture. At the commencement of this period, the ridge was made ſomewhat lower, and the rafters were three-fourths of the breadth of the building. This was called the true pitch, and ſubſequently the ſquare ſeems to have been conſidered as the true pitch. The heights of roofs were gradually depreſſed from the ſquare to one-third of the width, and from that to a fourth, which now ſeems to be a very general ſtandard. They have even been executed much lower. There are ſome advantages in high pitched roofs: they diſcharge the rain with greater rapidity, the ſnow continues to lie a much ſhorter time on the ſurface, and they are leſs liable to be ſtripped by heavy winds. Low roofs require large ſlates, and the utmoſt care in execution; but they have this advantage, that they are much cheaper, ſince they require ſhorter timbers, and of a much ſmaller ſcantling. The roof is one of the principal ties to a building, when executed with judgment: it binds the exterior walls to the interior, and to the partitions, which act like ſtrong counterforts againſt them.

Roofs are of various forms, which depend on the nature of the plan, the law of the horizontal and vertical ſections. The moſt ſimple form of a roof is that which has only one row of timbers, arranged in an inclined plane, which throws the rain entirely to one ſide. This form is called a ſhed-roof, or lean-too. But the moſt elegant roof for a rectangular building is that which conſiſts of two rectangular planes, of equal breadth, equally inclined to, and terminating in a line parallel to, the horizon; and conſequently the form of the roof is that of a triangular priſm, each ſide being equally inclined to the plane of the wall-head. This form of roof is ſometimes called a pent-roof.

When the form of the plan is that of a trapezium, and the wall-heads properly levelled, the roof cannot be executed on planes, ſo as to terminate in a level ridge. In this caſe, the ſides, inſtead of being planes, are made to wind, in order to have the ſummit parallel to the horizon; but the moſt eligible method is to make the ſides of the roof rectangular planes, incloſing a level ſpace, or flat, in the form of a triangle or trapezium, at the ſummit of the roof.

Roofs, which are flat on the top, are ſaid to be truncated.

Truncated roofs are chiefly employed in order to diminiſh the height, ſo as not to predominate over that of the walls.

When all the four ſides of the roof are formed by inclined planes, the roof is ſaid to be hiped, and is, therefore, called a hiped roof: the inclined ridges, which ſpring from the angles of the walls, are called the hips. Roofs of this deſcription are frequently truncated; and when the plan of the walls is in the form of a trapezium, the truncation of the roof becomes neceſſary.

Roofs which ſtand upon circular baſes, and which have all their horizontal ſections circular, and the centres of the circles in a ſtraight line drawn from the centre of the baſe perpendicular to the horizon, are called revolved roofs.

When the plan of the roof is a regular polygon, or a circle, or an ellipſe, and the horizontal ſections are all ſimilar to the baſe, and a vertical ſection a portion of any curve convex on the outſide, the roof is called a dome.

In order to ſave the expence of lead in rectangular roofs, inſtead of the flat, a valley is ſometimes uſed, which makes the vertical ſection in the form of the letter M, or rather an inverted W; and thus it is that this form of roof has obtained the name of an M roof.

Before we proceed to the conſtruction of roofing, it will be neceſſary to ſhew upon what principles a body or piece of timber may be ſupported in various poſitions.

Theory and Practice of Roofs.

Prop. I.

If a heavy body A B C D (*Plate* XLII. *fig.* 3. *Architecture*,) be ſuſpended by any two inclined ſtrings, D E and C F, in a vertical plane, a right line drawn through the interſection, perpendicular to the horizon, will paſs through the centre of gravity of the body.

It is ſhewn by the writers on mechanics, that if any three forces act upon a point, or a body, their directions will tend to the ſame point, or be parallel to each other. It is well known that every body acts with its full force in one point only, *viz.* in its centre of gravity, and in a direction perpendicular to the horizon: therefore, if a body is ſuſtained at E and F, it will revolve round theſe points, until the line G H, paſſing through the interſection, H, of the two ſtrings, D E and C F, and the centre of gravity G, become perpendicular to the horizon.

Cor. 1.—Hence if any body be ſupported by two ſtrings, it may alſo be ſupported by two planes perpendicular to theſe ſtrings, provided that the two points of the body ſupported are in the direction of the ſtrings; for every body, acting upon a plane, acts in a line perpendicular to that plane.

Cor. 2.—Hence, alſo, a body may be ſupported by two props in any two directions that may be ſupported by ſtrings, provided that the ſurface of the body, at the points of contact, or the ends of the props, be planes at right angles to the ſtrings.

Cor. 3.—Hence all the properties that have been demonſtrated of three forces acting upon a body, ſuppoſed void of weight, will equally flow from a heavy body ſupported by two ſtrings, by ſubſtituting the weight of the body for the middle force; and hence, if the direction of any force ſupporting a heavy body be given, the other may eaſily be found.

Prop. II.

Given the poſition in which a body ſhould be placed, and the poſition of a plane ſupporting the body at one end, to find the poſition of another plane to ſupport it at another given point, and to find the preſſure on the planes, the weight of the body being given.

Through the centre of gravity of the body draw a vertical line, and through any point on which the body reſts on the given plane draw a line perpendicular to that plane, meeting the vertical line; from the interſection draw a line to the other point which is to be ſupported; from that point draw a plane at right angles to this line, which will be the direction of the plane required. And to find the intenſity of the forces, take any diſtance on the vertical line to repreſent the weight of the beam from the interſection; then on that line, as a diagonal, complete a parallelogram, whoſe ſides are in the directions of the lines, perpendicular to the ſupporting planes; and the ſide of the parallelogram, perpendicular to either plane, will repreſent the force on that plane.

Example 1. *Plate* XLII. *fig.* 2.

Let the body A B C D lie upon the top of the wall K C, at C, ſo as to touch the lower edge, B C, of the body, at that point C; it is required to find the direction of a plane that will ſupport the lower end at B, and to find the preſſure of the body on the wall and on the plane.

Through the centre of gravity, G, of the body draw the vertical line G F; draw C F perpendicular to C E, join F B, and draw B I perpendicular to F B, and B I is the direction of the plane required. On the vertical line G F, make F M to repreſent the weight of the body, and complete the parallelogram L M N F; then F N repreſents the force on the wall-head, in the direction F C; and F L the force acting perpendicular to the plane, or in the direction B F. But if the vertical and horizontal thruſts on the wall at C are required, draw N P perpendicular to F G, meeting it in P; then the force F N is reſolved into two forces, F P and P N. P N repreſents the horizontal part of the force, *viz.* that which puſhes the wall in a direction parallel to the horizon; and F P the other part, which tends to preſs it downwards in a direction perpendicular to the horizon.

Example 2. *Fig.* 1.

Let the ſloping body, A B C D, be ſupported by a wall at its lower end, D, which coincides with the ſurface of the body, and let G be the centre of gravity; it is required to cut a notch out of the body, at the upper end C, ſo that it may reſt upon the top of a wall, which is made to fit the notch, and to find the preſſure on the walls.

Draw the vertical line G E, from D draw D E perpendicular to D C, join E C, and make C F at right angles to it; then the notch, H C F, being cut, the body, A B C D, will be at reſt. Then to find the preſſure on the walls, complete the parallelogram E I K L, having a given angle D E C, and its diagonal on the given line E G. Then if K E repreſent the weight of the body, I E will repreſent the preſſure in the direction D E, upon the wall at D, and L D the preſſure in the direction C E. The horizontal and perpendicular preſſures upon each wall may be found, as in the preceding example, by reſolving each of the forces, I E and L E, into two; one of which is perpendicular to the horizon, and the other parallel to it.

Scholium.—It muſt be obſerved in this example, that the notch, which is cut out at C, will remove the centre of gravity nearer to the lower end D, and conſequently alter the ſlope C F; but as this can only be in a very ſmall degree, the equilibrium will hardly be affected by it, when the notch is very ſmall.

Example

Example 3. *Fig.* 6.

Let one of the corners of a floping body, A B C D, reft upon the top of a wall at D, which is quite level; it is required to find the pofition of a notch, cut out of the upper end C, fo that the body may reft upon a wall made to fit the notch.

Let the fmall part, F C H, be fo cut, that C H may be parallel to the horizon, then the body will be fupported by the two walls at C and D. For draw D I, G K, and C L, perpendicular to the horizon, then thefe lines being produced, they may be fuppofed to meet at an infinite diftance. To find the preffure on the walls: join D C, and produce the vertical line K G to meet it in E; then if G be fuppofed to be the weight of the body, the preffure on D will be $\frac{EC \times G}{DC}$, and the preffure on C, $\frac{DE \times G}{DC}$.

Example 4. *Fig.* 5.

Let the body A B C D lie with its upper end againft the vertical face of a wall at C; it is required to find the pofition of a plane fupporting the lower end D, fo that the body may be at reft.

Draw the vertical line G E, and C E, perpendicular to the face of the wall C L; join E D, and draw D F perpendicular to E D, then D F is the pofition of the plane required. Complete the parallelogram E H I K; then the preffure on D, and on C, and the weight of the body, are to one another as E H, E K, E I.

Example 5. *Fig.* 4.

To fupport a body A B C D by two props at two given points, E and I, the direction of one of the props, E F, being given.

Draw the vertical line G K, produce F E to K, and draw K I H; and I H is the prop required. On the vertical line G K, take K M to reprefent the weight of the body; and on K M, as a diagonal, defcribe the parallelogram K L M N; then K L is the compreffion of the prop E F, and K N the compreffion of the prop I H.

In order to be underftood by the reader, it will be neceffary to explain fuch terms as are ufed in the fubfequent part of the article, by way of definitions.

Wall-plates are pieces of timber laid on the wall, in order to diftribute the preffure of the roof equally, and to bind the walls together. Thefe are fometimes called raifing-plates.

Truffes are ftrong frames of carpentry, generally of a triangular form, fupporting the covering. They are difpofed at equal diftances, and are ufed when the expanfion of the walls is too great to admit of common rafters alone, which would be in danger of being bent or broken by the weight of the covering, for the want of fome intermediate fupport. They are varioufly conftructed, according to the width of the building, the contour of the roof, and the circumftances of walling below, &c.

Tie is any piece of timber connected at its extremities to two others, acted upon by oppofite preffures, which have a tendency from each other; or to extend the tie, as rope or chain.

Straining-piece is any piece of timber, connected at its extremities to two others, acted upon by oppofite preffures, which have a tendency towards each other.

Hence a tie acts contrary to a ftraining-piece. A chain, rope, or fmall bar of iron, may be ufed for the former; but the latter muft always be inflexible, being in a ftate of compreffion.

Principal rafters are two pieces of timber in the fides of a trufs, fupporting a grated frame of timber-work over them, on which the flating or covering refts.

Purlins are horizontal pieces of timber, fixed upon the principal rafters.

Tie-beam is a horizontal piece of timber, connected to two oppofite principal rafters; it anfwers a twofold purpofe, *viz.* that of preventing the walls from being pufhed outwards by the weight of the covering, and of fupporting the ceiling of the rooms below.—N.B. The tie-beam, when placed above the bottom of the rafters, is called a collar-beam.

Common rafters are pieces of timber of a fmall fection, placed equidiftantly upon the purlins, and parallel to the principal rafters: they fupport the boarding to which the flating is fixed.

Pole-plates are pieces of timber refting on the ends of the tie-beams, and fupporting the lower ends of the common rafters.

King-poft is an upright piece of timber in the middle of a trufs, framed at the upper end into the principal rafters, and at the lower end into the tie-beam: this prevents the tie-beam from finking in the middle.

Queen-pofts, two upright pieces of timber framed below into the tie-beam, and above into the principal rafters, placed equidiftantly from the middle of the trufs, or its extremities.

Strutts are oblique ftraining-pieces, framed below into the king-pofts or queen-pofts, and above into the principal rafters, which are fupported by them; or fometimes they have their upper ends framed into beams, which are too long to fupport themfelves without bending.—N.B. Strutts are often called braces.

Puncheons are fhort tranfverfe pieces of timber, fixed between two others for fupporting them equally, fo that when any force is on the one, the other refifts that force equally, and if one break, the other will alfo break. Thefe are fometimes called ftuds.

Straining-beam is a piece of timber placed between two queen-pofts at their upper ends, in order to withftand the thruft of the principal rafters.

Straining-fill is a piece of timber placed at the bottom of two queen-pofts, upon the tie-beam, in order to withftand the force of the braces, which are acted upon by the weight of the covering.

Camber-beams are horizontal pieces of timber, made on the upper edge floping from the middle towards each end, in an obtufe angle, for difcharging the water. They are placed above the ftraining-beam in a truncated roof, for fixing the boarding on which the load is laid; their ends run three or four inches above the floping plane of the common rafters, in order to form a roll for fixing the lead.

Auxiliary rafters are pieces of timber framed in the fame vertical plane with the principal rafters, under and parallel to them, for giving additional fupport, when the extent of the building requires their introduction. Thefe are fometimes called principal braces, and fometimes cufhion rafters.

Joggles are the joints at the meeting of ftrutts with king-pofts, queen-pofts, or principal rafters; or, at the meeting of principal rafters with king and queen-pofts: the beft form is that which is at right angles to the ftrutts.

Cocking, or *cogging*, is the particular manner of fixing the tie-beams to the wall-plates: one method is by dovetailing, and the other is by notching the under fide of the tie-beam, and

and cutting the wall-plate in a reverſe form to fit it. This method is far preferable to the other, as it is not liable to be drawn, which the other is very ſubject to, when the timber ſhrinks.

Ridge-tree is a piece of timber fixed in the vertex of a roof, where the common rafters meet on each ſide of it; the upper edge of it is higher than the rafters, for the purpoſe of fixing the lead which goes over it to cover the ends of the ſlates in the upper courſe.

Straps are thin pieces of iron running acroſs the junction of two or more parts of a truſs or frame of carpentry, branching out from the interſection in the direction of the ſeveral pieces, for the purpoſe of ſecuring them to each other. They ought always to be double, *viz.* one ſtrap on each ſide; and their ends ſtrongly bolted to each of the pieces.

The uſes of the various parts are illuſtrated as follows; and here it may be proper to obſerve, that though every one of the parts above defined may be found in the ſame roof, it is not neceſſary that a complete roof ſhould have all theſe parts; the introduction of many of them depends on the diſtance of the walls, the contour of the roof, the partitions below, the quantity of head-room wanted in the garret-rooms, &c.

Of common roofs, the ſimpleſt conſtruction is that which conſiſts of two rafters, A B and B C, *Plate* XLII. *fig.* 8; D and E are wall-plates, on which the feet A and C of the rafters reſt; the bottom of the rafters is cut in the form of a right angle (called by workmen a bird's mouth), reverſed to the wall-plate, and is fixed to it with nails; but this form can only be applied to buildings that have their walls at no great diſtance from each other.

The next form is that of having two rafters, A B, B C, *Plate* XLII. *fig.* 7, a collar-beam D E, with two wall-plates, F and G, below. This form will admit of a greater diſtance between the walls than the other: the beam is placed in the ſituation D E, in order to give head-room within; but when the ſpan, F G, of the walls is conſiderable, the parts A D and C E being conſidered as levers, and acted upon by the re-action of the walls, the rafters are either liable to be broken at the points D and E, or curved with a concavity on the upper edges.

The third form of common roofs conſiſts of two rafters, A B, B C, *Plate* XLII. *fig.* 10, a tie-beam A C, for preventing the rafters from puſhing out the walls, a collar or ſtraining-beam D E, and two puncheons, or ſtuds, F G and H I, for keeping the rafters ſtraight: this conſtruction is uſed for cheapneſs, and may be executed with ſafety in houſes not exceeding forty-five feet wide; but it is neceſſary to have partitions immediately below, or at no great diſtance from the ſtuds. Inſtead of ſupporting every oppoſite pair of rafters, as in this example, in many roofs of this conſtruction, the rafters take the place of principals, and are fixed at 7, 8, 9, or 10 feet from each other, and purlins run over the heads of the puncheons at K and L; and at the ends of the collar-beams at M and N, between every two rafters, ſmall rafters are fixed to the purlins, the wall-plates at bottom, and the ridge-tree at the top.

The moſt ſimple conſtruction of a truſs is that conſiſting of the following parts, *Plate* XLII. *fig.* 9. A B the tie-beam, cocked upon the wall-plates C and D; E K the king-poſt; A G and B H principal rafters, fixed to the king-poſt at the joggles, G and H; L M and N O ſtrutts, mortiſed into the rafters at L and N, and joggled to the king-poſt at M and O. Other names of timbers will be fully illuſtrated by the deſcriptions of other roofs in due order of ſucceſſion. What has been ſaid may ſuffice for the preſent.

Prop. III.

The poſition of ſeveral rafters, A B, B C, C D, D E, &c. *Plate* XLIII. *fig.* 1, being given in a vertical plane, joined together and moveable about the angular points B, C, D, E, &c. while the points A and G remain ſtationary; it is required to find the proportion of the forces at the angles, ſo that the rafters may be kept in equilibrio.

Through the points B, C, D, E, &c. draw the vertical lines Bi, Cm, Dp, Es, &c. being the direction of the forces. Make Bi of any indefinite length, and complete the parallelogram $Bhik$. Make Cl equal to Bk, and complete the parallelogram $Clmn$. Proceed in this manner with all the remaining parallelograms, making the two oppoſite forces in the direction of each rafter equal to each other, and the diagonals, Bi, Cm, Dp, Es, &c. will repreſent the forces required, as is evident from the conſtruction. Then, to find the proportion of the weights upon any two angles, the ſine of any angle is the ſame with the ſine of its ſupplement, therefore the ſine of the angle A B C is the ſame as the ſine of Kbk, or Bki; and the ſine of B C D the ſame as the ſine of Cnm; likewiſe the ſine of the angle Cml is equal to the ſine of the alternate angle mCn, and the ſine of the angle Dpo is equal to the ſine of the angle pDq; moreover, the ſine of the angle iBk is equal to the ſine of the angle mCl, and the ſine of the angle mCn is equal to the ſine of the angle pDo, and ſo on: then, becauſe the ſides of triangles are as the ſines their oppoſite angles, it will be by trigonometry,

$$Bi : Bk, \text{ or } Cl :: S\cdot Bki, \text{ or } ABC : S.Bik, \text{ or } iBh$$
$$Cl : lm, \text{ or } Do :: S.Cml, \text{ or } mCn : S.mCl, \text{ or } iBk$$
$$Do : op, \text{ or } Er :: S.Dpo, \text{ or } pDq : S.pDo, \text{ or } mCn$$
$$Er : sr, \text{ or } Fu :: S.Esr, \text{ or } vFu : S.sEr, \text{ or } pDq$$
$$Fu : Fv :: S\cdot Fvu, \text{ or } vFw : S.vuF, \text{ or } EFG$$

$$\text{Therefore } Bi : Fv :: S.ABC \times S.vFu \times S.vFw : S.iBh \times S.iBk \times S.EFG$$

$$\text{Therefore } Bi : Fv :: \frac{S.ABC}{S.iBh \times S.iBk} : \frac{S.EFG}{S.vFu \times S.vFw}$$

That is, the weights on any two angles are as the ſines of theſe angles directly, and reciprocally as the product of the ſines of the two parts of theſe angles, divided by the vertical lines.

Cor. 1.—Hence the weights on any two angles are as the ſines of the angles directly, and as the product of the coſines of the two parts of theſe angles reciprocally. For draw B H perpendicular to Bi, and produce iB and A B to I and K; then will the angle K B I, equal to the angle hBi, be the coſine of the angle H B K; *viz.* the coſine of the angle of elevation of the rafter A B above the horizon; and becauſe C B I is the ſupplement of iBC, the angles C B I and CBi have the ſame ſine, and the angle C B I is the coſine of the angle H B C; *viz.* the angle of elevation of the rafter B C.

Cor. 2.—Hence alſo, the weights on any two angles are as the ſines of the angles directly, and as the products of the ſecants of elevation jointly, becauſe the ſecants of any two angles are reciprocally as the coſines of theſe angles.

Cor. 3.—The force which any rafter makes in its own direction is as the ſecant of its elevation. For make A P equal to Bh; draw the lines P N, kH, nL, &c. parallel to the vertical lines Bi, Cm, &c. and draw A N, B H, C L, &c. parallel to the horizon; then becauſe the angles N A P, HBk, LCn, &c. are the angles of elevation, and A N, B H, C L, &c. are all equal, if A N, B H, C L, &c. be conſidered as radii, A P, Bk, Cn, &c. are the ſecants of elevation, which alſo repreſent the forces on the rafters.

Cor. 4.—Hence the horizontal preſſures at A and G are equal;

equal; for all the perpendiculars drawn from the oppofite angles of each parallelogram to meet the vertical diagonal, are all equal.

Cor. 5.—Hence, if the pofition of any two rafters, and the proportion of the weights, be given, the pofition of the remaining rafters may be determined.

Cor. 6.—If the vertical line S D V be drawn, the horizontal line A V G, and the lines A S, A R, A Q, A T, &c. be drawn parallel to the rafters A B, B C, C D, D E, &c. meeting the vertical line in S, R, Q, T; then will A S, A R, A Q, A T, reprefent the forces, and S R, R Q, Q T, the forces upon the angles; for A S, A R, A Q, A T, &c. are the fecants of the elevation, and the triangles A S R, A R Q, A Q T, are all fimilar to the triangles *h* B *i*, *l* C *m*, *o* D *p*, &c.

Cor. 7.—In every roof kept in equilibrio by the weights of the rafters, if U, V, W, &c. be the centres of gravity of the rafters, and alfo reprefent their weights; then the weight preffing vertically on B, will be $\frac{AU \times U}{AB} + \frac{VC \times V}{BC}$, and the weight on C $= \frac{VB \times V}{BC} + \frac{WD \times W}{CD}$ and fo on; hence $\frac{AU \times U}{AB} + \frac{VC \times V}{BC} : \frac{VB \times V}{BC} + \frac{WD \times W}{CD} :: \frac{S.ABC}{S.hBi \times S.iBk} : \frac{S.BCD}{S.lCm \times S.mCn}$.

Cor. 8.—Hence, if the rafters be prifmatic figures, the weights on the angles B, C, D, &c. will be refpectively as $\frac{AB+BC}{2}$, $\frac{BC+CD}{2}$, $\frac{CD+DE}{2}$, and fo on.

Prop. IV.

Given the vertical angle of a roof, and the proportion of the rafters on each fide, to defcribe the roof to a given width, fo that it fhall be in equilibrio.

Let the proportion of the rafters from the top downwards be as 2, 3, 4, that is, as 4, 6, 8; then the weight on the vertical angle is $\frac{4+4}{2} = 4$; on the next fucceeding angle $\frac{4+6}{2} = 5$; and on the bottom angle $\frac{6+8}{2} = 7$. (*Plate* XLIII. *fig.* 2.) Now let A B C be the given angle. Make B A equal to B C; join A C, and draw D B E perpendicular to A C; then make D B to reprefent half the weight of the vertical rafter: let B D be divided into two equal parts; make B M five of thefe parts, and M E feven; join M A, M C, E A, E C; then from any fcale of equal parts, make B F and B G each two parts; draw F H and G I parallel to M A and M C, and make F H and G I each equal to three equal parts of the fame fcale. Laftly, draw H K and I L parallel to E A and E C, and make H K, I L, each equal to four equal parts; then K H, H F, F B, B G, G I, I L, are the rafters, in the proportion required.

How to reduce this proportion of figure to a given width is obvious; it is only drawing a figure, having a given fide in the fame proportion as another.

Prop. V.

The angular points at the meeting of every two rafters of a roof in equilibrio, by equal weights hung at the angles in vertical directions, equidiftant from each other, are in the curve of a parabola.

Let A B C D E, &c. (*Plate* XLIII. *fig.* 3.) be kept in equilibrio by equal weights, fufpended at the angular points B, C, D, E, &c. in the equidiftant directions B F, C G, D H, E I, &c. the points A, B, C, D, E, &c. are in the curve of a parabola.

For let B F meet A N at F. Draw A K parallel to D E, A L parallel to C D, and A M parallel to B C, cutting F B at K, L, M. Draw B Q, C P, D O, parallel to A N, cutting the middle line I E at Q, P, O.

Then, becaufe the weights on the angles are equal, F K, K L, L M, M B, are alfo equal, the firft excepted, being half, or as the numbers 1, 2, 2, 2; therefore F K, F L, F M, F B, are as the odd numbers 1, 3, 5, 7: but becaufe of the equidiftant lines B F, C G, D H, E I, &c. and the parallels D O, C P, B Q, A I, the triangles A F K, A F L, A F M, are refpectively equal and fimilar to the triangles D O E, C S D, B R C; therefore K F is equal to E O, L F equal to D S, and D S equal to O P, M F equal to C R, and C R equal to P Q: and laftly, B F is equal to Q I; therefore E O, O P, P Q, Q I, are to one another as the numbers 1, 3, 5, 7; and E O, E P, E Q, E I, are as the fquare numbers 1, 4, 9, 16; but the lines O D, P C, Q B, are to one another as 1, 2, 3, 4; therefore the abfciffes E O, E P, E Q, E I, are as the fquares of the ordinates O D, P C, Q B, I A, and the points A, B, C, D, E, are placed in the curve of a parabola. In the fame manner it may be fhewn, that this is the cafe, whatever be the number of ordinates.

Corol.—Hence a roof of this conftruction may be defcribed to any given height and vertical angle, or to a given width and height, with any number of rafters on each fide.

Example.—To defcribe a roof with any given number of rafters on each fide to a given width and height, fo that all the vertical lines paffing through the angular points of the rafters fhall be equidiftant, and the rafters in equilibrio.

Let there be four rafters on each fide, (*Plate* XLIII. *fig.* 3.) Let I N be half the width, and I E the height. Draw N T and E T parallel to I E and I N; divide N T into four equal parts N *f*, *f e*, *e d*, *d* T, and draw *d g* E, *e h* E, *f i* E; likewife divide I N into four equal parts I *c*, *c b*, *b a*, *a* N, and draw *c g*, *b h*, *a i*, parallel to I E. Join E *g*, *g h*, *h i*, *i* N, and thefe lines will be the rafters of half the roof required.

For let C B (*Plate* XLIII. *fig.* 4.) be the height, and A B half the bafe. Draw C D parallel to A B, and A D parallel to B C. In A B take any point *a*, and divide A D, fo that *b* D may be to A D as B *a* to B A. Join *b* C, draw *a c* parallel to B C, meeting *b* C at *c*; and *c d* and *b e* parallel to A B, cutting B C at *e* and *d*, then the triangles C *d c* and C *e b* are fimilar.

Therefore C *d*: C *e* :: *c d* : *e b*, or A B
And by conftruction, C *e* : C B :: *a* B or *c d* : A B or *b e*
Therefore C *d* : C B :: cd^2 : AB^2
Therefore the point C is in the curve of a parabola.

Another method may be as follows: Let B E (*Plate* XLIII. *fig.* 4.) be half the width, B C the height. Produce B C to F, making C F equal to C B. Divide C F into four equal parts, C *f*, *f g*, *g h*, *h* F, and join *f* E, *g* E, *h* E. Divide B E into four equal parts, B *i*, *i k*, *k l*, *l* E, and draw the lines *i m*, *k n*, *l o*, parallel to B C, cutting the former lines *f* E, *g* E, *h* E, at *m*, *n*, *o*; the points *m*, *n*, *o*, are in the curve of a parabola. For the principles of this conftruction, the reader may confult Theorem VII. p. 123. vol. ii. Hutton's Mathematics.

Prop. VI.

To defcribe a roof with four equal rafters, that fhall be in in equilibrio by the weight of the rafters; of a given width A E, *Plate* XLIII. *fig.* 5, and height F C.

Join E C, and bifect it in H, by a perpendicular D H G, meeting A E in G; on G, as a centre, with the diftance G E or G C, defcribe the circle C E O. Draw K H I parallel to F E, meeting the vertical line O C in K, and the circle in I. Draw I D C, and join D E; then make the fide C B A fimilar to C D E, and A B, B C, C D, D E, will be the rafters of the roof required.

For complete the parallelogram C D Q B, and join B D, I F, and draw C L perpendicular to C F, and equal to F G. On L, with the diftance G E, defcribe the circle N I F, meeting the vertical line at N and F; produce E D to meet it alfo in M, and B C to P.

Then becaufe K F is equal to K C, and R C equal to R Q, the triangles C I F and C D Q are fimilar; therefore I F is parallel to D Q: and becaufe the two fegments N I F and C E O are equal to one another, the angle N I F is equal to the angle C E O, equal to twice the angle C E F, or twice the alternate angle E C L equal to E C D + D C L, but E C D is equal to half the external angle M D C, and D C L is half the angle D C P equal to C D Q. Therefore the angle N I F is equal to the angles M D C + C D Q equal to the angle M D Q, and C F : C N :: C Q : C M; but C F and C N are equal, therefore C Q and C M are equal; but C Q is to C M as the weight on C is to the weight on B; therefore the weights on C and B are equal, and the rafters A B, B C, C D, D E, are in equilibrio.

Prop. VII.

Suppofe it were required to conftruct a curb roof, the bottom rafter being in proportion to the upper rafter, as 2 to 3, and to a given vertical angle at the top, and to be of a given width A B, *Plate* XLIII. *fig.* 6.

Now the weight on the upper angle is to the weight on the lower angle, as $\frac{2\,HI}{2}$ is to $\frac{HI + IA}{2}$, that is, as $\frac{3+3}{2} = 3$ is to $\frac{3+2}{2} = 2\frac{1}{2}$; this is in the proportion of 6 to 5, or the half weight at H is to the bottom weight at I, as 3 is to 5.

Bifect A B by the perpendicular C D, and make the angle A E C equal to half the vertical angle, or the angle E A C equal to its complement. Make E D to E C as 5 to 3. Join D A and D B. Take A G of any length; draw F G parallel to A E, and make A G to G F as 2 to 3. Draw A F H, meeting C D at H; and H I parallel to F G or E A, cutting A D at I; make B K equal to A I, and join K H; then A I H K B is the contour of the roof required. This is fo evident from its conftruction, that it does not require demonftration.

Prop. VIII.

In any roof conftructed with two equal rafters only; as the height of the roof is to half the breadth of the building, fo is half the weight of the roof to the horizontal thruft, or lateral preffure.

Let A B C, *Plate* XLIV. *fig.* 1, be a roof, having the two equal rafters A B, B C; join the bottom of the rafters A C; draw B D perpendicular to it; complete the parallelogram B E F G, and draw E G, cutting B D in H. Then, becaufe the triangles B H E and B D A are fimilar, B D : D A :: B H : H E.

Cor. 1.—Hence, in a roof with two rafters and a tie-beam at the bottom, the tenfion, H E, of the tie-beam is $= \frac{DA \times BH}{BD}$.

Cor. 2.—Hence, alfo, B D : B A :: B H : B E, that is, as the height of the roof is to the length of the rafter, fo is half the weight, reprefented by B H, of the roof to the compreffion of the rafters $= \frac{BA \times BH}{BD}$.

Cor. 3.—Half the weight of the roof, the tenfion of the tie-beam, and the compreffion of the rafters, are to one another as the height of the roof, half the breadth of the fpan, and the length of the rafters; for the triangle B H E is fimilar to the triangle B D A.

Prop. IX.

If a rafter bear any weight, or have a weight uniformly diffufed over it, the force tending to break it is equal to the cofine of elevation, multiplied into the weight, divided by radius.

Let A B, B C, *fig.* 2, be two equal rafters; join A C, draw B G perpendicular to it, meeting it in G; and let the weight W be fufpended by the ftring D E. Draw D F perpendicular to A B, and E F parallel to it; then if D E reprefent the weight, D F will reprefent the force tending to break the rafter; F E its tendency to pufh it from B towards A.

Now, becaufe E F is parallel to A B, the alternate angles A D E and D E F are equal, and the angles D F E and A G B are right angles; the triangles E D F and B A G are fimilar; therefore A B : A G :: D E : D F $= \frac{AG \times DE}{AB}$, that is, as radius is to the cofine of elevation, fo is the force employed to its tendency to break the rafter, that is, as R : cof. :: D E : D F $= \frac{\text{cof. elevation} \times DE}{R}$.

Cor. 1.—Hence the weight employed, the preffure in a direction of the length of the rafter at A, the tendency to break it, are as radius, the fine, and cofine of elevation.

Cor. 2.—Becaufe D F $= \frac{\text{cof. elevation} \times DE}{R}$, and becaufe the ftrefs is as the length when the weight is given, the ftrefs is as the cofine of elevation multiplied into the weight, and this product multiplied into the length of the rafter, the radius being a conftant quantity.

Prop. X.

To prevent the rafters of a roof, with a tie-beam, from bending in the middle, and to remove lateral preffure from the walls, when there is no beam.

A variety of methods may be ufed for this purpofe; but the beft are thofe where the fhorteft and leaft quantity of timber are employed without producing a tranfverfe ftrain upon any part. When a roof confifts of two rafters only, no part of the rafters can be loaded between their extremities, nor indeed will they bear their own weight without producing a concavity on the upper fide, which will be greater as the length of the rafter and weight applied to it are greater. Now becaufe the fhorter the rafters are at the fame elevation, the greater the weight they will bear, and be more able to fupport their own weight; the thing to be done is to fupport them by a fufficient number of fixed points

points either from the roof itself, or other immoveable places. There are three points for this purpose; if the rafters have a tie-beam below, that is, at the vertex, and at the two extremities of the rafters, the triangle being immoveable at the angles, every force applied there tends either to compress or extend the sides of the frame without transverse strain.

Examples.—Let it be required to divide each of the rafters into three equal lengths, in order to support two purlins on each side; this may be done, as in *fig.* 3, by pieces, C E, C D, A G, A F, reaching from the two lower angles C and A, and to the opposite sides of the rafters A B and B C, intersecting each other at H and I, and halved upon each other at these intersections: this mode prevents the rafters from sagging, but does not afford any support to the tie-beam. The meeting of so many braces at the same point, too, gives little opportunity of making the ends entirely secure, even though assisted by iron straps. Another mode may be by introducing a king-post, B K, *fig.* 4, to which the strutts D H, E I, F M, G L, may be firmly joggled at H, I, M, L, and mortised to the rafter at D, E, F, G: this method keeps up the middle of the beam, but when the roof is low, and the span great, the strutts, D H and F M, require themselves to be supported, and are much too oblique to prevent a change of figure.

Another method may be as in *fig.* 5, with the king-post in the middle, as before, two queen-posts under the rafters at E and F, two strutts, H E and I F, joggled to the bottom of the king-post at H and I, and to the top of the queen-posts at E and F; and in order to secure the points N and P, two other braces, N Q, P R, are joggled to the bottom of the queen-posts at Q and R, and mortised into the rafters at the upper end. This construction supports the tie-beam in three different points, and each of the rafters in two. The timbers are much shorter than those of the preceding; but so many joggles are certainly an objection to this method, as the shrinking of the timber must be very considerable in three breadths, which would allow the roof to descend. When the span is great, and the points to be supported many, an excellent method may be as in *fig.* 6, where there are two arches of cast-iron or good English oak introduced, which abutt on the king-post, and at the other extremity at the ends of the beam. The rafters and the beam by this mode may be supported by as many equidistant points as we please.

When the tie-beam is removed from the bottom, as in *fig.* 7, and no fixed points are to be found from below, a longitudinal truss may be constructed, the end of which is shewn at A B, and the manner of framing it in *fig.* 9, the two ends being supposed to be firmly fixed into the gables; but where the length is great, the form of *fig.* 10, with a parabolic arch, would be much better: by this method, the rafters will be kept nearly in the same plane, and all lateral pressure from the walls will be removed; for it is evident that if the ridge-tree is supported, there can be no motion downwards in the direction of the rafters, the whole roof being hung to this longitudinal frame.

Prop. XI.

If a roof be constructed with two equal rafters, A M, C M, (*fig.* 8.) and if a tie extend from the bottom of each rafter to an intermediate point in the opposite rafter, and the ties halved together at their intersection B, forming with the rafters a quadrilateral M D B E at the vertex, and two triangles A D B and C E B; then if M D is equal to M E, and if C P represent the direction and quantity of force on the wall at C, the force tending to break the rafters at D and E is $\dfrac{S.PCK \times S.DME \times LK \times DM}{S.LCK \times R}$.

For complete the parallelogram P C L K; make M N equal to C L, and draw N O parallel, and M O perpendicular to A M. Now the triangles C B E and A B D may be looked upon as solid levers, (at least with regard to forces applied to the angles,) moveable round B. Then the force C P will communicate the force C L to the rafter, and C L is the power acting obliquely at M, upon the rafter A M: then because N O is parallel, and O M perpendicular to A M, O M is the force tending to break the rafter at D; O N that pushing it towards A: let M N be considered radius, then O M will be the sine of the angle D M N, or D M E; for produce A M to Q, and the angle N M Q will be the supplement of the vertical angle D M E, therefore the sine of N M Q, equal to the sine of the angle M N O, is the same with the sine of N M A; then by trigonometry,

$$LK : LC :: S.LCK : S.CKL \text{ or } S.PCK$$
$$NM \text{ or } LC : MO :: R : S.DME = S.MNO$$
$$\text{Therefore } LK : MO :: S.LCK \times R : S.PCK \times S.DME.$$

$$\text{Hence } MO = \frac{S.PCK \times S.DME \times LK}{S.LCK \times R} = \text{the}$$

force acting perpendicular to A M at M, but the force tending to break the rafter at D, is as the lever D M multiplied into this force; that is $= \dfrac{S.PCK \times S.DME \times LK \times DM}{S.LCK \times R}$.

Corol. 1.—Hence, if the angle D M E is a right angle, the force tending to break the rafter at D will be $\dfrac{S.PCK \times LK \times DM}{S.LCK}$.

Corol. 2.—Hence the rafters of every roof of this construction must sag in a greater or less degree, by the action of the rafters against each other at the point M, that is, they will be bent into curves concave on the upper edges; but if a diagonal connect the two vertical points M and B, this change of figure will be prevented.

Prop. XII.

To remove the lateral pressure of a roof without any intermediate beam, brace, or strutt.

Let A B, B C, (*Plate* XLV. *fig.* 1. N° 2.) be two rafters, and let there be constructed a strong wall-plate D E F G, N° 1, firmly bolted together at the angles; then if the roof is to be gable-ended, after having fixed the rafters to a common ridge-tree, let two curves be made of cast-iron, or good English oak, of a parabolic form, and let into the rafters, either on the upper or under surface, and firmly secured to them by bolts or nails, and at their lower extremities to the angles of the wall-plates, the vertex of each curve meeting the ridge-piece on each side of it, or nearly, as may be found convenient. One half of the plan N° 1. exhibits the form for the execution of a gable-ended roof, and the other for a hiped roof. The two sides, laid in plano for each form, are shewn in N° 3 and 4; at H I K L and M N O P, H L and D G represent the same wall-plate; D G, N O, and E F another wall-plate, I K and M P meeting the ridge on each side of it: but it must be observed, when the roof is to be hipt, that the ridge-tree must be very strong, as the compressure will be very great, the hip-rafters acting like powerful braces at the extremities of it. Hence it is evident that the wall-plates act as the tie-beams

beams of a common roof, and the curves as the rafters, or more naturally like an arch of a bridge in equilibrium. It has already been ſhewn that equal weights, acting in equidiſtant lines, require an arch of a parabolic form to keep them in equilibrio. In this it is to be conſidered, that as the arches are placed with their crown upwards, they are in a ſtate of compreſſion, and may be got out very conveniently in ſeveral lengths; but if the arches were inverted they would be in a ſtate of tenſion: each arch muſt then be in one piece; the ridge would be compreſſed by the tenſion of the two curves. This inverted diſpoſition of equilibration is not ſo ſecure as when the crown of the arches either meets the ridge or lies towards it. Though the above conſtruction will prevent lateral preſſure, it will not hinder the rafters from ſagging; but the addition of a collar-beam will effectually anſwer this purpoſe in all moderate ſpans.

Prop. XIII.

Given the conſtruction of a roof, of which not more than three timbers meet at the ſame junction, and a force in the direction of any one of the timbers; to find the forces communicated to the other timbers, ſo that the roof ſhall be in equilibrio.

Begin with the given force, and take a part of the line of its direction from the junction to repreſent it; then with the other two directions complete a parallelogram, and apply them from the next junctions on the ſame ſtraight line from which they were taken, and complete parallelograms as before. Proceed in this manner from one junction to another, until parallelograms have been made at every junction. Then the parts of theſe parallelograms in the directions of the timbers are the forces in theſe directions; then to know the ſtate of tenſion or compreſſion of any timber, obſerve that when two of the angles formed by three directions are leſs than two right angles, the middle force acts always contrary to the two extreme ones, as has already been explained; and that when any two of the angles of direction are greater than two right angles, then the forces will act towards or from the ſame point.

Example 1.—Let A B C D A (*fig.* 2.) be a roof, conſiſting of two rafters, A B, B C, two beams, C D, D A, and a king-poſt, D B, ſupported by the walls A O and C E. Let C E repreſent half the weight of the roof, or the re-action of the wall C E; complete the parallelogram C E F G; make D L equal to F C, and complete the parallelogram L M N D, then C F or D L is the force in the direction of the beam C D or A D, and D M the force in the direction of the poſt D B; then becauſe the angles E C F and F C G are leſs than two right angles, and becauſe the point C is preſſed by the re-action of the wall E C, it will alſo be preſſed by the force G C, and drawn by the force C F; therefore the beam C D is in a ſtate of tenſion, and the rafter B C in a ſtate of compreſſion. Again, becauſe C D B and B D A are greater than the two right angles, and becauſe C D is in a ſtate of tenſion, B D and D A are alſo in a ſtate of tenſion.

If B H be made equal to G C, and the parallelogram B H I K completed, and if B P be made equal to D M, then will P I be equal to twice C E, the preſſure on the walls.

Example 2.—Let A B C D E A (*fig.* 3.) be a roof ſupported by walls in the direction P A and Q C, and let there be two pieces of timber, B D and B E, connecting the angular points D and E to the ridge at B.

Take C F to repreſent half the weight of the roof, or the re-action of the wall Q C: complete the parallelogram C F G H, produce C D to K, make D K equal to G C, and complete the parallelogram D I K L; then G C or D K is the force in the direction of the timber C D or A E, and is in a ſtate of tenſion, becauſe the angles F C G and G C H are leſs than two right angles, and becauſe C F is in a ſtate of compreſſion; C H, the force in a direction of the rafter B C, is alſo in a ſtate of compreſſion; and becauſe any two of the three angles G D B, G D E, E D B, are greater than two right angles, and D C is in a ſtate of tenſion, the two pieces, D B and D E, are alſo in a ſtate of tenſion: that is, E A, E B, E D, D B, D C, are all ties. The force in D B or E B is D L, that in D E is D I.

If B R and B S be made equal to C H, and the parallelogram B R W S completed; and if B T and B U be made equal to L D, and the parallelogram B T V U completed, then will V W be equal to twice C F, that is, by reducing the force in the direction of the pieces B E and B D to an equivalent one.

Prop. XIV.

Given the lengths A B, B C, C D, D E, (*Plate* XLVI. *fig.* 1.) of the rafters of a roof and their angles of poſition, to find thoſe angles that require ties, and thoſe which require ſtrutts.

Let A B be to B C as 3 is to 4, that is, as 6 to 8, the proportion of the weight of the rafters; then if 8 be taken for the weight of each of the upper rafters, $\frac{8+8}{2} = 8$ is the weight on the vertical angle C, and $\frac{6+8}{2} = 7$, will be the weight on each of the vertical angles B and D, ſo that the weight on the vertical angle is to the weight on each of the lower angles, as 8 is to 7. Draw the vertical line B G F, and draw A G, A F, parallel to the rafters B C, C D; then if F G be to G B as 8 to 7, the rafters are in equilibrio, and require no ties. But ſuppoſe it ſhould be found that F G is to G B as 1 to 2; now as that will keep it in equilibrio, it would then require a very conſiderable addition laid on the angle B to keep it from ſpringing outwards, ſo that if two braces, F G and K L, N° 2, were fixed to the rafters A B, B C, C D, D E, theſe braces would be in a ſtate of compreſſion, and if the brace H I were fixed at the top it would be in a ſtate of tenſion: F G and K L only require firm butments, but H I to be well bolted. It may here be obſerved, that if the vertical angle only be braced and ſecured to the two rafters, the whole frame will then be immoveable.

Prop. XV.

To diſcover the effect of bracing the angles of a roof flat on the top, ſupported by puncheons at the bottom of the rafters, to accommodate a ſemicircular ceiling within.

Let A B C D E F (*fig.* 2. N° 1.) be the truſs, diveſted of its braces, the bottoms of the puncheons reſting firmly on the walls at A and F, and the joints at B, C, D, E, to be quite moveable, like rule joints. Now, as this diſpoſition of timbers would fall, and in falling, would aſſume the form of N° 2, the angles at C and D would become more and more obtuſe, while thoſe at B and E would become more and more acute; the latter would therefore require ſtraining-pieces, and the former ties: the ſtraining-pieces muſt have good abutments, and the ties be well bolted at their extremities.

Let N° 3 be the truſs, with braces diſpoſed in the lower angles: this diſpoſition will bend the rafters B C, D E, and the puncheons B A, E F, convex towards the outſide, which is is entirely occaſioned by the braces G H and N O: the camber-beam C D is no otherwiſe affected than by its own weight. Let it now be ſuppoſed, that the angles C and D, N° 4, are braced at I K, L M. In this diſpoſition, the puncheons B A and E F are not affected in reſpect of tranſverſe ſtrains; the rafters C B, D E, and beam C D, would all become concave on the outſide; and the points B and E, at the bottom of the rafters and top of the puncheons, would be puſhed out beyond the perpendicular of A and F, at the bottom: here it is neceſſary to obſerve, that the effect produced in this caſe on the rafters C B and D E is contrary to the effect produced in N° 3, by the braces being diſpoſed in the lower angles. Laſtly, ſuppoſe that all the angles are braced, as in N° 5, it is evident, ſince the braces H G, N O, produce a contrary effect to the braces K I, L M, theſe bending the rafters downwards, and thoſe upwards, that the rafters C B and D E will become nearly ſtraight, or aſſume an undulated line: the puncheons B A and E F, receiving the force of the braces H G and N O at the points G and O, muſt ſtill be bent, ſo long as the under ends G and O of the braces do not coincide with the under ends A and F of the puncheons: in this caſe, there is no other remedy than by giving the puncheons a ſcantling ſufficient to withſtand this tranſverſe ſtrain, or horizontal thruſt, at the points G and O: however, the ſhape of the contour may be pretty well ſecured by introducing two abutments, H I and M N, N° 6; theſe, by being bolted through the two ends, will add greatly to the ſtiffneſs of the rafters B C and D E: the bolts that go through the upper ends may alſo ſerve for the braces I K and L M: the ſhape of the horizontal beam C D will likewiſe be very much preſerved by the piece K L, bolted in three places, one at each end, into the braces I K and L M, and another in the middle: the contour of a roof, thus ſupported, would be quite unchangeable, if the rafters were inflexible; but as this is not the caſe, and as they are acted upon tranſverſely by the braces, the truſs will, therefore, in ſome degree, be expanded at B and E, and conſequently occaſion lateral preſſure on the walls; it will therefore be unfit for an oblong building, without other precautions for this purpoſe. By inſerting parabolic curves in the ſides B C and D E, as in *Plate* XLVI. *fig.* 1, it will be effectually prevented.

In roofs of this deſcription, joggle-pieces of wood ſhould never be uſed, as the ſhrinking of them would tend greatly to alter the outline of the rafters.

Having laid down ſuch principles as will enable the workman to judge of the ſtrength and ſtrain of timbers in the framings of carpentry, it will now be neceſſary to proceed to ſhew the mode of conſtructing roofs to anſwer various purpoſes; to give ſome practical obſervations relative to their ſtrength, and to ſhew the various modes of joining timbers, the forms of ſtraps, &c.

Plate XLVII. *fig.* 1. is the roof of the chapel of the royal hoſpital at Greenwich, conſtructed by Mr. S. Wyatt.

	Inches Scantling.
A A, The tie-beam, 57 feet long, the ſpan of the walls being 51 feet - -	14 × 12
B, Queen-poſts - - - -	9 × 12
C, Braces - - - -	9 × 7
D, Straining-beam - - -	10 × 7
E, Straining-piece - - -	6 × 7
F, Principal rafters - - -	10 × 7
G, Camber-beam for the platform -	9 × 7
H, An iron rod, ſupporting tie-beam -	2 × 2

The truſſes are ſeven feet clear; the platform is covered with lead, which is ſupported by horizontal beams ſix by four inches.

The timbers of this truſs are well diſpoſed, and perhaps contain leſs wood than moſt roofs of the ſame dimenſions. The iron rod ſeems of no other utility than to prevent the middle compartment of the beam from ſagging.

Fig. 2. is the roof of St. Paul's, Covent-Garden, deſigned by Mr. Hardwick, and conſtructed by Mr. Wapſhot, in 1796.

	Inches Scantling.
A A, The tie-beam, ſpanning 50 feet 2 inches	16 × 12
B, Queen-poſts - - - -	9 × 8
C, Straining-beam - - -	10 × 8
D, King-poſt, 14 inches at the joggle -	9 × 8
E, Strutts - - - -	9 × 8
F, F, Auxiliary rafters, at bottom -	10 × 8½
H, H, Principal rafters, at bottom -	10 × 8½
I, Studs ſupporting the principals -	8 × 8

This roof is much better conſtructed than the original one by Inigo Jones. A truſs of the preſent deſign contains only 98 cubic feet of timber, whereas that by Inigo Jones had 273, and was very inſufficient at the joggles, and had ſome of its timbers very ill diſpoſed: the interior truſs is well contrived for ſupporting the exterior, which reaches ſeven feet beyond the walls. The tie-beam has perhaps too much camber, being ſix inches; for ſince it acts as a ſtring, it will lengthen in the ſettling of the roof.

Fig. 3. is the roof of Drury-lane theatre, 80 feet 3 inches ſpan, and the truſſes 15 feet apart: conſtructed by Mr. Edward Gray Saunders.

	Inches Scantling.
A, Beams - - - -	10 × 7
B, B, Rafters - - - -	7 × 7
C, King-poſts - - - -	12 × 7
D, Strutts - - - -	5 × 7
E, Purlins - - - -	9 × 5
G, Pole-plates - - - -	5 × 5
H, Common rafters - - -	5 × 4
I, Tie-beam - - - -	15 × 12
K, Poſts to ditto - - -	15 × 12
L, Principal braces to ditto -	14 and 12 × 12
M, Strutts - - - -	8 × 12
N, Straining-beam - - -	12 × 12

The principal beams are truſſed in the middle ſpace with oak braces, five inches ſquare. This was requiſite on account of its width, which is thirty-two feet, that the floors might carry the work-ſhops neceſſary for the uſe of the theatre. This truſs is moſt admirably conſtructed, it is hardly equalled for ſtrength, ſtiffneſs, and lightneſs by any other, and will ſafely bear a load of nearly 300 tuns, which is four times more than ever it is likely to be loaded with.

Plate LVIII. *fig.* 1. is the deſign of a truſs-roof for a church, with a nave and two ſide aiſles. The beam of the middle compartment is kept from ſagging in the middle by two ſtrutts, reſting at the bottom on poſts over the columns, and connected together at the top by a ſtraining-piece. As the poſts firmly ſupport the middle of the rafters, keeping theſe points always ſtationary, there will be little danger of lateral preſſure from a roof of this conſtruction. All that is wanted further is to give the rafters ſtiffneſs, by fixing other pieces from the two fixed points of the tie-beam, and from the two poſts.

Fig. 2. is a deſign for the truſs of a curb-roof, with a door in the middle. The rafters are ſupported at equal diſtances, from

from fixed points of the trufs; the weight of the covering being always uniform, or nearly fo.

Fig. 3, N° 1, a defign for a roof, with lanterns in feveral ftages, diminifhing in the form of fome Chinefe buildings. Thefe towers may be carried to any height, at pleafure, by always truffing in the plane of the diagonal between every two ftages from the lower, to fupport that immediately above. There are fome excellent fpecimens to be feen in the buildings of Deptford, belonging to the victualling office, called ufually the Red-houfe. N° 2. is a plan for the feat of the upper ftage.

Fig. 4. is the defign of a conic roof for a rotunda or circular building, fupporting a lantern at the top. If the extent of the building is very large, the rafters would require to be fupported in the middle; for this purpofe the bottom piece may be continued, as is expreffed by the dotted lines.

Fig. 5. is a defign for a pent roof, fupporting a lantern of an octagonal form. N° 1. is the form of the trufs; N° 2, the lower plan, with the feat of the pofts; N° 3, the plan of the upper part; N° 4, the trufs of the two tranfverfe parts.

Having defcribed the form of roofs fupporting lanterns, and the truffes in which they may be executed with fafety, it will now be proper to give a few examples of domes, and fhew how they may be conftructed under various circumftances. If the dome to be conftructed be on a circular plan, and have no lantern above, the ribs may be built in the following manner, with planks of convenient lengths in three thickneffes. Having afcertained the length of the ribs, and the number of pieces in that length, and having properly fhaped all the pieces to the curve, the middle piece at the bottom may be one of thefe lengths; to each fide may be joined two other pieces, one reaching to a third of the middle piece, and the other to two-thirds from the bottom; fo that by continuing with planks of the whole length to the other extremity of the rib, the middle thicknefs will always be covered two-thirds from the bottom on one fide, and one-third on the other; the deficiency at the top muft be filled up with pieces, one of a third and the other of two-thirds, as at the bottom; the whole, being well bolted together and ftrapped acrofs the joints, will be nearly as ftrong as a folid rib. *Plate* LIX. *fig*. 1 fhews the manner of conftructing this kind of dome; N° 1 being the femi-plan, N° 2 the elevation, N° 3 the manner of building the rib. In domes of this kind it may fometimes be neceffary to difcontinue the ribs, in order to divide the fpaces more equally for the horizontal ribs. It is evident that a dome built in this manner may be carried almoft to any degree of extent, provided that it have a fufficient number of horizontal ribs. Of this conftruction is the Halle du Bled at Paris, of 200 feet in diameter, the invention of a judicious carpenter, the Sieur Molineau, a man of little education in the point of fcience, but of confiderable mechanical experience, from which he formed his theory. Being convinced that a very thin fhell of timber might not only be fo fhaped as to be nearly in equilibrio, but that, if well connected with horizontal ribs, it would have all the ftiffnefs that was neceffary; he accordingly prefented his fcheme to the magiftracy of Paris: the grandeur of the idea pleafed them, but they doubted of the poffibility of its being put in practice. Being a great public work, they prevailed on the Academy of Sciences to confider it. The members, who were competent judges, were ftruck with the juftnefs of Mr. Molineau's principles, and aftonifhed that a thing fo plain had not become familiar to every houfe-carpenter. It quickly became an univerfal topic of converfation, difpute, and cabal in the polite circles of Paris. But the Academy having given a favourable report of their opinion, the project was immediately carried into execution and foon completed, and now ftands as one of the greateft exhibitions of Paris. The circular ribs which compofe this dome confift of planks 9 feet long, 13 inches broad, and 3 inches thick, made in three thickneffes, as in that already defcribed. At various diftances thefe ribs were connected horizontally by purlins and iron ftraps, which made fo many hoops to the whole. When the work had reached fuch a height, that the diftance of the ribs was two-thirds of the original diftance, every fecond (now confifting of two ribs, very near each other,) was in like manner difcontinued, and the void glazed. A little above this the heads of the ribs are framed into a circular ring of timber, which forms a wide opening in the middle, over which is a glazed canopy or umbrella, with an opening between it and the dome, for allowing the heated air to get out. All who have feen this dome fay, that it is the moft beautiful and magnificent object they ever beheld.

The only difficulty which occurs in the conftruction of wooden domes, is when they are loaded in the upper part by a heavy lantern or cupola. Such a dome as has now been defcribed would be in danger of being crufhed at the top inwardly; the moft effectual method of preventing which is by making the ribs in the form of truffes, as in *Plate* LIX. *fig*. 2, where the ftraight pieces connecting the two extremities of the exterior fide, forming as it were the bafe of a trufs in a common roof, act contrary to the nature of a tie-beam; they refift the vertical preffure of the lantern, without having any tendency to burft out the fides, by acting entirely longitudinally on the wall-plate. In order to fecure the lantern, horizontal braces are fixed from the bottom of the lantern to the middle of the principal braces under the joggles, fo that the whole is refolved into triangles, which are all immoveable at the angles. The wall-plates fhould be framed as the ribs of a dome, conftructed as in the laft example.

When a dome is to fupport a heavy cupola of ftone, fuch a conftruction as that of the cathedral of St. Paul's, London, may be employed. *Fig*. 3. N° 1. exhibits the trufs of this dome, taken from accurate meafurement. A *a a* A, a dome of brick, two bricks thick, which, as it rifes every five feet, has a courfe of ftrong bricks 18 inches long, bonding through the whole thicknefs. B *b b* B is a cone, built with bricks one foot fix inches in thicknefs, for fupporting the heavy cupola above, of Portland ftone, which is 21 feet diameter, and near 61 feet high, and alfo the timber-work of the dome. The horizontal or hammer-beams, C,C, &c. being curioufly tied to the corbels D, D, D, &c. with iron cramps, which are bedded into the corbels with lead, and bolted to the hammer-beams. N° 2. fhews more particularly the manner of tying the hammer-beams to the corbels.

This dome is boarded from the bafe upwards, and the ribs are therefore fixed horizontally, having their fides in planes tending to the centre of the dome. The contour of the dome is formed of two circular fegments, which meet in the axis like a pointed arch. The fcantlings of the curve rib of the trufs are 10 inches by $11\frac{1}{2}$ at the bottom, and 6 inches by 6 at top. It has a very ftrong double iron chain, linked together at the bottom of the cone, and feveral other lefs ones between that and the cupola, which may be feen in that beautiful fection of St. Paul's, engraved by Rooker. This dome was turned upon a centre, which was fupported without any ftandards from below. As every ftory of the fcantling was circular, and the ends of the ledgers meeting like fo many rings, and truly wrought, it fupported itfelf; and as it was both centering and fcaffolding it remained for the

the uſe of the painter, there being a ſpace of twelve feet between it and the dome. This machine, it is ſaid, was original of its kind.

Roof, *Rotative*, or *Rotatory*, in *Aſtronomy*, is one which is made to turn round in a horizontal direction, ſo that its openings or doors may be directed to any azimuthal line in the concave expanſe of the heavenly regions. In a tranſit room, where a meridian line is the only one that is wanted, a fixed roof, with trap-doors opening at different altitudes above one another, ſufficiently anſwers the purpoſe of the aſtronomer; but in an obſervatory, where an inſtrument that meaſures azimuths as well as altitudes is placed; or where a good teleſcope, of either the achromatic refracting, or reflecting conſtruction, is uſed, for viewing the ſtars and planets in various parts of the heavens on the ſame evening, a rotative roof is indiſpenſably requiſite. The conſtruction which has been moſt generally adopted, and which we ſhall firſt deſcribe, was contrived by the ingenious Mr. Smeaton, one of whoſe papers, of the date of 1788, now lying before us, was deſigned for the late Mr. Aubert's obſervatory at Highbury, and will ſupply us with materials ſufficient for the purpoſe of illuſtration. In *Plate* XXII. of *Aſtronomical Inſtruments*, *fig*. 1. repreſents a ſection of the whole roof along that plane, which paſſes through the doors, or opening, that divides it into two equal portions; *fig*. 2. is the plan of the ſame, and ſerves to illuſtrate *fig*. 1; in both theſe, *a*, *a*, are the rafters, or door-cheeks, covered by two oblong doors meeting at the apex, and ſo contrived by cloſe fitting, as to exclude the rain and ſnow when nicely made. An enlarged ſection acroſs one of theſe doors is ſeen in *fig*. 3, and will be explained preſently. The frame of the roof is covered with alternate boards of deal of a triangular ſhape, tongued into one another at the edges, and when perfectly put together with ſtrong glue, and ſeveral times painted over, will be light, and will laſt ſeveral years; but if a coat of copper, particularly of tinned copper of Mr. Wyatt's patent manufactory, be ſuperadded, the weight will not be conſiderable, and the durability will be enſured. A ſquare foot of Mr. Wyatt's copper of the thinneſt kind weighs a pound, and therefore a given number of ſquare feet will be covered by ſo many pounds weight. An edge plate, formed into a circle, terminates the eaves, and conceals a ſtrong annular ſupport, which reſts on ten rollers, five of which are ſeen in *fig*. 1, three as circles, and two at the extremities of the roof in ſection as ſmall parallelograms. All the ten rollers are repreſented in the ring ſeen in *fig*. 4, which is united by five pairs of hinges that connect the five equal portions thereof, as ſeen on the plane of the ring; while each of theſe five portions contain two rollers ſeen in ſection, and one handle projecting inwards. The uſe of the hinges is to allow each of the five portions of the ring to yield to the preſſure of the ſuperincumbent roof, in order that all the rollers may be made to act in every poſition of the roof, in the event of any of the parts becoming diſtorted or partially worn. This ring, which receives the pivots of the rollers, lies intermediate between the roof and fixed circle that bears the whole weight, and is repreſented by the letters *b*, *b*, in *fig*. 1, the fixed circle or bed being denoted by the letters *c*, *c*; both which, in the ſection, appear as ſtraight lines, though they are circles or rings, as above deſcribed, and the fixed one, *c c*, reſts on ſtrong upright pieces, *d*, *d*, properly braced by frame-work, which it is not neceſſary to ſhew. From this ſhort deſcription the reader will now conceive that the roof is ſeparated from the bed *c c*, by exactly the whole diameter of the rollers, which therefore ought to be turned nicely to the ſame dimenſions, in order to preſerve the horizontal poſition of the ring, and to make the rollers act ſmoothly, when the roof is puſhed round by any force internally applied; but unleſs ſome proviſion is made, more than we have yet deſcribed, the roof might be puſhed from its bed, and be upſet; to avoid this accident a groove is made along the upper face of the annular bed *c c*, in which the rollers move, and while all the parts of this contrivance remain unaltered by the weather, the action of the rollers is uniform, and the conſtruction anſwers its purpoſe in a ſatiſfactory manner: but in many inſtances, we learn that the work of turning a large roof, thus conſtructed, becomes laborious, in conſequence of either the ring of rollers, or the groove in the bed, taking an elliptical ſhape, in a ſmall degree, by partial ſhrinking or ſwelling in different ſtates of the atmoſphere; in which caſe the rollers bind in the groove, and require mechanical force to move them, in certain parts of the revolution; which force will of courſe ſtrain the joints, and ultimately deſtroy the union of the different parts of the ſtructure. It is, therefore, of importance that an attention be paid to the grain of the wood, as well as to its being ſeaſoned, before the upper covering be attached; which precaution will prevent the bad effect of external moiſture. At *e*, in *fig*. 3. is one of the hinges of the doors, attached firſt to the ſide of the door, and then to a piece of wood that lies over the roof to receive the ſcrews, without penetrating the roof itſelf; and the crank-ſhape of the ſection of the door will explain how it claſps the door-cheeks, ſo as to exclude the admiſſion of rain or ſnow, ſo long as the materials do not warp or decay. The handle-piece, *f*, puſhes the door back, and brings it cloſe again, by the aid of a ſtaff with a hook at the end, that takes hold of the ring at the lower extremity of the handle *f*, when the roof is too far elevated for the reach of the human hand. During the peruſal of this account of the mechaniſm of Smeaton's rotatory roof, it may have occurred to the reader, that the rollers might have been attached to the annular portion of the roof, which now reſts on the upper extremities of the rollers, and that conſequently the ring, that now carries the ſaid rollers, and that is repreſented by *fig*. 4, might have been omitted. But the inventor had a good practical reaſon for the introduction of this ring, which may not yet have occurred to our reader; and it might perhaps puzzle him to diſcover it, without our aſſiſtance. Smeaton knew very well that the roof with rollers, or ſmall wheels under it, would move in a groove made in the bed to receive them; but he knew, moreover, that, to move in a *circular* groove, the diameters of the rollers could not be *great*, without ſticking faſt againſt the ſides of the ſaid groove; and, alſo, that the pivots of the rollers muſt be *ſtrong*, to ſupport the whole roof. The relative diameters of the rollers, and of their pivots, on which the quantity of friction depends, would not conſequently produce, under theſe circumſtances, the eaſy motion of the roof that conſtitutes a leading object of the aſtronomer: the ring was, therefore, introduced, for the purpoſe of diminiſhing the friction *one-half*, without altering the neceſſary dimenſions of the rollers, and of their pivots; which effect may be thus explained. In the firſt place, ſuppoſing the roof to be moving forwards on rollers attached to it, like a carriage on wheels; in this caſe, the velocity of the roof and of the rollers, or of the carriage and wheels, would be the ſame; and the horizontal diſtance paſſed over in a given number of revolutions of the roller, or wheels, would be meaſured by the circumference of the roller, or wheel, multiplied by its number of revolutions; and the mechanical diminution of friction would be as the diameter of the roller to that of the pivot of the axis, or of the wheel to that of its axle. When a motion is thus produced in a roof, or in a carriage, a carriage, we may ſay that it *rides* on, or *is carried* by its roller, or wheel, and that with the ſame velocity with which the roller or wheel moves forwards, by virtue of its rotations. But, in the next place, let the rollers be conſidered as attached to the ring in *fig.* 4, which has as many holes cut through it as there are rollers for them to paſs through; and let us conceive this ring to be put in motion, as it is placed on its circular bed *c c*, without any reference to the roof. In this ſituation, the ring rides on, or is carried by the rollers with their velocity, as the roof or carriage was on our firſt ſuppoſition. Let now the roof reſt on wedges placed on the ring, but ſo as *not to touch* the rollers, and it will alſo ride as before, with the velocity of the rollers; but remove the wedges, and let the roof fall upon the upper edges of the rollers, and it will now have two motions combined: for, firſt, it will ride in common with the ring on which it reſts, in the way we have deſcribed; and, ſecondly, it will be urged by the rollers acting on its annular face, as ſo many toothleſs pinions, with a ſimilar velocity with which it *rides* on the rollers, along with the ring; or, in other words, the roof will have *double* the *velocity* of the ring on which the rollers are fixed. To underſtand this effect more clearly, let the reader ſuppoſe himſelf in an open carriage. While he ſits ſtill, he is carried with the velocity of his vehicle; but if he ſhould venture to place his foot on the circumference of one of the wheels, in getting out, while the vehicle is in motion, he will run the riſk of being toſſed forward by the ſaid moving wheel with an *increaſed velocity*, that will convince him of the danger of ſuch an experiment. This effect is familiar to all, but the cauſe is not generally conſidered, perhaps but little underſtood.

In order that the adaptation of all the parts that are connected with the rollers may be the more evident, we have given an enlarged ſection of one corner of the roof, near the eaves, within the ring of *fig.* 4, which, therefore, may be conſidered as a ſeparate figure, in which the ſame letters repreſent the ſame parts as in *fig.* 1: namely, *a* is one of the rafters, forming one of the door-cheeks, projecting above the covering of the roof; *b b*, the roller, ſeen both in ſection and plan; *c*, a ſection of the fixed annular bed; *g*, a ſection of the moveable annular part of the roof, on which the eaves lie; and *g h*, an iron cranked bar, ſcrewed to *g* above, and therefore moving with the roof, but in ſuch way, that the crooked part at *h* lies juſt below an annular piece *i*, attached to the bed *c*; ſo that if any blaſt of wind, or other external force, ſhould move the roof, it will be ſecured from overſetting, by the crank-bar at *h* catching the ſaid fixed piece *i*; and if four or more of theſe crank-bars be uſed, the roof will be ſecure in all directions.

The objection which we have ſtated, as applying to the conſtruction of Smeaton's roof, has very lately been obviated by the Rev. W. Pearſon of Eaſt Sheen, Surrey, who has juſt finiſhed a rotative dome, to receive a large and very accurate circular inſtrument for meaſuring azimuths, as well as altitudes, by Troughton; which inſtrument was originally ordered by the Ruſſian Academy, but was countermanded by reaſon of the ravages committed by the French in Ruſſia, at the time that the conſtruction of it was in hand. This dome is repreſented in ſkeleton in *fig.* 5, where the circular rafters are ſeen at ſixteen equal diſtances, excluſive of the opening, *a a*, *a a*, which is nearly nine inches, through which the teleſcope of the inſtrument, placed on the top of the pillar A, is directed to any part of the heavens. This ſemicircular opening, which divides the dome into two equal portions, or quarters of an oblong ſphere, is covered by five doors, two on each ſide, and one at the ſummit; but in ſuch a way, that a ſmall door on one ſide faces a large one on the other, and the top door takes in five or ſix inches more on one ſide than on the other, ſo that there is no altitude to which the teleſcope may not be directed, by reverſing the poſition of the dome, *i. e.* by turning it juſt half round, when neceſſary; and yet the fittings are ſo contrived, that any one of the doors may be opened, while the reſt are ſhut. The two quarters of the oblong ſphere are connected by braſs bars at the points where the doors meet, and grooves are made on the edges of the rafters, that form the door-cheeks; ſo that any rain, that may be driven into the ſides or ends of the doors, runs down theſe grooves to the eaves, and diſappears, without being admitted within. We have not thought it neceſſary to ſhew theſe doors, which turn back on hinges, placed at their edges, upon the roof, which is covered firſt with triangular ſlips of deal about three-eighths thick, and then with tinned copper from Wyatt's manufactory; which metal being eaſily ſeamed, requires not the aid of many nails. The ornament at the top, being light, turns back with the top-door, and lies alſo on the roof, while obſervations are made in or near the zenith. The rotative part of this roof is of the ſimpleſt conſtruction that can well be imagined, and yet is ſafe, and more free from friction than Smeaton's, though made with the utmoſt care. The ring of rollers is here entirely left out, and three large balls of lignum vitæ are ſubſtituted in a detached ſtate, that is, without any fixed axis of motion, or pivots; and a four-ſided circular tunnel is ſo formed of wood, that theſe balls, by their ſimilarity of dimenſions, keep their relative diſtances from one another, and act as friction-rollers both in a vertical and horizontal direction; nay, even in both at once, whenever they happen to come in contact with either of the ſides of the ſaid tunnel. The balls, which are $4\frac{1}{4}$ inches in diameter each, are ſhewn in *fig.* 5. at oppoſite diameters of the dome, near the eaves, as though four were uſed, for the ſake of exhibiting their mode of poſition and action; but three only are much better, becauſe in every ſituation of their revolution they are certain to bear equal ſhares of the whole weight, when the bed is horizontal; and therefore none of them will refuſe to move, when the dome is puſhed round; but ſhould they happen to gain ground of one another in moving forwards, by any difference in their diameters, they will reſume their original ſituations reſpectively during the backward motion of the dome. *Fig.* 6. is an enlarged ſcale of the tunnel and of one of the balls, in which A is a portion of the roof, terminated by the annular piece of deal B, which is lined with the annular piece of wainſcot C, to both which the covering-piece D above the eaves is ſcrewed; E is a piece of wainſcot forming the inner ſide of the tunnel, and G is a continuation of one of the upright planks attached to the annular bed H, and forms the exterior ſide of the ſame. All the four ſides of the ſquare tunnel, which we called circular, becauſe it ſurrounds the circular erection, are either of wainſcot, or lined with wainſcot, to come in contact with the lignum vitæ which compoſes the balls; though the rings of deal, B and I, might have been in contact with the balls, if they had been hard enough; but the weight of a dome, of nearly ten feet diameter, covered with copper, would, in that caſe, have produced hollow places, that might have impeded the uniform motion of the balls. The piece J is one of the ſupporters of the bed I, to which the deal planks G are made faſt, and alſo the external pilaſters that ornament the vertical portion of the ſtructure. In this dome the velocity of the ſuperſtructure, as in Smeaton's, is double to that of the balls; and as theſe are left at liberty to turn in any direction, where an obſtacle to motion is preſented to any of them, they in-

ſtantly

ftantly right themfelves, and fet forwards again with their load without impediment, and without groaning. A cranked bar attached to the piece E, and bending below a ring, faft to the bed I, but not fhewn in the figure, prevents the dome from overturning by either accident or violence, and by the aid of a thumb-fcrew fixes it in any given pofition. This conftruction was, we believe, fuggefted firft by Mr. Troughton, and as it has not been long in ufe, we cannot forefee what objections may hereafter apply to it; but we give the particulars of it from a perfuafion, that it will be found to be a confiderable improvement on Smeaton's, and that it may ultimately be generally adopted.

Roofs, in *Rural Economy*, are formed of many different forts of materials. Thatch was formerly almoft in general ufe for covering the roofs of farm-buildings; but it is obvioufly objectionable on many accounts; it not only ferves as a hiding-place for rats, mice, infects, birds, and other forts of vermin; but it is extremely perifhable in its nature, fubject to be much damaged by high winds, and of courfe liable to frequent repairs, and, above all, highly dangerous from its combuftible nature; it is, therefore, probably the moft improper, the leaft fafe, and, in the end, the moft expenfive material that can be employed for the purpofe. Mr. Middleton, however, thinks that it keeps out the fummer's heat and winter's cold more effectually than any other material now in ufe; but that, as it is not quite fo compact and fightly as flates or tiles, and the ftraw being of fuch value for other purpofes, it will probably be fuperfeded by them. Tiles, though little expofed to danger from fire, do not, by any means, conftitute a good roof, being ill calculated for preferving grain or other farm produce. In fummer they admit a heat very unfriendly to hay, corn, or ftraw, while, in winter, they are equally objectionable, on the ground of tranfmitting moifture in a high degree, while flates, though more expenfive at firft, are liable to none of thefe objections, efpecially when of the more thick kind. A roof covered with them, therefore, anfwers every ufeful purpofe, and is very durable, lafting half a century, with very flight repairs in any way.

In the Middlefex Report on Agriculture, it is remarked on this important fubject, in fpeaking of the roofs of houfes, that pantiles are fo eafily heated through by the fun during the fummer months, that the rooms underneath are as hot as an oven; while, in the winter feafon, in every common froft, thefe tiles are fo completely frozen through, as to become as cold as a covering of ice. Thefe extremes muft confequently have a very bad effect on the health of the inhabitants. The blue flates are fo very thin, as to be equally liable to the fame objection, particularly as they are now laid on moft of our fafhionable houfes, under Wyatt's patent. They are rather better when laid on in the common manner, that is, on double laths, but much better on boards. Plain tiles make a confiderably more temperate covering for houfes than either pantiles or flates, by reafon of their being laid double and in mortar, and thereby forming a much thicker and clofer roof. In this they are nearly equalled by the thick or ftone flating of the midland counties; they might alfo be glazed of a flate colour; in which cafe they would make a roof more handfome, temperate, and durable than any other covering material now known.

Some other fubftances have been had recourfe to in this intention. In different parts of the country, cements of various kinds, and coarfe paper laid over with refin, tar, &c. and other fimilar matters, have been tried, but with no very promifing fuccefs as to their application. In fome parts of Devonfhire, though flate is by no means difficult to be procured, a fubftitute for that fort of covering is, Mr. Vancouver afferts, getting very much into ufe, which is prepared in the following manner:—three parts of whiting, five of fand, one of pounded charcoal, and one of bone-afhes, to a barrel of common tar, to which are added four pounds of black refin; the two laft materials are to be melted together, and, when boiling, the other ingredients are to be added in fmall quantities, keeping them conftantly ftirred and in motion over the fire, until the whole mafs becomes of a confiftence fit for ufe. Then the roof, being previoufly covered over with fheathing-paper fecurely nailed down, is to be carefully and evenly fpread with the liquid hot from the copper, to the thicknefs of about three quarters of an inch; which will coft, at the cauldron, about thirty-five fhillings for each fquare of ten feet. The fame meafure of the common flate roof will coft about thirty-two fhillings. The roofs for this fort of compofition are pitched very flat, and, from the lightnefs of the fcantling which is neceffary in their conftruction, come confiderably cheaper than thofe required for carrying flate or tiles.

Materials of the reed and heath kinds have alfo been tried as coverings for the roofs of farm-houfes and cottages, in places where they are capable of being procured in fufficient quantities for fuch purpofes; and, though they are confiderably more durable than common ftraw thatch, they are fubject to all the inconveniencies and objections of that fort of covering. Indeed, no kind of material that has hitherto been made ufe of for forming the coverings of the roofs of buildings are quite free from imperfections of fome fort or other. It is confequently a matter of great individual, as well as national importance, to be acquainted with a fubftance which is not liable to any fuch defects, as a good, cheap, and durable material of fuch a nature, for this ufe would evidently be a moft valuable difcovery, as fuch a material is ftill clearly wanting for this purpofe.

Roof, *Attic of a*. See Attic.

Roof, *Falfe*. See False.

Roof, *Hip*. See Hip *Roof*, and Roof, fupra.

Roof-*Trees*, or Ruff-*trees*, are the timbers, in a fhip, which go from the half-deck to the forecaftle. See Rough-*Tree*.

The term is alfo ufed for the upper timbers of any building; whence, in the northern counties, it is common to fignify a whole family, by faying all under fuch-a-one's roof-tree.

Roof-*Tyles*. See Tyle.

ROOFING, in *Rural Economy*, fometimes a word applied provincially to the ridge-cap of thatched roofs. It alfo fignifies any fort of material employed in forming the roof of a building, whether in the frame-work, or covering. In the bufinefs of roofing farm or other buildings, the chief circumftance neceffary to be attended to, is that of tying the two fide-parts well together, and in a fafe manner, by means of the wall-plates and binding-beams; efpecially thofe erections which are of the more long kind, without any crofs-walls to ftiffen and fupport them. It has been remarked, that it is generally for want of attention to thefe matters that farm-buildings, as well as thofe of other forts, are fo frequently feen propped up with fhores and buttreffes; or fallen to the ground half a century fooner, perhaps, than they would have done under a better and more judicious management. And it ought, indeed, to be a general principle, or line of conduct, which every careful and intelligent manager fhould follow in erecting fuch buildings;—a principle which is equally applicable to the other parts as well as the timber and the covering: which is, that of fparing no requifite expenditure; as a few fhillings, or pounds, of additional

tional coſt, in the firſt inſtance, may be the ſaving of ten times the ſum in the end.

In the work of repairing buildings of this nature, the roofing claims equally the regard of the manager, with thoſe of the foundations and other external parts. But the inſide works, in all caſes, more commonly and properly demand the notice of the occupiers.

ROOGEN, in *Geography*, a town of the duchy of Courland; 36 miles E.N.E. of Piltyn.

ROOK, in *Ornithology*, a well-known bird of the crow-kind. See CORVUS *Frugilegus*.

Great care ſhould be taken to guard againſt theſe miſchievous birds at the time when the wheat is juſt ſhooting up; for they perceive it ſhooting much ſooner than the farmer can, and are led by the ſhoot to pick it up. They muſt therefore be carefully kept off the ground until about a week or ten days after this ſeaſon; for at the end of that time the blade will be grown up, and the grain ſo exhauſted of its ſubſtance, that they will not give themſelves any trouble to pick it out of the ground. They ſeldom or ever moleſt the wheat, which is ſown about Michaelmas; becauſe ſo much grain of the late harveſt then lies ſcattered about the fields, that they find it much eaſier to pick up there, than to ſearch for corn under ground in new-ſown lands. They often do harm when the ſnow is going off from the green wheat towards the end of winter; for having been pinched for food during that ſeaſon, they then greedily pluck up the young plants, in order to come at the remainder of the ſeeds ſtill adhering to their roots; and are greatly aſſiſted in this by the looſe ſtate of the earth at that time.

And they are alſo highly deſtructive to pea and bean crops in the early ſpring ſeaſon, when they firſt appear above the ground, as they dig up the whole, both root and ſtem, even when conſiderably advanced in growth. They muſt, therefore, be kept off with great care. A great many contrivances have been invented to frighten them away, ſuch as feathers ſtuck up, the limbs of rooks ſcattered about the ground, dead rooks hung on ſticks, the gun, a boy to halloo, and toſs a dead rook up in the air. Mr. Tull found this laſt to be the moſt effectual. It is probable, however, that firing at them frequently with a gun is the moſt certain means of deterring them from doing ſuch injuries, as they have a great diſlike to the ſmell of gunpowder.

It is remarked by Mr. Marſhall, in his Rural Economy of Norfolk, that the method of frightening rooks in practice there, eſpecially when they take to patches of corn, which are lodged before harveſt, is ſimply to ſtick up a tall bough in the part infeſted; and if a gun be fired near the place, before the bough is ſet up, this ſimple expedient ſeldom fails of being effectual. And that if rooks make an attack after ſeed-time, or when they take generally to the crop before harveſt, a boy is ſet to ſcare them; they being ſeldom attempted to be ſhot at in Norfolk; where a notion prevails, and is perhaps well founded, that rooks are eſſentially uſeful to the farmer, in picking up worms and grubs; eſpecially the grub of the cock-chaffer, which, it is believed, is frequently injurious to the meadows and marſhes of that country. This opinion alſo prevails in other diſtricts, and has moſt probably ſome foundation in truth, as they are often ſeen to follow the plough cloſe to pick up ſuch grubs.

It has indeed been ſtated, and ſuppoſed by ſome, that theſe birds do as much good by the deſtruction of grubs, inſects, worms, and other ſimilar ſorts of animals, as they produce miſchief by their attacks and ravages on the crops of the farmer; an inſtance in favour of which is noticed to have occurred on the Yorkſhire ſide of the county of Lancaſter, where it is ſaid they wholly devoured, deſtroyed, and removed ſome ſort of inſects, which, like locuſts, had ſeized upon and taken poſſeſſion of the graſs-plants of a large track of graſs-land in that neighbourhood in the early ſpring ſeaſon, and nearly eat up and conſumed the whole of it, to the very great alarm of the farmers of the vicinity; but which, on the firſt flight of the young rooks, were ſoon obſerved to be completely eaten up and deſtroyed, as was evident from the freſh graſs quickly ſpringing up and the ſurface becoming green again.

Theſe birds are, however, in general conſidered as the greateſt peſts and plagues of the farmers in the above and ſome other northern diſtricts, as they not only deſtroy the ſeed-wheat when newly ſown, but drag out of the earth the ſpires of the grain or pulſe ſeeds with them altogether, in the manner already ſuggeſted.

They are alſo, in theſe diſtricts, equally deſtructive of the potatoe crops, both at the time of ſetting or putting them into the ground, and when they are coming up, as they eat and drag them out with great eagerneſs, thereby cauſing much irregularity and miſchief in them. That they may ſometimes, however, be uſeful in the above manner may readily be ſuppoſed; but they exiſt in ſuch vaſt numbers in theſe, and ſome other parts of the country, that the ravages and injuries which they commit, very greatly preponderate over any good they are capable of performing in the ways that have been already ſtated.

They are, on the whole, an impudent and miſchievous race of birds, with which, all the means the farmer can poſſibly take in the way of ſcaring them, are too often of very little avail. They frequently go to very great diſtances, ſo that the ravages they are productive of are of an extenſive nature, and not confined to particular places or tracts of country only. The only ſafety for the farmer, therefore, ſeems to conſiſt in the prevention of their breeding and rearing their young, and their deſtruction and eradication, as much as poſſible, in other ways. See ROOKERY.

ROOKE, LAWRENCE, in *Biography*, an able mathematician, was deſcended from a reſpectable family, and born at Deptford, in Kent, in the year 1623. He was educated in grammar-learning at Eton ſchool, whence he removed, in 1639, to King's college, in the univerſity of Cambridge, where he took his degrees. In 1650 he went to Oxford, where he had apartments in Wadham college, for the ſake of improving in the ſociety of Dr. Wilkins, and Mr. Seth Ward. He at length became a fellow-commoner of the college, and made it his principal place of reſidence for ſome years, during which he aſſiſted Mr. Boyle in his chemical experiments. In 1652, Mr. Rooke was elected profeſſor of aſtronomy at Greſham college, and in the ſame year he made ſome obſervations, at Oxford, on the comet which appeared in the month of December, and which obſervations were printed by Mr. Ward in 1653. In 1657, Mr. Rooke exchanged the aſtronomical profeſſorſhip at Greſham college for that of geometry. He was one of the gentlemen by whoſe exertions the Royal Society was firſt formed, though he did not live long enough to ſee it eſtabliſhed by the royal charter. Among the men of rank who cultivated his acquaintance was the marquis of Dorcheſter, who was not only a patron of learning, but very learned himſelf; and after the reſtoration, that nobleman frequently entertained Mr. Rooke as a viſitor at his ſeat at Highgate, whence he uſed to bring him in his carriage every Wedneſday to the Royal Society, which then met weekly at Greſham college. Mr. Rooke had always a tender conſtitution, and walking from

from Highgate to London on a hot summer's day, he took cold, which proved fatal to him. He died in June 1662, in the 40th year of his age. He was highly esteemed by his contemporaries, as will appear from the following testimonies. Dr. Pope, in his life of Ward, bishop of Salisbury, speaking of Mr. Rooke, says he was profoundly skilled in all sorts of learning: "I durst," says he, "venture my life upon the truth of any proposition which he asserted, either in mathematics, natural philosophy, or history, for I never knew him affirm any thing positively, that was dubious. And when I have asked his opinion of an hypothesis, his usual answer was, I have no opinion. He was very modest, and sparing of his words, unless among intimate friends, and never talked idly. I may truly say I never was acquainted with any person who knew more and spoke less." Mr. Hooke places him among those who were most eminent for their knowledge and improvement of astronomy. Dr. Sprat, in his History of the Royal Society, speaks of him as "a man of a profound judgment, a vast comprehension, prodigious memory, and solid experience. His skill in mathematics was reverenced by all the lovers of those studies, and his perfection in many sorts of learning deserves no less admiration."

The only pieces which were published from his papers consist of "Observationes in Cometam, qui mense Decembri Anno 1652 apparuit;" "Directions for Seamen going to the East and West Indies," which were drawn up at the appointment of the Royal Society, and inserted in their Transactions for 1665; "A Method for observing the Eclipses of the Moon;" "A Discourse concerning the Observations of the Eclipses of the Satellites of Jupiter;" and "An Account of an Experiment made with Oil in a long Tube." Ward's Life of the Gresham Professors.

Rooke, *Sir* George, a celebrated naval commander, the son of sir William Rooke, knight, of an ancient and honourable family in the county of Kent, was born in 1650. Though destined for another profession, a strong inclination for the sea-service induced him to enter into the navy. His first station was that of a volunteer, in which he distinguished himself by his undaunted courage and indefatigable application to business. He very soon obtained the post of lieutenant, from whence he rose to that of captain before he was thirty years of age, which was considered as a very extraordinary circumstance, at a time when no man, be his quality what it would, was advanced to that station before he had given ample testimonies of his being able to fill it with honour. These preferments he obtained during the reign of Charles II. and under his successor, James II., he was appointed to the command of the Deptford, a fourth rate man of war. His obligations to the Stuart family did not prevent his hearty concurrence in the revolution, and in 1689 he was appointed by admiral Herbert as commodore, with a squadron on the coast of Ireland. In this station he concurred with major-general Kirke in the famous relief of Londonderry. Soon after he was employed in escorting the duke of Schomberg's army, and landing them safe near Carrickfergus, facilitated the siege of that place, and, after it was taken, sailed with his squadron along the coast; where he first looked into the harbour of Dublin, manned all his boats, and insulted the place where king James was in person; and in the night of the 18th of September, he formed the design of burning all the vessels in the harbour, which he would certainly have executed, if the wind had not shifted and driven him out to sea. In 1690 he was, upon the recommendation of the earl of Torrington, appointed rear-admiral of the red, and in that rank he served in the fight off Beachy-Head, in which unfortunate affair it was admitted, on all hands, that he had done his duty. He was employed twice or thrice to convoy king William to Holland, and in 1692 he was promoted to the rank of vice-admiral of the blue, when he served in the famous battle of La Hogue. This was on the 22d of May, and he behaved with such distinguished courage as to obtain the most marked applause of admiral Russel, it being owing to his vigorous behaviour that the last stroke was given to that important day, which threw the French entirely into confusion, and forced them to run such hazards, in order to shelter themselves from their victorious enemies. The next day was, however, still more glorious, for vice-admiral Rooke had orders to go into La Hogue and burn the enemy's ships as they lay. There were thirteen large men of war, which had crowded up as far as possible, and the transports, tenders, and ships with ammunition, were disposed in such a manner that it was thought impossible to burn them. Moreover, the French camp was in sight, with all the troops intended to have been employed in an invasion of this country, and several batteries upon the coast well supplied with heavy artillery. Notwithstanding all these preparations, admiral Rooke performed the business entrusted to him with so much skill and judgment, that he destroyed twelve ships of the line, and one fifty-six gun frigate. This desperate enterprise he effected with the loss of ten men only. The behaviour of the vice-admiral at La Hogue appeared to the king so great, and so worthy of public notice, that, having no opportunity at that time of providing for him, he settled upon him a pension of 1000*l.* *per annum* for his life. In 1693 the honour of knighthood was conferred upon him, and he was, at the same time, made vice-admiral of the red.

The grand fleet of the English and Dutch proceeding to sea in the month of May, sir George Rooke was detached from it with a squadron of twenty-three ships of both nations, to convoy a large fleet of merchantmen up the Mediterranean. The French, in the mean time, had been indefatigable in repairing their losses, and with a very powerful fleet, of which the English ministry had obtained no proper intelligence, were lying in Lagos-bay, off Portugal, to intercept the combined fleet. On descrying the enemy, admiral Rooke ordered the smaller ships to make their escape into the nearest Spanish ports, and stood off under an easy sail for the protection of the rest. Two Dutch men of war, and a great number of merchant-ships, were captured: the conduct of the English admiral was, however, not only exempt from all blame, but he received the thanks of the merchants, and his promotion was not in the least impeded by this misfortune, which was owing to the mismanagement of the ministers. In 1696, having the chief command of the Channel fleet, he was ordered to prevent the Toulon fleet from getting into Brest, which, from the defective manning of his ships, he was unable to accomplish. On this account he underwent a long examination before the house of commons, but nothing appeared upon which a charge against him could be founded. He continued in command till the peace of Ryswick, in 1697. He was chosen member of parliament for Portsmouth, and in this capacity he performed the duties of his station with activity and energy; however, as he mostly voted with the Tories, great pains were taken by the opposite party to ruin him in the king's opinion; but, to the honour of king William, when pressed to remove sir George Rooke from his seat at the admiralty, he answered resolutely, "I will not." "Sir George (continued his majesty) served me faithfully at sea, and I never will displace him for acting as he thinks most for the service of his country in the house of commons:" an answer truly worthy of a British prince, as it tends to preserve the freedom of the constitution, and the liberty

liberty of parliament. In 1700 he was ſent with an Engliſh ſquadron, in conjunction with a Dutch one, into the Baltic, to preſerve the balance of power in the North, where a confederacy had been formed againſt Charles XII., the young king of Sweden. Rooke bombarded Copenhagen, and a peace being effected in the courſe of the year, he returned. In the following year he acted as commander of the Channel fleet; and being a ſecond time choſen repreſentative for Portſmouth, he continued to act with the oppoſition. This line of conduct was conſidered as highly meritorious with the miniſtry of queen Anne, who ſucceeded to the crown in 1702; and when war with France was declared, he was appointed as vice-admiral of England, to an united Engliſh and Dutch fleet, in an expedition againſt Cadiz, the duke of Ormond being commander of the land forces. The plan failed, probably for want of a proper degree of cordiality between the ſea and land-ſervice. Soon after, ſir George obtaining intelligence that twenty-two Spaniſh galleons, guarded by a ſquadron of French men of war, were arrived in the harbour of Vigo, ſailed thither; and ſending a detachment of his fleet, with fire-ſhips, into the harbour, deſtroyed all the enemy's men of war, and a number of galleons, and took the reſt. A vaſt booty was brought home, and a new coinage of ſilver, with the ſtamp Vigo, was iſſued as a national memorial of this brilliant ſucceſs. On his return home, ſir George Rooke was appointed to a ſeat in the privy council, and an inquiry having been moved in the houſe of lords into his conduct at Cadiz, it was voted that he had honourably diſcharged his duty.

In 1704 he was appointed to the command of the fleet deſtined to convey to Liſbon Charles, at that time competitor for the crown of Spain. Having performed that ſervice he proceeded to the Mediterranean, where he cruiſed for ſome time. On his return through the Straits, he was joined by ſir Cloudeſley Shovel with a large reinforcement, and ſeveral ſchemes of further ſervice being propoſed, he determined to make a ſudden attempt on Gibraltar. This he carried into execution in July, and the prince of Heſſe, with the land forces, being diſembarked on the neck, the ſhips proceeded to cannonade the fortifications at the mole. The enemy were driven from their guns, and a party of ſeamen landing, took poſſeſſion of the batteries. The governor, intimidated by this bold and unexpected action, capitulated; and that important fortreſs has ever ſince remained in the hands of the Engliſh. Sir George Rooke then proceeded to Malaga, where he encountered the French fleet under the count de Toulouſe. The numbers on each ſide were nearly equal in ſhips of the line, but the French were ſuperior in men and guns. The engagement, which enſued Auguſt 13th, was undecided, neither party loſing a ſhip, and each returned to their own ports.

Factions now ran high in the nation; and ſir George Rooke, perceiving that as he roſe in credit with his country, he loſt his intereſt with perſons in power, reſolved to retire from public buſineſs, and prevent the affairs of the nation from receiving any injury on his account. Thus, almoſt immediately after he had taken the important fortreſs of Gibraltar, and beaten the whole naval force of France in the battle of Malaga, he was conſtrained to quit his command: and as the Tories had before driven the earl of Orford from his poſt immediately after the battle of La Hogue, ſo the Whigs returned them the compliment, by making uſe of their aſcendancy to the like purpoſe with regard to ſir George Rooke. After this return for the important ſervices he had done his country, ſir George Rooke paſſed the remainder of his days as a private gentleman, and, for the moſt part, at his ſeat in Kent. "His zeal for the church," ſays the diſcerning Campbell, "and his ſtrict adherence to the Tories, made him the darling of one ſet of people, and expoſed him no leſs to the averſion of another, which is the reaſon that an hiſtorian finds it difficult to obtain his true character from the writings of thoſe who flouriſhed in the ſame period of time. For my part, I have ſtudied his actions, and his behaviour, and from thence have collected, that he was certainly an officer of great merit; if either conduct or courage could entitle him to that character."

In party matters he was perhaps too warm and eager; but in action he was perfectly cool and temperate, gave his orders with the utmoſt ſerenity; and as he was careful in marking the conduct of his principal officers, ſo his candour and juſtice were always conſpicuous in the accounts he gave of them to his ſuperiors; he there knew no party, no private conſiderations, but commended merit wherever it appeared.

In private life he was a good huſband and a kind maſter, lived hoſpitably towards his neighbours and left behind him a moderate fortune: ſo moderate, that when he came to make his will, it ſurpriſed thoſe that were preſent; but ſir George exclaimed, "I do not leave much, but what I have was honeſtly gotten; it never coſt a ſailor a tear, or the nation a farthing." He died in January 1708, in the 58th year of his age, and was interred in the cathedral of Canterbury. He had been thrice married, and left one ſon only. Sir George Rooke has merited very highly the reputation of a brave and able ſeaman, who maintained the honour of the Britiſh flag, at a period when its ſuperiority was much leſs decided than it has been during the preſent reign. Stockdale's edition of Campbell's Lives of the Admirals, vol. iv.

ROOKERY, in *Rural Economy*, a term applied to a nurſery of rooks, or place where they build their neſts, and collect in large numbers.

There are every where in many of the northern and other counties of the kingdom, numbers of ſuch deteſtable nurſeries of theſe miſchievous and rapacious vermin, where they are ſuffered to breed and multiply in countleſs multitudes, to the great deſtruction of the hopes of the farmer and the nation at large. If it be neceſſary that ſuch repoſitories of miſchief to the produce of the huſbandman ſhould be preſerved and kept up, for the vernal ſport and amuſement of their proprietors, certainly ſome other more certain and effectual means than thoſe of the croſs-bow kind ſhould be had recourſe to for the deſtruction of their young, in order that they may be kept ſufficiently reduced and thinned in their numbers, to obviate, in as great a meaſure as poſſible, their baneful depredations and effects on the ſeeds and produce of the farmer.

The rooks fly from theſe deſpicable abodes, which are the head-quarters or dwellings where they collect and repoſe themſelves, as well as breed, to very conſiderable diſtances, in order to execute and effect their different miſchievous and rapacious attacks on the newly ſown or riſing crops of the huſbandman, as they but ſeldom commit ſo much depredation on the fields which are near home.

They collect together during the ſeverity of the winter ſeaſon, eſpecially in the more northern diſtricts, from the different neighbouring ſmall rookeries to be protected in large ones, and the woods which may happen to be near them; and thus render themſelves ſecure at this inclement period, ſeparating in the early ſpring to form their neſts and breed in their particular rookeries.

In Lancaſhire, the whole track of the Fildes, as well as ſome others, is beſet with theſe deſtructive and impudent birds,

birds, from the vaſt rookeries and woods of Rawcliff-Hall and other halls in the ſame neighbourhood, without the owners of them ever ſuſpecting that they harbour and ſupport a breed of deſtructive vermin, which greatly injure and leſſen the agricultural produce of the county. The ſame is alſo the caſe in a variety of other diſtricts of the kingdom. Therefore ſome ſteps ſhould be taken, either by ſeverely taxing them, or ſome other means, in order that the miſchievous conſequences of ſuch nurſeries may be leſſened, or wholly prevented, by their affording the convenience of breeding and rearing of ſo many of theſe birds.

ROOKPOUR, in *Geography*, a town of Bengal; ſix miles N. of Kiſhenagur. N. lat. 24° 28′. E. long. 86° 46′.

ROOM, in *Building*. See BUILDING.

ROOM, *Cook*. See COOK-*Room*.

ROOM, *Fruit*, in *Gardening*, a place conſtructed for the purpoſe of ſtoring and laying up different articles of the fruit kind. Rooms of this nature are contrived in many different ways, but the beſt are perhaps thoſe made with drawers and ſhelves for containing and preſerving this ſort of produce in all the different kinds and ſtates of it. An ingenious plan and contrivance of this deſcription has lately been ſuggeſted and delineated in the ſecond volume of the Tranſactions of the Horticultural Society, by Mr. Maher, who has found it, in ſeveral years' experience, extremely uſeful in keeping fruit, eſpecially of the apple and pear kinds.

It is repreſented as conſiſting of a long ſquare form, the inſide of which is fitted up, from the top to near the bottom, with drawers in different diviſions, according to the ſize of the room. The number of each of the drawers is marked upon it, and a ſpace left oppoſite to each ſuch number, for inſerting the name of the particular kind of fruit it may contain.

The lower rows of drawers have cloſe bottoms, and are termed ſweating drawers, as the fruit is put into them immediately after it is gathered, in order to undergo that operation. Then, in the courſe of ten or fifteen days, accordingly as the apples and pears may be found to have come forward, they are ſorted, and the other drawers prepared for receiving them, by covering the bottoms of them with very clean wheat ſtraw, which has been thoroughly ventilated and rendered quite dry in the open air. The bottoms of the drawers for this purpoſe are to be formed in open trellis work.

It is recommended, as ſaving much time and trouble in running up and down ſtairs, to have theſe rooms built upon the ground ſurface; and that the door and window of each ſhould have ſlides, in order to admit a free circulation of air, when the weather is fine; but in damp days, or when it rains, the rooms ſhould conſtantly be kept ſhut up in a cloſe manner.

It is alſo adviſed, that a ſlate and pencil ſhould hang in the rooms, the former of which ſhould be divided into ſeven different columns, in which may be put down what fruit is delivered out each day in the week, for the ſatisfaction of families and ſervants.

Where theſe kinds of rooms are conſtructed with ſhelves, they ſhould be formed of ſuch ſorts of wood as communicate no bad ſmells or taſtes, and have thin ſlips of boards faſtened on their fore parts to prevent the fruits from falling off from them. Some adviſe their being covered all over with a very coarſe canvas, in order to prevent any ſort of injury in the above way. The fruit is then to be laid ſingly in rows all over the ſurfaces of the ſhelves after being well dried, but never heaped over each other. Some cover it by means of the ſame ſort of canvas or by paper, taking care to turn it, and remove all that is damaged, two or three times during the winter ſeaſon.

When the fruit is firſt laid upon the ſhelves, the earlieſt ſhould be put upon the loweſt ſhelves, and ſo on to the higheſt in their proper order. As this requires much time in many inſtances, it ſhould always be done at every leiſure period.

Many, however, think it the beſt way of keeping fruit, to firſt put it in glazed earthen pans, well packed and cloſed with covers, which are then to be placed on the ſhelves in theſe drying rooms.

Theſe ſorts of rooms ſhould conſtantly be placed in the moſt convenient ſituations, and contiguous to the rooms deſigned for other ſorts of garden produce.

ROOMS, *Flight of*. See FUGUE.

Rooms in houſes might be warmed by the ſteam of boiling water conveyed in pipes along their walls. See Phil. Tranſ. N° 476. p. 370. ſeq.

This contrivance is a copper with a ſtill-head, and a lead or copper pipe fixed to this head, which conveys the hot ſteam of the boiling-water through the different rooms intended to be warmed.

ROOMS, in *Ship-Building*, the different vacancies between the timbers, and likewiſe thoſe between the beams, as the maſt-rooms, capſtan-rooms, hatch-rooms, &c. Alſo the different apartments or places of reſerve, of which there are a number in a ſhip, as the bread-room, an apartment in the hold abaft for containing the bread for the ſhip's uſe. The ſpirit-room is adjoining the after-hold, to contain the ſpirituous liquors for the ſhip's uſe. The captain's and lieutenant's ſtore-rooms are two apartments built next each other on the ſtarboard ſide of the after platform abaft, for thoſe officers to ſtow their wine, &c. in. On the oppoſite ſide to the above is the ſteward's room, whence moſt of the proviſions are iſſued, and which is the place appointed for the purſer's ſteward to tranſact his buſineſs in. Sail-rooms are built between decks, upon the orlop or lower deck, to contain the ſpare ſails. Beſides theſe, there are ſeveral other ſtore-rooms, in which the carpenter's, boatſwain's, and gunner's ſtores are kept. Filling-room is a place parted off in the magazine; it is lined with ſheet-lead, and therein the powder is ſtarted, in order to fill the cartridges.

ROOM *and Space*, the diſtance from the moulding edge of one timber to the moulding edge of the next timber, which is always equal to the ſiding of two timbers, and the room or opening between.

ROOMS, in a military ſenſe, are thoſe parts of a building or barrack, which, by ſpecific inſtructions, the different barrack-maſters muſt provide, and furniſh for the accommodation of the king's troops in Great Britain or elſewhere. The ſchedule, as publiſhed by authority, deſcribes the number of rooms allowed in barracks for the commiſſioned, warrant, and non-commiſſioned officers, and private men, to be as follows:

Cavalry Rooms.—Field-officers, each two rooms; captains, each one ditto; ſubalterns, ſtaff, and quarter-maſters, each one ditto; the ſerjeants of each troop of dragoons, and the corporals of each troop of horſe, one ditto; eight rank and file, one ditto; officer's meſs, two ditto.

Infantry Rooms.—Field-officers, each two ditto; captains, each one ditto; two ſubalterns, one ditto; ſtaff, each one ditto; twelve non-commiſſioned officers, and private men, one ditto; officer's meſs, two ditto; ſerjeant-major, and quarter-maſter ſerjeant, one ditto. When there are a ſufficient number of rooms in a barrack, one may be allowed to each ſubaltern of infantry.

ROONAY,

ROONAY, in *Geography*, a town of Bengal; 33 miles S.E. of Ghidore.

ROOP, a term applied to fignify a hoarfenefs, fuch as happens among animals of the cattle kind.

ROOPAPOUR, in *Geography*, a town of Hindooftan, in Oude; 31 miles E.N.E. of Manickpour.

ROOPAT, a town on the E. coaft of Sumatra. N. lat. 1° 3′. E. long. 101° 12′.

ROOPGUNGE, a town of Bengal; 34 miles N.N.W. of Dinagepour.

ROOPGUR, a town of Hindooftan, in Guzerat; five miles S. of Surat.

ROOPNAGUR, a town of Hindooftan, in the country of Agimere; 30 miles E. of Agimere. N. lat. 26° 39′. E. long. 75° 52′.

ROOPOUR, a town of Hindooftan, in the circar of Sirhind; 58 miles N. of Sirhind.

ROOS, Philip, better known by the name of *Rofa da Tivoli*, in *Biography*, was the fecond fon of a painter, whofe name was John Hendrick Roos; and he was born at Frankfort in 1655. His early inclination to the art practifed by his father, and the proficiency he exhibited, gained him the favour of the landgrave of Heffe, at whofe court the father and an uncle of Philip, called Theodore Roos, refided; and for whom they painted, conjointly, compofitions of animals, landfcapes, and figures.

This prince became the patron of Philip alfo, and prefented him with a fum of money to profecute his ftudies at Rome, from whence he never returned to repay the obligation. He married a beautiful woman, daughter of an hiftorical painter, Giacinto Brandi, but was diffipated and extravagant.

He took up his refidence at Tivoli, from whence comes his cognomen of Rofa da Tivoli, and there he imitated and combined the forms he met with. His pictures are generally made up of a group of fheep, goats, or cattle, a herdfman or woman, and a piece of building, illumined with ftrong contrafts of light and fhade, and touched with uncommon fpirit and freedom. That latter quality is their bane, for relying upon its effect upon the obfervers, and working generally from neceffity, or the fpur of the moment, he was tempted to reft fatisfied with incorrectnefs and commonplace. His fhadows are generally too dark and too brown, effected by leaving the dark ground upon which he worked; but the arrangements of his lights are ingenious and capitally executed, and the colour is frequently rich and full. He died in 1705, at the age of 50.

ROOSAND, in *Geography*, a town of Norway; 48 miles N.N.E. of Romfdal.

ROOSEBURG, a fmall ifland in the Meufe; 3 miles N.E. from the Brill.

ROOT, (Radix,) in *Botany* and *Vegetable Phyfiology*, an important part of the vegetable body, being the bafis of the whole, and what is firft produced from the feed, when evolved by the procefs of germination. Its ufes are, to fix the plant to a commodious fituation, and to derive nourifhment for its fupport. This organ is therefore perhaps indifpenfably neceffary, at the firft period of the growth of vegetables; and it ufually continues to be fo, at leaft amongft what are termed the more perfect kinds; the *Cufcuta*, or Dodder, being almoft a folitary inftance, of a phænogamous plant, parting with its root at an early age, and trufting for its future fuftenance to the vegetable bodies on which it parafitically fixes. In fome cryptogamous tribes the roots, though lefs difcernible to us, are not the lefs effective for the performance of one or other of thefe functions. Thus, the cruftaceous Lichens have not only a confiderable inequality of furface underneath, infinuating itfelf into every minute irregularity of the ftone or bark over which they fpread, but feveral of them have very diftinguifhable, fibrous, branched roots; witnefs *Lichen faxifragus*, Sm. Tranf. of Linn. Soc. v. 1. 82. t. 4. f. 4, and *L. tartareus*. The Submerfed *Algæ*, or Sea-weeds, feem, at firft fight, to be merely fixed by their fmall difk-like roots; though many of them have branched and entangled radicles, infinuating themfelves among pebbles at the bottom of the fea, which laft may well be organs of nourifhment, as well as of fupport. But even fuch as are fixed by a mere difk, are found, if cut down to that part, to fprout up again with all the rapidity and vigour of a full-grown fhrub, treated in the fame manner. Hence it appears that the difk in queftion muft act as an organ for imbibing nutriment. That procefs indeed feems not to be accomplifhed, as ufual, by the bafe, or under part, efpecially confidering the nature and fize of the bodies to which this kind of root is commonly attached. But fomething analogous may be obferved in feveral parafitical plants of the *Orchis* family, (fee Orchideæ,) whofe thick fibrous roots lie naked upon the bark or branches of trees; and if they do imbibe a part of their fuftenance from the latter, fhould feem alfo to be indebted confiderably to the atmofphere, (to which a much larger portion of their furface is conftantly expofed,) as feaweeds are to the circumambient water. With the roots of parafitical ferns, indeed, as well as the fupplementary radicles, thrown out from the climbing ftem of the *Cufcuta*, the cafe may be different, as both are infinuated into the bark of the plants on which they grow. Floating fea-weeds, and abundance of frefh-water plants nearly related to them, agree with the *Cufcuta* fo far, that after vegetating on fome fixed fpot, to which the parent feed attaches itfelf, they foon feparate therefrom, and can derive nothing fubfequently from thence. But being entirely difengaged, they can obtain matter of growth and nourifhment, in future, from no other fource, than the water in which they float. Who fhall fay whether fuch nutriment is abforbed by their whole furface; or whether the various and multiplied, fibrous or tubercular, appendages of their curious, and often complex, ftructure, may not, many of them, be analogous to the fibrous radicles, thrown out by the ftems of the Dodder?

The moft ufual economy of the roots of plants is to be immerfed in the earth, they having always a tendency to grow downwards, as ftems in general have to afcend. Dr. Darwin's fimple and luminous explanation of this phenomenon is quite fufficient, and precludes all others. He conceives that each part elongates itfelf in the direction in which it is moft ftimulated; the infant ftem being moft acted upon by air, the radicle by moifture.

A root commonly confifts of two parts; the *caudex*, or body, and *radicula*, the fibre. The latter, generally greatly multiplied, branched, and extended, is the effential organ of nourifhment.

The duration of roots is either annual, biennial, or perennial. Annual Roots, confifting chiefly of numerous fibres, belong to plants whofe exiftence is limited to one fummer, as Barley, and a vaft tribe of field or garden flowers, many of which muft occur to every one's recollection. Biennial Roots produce, the firft feafon of their growth, only herbage, and, living through the enfuing winter, bear flowers and fruit, or feed, in the following fummer, after which they perifh; for they never bloffom or fructify but once, any more than annual herbs. Their exiftence indeed may be prolonged by accidents which hinder their flowering, year after year, in fome cafes; but after perfecting feed, or

even

even bloſſoms, they die. Wheat, as cultivated with us, may be termed biennial; but is more properly an annual, which is ſown and ſprings up the ſeaſon before it flowers, as many annual weeds often do; while the ſeeds of others, perhaps of the ſame ſpecies, remain latent in the earth, awaiting the approach of ſpring. More genuine biennials are ſome ſpecies of *Verbaſcum*, the *Digitalis purpurea* or Fox-glove, &c. Perennial Roots belong to plants which live and bloſſom through many ſucceſſive ſeaſons, to an indefinite period, as is the caſe, not only with all trees and ſhrubs, but with many herbaceous plants, whoſe entire ſtems and foliage are frequently annual. Such are the bulbous roots of Tulips, Hyacinths, Anemonies, &c. and the large fleſhy ones of Rhubarb, and the *Gentiana lutea*, with many others, whoſe herbage dies every year entirely down to the ground; while other perennial roots, principally of a fibrous nature, are never deprived of herbage, as the *Gentiana acaulis*, *Lamium album*, and moſt perennial graſſes. Several plants of hot climates, naturally perennial, and even ſhrubby, become annuals in our gardens, as the Common Naſturtium, *Tropæolum*, which is capable of being increaſed by cuttings, nearly as well as by ſeeds, and thus its double-flowered variety is preſerved. The ſame thing may be ſaid of the *Hemimeris urticifolia*. The Tree Mallow, *Lavatera arborea*, wild in Pembrokeſhire, and occaſionally ſeen in gardens, exemplifies, in a remarkable manner, the durability of the vital principle in ſeeds, as well as in biennial plants hindered from flowering. Nearly twenty years ago the ſeeds of this large and handſome ſhrubby plant were ſown in a garden under our obſervation. From that period many of the young plants have, every year, ſprung up, but the winter uſually deſtroys them. A few have, now and then, ſurvived a mild winter, and attaining a large ſize, have borne flowers, dying entirely at the end of autumn, nor do we believe that any of them has ripened ſeeds, ſo as to repleniſh the ſtock in the earth. At leaſt this has not been the caſe for eight or nine years paſt. We have never taken the pains to ſhelter a young plant of this ſpecies in a ſtove, or green-houſe, through one or more winters; but Linnæus, with whom it was a favoured exotic, aſſerts that it will ſometimes wait, for ſeveral years, for a proſperous flowering ſeaſon, even in the open ground, though periſhing afterwards, with the firſt cold, in ſpite of all the protection it can receive.

The *Caudex*, or Body of the root, in the Turnip, aſſumes the appearance of a ſtem, by riſing conſiderably above the ſurface of the ground. Such is partly the caſe with onions, and many exotic bulbous plants. Linnæus ſpeaks of the ſtem of a tree as a *caudex*, or root above ground. Perhaps the *caudex* may be as properly termed a ſubterraneous ſtem. This analogy neverthleſs is ſcarcely correct, the line of demarcation being much more ſtrictly drawn between an annual ſtem, and its perennial root, than between the branches of any tree and its trunk.

The fibres of the root, at leaſt their growing extremities that imbibe nouriſhment from the earth, into which they are gradually and continually inſinuating themſelves, are, in every common caſe, ſtrictly annual. The powers of roots lie dormant through our winters, or in bulbous plants, inhabitants of arid burning ſands, through the ſummer of ſuch climates. After they have begun to form freſh radicles, they cannot without deſtruction, or great danger, be tranſplanted; nor can even herbs with fibrous roots be ſafely removed, while their fibres are in a progreſſive ſtate, very young annuals alone excepted.

Botaniſts, as well as gardeners and agriculturiſts, diſtinguiſh ſeveral kinds of roots, whoſe nature requires attention from thoſe who wiſh to be maſters of their economy or cultivation. The following are the principal heads under which they may be comprehended.

1. *Radix fibroſa*, a Fibrous Root, the moſt ſimple of all, conſiſts entirely of fibres, undivided or branched, neceſſarily connected indeed by a common head, or by the baſe of the ſtem. Theſe fibres convey nouriſhment directly to the ſtem or leaves. Such conſtitute, in general, the roots of graſſes, and of moſt annual herbs; which latter requiring no reſerved ſtore of proviſion for another ſeaſon, have no need of a *caudex* in which it might remain through the winter. While ſuch roots exiſt, they keep growing, ſucceſſively forming new fibres, as well as elongating their older ones. Their fibres are occaſionally remarkably ſhaggy, or downy; whether to increaſe the ſurface for more ample abſorption, or to fix the plant more firmly in the ground, we cannot always directly determine. Botanical experience has taught us, that very downy or woolly fibres are eſpecially appropriated to graſſes that inhabit looſe blowing ſand.

2. *Radix repens*, a Creeping Root, is rather perhaps a ſubterraneous ſtem, branching off horizontally, extending itſelf at the extremity, and decaying at its origin, throwing out fibres as it goes, which are the efficient or actual roots. Such a root is extremely tenacious of life, as any portion of it will grow. Weeds which have this ſort of root, as Couch-graſs and Mint, are the moſt difficult of all things to eradicate, except perhaps the deeply deſcending roots, partly fleſhy, of *Convolvulus arvenſis*, and *Carduus*, or rather *Cnicus, arvenſis*, whoſe more vertical poſition enables them to run ſo far into the ground as to be hardly acceſſible. The widely creeping roots, well guarded with hard and durable ſheaths, and ſupported by long woolly fibres, which belong to many ſea-ſide, or ſand, graſſes, render ſuch plants of great importance in the economy of nature. They bind down the looſe ſand, and form barriers againſt the encroachments of the ocean itſelf. The whole country of Holland is perhaps indebted for its very exiſtence to ſuch natural mounds, judiciouſly foſtered and imitated by art. The three principal graſſes that ſerve ſo valuable a purpoſe are *Carex arenaria*, *Arundo arenaria*, and *Elymus arenarius*, all plentiful on our ſandy ſhores.

3. *Radix fuſiformis*, a Spindle-ſhaped, or Tap Root, like the Carrot, Parſnep, Radiſh, and many common plants, of biennial, perennial, or more rarely annual duration. Its form is beſt calculated for penetrating deeply into the ground, or rather is owing to the reſiſtance encountered by the young deſcending radicle. The *caudex*, of a fleſhy juicy ſubſtance, abounding with peculiar ſecretions, and pregnant with the materials of the future herb, throws out numerous fibres, which are the real roots.

4. *Radix præmorſa*, an Abrupt Root, is nothing more than an oblong or ſpindle-ſhaped, vertical or horizontal, fleſhy root, whoſe progreſs has been impeded, either by want of vigour, or by ſome mechanical interruption, ſo that it ſeems to have been cut or broken off. The name alludes to an ancient opinion of its having been bitten off, by no leſs a perſonage than "the divel," out of ſpite to mankind. Hence ſeveral plants, with ſuch a root, were relied on for their ſuppoſed medical virtues, which nothing but hereſy and ſchiſm could doubt.

5. *Radix tuberoſa*, a Tuberous or Knobbed Root, is of various kinds. This ſort of root belongs to perennial plants, its knobs, whether of themſelves annual, biennial, or perennial, being reſervoirs of nouriſhment, and of vital energy, in which the reſources of the herb are huſbanded through the winter. Such are the Potatoe, and Jeruſalem Artichoke. Many of the Vetch or Pea tribe

have

have likewise small annual tubercles to their roots, by which these plants are enabled better to support the casual privations of a barren, dry soil. The knobs of Pæonies and *Spiræa Filipendula* are perennial, and analogous to bulbs. In the Orchis family they are biennial, whether simply oval, hand-shaped, or fasciculated; for in each case the plant of the season lives on that portion of its root which was formed during the preceding year, and meanwhile makes a new pair of knobs, or bulbs, to blossom in the following summer, or at least to produce herbage, whether circumstances may admit of flowers or not. There is reason to believe that certain species of this family, as the Linnæan *Ophrys spiralis*, often produce a mere tuft of leaves, without flowering at all, for many successive years, in spots which, in favourable seasons, are profusely decorated and perfumed with that charming little flower.

6. *Radix bulbosa*, a Bulbous Root, is often solid, as in the common *Crocus*, and its near relations *Ixia*, *Gladiolus*, the splendid *Tigridia*, &c. In the Onion tribe, the bulbous root consists of concentric layers, enveloping one another, as also in the more solid root of the Tulip. The Lily has a scaly bulb, exactly analogous to the last; but as the leaves of this plant are narrow, and in some measure whorled, not sheathing, like those of the Onion and Tulip, the layers of its roots, having the closest affinity to leaves, assume a similar arrangement. The strict analogy of such coated or scaly bulbs with leaf-buds, indeed one might almost say their identity, appears from the scaly axillary buds of the Orange Lily, and other species, formed on the upper part of the stem, which, falling to the ground, become actual bulbous roots, without any transformation. Similar buds in *Dentaria* become, by a slight alteration, the tuberous scaly root proper to that genus. The constitution of bulbous roots is admirably suited for plants inhabiting hot sandy countries, subject to long drought. After flowering, their withered herbage serves like wings to disperse them far and wide, till the first rains cause them to fix their sprouting radicles in the moistened soil, where they speedily put out fresh leaves and blossoms, during the favourable season; after which their life and energy are locked up again in the bulb, or perhaps multiplied in seeds, for the succeeding year. The seeds of the *Ixia* and *Gladiolus* families are no less admirably adapted to the circumstances of their sandy and windy country; such as are winged being readily wafted, and the large polished round kinds, as extensively rolled, over the open desarts which they are appointed to adorn.

7. *Radix articulata*, or *granulata*, a Jointed or Granulated Root, does not essentially differ from a scaly bulb. The Wood Sorrel, *Oxalis Acetosella*, for instance, has, as it were, a scaly bulb, pulled out into an oblong form, and connected by a thread; while the *Saxifraga granulata* has a series of subterraneous buds, like solid bulbs. *S. cernua* and *bulbifera* have axillary buds, formed on their stems, like *Dentaria*, which become granulated roots.

The object of Nature is nearly the same throughout all these seemingly different productions; to establish a reservoir, in which the vital force of the plant, as well as its material resources, are stored up; till the former is strengthened, in consequence of suspended action, and the latter are matured by rest. Such assistance is occasionally afforded to plants whose roots have naturally hardly any thing of a fleshy substance, whenever they are exposed to danger from vicissitude, or from interrupted supplies. Thus grasses with fibrous roots, accidentally stationed in a soil too dry or fluctuating, have a power of becoming bulbous. For the same reason, bulbous roots, when desired to be had in great size or perfection, should first be supplied with plentiful nourishment, and then be checked in the too luxuriant growth of their herbage. By some treatment of this kind, exotic bulbs, which seldom afford flowers in our gardens or stoves, because of the uniformity of their languid existence, may perhaps be made to blossom more frequently than they do. Sudden and abundant supplies of heat, food, or moisture, and as sudden checks of one or the other, at the discretion of the cultivator, are likely to have this effect. In general, an interruption of the luxuriance of a root, favours its production of flowers and of seeds. The latter are seldom perfected in the more luxuriant sorts of Mint, except by greatly restraining the growth of the roots, in a garden-pot, dry border, or otherwise. The bulbous lilies will often form seeds, if their buds are stripped off, but seldom in their ordinary state of culture.

A just attention to the nature and constitution of each different kind of root, will teach us to understand its best mode of cultivation, transplantation, &c. and will account for those general practices, founded on experience, which are too well known to require illustration here, and properly come under the notice of the agriculturist and gardener.

Root, in *Husbandry*, the lower part of a plant, or that which is in the ground, and by which it adheres to the earth, draws its nourishment, and transmits it to the other parts. For the method of clearing lands from the roots of trees, under-wood, &c. see Reclaiming *Lands*.

It may be noticed, that the roots of plants are of use to them principally in two respects, namely, to give them stability in the ground, that they may not be displaced, or blown down by high winds, or other accidents; and by their spreading in the ground, for collecting, and perhaps in some measure preparing, food for the whole plant. Plants are, however, in part fed or nourished from the air, fine vapours, dews, &c.; which enter by their leaves and branches, but principally by what is absorbed and taken up by their roots: for which reason the farmer takes infinite pains to prepare the land by tillage and manure, whereby it is opened, pulverized, and not only made more easily penetrable for the roots to spread in, and collect their nourishment, but rendered more proper for being impregnated with such matters, as well as for retaining and conveying them to their fibrous roots in order to be drank up.

Roots, in the intention of the farmer, may also be divided into two sorts, namely, perpendicular or tap-roots, which penetrate deep, and run down into the ground, usually singly, such as carrots, parsneps, and the roots of some trees, as the oak, &c. And those that divide near the surface of the ground, and spread out in it in various directions, which are called horizontal and fibrous roots, and if very small, capillary roots. The tap-roots have also fibrous roots issuing from their sides, all round the tap-root; and these lateral roots are longest near the surface of the ground, and gradually shorter as the tap-roots descend deeper into the soil.

And further, the surfaces of roots are soft and spongy, more particularly in the small or fibrous roots, and these are furnished with absorbent vessels, the mouths of which drink up the vegetable food, and distribute it to all parts of the plant. As the large roots are more close and hard on their surfaces, it would appear that they are chiefly intended for the support and stability of the plant, while the fibrous roots collect the nourishment for the support of the plant as well as the large roots. The branches of roots are formed with their extreme ends pointing from the stem of the plant, and hence it appears that roots, when once well formed, do not afterwards increase, or extend further longitudinally; they lengthen at their ends, but not at their intermediate

termediate parts, for if they did, the branches, being left behind, would be drawn back, with their ends pointing towards the ſtem; but they are conſtantly found in a contrary poſition, with their ends pointing in a direction from the ſtem. If a root is cut it extends no farther in length, as already obſerved, but new roots are formed near the cut end of the old root; two or more new or young roots being formed in the room of the former old one. Hence the fibrous roots of plants are multiplied by cutting them with a ſpade or hoe; and this is often a great benefit to the plant. The pores of the fibrous roots are the mouths of the abſorbent veſſels, by which the whole plant is fed, and the more they are multiplied the more nouriſhment they collect for it.

And thus a plant that naturally extends its roots to a conſiderable diſtance, is in danger of being killed by tranſplanting, unleſs it is alſo furniſhed with fibrous roots, which muſt be carried with it to the new ground; or new ones muſt be formed to make the plant thrive. Hence it is that plants which have long ſtraggling roots are removed with difficulty; but plants of the ſame kind and age, and that grow in the ſame ground, are tranſplanted with ſafety and ſucceſs, if they have been previouſly dug round with a ſpade, whereby their fibrous roots have been cut and multiplied, ſo that they riſe with a ball of earth adhering to them.

Beſides, there is a communication between the different roots of a plant, as when ſome of them are well nouriſhed the others are benefited thereby. If ſome of the roots of a plant be laid in dry earth or ſand, and others in water, the latter will furniſh the dry roots with water ſufficient to keep them and the earth about them moiſt, ſo long as they have a ſupply of water; it is for this reaſon that deep rooting plants are little affected by drought; the tap-roots finding moiſture below, ſend ſome of it up to the roots near the ſurface; for which reaſon, alſo, lucern and ſaintfoin flouriſh in dry hot weather, in which common graſs, and other fibrous-rooted plants, that do not deſcend deep, are ſcorched and burnt up. And as roots communicate moiſture to each other, they therewith alſo communicate nouriſhment; for it is found by experience, that drilled plants, well hoed on each ſide of a row only, are better nouriſhed than ſown plants ſtanding at equal diſtances, or upon an equal ſurface of ground with the drilled, and not hoed. Beſides theſe ſorts of roots, ſome kinds of grain, as that of wheat, have them double, or what may be termed two ſets; the firſt coming directly from the grain or ſeed, while the latter ſhoots ſome time afterwards from the top or crown. Hence they are denominated *ſeminal* and *coronal* roots. The ſeminal root is, Dr. Hunter ſays, puſhed out at the ſame time with the germ, which, together with the farina, nouriſhes the plant during the winter, before the crown and coronal roots are formed. But that in the ſpring, when the crown has become ſufficiently large, it detaches a number of ſtrong fibres, which puſh themſelves obliquely downwards. Theſe are the coronal roots ſerving to nouriſh the plant till it arrives at maturity. And he adds, that a ſmall pipe preſerves the communication between them and the ſeminal roots. This makes an eſſential part of the plant, and is obſerved to be longer or ſhorter, according to the depth that the ſeed has been buried. But on the contrary, it is remarkable, that the crown is always formed juſt within the ſurface. Its place is the ſame, whether the grain has been ſown deep or ſuperficial. And that as the increaſe of this ſort of grain depends upon the vigorous abſorption of the coronal roots, it is obvious why they fix themſelves ſo near the ſurface, where the ſoil is the moſt rich, and contains the largeſt proportion of nutritious ſubſtances. It is alſo evident, that as this ſort of grain muſt be expoſed to the ſeverity of the winter ſeaſon, its roots are admirably diſpoſed to withſtand its effects.

It is evident, that theſe facts, and thoſe connected with the nature of the roots of different plants of the graſs kind, lead to many important conſiderations in the practice of the farmer, and fully ſhew the neceſſity as well as utility of his being perfectly acquainted with the nature, form, and mode of growth of the roots of ſuch plants as have been introduced into the field culture.

All thoſe ſorts of fleſhy roots which run to a conſiderable depth in the ground, as is the caſe with the carrot, parſnep, beet, mangel wurzel, liquorice, and ſome others of the ſame nature, conſtantly require a great depth of cultivation and tillage to ſecure good and full crops. And the various leſs fleſhy roots, which run deeply in the earth, ſuch as thoſe of beans, hops, parſley, red clover, lucern, ſaintfoin, and many ſorts of graſſes, as well as the common and Swediſh turnip, &c. alſo ſtand in need of a rather fine and deep preparation of the ſoil in order to afford equal and full crops.

Among the grain kinds of crops, wheat, from the nature of its root, demands the deepeſt and fineſt tillage; but neither this nor any of the others require any great depth of ploughing merely on that account, as the roots always ſpread out very near the ſurface. The ſame is the caſe with moſt of the cabbage ſorts, yet the land ſhould always be well prepared for them.

Much difference of opinion has been entertained by different inquirers reſpecting the cauſe of the conſtant downward direction of roots and the upward growth of ſtems. Some have ſuppoſed it to depend on the quality of the ſap juice which circulates within them; others have, with greater ingenuity and plauſibility, aſſerted it to be owing to the living principle or power in them, and the ſtimulus of the air and moiſture upon different parts of them. And more lately, and with ſtill greater probability, it has been attributed to circumſtances of a mechanical nature, as depending on the principle of gravity. This notion has been beautifully illuſtrated and explained by the experiments of Mr. A. Knight, by placing moiſtened beans in favourable ſituations for vegetating upon the circumferences of wheels moving with different degrees of velocity in vertical and horizontal poſitions.

The roots of large old trees, which have been felled, are often got out of the ground in a cheap convenient manner by blaſting or blowing them with gunpowder, by means of a boring auger contrived for the purpoſe. See BLASTING.

ROOTS, in *Gardening*, are of many different kinds, which vary conſiderably in their nature. They moſtly conſiſt of a ſtock, or thick main part, which ſtrikes into the earth or ſoil, and of fibrous or thread-like parts, which terminate, and are ſent off from different portions of it, ſpreading themſelves to great diſtances in the ground, for the purpoſe of collecting the nouriſhment and ſupport of the particular plant.

The peculiarities of ſtructure, and the direction in the ſtock parts of roots, have led to ſeveral diſtinctions in regard to their kinds.

In this way we have *perpendicular* and *horizontal* roots, or thoſe which deſcend and run down into the earth or ſoil in a ſtraight downward direction; and thoſe which run or paſs along under the ſurface of the ground in a ſuperficial tranſverſe manner: *ſimple* and *compound* or *branched* roots, or ſuch as are perfectly ſingle, and without any ſort of ſubdiviſion in their parts, and ſuch as are divided in a lateral

lateral branched manner, with many ſubdiviſions and ramifications: *ſpindle-ſhaped* and *tapering* roots, or thoſe which have oblong thick upper parts, which taper in a regular gradual manner to the lower extremities: of this nature are the roots of the common radiſh, the parſnep, the carrot, and many others: *bulbous* and *tuberous* roots, or thoſe which have a roundiſh, oval, ſwelling, bulbous form, and which are compoſed, in ſome caſes, of many ſucculent imbricated ſcales, and in others, of numerous involving coats, including three diſtinct ſorts, as ſcaly bulbs, having the parts lying over one another, as in the root of the lily; tunicated bulbs, which are formed of ſeveral different tunics or coats involving each other in a cloſe manner, as in the onion; and ſolid bulbs, as in the tulip; and thoſe which are of a thick, fleſhy, knobby, ſolid, lumpy form, whether of a roundiſh, irregularly knobbed or oblong ſhape, whether conſtituted of only one knob, or of ſeveral collected into bundles: examples of theſe ſorts are met with in the roots of the potatoe, the Jeruſalem artichoke, anemone, pæony, &c. as well as in all thoſe which are made up of a ſolid fleſhy ſubſtance: *fibrous* and *creeping* roots, or ſuch as are wholly compoſed of numerous radical or ſlender fibrous parts, and are the moſt common ſort, eſpecially in various deſcriptions of herbaceous plants, conſiſting of roots of the perpendicular, horizontal, ſimple, and branched kinds; ſome of which are very thin and fine, like threads, others ſomewhat of a fleſhy nature; and ſuch as run along immediately under the ſurface of the ground to a conſiderable length or diſtance, emitting and ſending forth at certain points ſmall fibres below and ſhoots at the upper parts: *globular* and *bundled* roots, or ſuch as have roundiſh, fleſhy, ſolid roots of the tuberous deſcription, as in the earth-nut, &c. and ſuch as are compoſed of many ſmall, oblong, fleſhy kernelly parts or knobs, which are all connected on the upper part, and terminated underneath in radicles or fibres, as in the ranunculus, &c.: theſe are alſo often termed *grumous* roots: *granulous aggregate* and *pendulous cluſtered* roots, or thoſe which conſiſt of many roundiſh knobs, like grains of corn, the whole of which is congregated together, ſo as to form a root; and thoſe which are compoſed of ſeveral roundiſh fleſhy knobs or tubers, which are ſtrung on and ſuſpended, as it were, at the ends of fibres, as in the aſphodel and many others: *handed tuberous* and *teſticulated* roots, or ſuch as have oblong tuberous forms of them which divide and ſpread out like an open hand, and ſuch as are compoſed of two roundiſh, egg-like, tuberous knobs, united in ſomewhat a teſticulated manner: *jointed* and *woody* roots, or thoſe which are long, thickiſh, and jointed at certain diſtances; and thoſe which are conſtantly becoming of a hard, tough, woody nature, as thoſe of moſt trees, ſhrubs, and under-ſhrubs: and *downright* or *tap* roots, or thoſe which have a main fleſhy part, that runs directly downwards in a perpendicular manner, as in the carrot, parſnep, beet, &c. as well as in ſome ſorts of trees and ſhrubs.

Garden roots are likewiſe further divided and diſtinguiſhed according to the time of their duration or laſting in the ſoil or ground. In this reſpect, there are *annual* roots, or thoſe which continue or endure for one year only, at the fartheſt, and then wholly periſh and decay, as in all the annual plant kind: *biennial* roots, or ſuch as continue and laſt out for two years, or thereabouts, only, after which they entirely decay and are deſtroyed; and *perennial* roots, or ſuch as are of many years' duration or continuance. In ſome caſes of this nature both the roots and ſtems are perennial, while in others only the former.

Roots of the garden deſcription, for the moſt part, penetrate and inſert themſelves into the ſoil or ground, in order to draw and derive nouriſhment and ſupport from it; but there are ſome few which form exceptions to this rule, as the root of the miſletoe, which attaches and fixes itſelf to the branches or other parts of trees, being inſerted between their bark and wood, whence it acquires its means of ſupport, the ſtem proceeding in a downward direction from it, &c.

In bulbous roots of different kinds, there are great differences in regard to their habits of growth, in ſo far at leaſt as relates to the depths which they require to be in the earth or ſoil; ſome ſtanding in need of being quite ſuperficial, while others neceſſarily deſcend to conſiderable depths below the ſurface. Theſe circumſtances therefore probably require much greater attention in their cultivation than has hitherto been beſtowed upon them, in order to procure good roots of ſuch kinds.

The roots of different kinds of garden plants require to be taken up at particular ſeaſons, and to be kept and preſerved for uſe in different manners, according to their different natures, and the purpoſes for which they are intended. All the roots of the different flower bulb and tuberous kinds may be taken up when the ſtalks decline towards the end of ſummer, or the beginning of the ſucceeding ſeaſon; they ſhould then be rendered perfectly dry by ſome gentle means, ſuch as expoſing them to a dry current of air and a middling degree of heat, when thinly ſpread out in a ſieve, or ſome other convenient manner; afterwards, when this has been perfectly accompliſhed, they may be put into drawers in dry ſituations, or hung up in bags in ſimilar places.

Bulbous culinary roots of the onion kind have been attempted to be kept in many different ways, as by laying them thinly in dry rooms, roping them and hanging them up in dry airy places, and burning or charring the root parts of the bulbs; but they ſeem not to be capable of being long preſerved without ſhooting while in the open air, in any way that has hitherto been made trial of in ſuch intention. The beſt methods of proceeding with them are probably thoſe of taking them from the ground after ſome dry weather, expoſing them thinly to the ſun and air until they are become, in every reſpect, perfectly in a ſtate free from any ſort of mould or moiſture, and then either to have them roped and hung up, or ſpread out in a thin manner upon a dry boarded floor. The warmth or heat of the ſun or fire ſhould never be ſuffered to penetrate into the places where they are kept, but they ſhould be naturally dry.

Tuberous roots, ſuch as thoſe of the potatoe, in the general keeping crop, ſhould always be taken up during a dry ſeaſon, and be afterwards, as quickly as poſſible, by mild means, made thoroughly dry and free from any mouldy matter that may hang about them, when they may be laid up in any place which is free from damp, taking care to cover them ſufficiently thickly with dry ſtraw when the weather is froſty. Roots of the Jeruſalem artichoke, and other ſimilar kinds, may be preſerved in the ſame way, but without the uſe of the ſtraw, as they do not ſtand in need of it.

Perpendicular and tap-roots, ſuch as thoſe of the carrot, parſnep, beet, and others of the ſame fleſhy kind, ſometimes require to be laid up in order to preſerve them in a juicy moiſt ſtate. This is beſt accompliſhed by the uſe of dry light ſand, or other ſimilar materials of a light dry nature, packing them up in layers one over the other, each ſort together, in a ſeparate manner. In this way they may be well preſerved in a ſtate fit for conſtant uſe. The roots of celery and cardoons may alſo be preſerved in the ſame way with much ſucceſs and advantage when neceſſary.

It is occasionally neceſſary that the tap-roots of ſeedling plants, while they are in the nurſery, ſhould be ſhortened, with the view of preventing their ſtriking down too deep into a bad ſubſoil, as well as to force out lateral horizontal roots in greater abundance nearer to the ſurface of the ground, where the ſoil is good, that they may derive more full nouriſhment and ſupport, and thereby thrive in a better and more expeditious manner.

The roots of annual and biennial plants ſtand in need of being renewed every year, or at the end of every two years, by the ſowing of their ſeeds, or the ſetting of ſome other part of them: and the perennial roots are continued by the parting, dividing, ſlipping, cutting, and reſetting of them or their different parts, as well as by various other methods, as may be ſeen fully deſcribed under their different proper heads.

Roots, in *Medicine.* The principal roots uſed in the practice of phyſic, are rhubarb, rhaponticum, ſarſaparilla, ipecacuanha, jalap, zedoary, galangal, caſſumenar, gentian, turmeric, liquorice, madder, &c. See Rhubarb, Sarsaparilla, Ipecacuanha, &c.

There are ſeveral ways of preparing roots for medicinal uſe in the eaſtern nations, which ſtrongly alter them from their original form and appearance. An inſtance we have of this in the drug called ſalep, which is no other than the root of an orchis thus prepared.

Other roots they alſo prepare in the ſame manner, or ſomething like it; an inſtance of which we have in ſome of the oriental ginſeng, which is clear and pellucid, as a reſin, and friable like one, retaining very little of the ſtructure or appearance of the root. Kæmpfer gives the method by which the people in the Eaſt do this, and it may be well worth trying on ſome of our own roots.

The Chineſe, this author informs us, give their ginſeng its colour and tranſparence in this manner. They macerate the freſh root for three days in cold rice-water, then expoſe it in cloſe veſſels to the vapour of the ſame water; after which they carefully and leiſurely dry it, and it becomes hard and brittle, of a browniſh-red colour, and as tranſparent as a reſin.

All the ginſeng of China is not of this ſort; and it has been ſuppoſed by ſome, that ſuch as was ſo had aſſumed that appearance by age, as many of the more ſucculent roots, which have very ſmall fibres, will become much leſs opaque when perfectly dry than they were at firſt; but experience ſhews that this is not the caſe; for many perſons have kept the oriental ginſeng a great many years, but it has never been known to aſſume that appearance. There is no doubt, however, but that if the Weſt Indian ginſeng were treated in this manner, it would equal the prepared ginſeng of the Eaſt; for the roots of ſome of our umbelliferous plants, particularly the ſkirret, may be made clear and tranſparent in this manner, by only boiling it in common water, and afterwards drying it in the open air. Mem. Acad. Scienc. Par. 1740.

Roots, *Flower.* See Flower.

Root *of Oſteocolla*, a word uſed to expreſs a ſort of ſoft and rotten matter, on which the oſteocolla of Germany is found in ſandy grounds.

The workmen ſeek after the oſteocolla by the direction of certain lumps of a white marley matter, which they find lying on the ſands; under this they always find a parcel of rotten vegetable matter, branching out from a main ſtem or trunk, at ten or twelve feet deep up to the ſurface; this rotten ſubſtance they call the root of the oſteocolla; and they obſerve, that where the matter they ſeek after is not found round it at the time of their digging, they need only mark the place, and dig again a year afterwards, and they will find it formed in a perfect manner. The oſteocolla found near Frankfort is all of this kind; and we find the holes in the centre of all the pieces through which this root had paſſed. It is ſo tender, that it uſually moulders away on the oſteocolla being expoſed to the air; but ſometimes they waſh it out. Phil. Tranſ. N° 39.

It is not eaſy to conceive what this is, unleſs the remains of foſſile branches of trees; but even then it is as difficult to account for the formation of the oſteocolla about them, as there is none of it found concreted where they are not. We have a ſort of oſteocolla found with us in what we call *petrifying ſprings;* but as this is done in the water, it is eaſier to conceive how it becomes ſo pure, than how a ſoft and pappy ſubſtance, found in the midſt of a bed of ſand, comes not to have ſome ſand embodied in it.

Root, *Indian Arrow.* See Arrow-*root.*

Root, *China.* See Smilax.

Root, *Falſe China*, a ſpecies of *Senecio;* which ſee.

Root, *Fever*, a ſpecies of *Trioſteum;* which ſee.

Root, *Hollow*, a ſpecies of *Adoxa;* which ſee.

Root, *Roſe.* See Rose-*root.*

Root, *Seminal.* See Seminal.

Root, *Snake.* See Snake-*root.*

Root, *Black*, or *Wild Snake*, of America, a ſpecies of *Actæa;* which ſee.

Root, *Dr. Witt's Rattle-ſnake*, a ſpecies of *Prenanthes;* which ſee.

Root, *Senegaw Rattle-ſnake*, a ſpecies of *Polygala;* which ſee.

Root, *Sweet*, a ſpecies of *Glycirrhiza;* which ſee.

Root *of Scarcity*, in *Agriculture*, the common name of a plant of the tap-rooted fleſhy kind, that has much reſemblance to the beet, and which is now cultivated to a very large ſize both in the root and top, as cattle food, where a proper ſort of ſeed is provided. It is a very hardy vegetable, is eaſily grown, and much reliſhed by horſes as well as neat cattle. See Mangel *Wurzel.*

Root-*Crops*, ſuch ſorts of field crops as afford their produce in roots, ſuch as potatoes, turnips, carrots, parſneps, &c. Theſe ſorts of crops conſtantly require to have the ground peculiarly prepared for them. See theſe ſeveral heads.

Some of the crops require that the land be well pulverized and prepared before they are put into it, and afterwards to have the mould well ſtirred and laid up about them while they are growing. They ſhould alſo, in many inſtances, be at firſt, or in a gradual manner, thinned, ſet out, and left at ſuitable diſtances for gaining their full and perfect ſtates of growth. Some of them ſtand in need of being regularly taken up out of the ground at the proper ſeaſon and ſtored up, as the potatoe, carrot, parſnep, beet, &c. while others may often remain in the ſoil until they are conſumed, as the various ſorts of turnips, and ſome others, not only without ſuſtaining any great injury, but ſometimes with much benefit. The Swediſh turnip is, however, frequently ſtored up with utility and convenience. When laid up they require to be in a dry condition on the outſide, and to be depoſited in dry ſituations. Potatoes ſhould always be kept dry and ſecured from froſt, by means of ſtraw or other ſimilar matters being laid round them.

Root-*Grafting.* See Engrafting.

Root-*Houſe*, in *Rural Economy*, the place where roots are depoſited for the more readily ſupplying live-ſtock of different kinds with them. It is of much conſequence to the farmer to have this place as near as poſſible to the ſtables, feeding-houſes, and cattle-ſheds. Theſe houſes are eſſentially neceſſary

necessary wherever there is a number of cows or other sorts of cattle to be supported on roots of the carrot, parsnep, turnip, and potatoe kinds, as well as for cabbages, as without them it would not be only inconvenient, but in many cases, in severe weather, impossible to provide them for the daily supply of such stock. The cabbages should not, however, ever be kept long in these houses, as they are very apt to take on the putrid fermentation, and become useless. The farmer should be careful that the yard-man constantly keeps such places perfectly clean and sweet, in order that the roots may contract no bad smell, as cattle are in many cases extremely nice in their feeding, and when once disgusted with any sort of food of this kind, seldom take to it again in a proper manner.

Root-houses are always the best and sweetest when laid over on the insides with a coarse plaster, or boarded with some rough common boarding material. They may in many cases be divided for different sorts of roots, with great advantage and convenience. The doors of them should for the most part be large, so that the carts may be backed and readily emptied in at them without any difficulty.

Root, in *Arithmetic* and *Algebra*, denotes a quantity which, being multiplied by itself, produces some higher power, and it is called the 2d, 3d, 4th, &c. root, according to the number of times that the multiplication by itself is performed, that number being always one less than the denomination of the root: thus, if a number is multiplied once by itself, it is called the square root, or 2d root of the product; if twice, it is called the cube, or 3d root; if three times, the biquadrate, or 4th root; and so on to other roots, which, beyond the 4th, are commonly denoted by the 5th, 6th, &c. root; though ancient authors, and even some modern ones, use particular denominations for all higher roots, as we do for the square root and cube root. Thus, the

2d root, is called the		*square* root.
3d root	—	*cube* root.
4th root	—	*quadrato-quadratum*, or *biquadratic* root.
5th root	—	*sursolid* root.
6th root	—	*quadrato-cubo*.
&c.		&c.

But such distinctions are useless, and are, therefore, now commonly omitted.

For the method of extracting the roots of numbers, see the articles Approximaton and Extraction; and for a table of the square roots and cube roots of numbers, see the conclusion of this article.

Roots *of Equations*, in *Algebra*, denote such a number or quantity as, when substituted for the unknown quantity, will produce an equality between both sides of the equation: thus, in the equation

$$x^3 - 6x^2 + 11x = 6, \text{ or } x^3 - 6x^2 + 11x - 6 = 0;$$

if we substitute 1 instead of x, we have $1 - 6 + 11 = 6$; therefore 1 is a root of that equation: if we substitute 2 instead of x, we have $2^3 - 6 \cdot 2^2 + 11 \cdot 2 = 6$; therefore 2 is also a root of the same equation: and if we substitute 3 for x, then $3^3 - 6 \cdot 3^2 + 11 \cdot 3 = 6$; and, therefore, 3 is likewise a root of the same equation: hence the roots are 1, 2, and 3; that is, there are three distinct numbers, which, when substituted for x, will produce the equality required. And it is the same in all equations, *viz.* it has always as many roots, real or imaginary, as there are units in the index of the highest power of the unknown quantity. This property has place in equations of the most simple forms, as $x^2 = 1$, $x^3 = 1$, $x^4 = 1$, $x^5 = 1$, &c. each of these having as many roots as there are units in the exponent of the power: thus, the

two square roots of 1, are $+1$ and -1;
three cube roots of 1, are 1, $-\frac{1}{2} + \frac{1}{2}\sqrt{-3}$, and $-\frac{1}{2} - \frac{1}{2}\sqrt{-3}$;
four 4th roots of 1, are 1, -1, $+\sqrt{-1}$, and $-\sqrt{-1}$;

$$\text{five 5th roots of 1,} \begin{cases} \text{are } 1, \dfrac{-1+\sqrt{5}}{4} \pm \sqrt{\left\{\left(\dfrac{-1+\sqrt{5}}{4}\right)^2 - 1\right\}} \\ \text{and } \dfrac{1-\sqrt{5}}{4} \pm \sqrt{\left\{\left(\dfrac{-1-\sqrt{5}}{4}\right)^2 - 1\right\}} \end{cases}$$

the two latter forms containing each two roots, in consequence of the ambiguous sign, $\pm$, which enters into their composition.

The doctrine of the roots of equations is one of the most intricate, but at the same time most interesting, of any branch of algebra. The method of finding the roots of quadratic equations is found in the earliest algebraic authors; it is even given, though somewhat different in form, in the *Bija Ganita*, a Sanscrit algebra, written about the latter end of the 12th, or the beginning of the 13th century, translated into Persian in 1634, and lately into English by Mr. Strachey, of the East India Company's Bengal civil establishment. The solution of cubic equations was first published by Cardan about 1540, though it is clear that he was not the inventor of the method, having received it from Tartaglia, who is commonly considered as the real author; however, Lagrange attributes the general investigation to Hudde, a celebrated Dutch mathematician, a contemporary of Descartes and Fermat. Equations of the 4th degree were first solved by Ferrari, a pupil of Cardan's, and published by the latter in 1540; since which time no further extent has been given to the subject, the 5th, and all higher equations having resisted the whole accumulated power of the modern analysis. Still, however, many important properties of the roots of equations have been discovered; the whole theory has been reduced to one uniform principle of operation; and approximations have been made in all those cases where direct methods of solution were unattainable. We cannot, of course, enter upon this subject at any great length; but a summary of the most interesting particulars, though not accompanied, in all cases, with their demonstration, will not, we presume, be unacceptable to the general reader; in the enumeration of which we shall avail ourselves of the Introduction to Barlow's Mathematical Tables.

General Properties of the Roots of Equations.

1. Every equation of the general form

$$x^m + Ax^{m-1} + Bx^{m-2} + Cx^{m-3} + \&c. + K = 0$$

has m roots real or imaginary (see Imaginary *Roots*); and may be supposed to be formed by the continued product of m factors,

$$(x - \alpha)\ (x - \beta)\ (x - \gamma)\ (x - \delta)\ \&c. = 0,$$

where α, β, γ, δ, &c. are the roots of the equation.

2. The imaginary roots of an equation always enter in pairs, and if $a + b\sqrt{-1}$ be one of those roots, $a - b\sqrt{-1}$ is another of them; so that the sum of every pair of them is a real quantity, and the square of their difference a real negative quantity; and an equation can have no imaginary root but is reducible to the above form. These properties of the imaginary roots of equation are generally attributed to d'Alembert.

3. Since

3. Since every equation

$$x^m + Ax^{m-1} + Bx^{m-2} + Cx^{m-3} + \&c. + K = 0$$

is compofed of the factors

$$(x-\alpha)\ (x-\beta)\ (x-\gamma)\ (x-\delta)\ \&c. = 0,$$

it is obvious, that if, by any means, one of thofe roots, as α, can be found, the original equation may be divided by $(x-\alpha)$, and thence be reduced to another of lower dimenfions.

4. If we fuppofe the figns of each of the roots of an equation to be changed, then the co-efficient of the fecond term of that equation will be equal to the fum of all thofe roots fo changed; the co-efficient of the third term equal to the fum of all the products that can be formed with them, taken two and two at a time; the co-efficient of the fourth term equal to all the products that can be formed with them, taken three and three at a time; and fo on to the abfolute term, which is equal to the product of all the roots; thus, if a, b, c, d, be the roots of an equation, then the co-efficient of the firft term being 1, that of the

$$\begin{aligned} 2\text{d} &= -(a+b+c+d) \\ 3\text{d} &= \quad (ab+ac+ad+bc+bd+cd) \\ 4\text{th} &= -(abc+abd+acd+bcd) \\ 5\text{th} &= \quad abcd \end{aligned}$$

5. If the fubftitution of any two numbers, m and n, inftead of the unknown quantity of an equation, give refults with contrary figns, one, or fome odd number, of the real roots of the equation, are contained between thofe two limits.

6. And converfely, if two numbers be fubftituted for the unknown quantity of an equation, which comprife between them any odd number of the roots of that equation, the refults thus obtained muft neceffarily have contrary figns. But if two, or any even number of roots, be comprifed between thofe limits, then no change of figns will take place in the refults. See a demonftration of thefe properties in Barlow's Tables.

7. Therefore, when we fubftitute for the unknown quantity of an equation the feveral terms of the progreffion, 0, 1, 2, 3, &c. it will furnifh us with the integral limits of all the real pofitive roots of that equation, provided it has not any that differ from each other by a quantity lefs than unity, or if it have any odd number of fuch roots; but if two, or any even number of its roots, be comprifed between two confecutive integers, then thefe fubftitutions will not enable us (at leaft not by the change of fign) to difcover the integral limits between which they are comprifed.

8. But if we fubftitute for the unknown quantity the feveral terms of the progreffion, 0, Δ, 2Δ, 3Δ, &c. Δ being fuppofed lefs than the difference of any two of the real roots of the equation, then the limits of every real pofitive root will be indicated by the feveral changes of figns in the refpective refults.

The above two properties have chiefly reference to Lagrange's method of approximation.

9. If, in an equation, whatever real value be fubftituted for the unknown quantity, the refult is always pofitive, it is certain that all the roots of that equation are imaginary.

10. The figns of all the roots of an equation may be changed from pofitive to negative, or from negative to pofitive, by changing the figns of the alternate co-efficients, *viz.* the 2d, 4th, 6th, &c.; and hence the finding the real roots of an equation is reduced to that of finding pofitive roots only.

11. Every equation of an odd degree has at leaft one real root, which will be pofitive if the laft term be negative, or negative if that term be pofitive.

12. Every equation of even dimenfions, having its laft term negative, has at leaft two real roots, one pofitive and the other negative; but if its laft term be pofitive, it furnifhes us with no means of judging of the nature of the roots.

13. The firft term of an equation having (as we have fuppofed throughout) unity for its co-efficient, its greateft pofitive root will be lefs than the greateft negative co-efficient plus 1.

14. And the abfolute term of an equation being divided by the fum of that term, and the greateft co-efficient having a contrary fign, will give a limit lefs than the leaft root of that equation.

15. An equation, having unity for the co-efficient of its firft term, and integral co-efficients for all its others, cannot have a fractional root, *viz.* its roots muft be either integral, irrational, or imaginary.

16. An equation cannot have more real pofitive roots, than there are variations in the fucceffion of the figns of its co-efficients, nor more real negative roots than there are permanencies of figns.

Therefore, when all the roots of an equation are real, there are precifely as many pofitive roots as there are variations, and as many negative roots as there are permanencies.

17. When any term of an equation is wanting, or has its co-efficient equal to zero, and the preceding and following terms have the fame figns, the equation has neceffarily fome imaginary roots.

18. An equation cannot have all its roots comprifed between two confecutive integers, nor between any two integers, of which the difference is not greater than 2.

Thefe properties, the demonftrations of which are given by different algebraical authors, may frequently be advantageoufly confulted in determining the nature and limits of the roots of equations.

On the Forms of the Roots of Equations.—We have before obferved, that the roots of equations, beyond thofe of the fourth degree, cannot be generally exhibited in an analytical form; yet from the analogy difcoverable in thofe of inferior dimenfions, there feems little doubt but that thofe of the fifth and higher dimenfions partake of the fame form.

When an equation of the fecond, third, or fourth degree has its fecond term taken away, to reduce it to its moft convenient form for folution, the roots will have the following form.

Second Degree.

$x = a\sqrt{p}$, $x = a'\sqrt{p}$, where a, a', are the roots of 1.

Third Degree.

$x = \sqrt[3]{p} + \sqrt[3]{q}$, $x = a\sqrt[3]{p} + a^2\sqrt[3]{q}$, $x = a^2\sqrt[3]{p} + a\sqrt{q}$, where a and a^2 are the two imaginary roots of $\sqrt[3]{1}$.

Fourth Degree.

$$\left.\begin{aligned} x &= \sqrt[4]{p} + \sqrt[4]{q} + \sqrt[4]{r} \\ x &= a\sqrt[4]{p} + a^2\sqrt[4]{q} + a^3\sqrt[4]{r} \\ x &= a^2\sqrt[4]{p} + a^3\sqrt[4]{q} + a\sqrt[4]{r} \\ x &= a^3\sqrt[4]{p} + a\sqrt[4]{q} + a^2\sqrt[4]{r} \end{aligned}\right\}$$

where a, a^2, a^3, are the three imaginary roots of $\sqrt[4]{1}$.

Whence

Whence it is very natural to infer, that in an equation of the fifth degree, the roots will have the form,

$$x = \sqrt[5]{p} + \sqrt[5]{q} + \sqrt[5]{r} + \sqrt[5]{s}$$
$$x = a\sqrt[5]{p} + a^2\sqrt[5]{q} + a^3\sqrt[5]{r} + a^4\sqrt[5]{s}$$
$$x = a^2\sqrt[5]{p} + a^3\sqrt[5]{q} + a^4\sqrt[5]{r} + a\sqrt[5]{s}$$
$$x = a^3\sqrt[5]{p} + a^4\sqrt[5]{q} + a\sqrt[5]{r} + a^2\sqrt[5]{s}$$
$$x = a^4\sqrt[5]{p} + a\sqrt[5]{q} + a^2\sqrt[5]{r} + a^3\sqrt[5]{s}$$

where a, a^2, a^3, a^4, are the four imaginary roots of $\sqrt[5]{1}$.

This generalization of the forms of the roots of equations, though generally attributed to Euler, is, we believe, due to Waring; but neither of thefe able analyfts were able to derive from it the folution of any general equation above the fourth degree. On the fubject of equations, *viz.* of finding their roots, we would refer the reader to Waring's "Meditationes Algebraicæ," Lea's "Refolution of the higher Equations in Algebra," La Grange's treatife on the refolution "Des Equations Numeriques," and the Introduction to Barlow's "Mathematical Tables," from which we have extracted the following general fynopfis of refolution. See alfo Bonnycaftle's Algebra.

General Synopfis of the direct and approximate Methods of afcertaining the Roots of Numbers and Equations.

Extraction of the Roots of Numbers.

I. Let n reprefent the index of the root,
x the number of which the root is required,
r an approximate value of $\sqrt[n]{x}$;

which may be found by trial, or otherwife, as near as convenient, and either in excefs or defect: then will,

$$1.\ \sqrt[n]{x} = r + \frac{2r(x - r^n)}{(n+1)r^n + (n-1)x} \text{ very nearly.}$$

And ufing this new approximate value in the fame way, another value may be found ftill nearer; and fo on, to any degree of accuracy required.

This general formula refolves itfelf into the following particular ones; *viz.*

$$2.\ \sqrt{x} = r + \frac{2r(x - r^2)}{3r^2 + x}.$$

$$3.\ \sqrt[3]{x} = r + \frac{r(x - r^3)}{2r^3 + x}.$$

$$4.\ \sqrt[4]{x} = r + \frac{2r(x - r^4)}{5r^4 + 3x}.$$

$$5.\ \sqrt[5]{x} = r + \frac{r(x - r^5)}{3r^5 + 2x}.$$

$$6.\ \sqrt[6]{x} = r + \frac{2r(x - r^6)}{7r^6 + 5x}.$$

$$7.\ \sqrt[7]{x} = r + \frac{r(x - r^7)}{4r^7 + 3x}.$$

&c. &c.

By the Binomial Theorem.

II. Let $(a + b)$ reprefent any binomial, and n the index of the root or power, which may be either pofitive or negative, integral or fractional; then will

$$(a + b)^n =$$

$$(1)\ a^n + \frac{n}{1}a^{n-1}b + \frac{n(n-1)}{1 \cdot 2}a^{n-2}b^2 + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}a^{n-3}b^3 + \text{\&c.}$$

If b be negative, the odd powers of b will alfo be negative; that is,

$$(a - b)^n =$$

$$(2)\ a^n - \frac{n}{1}a^{n-1}b + \frac{n(n-n)}{1 \cdot 2}a^{n-2}b^2 - \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}a^{n-3}b^3 + \text{\&c.}$$

Otherwife: let $\frac{m}{n}$ reprefent the index, and put $\frac{b}{a} =$ Q; alfo, let A, B, C, D, &c. reprefent the firft, fecond, third, &c. terms of the feries, with their proper figns; then will

$$(a + b)^{\frac{m}{n}} = (a + aQ)^{\frac{m}{n}} =$$

$$(3)\ \overset{A}{a^{\frac{m}{n}}} + \overset{B}{\frac{m}{n}AQ} + \overset{C}{\frac{m-n}{2n}BQ} + \overset{D}{\frac{m-2n}{3n}CQ} + \frac{m-3n}{4n}DQ + \text{\&c.};$$

which is by far the moft convenient form in the cafe of fractional or negative indices.

ROOTS OF EQUATIONS.

QUADRATIC EQUATIONS.

III. Let $x^2 + ax - b = 0$, or $x^2 + ax = b$, reprefent any quadratic equation, a and b being either pofitive or negative; then will

$$x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}.$$

But if a and b, independent of the fign by which they are preceded, be always fuppofed pofitive; then this general formula refolves itfelf into the four following particular ones, *viz.*

1. $x^2 + ax - b = 0$, where $x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}$.

2. $x^2 - ax - b = 0$, where $x = \frac{a}{2} \pm \sqrt{\left(\frac{a^2}{4} + b\right)}$.

3. $x^2 - ax + b = 0$, where $x = \frac{a}{2} \pm \sqrt{\left(\frac{a^2}{4} - b\right)}$.

4. $x^2 + ax + b = 0$, where $x = \frac{-a}{2} \pm \sqrt{\left(\frac{a^2}{4} - b\right)}$.

By Sines and Tangents.

IV.

1. $x^2 + px = q$.

Put $\frac{2}{p}\sqrt{q} = \text{tan. } z$; then

$$x = \begin{cases} +\sqrt{q} \times \text{tan. } \tfrac{1}{2}z, \text{ or} \\ -\sqrt{q} \times \text{cof. } \tfrac{1}{2}z. \end{cases}$$

2. $x^2 + px = q$.

Put $\frac{2}{p}\sqrt{q} = \text{tan. } z$; then

$$x = \begin{cases} + \sqrt{q} \times \text{cof. } z, \text{ or} \\ - \sqrt{q} \times \text{tan. } z. \end{cases}$$

3. $x^2 + px = -q$.

Put $\frac{2}{p}\sqrt{q} = \text{fin. } z$; then

$$x = \begin{cases} - \sqrt{q} \times \text{tan. } \tfrac{1}{2} z, \text{ or} \\ - \sqrt{q} \times \text{cof. } \tfrac{1}{2} z. \end{cases}$$

4. $x^2 - px = -q$.

Put $\frac{2}{p}\sqrt{q} = \text{fin. } z$; then

$$x = \begin{cases} + \sqrt{q} \times \text{tan. } \tfrac{1}{2} z, \text{ or} \\ + \sqrt{q} \times \text{cof. } \tfrac{1}{2} z. \end{cases}$$

Cubic Equations.

By Cardan's Rule.

V. Let $x^3 + ax - b = 0$, or $x^3 + ax = b$, reprefent any cubic equation wanting its fecond term, and in which a and b may be either pofitive or negative; then will

$$1.\ x = \sqrt[3]{\left\{\frac{b}{2} + \sqrt{\left(\frac{b^2}{4} + \frac{a^3}{27}\right)}\right\}} + \sqrt[3]{\left\{\frac{b}{2} - \sqrt{\left(\frac{b^2}{4} + \frac{a^3}{27}\right)}\right\}}.$$

$$2.\ x = \sqrt[3]{\left\{\frac{b}{2} + \sqrt{\left(\frac{b^2}{4} + \frac{a^3}{27}\right)}\right\}} - \frac{\frac{1}{3}a}{\sqrt[3]{\left\{\frac{b}{2} + \sqrt{\left(\frac{b^2}{4} + \frac{a^3}{27}\right)}\right.}}.$$

Which latter form is frequently the moft convenient, as it requires only one extraction of the cube root, whereas the former requires two.

The fecond term of a cubic equation may be taken away by the following formulæ:

Let $y^3 + py^2 + qy + r = 0$.

Affume $y = \frac{x - p}{3}$; $a = 9q - 3p^2$; and $b = 9pq - 2p^3 - 27r$;

fo fhall $x^3 + ax - b = 0$ be the transformed equation required, which will, under this form, have integral coefficients.

When a is negative, that is, when the equation is $x^3 - ax = b$, the preceding formula becomes

$$3.\ x = \sqrt[3]{\left\{\frac{b}{2} + \sqrt{\left(\frac{b^2}{4} - \frac{a^3}{27}\right)}\right\}} + \sqrt[3]{\left\{\frac{b}{2} - \sqrt{\left(\frac{b^2}{4} - \frac{a^3}{27}\right)}\right\}}.$$

And here, when $\frac{a^3}{27} > \frac{b^2}{4}$, both branches of the root become imaginary, and the equation is faid to be of the irreducible cafe; no folution being then obtainable by this rule, except in thofe cafes in which the cube root of each of thefe branches can be found in other binomial furds, which, when poffible, is done by the following formulæ:

(1) $\sqrt[3]{(a \pm \sqrt{b})} = x + \sqrt{y}$.
(2) $x^3 - \frac{3}{4}x\sqrt[3]{(a^2 - b)} - \frac{1}{4}a = 0$.
(3) $y = x^2 - \sqrt[3]{(a^2 - b)}$.

By Sines and Tangents.

VI. In this cafe, it is neceffary to feparate the above general formula into the following particular ones, according as a and b are pofitive or negative, as follows; *viz.*

Form 1. $x^3 + ax - b = 0$.
2. $x^3 + ax + b = 0$.
3. $x^3 - ax - b = 0$.
4. $x^3 - ax + b = 0$.

1. *Solution of Form* 1: $x^3 + ax - b = 0$.

Put $\frac{b}{2}\left(\frac{3}{a}\right)^{\frac{3}{2}} = \text{tan. } z$; and $\sqrt[3]{\text{tan. }(45^\circ - \tfrac{1}{2}z)} = \text{tan. } u$.

Then $x = 2\sqrt{\frac{a}{3}} \times \text{cot. } 2u$.

2. *Solution of Form* 2: $x^3 + ax + b = 0$.

Put $\frac{b}{2}\left(\frac{3}{a}\right)^{\frac{3}{2}} = \text{tan. } z$; and $\sqrt[3]{\text{tan. }(45^\circ - \tfrac{1}{2}z)} = \text{tan. } u$.

Then will $x = -2\sqrt{\frac{a}{3}} \times \text{cot. } 2u$.

3. *Solution of Form* 3: $x^3 - ax - b = 0$.

This form refolves itfelf into two cafes, according as $\frac{2}{b}\left(\frac{a}{3}\right)^{\frac{3}{2}}$ is lefs or greater than 1.

In the firft cafe, put $\frac{2}{b}\left(\frac{a}{3}\right)^{\frac{3}{2}} = \text{cof. } z$, and $\sqrt[3]{\text{tan. }(45^\circ - \tfrac{1}{2}z)} = \text{tan. } u$.

Then will $x = 2\sqrt{\frac{a}{3}} \times \text{cofec. } 2u$.

In the fecond cafe, put $\frac{b}{2}\left(\frac{3}{a}\right)^{\frac{3}{2}} = \text{cof. } z$, then has x the three following values, *viz.*

1. $x = 2\sqrt{\frac{a}{3}} \times \text{cof. } \frac{z}{3}$.
2. $x = -2\sqrt{\frac{a}{3}} \times \text{cof. } \left(60^\circ + \frac{z}{3}\right)$.
3. $x = -2\sqrt{\frac{a}{3}} \times \text{cof. } \left(60^\circ - \frac{z}{3}\right)$.

4. *Solution of Form* 4: $x^3 - ax + b = 0$.

This has alfo two cafes, according as $\frac{2}{b}\left(\frac{a}{3}\right)^{\frac{3}{2}}$ is lefs or greater than 1.

In the firft cafe, put $\frac{2}{b}\left(\frac{a}{3}\right)^{\frac{3}{2}} = \text{cof. } z$, and $\sqrt[3]{\text{tan. }(45^\circ - \tfrac{1}{2}z)} = \text{tan } u$.

Then will $x = -2\sqrt{\frac{a}{3}} \times \text{cof. } 2u$.

In

In the second case, put $\frac{b}{2}\left(\frac{3}{a}\right)^{\frac{3}{2}} = \text{cos. } z$, then has x the three following values:

$$1.\quad x = -2\sqrt{\frac{a}{3}} \times \text{cos. } \frac{z}{3}.$$

$$2.\quad x = \quad 2\sqrt{\frac{a}{3}} \times \text{cos. } \left(60^\circ + \frac{z}{3}\right).$$

$$3.\quad x = \quad 2\sqrt{\frac{a}{3}} \times \text{cos. } \left(60^\circ - \frac{z}{3}\right).$$

The two latter cases of forms 3 and 4 belong to the irreducible case, each of which gives three real roots or values of x; whereas the other forms have each only one real root. See IRREDUCIBLE *Case*.

By infinite Series.

Let $x^3 + ax = b$ represent any cubic equation, in which a and b may be each either positive or negative.

Assume $\frac{2b}{\sqrt[3]{[2(27b^2 + 4a^3)]}} = \varphi$, and $\frac{27b^2}{27b^2 + 4a^3} = \pi$; then,

$$1.\ \begin{cases} x = \varphi \times [1 + \frac{2.5}{6.9}\pi + \frac{2.5.8.11}{6.9.12.15}\pi^2 + \frac{2.5\ldots17}{6.9\ldots21} \\ \quad \pi^3 + \&c.], \text{ or} \\ x = \varphi \times [1 + \frac{2.5}{6.9}\pi A + \frac{8.11}{12.15}\pi B + \frac{14.17}{18.21} \\ \quad \pi C + \&c.] \end{cases}$$

In which last form, A, B, C, &c. represent the preceding terms.

Again, assume $2\sqrt[3]{\frac{b}{2}} = \varphi$, and $\frac{27b^2 + 4a^3}{27b^2} = \pi$; then,

$$2.\ \begin{cases} x = \varphi \times [1 - \frac{2}{3.6}\pi - \frac{2.5.8}{3.6.9.12}\pi^2 - \frac{2.5\ldots14}{3.6\ldots18} \\ \quad \pi^3 - \&c.], \text{ or} \\ x = \varphi \times [1 - \frac{2}{3.6}\pi A - \frac{5.8}{9.12}\pi B - \frac{11.14}{15.18} \\ \quad \pi C - \&c.] \end{cases}$$

In which, also, A, B, C, &c. are the preceding terms.

Both these series are correct analytical expressions for the value of x, in the general cubic equation $x^3 + ax = b$; but they are not equally commodious for the purposes of solution.

The former must be used in all cases when a is positive, as also when a is negative, and $4a^3$ *greater* than $54b^2$; and the latter when a is negative, and $4a$ *less* than $54b^2$; because then π, in both cases, will be less than unity, and the series will, therefore, be converging ones.

BIQUADRATIC EQUATIONS.

By Simpson's Rule.

VIII. Let $x^4 + ax^3 + bx^2 + cx + d = 0$, be any equation of the fourth degree, in which a, b, c, d, may be any numbers at pleasure, positive, negative, or zero.

Find the values of p, q, and r, by means of the three equations

$$8p^3 - 4bp^2 + (2ac - 8d)p - a^2d + 4bd - c^2 = 0$$

$$q = \sqrt{(\tfrac{1}{4}a^2 + 2p - b)}$$

$$r = \frac{ap - c}{2q};$$

then will the four roots of the proposed equation be contained in the following formulæ;

$$x = -\frac{\frac{1}{2}a - q}{2} \pm \sqrt{\left\{\left(\frac{\frac{1}{2}a - q}{2}\right)^2 + r - p\right\}}$$

$$x = -\frac{\frac{1}{2}a + q}{2} \pm \sqrt{\left\{\left(\frac{\frac{1}{2}a + q}{2}\right)^2 - r - p\right\}}$$

The above rule was only generalized by Simpson, it is originally due to Ferrari, though commonly ascribed to Bombelli.

By Descartes' Rule.

IX. Let $x^4 + ax^2 + bx + c = 0$, be any biquadratic equation, wanting its second term.

Find the value of y in the double cubic equation

$$y^6 + 2ay^4 + (a^2 - 4c)y^2 - b^2 = 0;$$

then will the four values of x be comprised in the formulæ

$$x = \tfrac{1}{2}y \pm \sqrt{\left(-\tfrac{1}{4}y^2 - \tfrac{1}{2}a - \frac{b}{2y}\right)}$$

$$x = \tfrac{1}{2}y \pm \sqrt{\left(-\tfrac{1}{4}y^2 - \tfrac{1}{2}a + \frac{b}{2y}\right)}$$

By Euler's Rule.

X. Let $x^4 - ax^2 - bx - c = 0$, be any biquadratic equation, wanting its second term, a, b, and c, being any numbers, positive, negative, or zero.

Assume $\quad f = \frac{1}{2}a$; $h = \frac{b^2}{64}$; $g = \frac{1}{16}a^2 + \frac{1}{4}c$.

Then find the three roots of the cubic equation

$$y^3 + fy^2 + gy - h = 0,$$

which let be p, q, and r.

Then will the four values of x in the original equation be expressed as follows.

When b is positive,

1st root	$x =$	$\sqrt{p} + \sqrt{q} + \sqrt{r}$
2d	$x =$	$\sqrt{p} - \sqrt{q} + \sqrt{r}$
3d	$x =$	$-\sqrt{p} + \sqrt{q} - \sqrt{r}$
4th	$x =$	$-\sqrt{p} - \sqrt{q} + \sqrt{r}$

When b is negative,

1st root	$x =$	$\sqrt{p} + \sqrt{q} - \sqrt{r}$
2d	$x =$	$\sqrt{p} - \sqrt{q} + \sqrt{r}$
3d	$x =$	$-\sqrt{p} + \sqrt{q} + \sqrt{r}$
4th	$x =$	$-\sqrt{p} - \sqrt{q} - \sqrt{r}$

EQUATIONS IN GENERAL.

By Approximation.—First Method.

XI. Let $x^n + ax^{n-1} + bx^{n-2} + cx^{n-3} + dx^{n-4} + \&c. = 0$, be any general equation, in which a, b, c, d, &c. are any numbers, positive, negative, or zero; then r being an approximate value of x, we have

1. $x =$

$$1.\ x = \frac{(n-1)r^n + (n-2)ar^{n-1} + (n-3)br^{n-2} + (n-4)cr^{n-3} + \&c}{nr^{n-1} + (n-1)ar^{n-2} + (n-2)br^{n-3} + (n-3)cr^{n-4} + \&c.}$$

nearly, which general form resolves itself into the following particular ones; *viz.*

Equations of the third Degree.

2. $x^3 + ax^2 + bx + c = 0$;

$$x = \frac{2r^3 + ar^2 - c}{3r^2 + 2ar + b}.$$

Equations of the fourth Degree.

3. $x^4 + ax^3 + bx^2 + cx + d = 0$;

$$x = \frac{3r^4 + 2ar^3 + br^2 - d}{4r^3 + 3ar + 2br + c}.$$

Equations of the fifth Degree.

4. $x^5 + ax^4 + bx^3 + cx^2 + dx + e = 0$;

$$5.\ x = \frac{4r^5 + 3ar^4 + 2br^3 + cr^2 - e}{5r^4 + 4ar^3 + 3br^2 + 2cr + d}.$$

&c. &c.

By the second Method.

XII. Let $x^n + ax^{n-1} + bx^{n-2} + cx^{n-3} + dx^{n-4} + \&c. = w$, be any general equation, as before, and r an approximate value of x; then making

$$r^n + ar^{n-1} + br^{n-2} + cr^{n-3} + dr^{n-4} + \&c. = v$$

we shall have

$$1.\ x = r + \frac{(w-v)2r}{(n-1)w + (n+1)r^n + (n-1)ar^{n-1} + (n-3)br^{n-2} + \&c.}$$

Or,

$$2.\ x = r + \frac{(w-v)2r}{(n-1)v + (n+1)r^n + (n-1)ar^{n-1} + (n-3)br^{n-2} + \&c.}$$

The first formula being applicable to the case in which r is greater than unity, and the second to those in which it is less.

These general formulæ resolve themselves into the following particular ones; *viz.*

Equations of the third Degree.

3. $x^3 + ax^2 + bx = w$;

$$x = r + \frac{(w-v)r}{w \text{ or } v + 2r^3 + ar^2}.$$

Equations of the fourth Degree.

4. $x^4 + ax^3 + bx^2 + cx = w$;

$$x = r + \frac{(w-v)2r}{3w \text{ or } 3v + 5r^4 + 3ar^3 + br^2 - cr}.$$

Equations of the fifth Degree.

5. $x^5 + ax^4 + bx^3 + cx^2 + dx = w$;

$$x = r + \frac{(w-v)r}{2w \text{ or } 2v + 3r^5 + 2ar^4 + br^3 - dr}.$$

The latter formulæ, which are by far the most converging, were first published by Mr. Barlow, in No. 12. of Leybourn's Mathematical Repository; with reference to which we propose giving one example by way of illustration.

Example.—Given $x^3 - 2x = 5$.

Assume $r = 2$, then (by formula 1),

$$\begin{array}{rlrl}
r^3 = & 8 & 2r^3 = & 16 \\
-2r = & -4 & w = & 5 \\
\hline
v = & 4 & & 21 \text{ divisor.} \\
w = & 5 & & \\
\hline
w - v = & 1 & & \\
r = & 2 & &
\end{array}$$

whence $\dfrac{1 \times 2}{21} = .094$.

Therefore $x = 2.094$ nearly.

Assume, therefore, $r = 2.094$, then,

$$\begin{array}{rlrl}
r^3 = & 9.181846584 & 2r^3 = & 18.363693168 \\
-2r = & 4.188 & w = & 5 \\
\hline
v = & 4.993846584 & & 23.363693168 \\
w = & 5. & & \\
\hline
w - v = & .006153416 & & \\
r = & 2.094 & & \\
r(w-v) = & .012885253 & &
\end{array}$$

whence $\dfrac{.012885253}{23.3636931} = .0005515$.

Therefore $x = .0945515$ nearly; which is true to the nearest figure in the eighth place, by only two substitutions.

Table of Square Roots and Cube Roots, from 1 to 1200.

Root, *False*. See False.

Root, *Impossible*, is not only the square root of a negative quantity, but any other root denominated by any even number. Thus $\sqrt[4]{-1}$, $\sqrt[6]{-1}$, $\sqrt[8]{-1}$, or in general $\sqrt[2m]{-1}$, $\sqrt[2m]{-x}$, are all *impossible* roots, or quantities. Some call them imaginary roots or quantities. See False *Root*.

Root, *Real*. See False *Root*.

Root, *Residual*. See Residual.

Roots *of Equations*, *Extraction of the*. See Extraction, Reduction *of Equations*, and Root *of an Equation*, supra.

Roots, *Radices*, in *Grammar*, are the primitive words of a language, whence others are compounded or derived.

Thus the Latin *fluo* is the root of *fluctus*, *fluxio*, *flumen*, *fluvialis*, *influxus*, *refluens*, *fluctifer*, *fluctisonus*, *fluctivagus*, &c. Thus also the Greek [illegible] is the root of [illegible], [illegible], [illegible], &c.

And thus also, though in a less proper sense, the Danish *rood* is the root of the English word *root*; the Latin *radix* the root of the French *racine*, as *rado* is the root of *radix*; and perhaps ῥάδιος the root of *rado*.

Roots, in the Hebrew language, consist of those letters that are denominated *radical* (which see), and are generally verbs, consisting commonly of three, sometimes of two, and rarely of four letters. Of whatever letters, whether radical or servile, any word consists, it must, at least, contain one of a radical character. The investigation of the radical and a primitive is an object of importance in grammar. In order to facilitate their investigation in the Hebrew, and other Eastern languages, it is necessary to be well acquainted with the division of the letters into *radical* and *servile* (see each term), because these last must be rejected before the root is obtained.

If the root consist of pure radicals, commonly *three* in number, it is easily found, and as easily divested of the serviles which attend it. But, as the servile letters may also constitute roots, it is sometimes a matter of difficulty to distinguish when these letters ought to be considered in their *radical*, and when in their *servile* capacity. This difficulty is increased in the verbs denominated *imperfect*. For, in some of their parts, either by contraction, or commutation, these verbs lose sometimes one, sometimes two, of their radical letters, which must be restored to their place before the root can be exhibited in its true form.

The learner must therefore endeavour, by frequent practice, to acquire a dexterity in discovering the radical letters, in divesting them of their serviles, and in restoring them where they are lost by the abbreviated flexions. This exercise is the more necessary, as, in almost all lexicons, the words are arranged according to the alphabetical order of the roots. These are commonly printed in a larger character, and have below them their derivatives, as children and descendants. By this plan, neither the signification of any verb, nor of any noun derived from it, can be found, till its root be investigated and determined.

The following directions will be found useful in the investigation of radical words.

The chief things to be attended to are, what letters are commonly servile, either in nouns or verbs; in what part of the word they most generally appear; and what is the most probable conjecture to be formed, in order to restore such radicals as are lost by the abbreviated flexions.

The servile letters in nouns are such as form the feminine gender, and the plural terminations, the prefixes, including the signs of the cases, the heemantic letters, and the possessive pronouns, or affixes.

The servile letters in verbs are the personal prefixes and postfixes, formerly named the *pronominal serviles*, the characteristics of the different forms, and the verbal affixes.

ו and י whether inserted in nouns or verbs, must be rejected in the investigation of the root.

As the serviles generally appear in greatest number at the end of words, the most proper method of discovering the root seems to be this:

Begin from the left hand, remove the serviles as you go along, retain the pure and the supposed radicals, reject the inserted ו and י, restore or commute the radicals lost by abbreviations, and, finally, reject the prefixes.

Directions for finding the Root, and for restoring the deficient Radicals.

I. If, after rejecting the serviles, three pure radicals remain, you may conclude these to be the root.

II. If only two remain, as is the common case in abbreviated roots, prefix to these either נ or י or insert ו betwixt them, or postpone ה or double the second.

The investigation of roots is not peculiar to the Hebrew, but common to all languages, and is of singular advantage, if we would attend to accuracy and propriety of writing.

In such languages as do not admit of the distinction between radical and servile letters, the following may be observed as general rules for reducing words to their first principles. Let that part of the word which remains unvaried be considered as the radical term, and let the changes of termination be disregarded, or cut off. Compound words must be resolved into their component parts, and the prepositions excluded. In those words which seem reducible to Hebrew roots consisting entirely of consonants, the intermediate vowels employed for their enunciation, are not to be considered as essential, or as constituting a part of the root. See Wilson's Elements of Hebrew Grammar. Masclef Gram. Heb. vol. i. c. 21. p. 214, &c. Robertson's Gram. Heb. Appendix, iii.

The Greek and Hebrew tongues are learnt by roots. Of dictionaries, some are in alphabetical order, others are disposed by roots, as Scapula, Faber's Thesaurus, and the first edition of the Dictionary of the French Academy. In the edition of 1718, this last is thrown into the usual alphabetical order.

ROOTS, in *Geography*, a town of Virginia, in the Mattapony; four miles N.E. of West Point.

Roots, a township of Portage county, in the Ohio, containing 216 inhabitants.

ROOTWELT, in *Husbandry*, a term applied to the hattocks of grain, when the butt-ends of the sheaves are turned up towards the wind and sun, in order to dry them. The practice is common in bad rainy harvests. See Harvest, and Harvesting *Grain*.

ROPALON, in *Botany*, a name given by some authors to the *nymphæa*, or water-lily, and also to the *faba Ægyptia* of the river Nile.

ROPE, an assemblage of several twists or strings of hemp, twisted together by means of a wheel; of various uses, as in binding, staying, drawing, suspending, &c.; or, all cordage, in general, above one inch in circumference, mostly made of hemp spun into yarns or threads of a certain length; and a number of these yarns or threads, according to the size of the rope, are twisted together, and called a strand. Three of these strands twisted or laid together, is called a hawser-laid rope, and nine of them a cable-laid rope. See Rope-*Making*.

R O P

When the rope is made very thick, it is called a *cable*; and when very fmall, a *cord*.

Though it be difficult to give a certain account of the forces required to bend ropes of different diameters, in making them go round bodies of different bigneffes, yet to make no allowance for the lofs of motion fuftained thereby, would be as prejudicial to the practice of mechanics, as it would be to overlook the friction of the parts of engines. The difficulty of afcertaining this force arifes from the different materials of which they are made, their different ftiffnefs according as they are more or lefs twifted; and fometimes from the temperature of the air, as to moifture and drynefs.

Dr. Defaguliers has computed the forces required to bend ropes of different diameters, ftretched by different weights, round rollers of different bigneffes. The refult of his experiment is expreffed in the following table.

Diameters of the ropes of three ftrands, expreffed in tenth parts of an inch.	Weights ftretching the ropes, expreffed in lb. avoirdupois.	Refiftance about a roller of half an inch diameter, in oz. avoirdupois.	Refiftance about a roller of one inch in diameter, in oz. avoirdupois.	Refiftance about a roller one and a half inch diameter, in oz. avoirdupois.
	lb.	oz.	oz.	oz.
0.5	60	225	112½	75
0.2	60	90	45	30
0.1	60	45	22½	15
0.5	40	150	75	50
0.2	40	60	30	20
0.1	40	30	15	10
0.5	20	75	37½	25
0.2	20	30	15	10
0.1	20	15	7½	*

On the whole, it has been found by experiments, that the difficulty of bending a rope round a roller decreafes directly as the diameter of the roller increafes, or is, inverfely, as the diameter of the roller. See Defaguliers, Experim. Phil. vol. i. p. 233, &c. See alfo CORDAGE.

A TABLE, fhewing how many fathoms, feet, and inches of a rope of any fize, under fourteen inches, makes a hundred weight, with the ufe of the table.

The greateft confumption of rope is ufed for the purpofes of navigation in rigging of fhips: where, though ropes include the whole cordage, there are feveral particularly denominated, and which have particular names given to them; as follow. 1. Awning-ropes are the ridge and fide-ropes. The ridge-rope reeves through the trucks feized along the middle of the awning; the fide-ropes reeve through the trucks feized along the fide of the awning. By thefe ropes the awnings are fpread between the mafts. 2. Bell-rope, nine or ten feet in length, which fplices round a thimble in the eye of the bell-crank. In the middle of the rope is a diamond-knot, and at the end a double wall-knot crowned. 3. Boat-rope, or painter, that by which the boat is towed at the ftern; it fplices with a thimble to a ring-bolt infide the ftem. 4. Bolt-rope, the rope fewed to the edges of the fails, as the head-rope, foot-rope, and leech-rope. 5. Breaft-rope, that faftened along the laniard of the fhrouds, for fafety, when heaving the lead in the chains. 6. Bucket-rope, that which is faftened to the bucket for hauling up water. 7. Buoy-rope, the one faftened to the buoy and crown of the anchor. 8. Davit-rope, the lafhing which fecures the davit to the fhrouds when out of ufe. 9. Entering-ropes have their upper end thruft through the eye in the iron-ftantions at the gangways, and are walled and crowned; and diamond-knots are made at every nine inches afunder in the whole length. 10. Grapnel-rope, that which is bent to the grapnel, by which the boats ride. 11. Guift-rope, that faftened to an eye-bolt in the fhip's fide, and to the outer end of a boom projecting from the fhip's fide, by guys, to keep the boats clear from rubbing againft the fides. 12. Heel-rope, that which hauls out the bowfprit of cutters, and the jib and ftudding-fail boom. 13. Man-ropes are for the fecurity of the men going out upon the bowfprit. 14. Parral-ropes are to connect the ribs and trucks of the parral together. 15. Paffing-ropes lead round the fhip through the eyes in the quarter waift and forecaftle-ftantions, have one end ftopped through the eye of the gangway-ftantion, with a wall-knot crowned, and are fet forward through an eye-bolt in the knight-head with a laniard, having a thimble turned into the end. 16. Ring-ropes are occafionally made faft to the ring or ftopper-bolts in the deck, and by crofs turns round the cable, to confine it more fecurely in ftormy weather. 17. Slip-rope is to trice the bight of the cable into the heads;

heads; a ſlip-rope is alſo uſed in caſting off a veſſel, till got into the tide's way, &c. 18. Swab-rope is made faſt to the eye of the ſwab, to raiſe it out of the water. 19. Tiller-ropes are the ropes by which the tiller is worked by means of the ſteering-wheel. 20. Top-rope is the rope that is reeved through the ſheave-hole in the heel of the topmaſt, to raiſe it by its tackle to the maſt-head. 21. Yard-ropes are only temporarily uſed to heave the yards on board.

Ropes are diſtinguiſhed by being either *cable-laid* or *hawſer-laid:* the former are compoſed of nine ſtrands, *viz.* three great ſtrands, each of which is compoſed of three ſmaller ſtrands, and each containing an equal number of threads: and a rope, cable-laid, eight inches in circumference, has 333 threads, equally divided, and laid into nine ſtrands: the latter is made with three ſtrands, each of which contains a certain number of rope-yarns, in proportion to the ſize of the rope required. A rope hawſer-laid, eight inches in circumference, has 414 threads, equally divided, and laid into three ſtrands. Thirty fathoms of yarn make eighteen fathoms of rope cable-laid, and ſo in proportion. Thirty fathoms of yarn make twenty fathoms of rope hawſer-laid, and ſo in proportion. Ropes of from one to two and a half inches in circumference are hawſer-laid; of three inches to ten inches, either hawſer-laid or cable-laid; and from ten inches to any greater dimenſion, always cable-laid.

Twice-laid cordage is made of caſt rigging, as ſhrouds, ſtays, mooring and other cables, which, if not much worn, will make good ropes for netting ſhips' ſides, worming and woolding for cables, ſpun-yarn for ſeizing, worming for large ſtays, ſeizing for ſtrops of blocks, ſmall cable-laid ropes for warping ſhips, ratlines, ſcaffolding-ropes for dock yards, &c.

When the yarn of this old ſtuff is overhauled, a little thin tar ſhould be poured on it, which will make it pliable and lie better. The yarn unfit for knotting will pick into oakum for caulking.

To open a cable, for making it into ſmall ropes, hang the ſtrands upon three hooks in the tackle-board, ſtretch it out tight upon the hooks in the ſledge, and heave till they are untwiſted; then draw out the yarn.

The proceſs of making ſmall ropes is ſimilar to making large ones, except the twiſting and cloſing, which are done by a back-frame wheel or a table-wheel. See the next article.

Rope-*Making*, the art of preparing hemp, and ſpinning it into yarns or threads, and twiſting thoſe threads into ſtrands, and laying thoſe ſtrands into cordage of the largeſt ſize, as the ſmalleſt kind is called *cord* or *twine* ſpinning.

Before we proceed further, it may be neceſſary to inform our readers of the different ſorts of hemp proper to be made uſe of in the manufacturing of cordage. Of all the hemps yet produced at our Engliſh markets, the Ruſſian hemp has proved to be the beſt; it is grown in the ſouthernmoſt parts of Ruſſia, and ſhipped for England from the ports of St. Peterſburgh and Riga. The beſt ſort is Riga rhine hemp: the next in quality is termed Peterſburgh clean hemp. Theſe two are conſidered the beſt ſorts of hemp to be uſed in making the ſtrongeſt cordage.

The firſt proceſs in the art of rope-making is, *Hatchelling the Hemp.*

Hatchelling the hemp, is the combing or clearing the ends, which elſe, in ſpinning, would run in with the long hemp, and ſo preparing it ready for the ſpinner; in the proceſs of which, care and particular attention muſt be paid by the hatchellers that they do not uſe too great a quantity of oil, as in ſuch caſe it will prevent the yarn from imbibing its proper proportion of tar, and thereby prove a ſerious injury.

N. B. A ſmall quantity of train-oil, ſay one pint to every hundred weight, ſprinkled or daubed with a wad on the hemp, facilitates the hatcheller's buſineſs exceedingly, and is very neceſſary when the hemp is ſomewhat too dry, as the ſpinners are better able to perform their buſineſs when it has received ſuch aſſiſtance.

The ſecond and principal proceſs to be attended to in the manufacturing of cordage, is *Spinning the Yarn.*

In ſpinning, particular attention muſt be paid by the ſpinner that the yarn be ſpun even, ſolid, and round; to accompliſh which, he muſt ſpin with a ſtrong even grip of the hand, taking care not to make his yarn larger in one place than in another, nor make a practice of ſpinning too much in a hurry; and the ſpinning-wheel muſt be kept turning a conſtant regular pace, otherwiſe the yarn ſo ſpun will loſe its principal ſupport, which is its proper turn, or twiſt, and will be little ſtronger than a parcel of ſtraight hemp laid together, which would break in warping or ſtraining up. The following regulations muſt be attended to in ſpinning. Every ſpinner is to ſpin out of the beſt hemp ſix threads, one hundred and ſixty fathoms long, for a quarter of a day's work; but he is to ſpin out of the hemp which compoſe the bands by which the bales of hemp are bound together, no more than four threads, one hundred and ſixty fathoms long, for one quarter of a day's work. To every twelve ſpinners there are allowed two hatchellers, one wheel-turner, and one wheel-tender: the wheel-tender's buſineſs is to ſplice the threads, and wind them on winches. The latter mentioned perſons are paid in the ſame proportions as the ſpinners, that is, according to what work is done upon the wheel, only with this difference, the ſpinners are paid ſeven-pence *per* quarter for their work, the hatchellers, wheel-turner, and wheel-tender, only ſixpence.

Each thread of the under-mentioned ſizes of yarn to the ſpinning mark, (*viz.* 160 fathoms,) ſhould weigh as follows:

	lbs.	oz.	drs.		lbs.	oz.	drs.
16	4	0	0	21	3	0	4
17	3	12	4	22	2	14	9
18	3	8	14	23	2	12	8
19	3	5	14	24	2	10	10
20	3	3	3	25	2	8	15

The third proceſs to be attended to in the manufacturing of cordage, is *Warping the Yarn.*

Warping the yarn, is the ſtretching the yarns, previouſly to their being tarred, all to one given length, which, in full length rope grounds, is two hundred fathoms, and putting a ſlight turn or twiſt into it. The uſual method is to warp the yarn either in whole or half hawls, which is done by putting the number of threads you mean to draw down at once in a bite, into a block with one ſheave, (the one end of the bite of yarn being faſt at the upper end,) which being drawn down and fixed over the end of a hook made faſt to a poſt at one hundred fathoms diſtance from the warping poſt, forms, when opened, a length of two hundred fathoms, as above-mentioned. The number of half bites, or blocks of yarn, contained in a whole or half hawl, is to be governed, in a great meaſure, by the ſize of the yarn to be warped,—as, for inſtance, 16 to 19-thread yarn is warped three hundred and thirty-ſix threads in a hawl, 20 to 25-thread yarn is warped four hundred threads in a hawl. In winding the yarns on the winches after they are ſpun, it is moſt uſual to wind them on in companies of four in a company; but as that method cannot always be purſued, it frequently happens that whole or half hawls of yarn are obliged to be warped in half bites of an odd number.

The following rules and regulations reſpecting the warping of yarn muſt be particularly attended to.

In a hawl of yarn containing three hundred and thirty-ſix threads, there ſhould be warped as under-mentioned.

½ Bites.	Threads.			
37	3	of	9	threads in a ½ bite.
33	6		10	ditto.
30	6		11	ditto.
28	0		12	ditto.
25	11		13	ditto.
24	0		14	ditto.
22	6		15	ditto.
21	0		16	ditto.
19	13		17	ditto.
18	12		18	ditto.
17	13		19	ditto.
16	16		20	ditto.

In a hawl of yarn containing four hundred threads, there ſhould be warped as under-mentioned.

½ Bites.	Threads.			
44	4	of	9	threads in a ½ bite.
40	0		10	ditto.
36	4		11	ditto.
33	9		12	ditto.
30	11		13	ditto.
28	8		14	ditto.
26	10		15	ditto.
25	0		16	ditto.
23	9		17	ditto.
22	4		18	ditto.
21	1		19	ditto.
20	0		20	ditto.

When the yarn is warped in half hawls, it is to be carefully obſerved that only half the number of yarns, or threads, above-mentioned, are to be warped, and care ſhould be taken to warp the number of threads as near as poſſible.

It requires three men to warp a hawl of yarn, who are employed as follows: *viz.* two men to warp (or draw the yarns to their proper diſtance), and one man to ſet up (that is, to tighten the yarns, and bring each yarn to its proper bearing): each man is allowed twelve threads (or two quarters of a day's work) for his labour.

To take the hawl of yarn up after it is warped, and carry the ſame into the tar-houſe, requires ten men, who are each paid one thread (*viz.* one penny) for their labour.

The fourth proceſs to be attended to in the manufacturing of cordage, is *Tarring the Yarn.*

Tarring the yarn is a proceſs which ſhould be particularly attended to, being extremely careful that the tar is not boiling too faſt nor too ſlow; if too faſt, the tar will not ſtay in the yarn, if not hot enough, the tar will not ſufficiently penetrate the yarn; therefore a ſtrict medium muſt be carefully obſerved by the kettle-heater, as well as to keep the horſe, or men, which turn the capſtan round, going at a gentle, ſteady pace, thereby giving the yarn a proper time to imbibe its neceſſary proportion of tar, but at the ſame time not ſuffering it to be kept in the boiling tar too long, which is apt to make the yarn very tender, therefore ſhould be very carefully avoided; and ſhould the capſtan be ſtopped by accident, the ſtop that keeps the yarn down muſt be inſtantly raiſed, and the yarn taken out. Particular attention ſhould alſo be paid in paying (or coiling) the yarn into the kettle, that too long a length be not payed in at once; if it is ſo done, the yarn will, of courſe, touch the bottom of the kettle, which it ſhould, by no means, be ſuffered to do, as in ſuch caſe it will imbibe the dregs and ſettlements of the tar appertaining to the bottom of the kettle, and make the yarn in ſuch places black, or very much diſcoloured, and have a very unpleaſing appearance in the rope when made. Yarn for cables requires more tar than for hawſer-laid ropes. For ſtanding and running rigging the leſs tar the better, provided the thread is well covered. It ſhould be always remembered that the yarn, when tarred, ſhould be overſet (or removed) the ſame day, as this piece of buſineſs, being omitted, will be likely to prove of a ſerious conſequence in heating and tendering the yarn, which at all times muſt be carefully avoided. In overſetting the yarn it ſhould always be remembered that the yarn be well ſhook and opened for two or three days, as in ſo doing it admits the air, ſeparates and hardens the yarns, and contributes very much to the ſtrength of the cordage. The hawls or half hawls of yarn, when tarred, ſhould always be weighed and tallied.

Tarring yarn requires three men, who are employed as follows: *viz.* one to heat the kettle, one to pay (or coil) the yarn in the kettle, and one to haul off and overſet the yarn. They are, in general, paid in proportion to the work the ſpinners perform, which is called going by the wheel.

The fifth and laſt proceſs to be attended to, is *Laying the Cordage.*

In laying cables, and all ſorts of ropes in general, the great art lies in making each yarn to bear alike. For this purpoſe it was, particularly in the larger ſized cables, that the patent machines have been introduced. Particular attention muſt be paid to this point, as therein conſiſts the grand principle of making a ſtrong rope. For all ſorts of ropes which are to be immerged in the water, the utmoſt care muſt be taken to give the ſtrands their proper hardneſs in their firſt proceſs, according to the remarks laid down before, which will prevent the water from penetrating the ſtrands, and thereby preſerve the inſide yarns of the cable; as, if this proceſs is not regularly attended to, the inſide yarns will be always wet, and very ſoon decay. It frequently happens that when the yarn is tarred ſomewhat too deep, that many a cable is ſpoiled, though not intentionally; the fear in the perſon who has the direction in making the cable, of turning a very dark coloured rope out of hand, prevents the regular make being given the cordage, as in preſſing the yarn to their proper hardneſs, the tar will ſpring out, very much diſcolour the rope, and thereby give it a very unpleaſing appearance, eſpecially when the ſun is ſhining very hot upon the yarn; to prevent which, in a great meaſure, care ſhould be taken, in the ſummer months, to lay cables, and all ſorts of cordage in general, either early in the morning, before the ſun has much power on the yarn, which is alſo apt to tender it, or late in the evening, after the ſun has ſet, or gone off the ground, or in heavy weather (by no means rainy); in which caſe your cordage will have a bright pleaſing appearance, as the ſmall fibres of the hemp will all yield to the top, and lay ſmooth, which otherwiſe would look rough, and appear as if the cordage was made of inferior hemp, though in fact it was not ſo, as all ſorts of hemp have ſmall fibres appertaining to them, and which it is paſt the art of man to prevent the ſun from drawing up, and thereby making the rope look rough and unſeemly.

N. B. The above remarks reſpecting taking advantage of the time for laying the cordage are only to be obſerved in uncovered grounds.

In

In *laying cordage*, the yarn for twiſting into ſtrands is hung on the hooks in the tackle-board, at the upper end of the ground, and upon hooks in the breaſt-board of the ſledge, at the lower end, which are turned by men at both ends until the ſtrands are hard; and are kept up from the ground by the ſtake-heads.

Before the turn is put in, the yarn ſhould be ſtretched to its full extent by means of the tackle fixed from the ſledge to the capſtern, at twenty yards aſunder, at the lower end of the ground; and when ſtretched to two hundred fathoms, the preſs is put upon the ſledge and drag, before the tackle-fall is caſt off; for if the yarn be not properly ſtretched before the tackle-fall is caſt off, the rope will not be of its ſize, nor well made.

The ſtrands ſhould have a good hardening before the top is put in to lay the rope, and the layer ſhould ſee that the heavers at the upper end keep the ſame hardneſs that the ſtrands had before the top ſet off, nor ſhould he begin to lay the rope until the ſledge or wheel is moved by the power of the twiſt from the upper end.

When twiſted ſufficiently hard, the ſtrands are hung on one hook in the breaſt-board of the ſledge, but remain ſeparate on the three hooks at the other end. The top is placed in at the ſledge, and the rope twiſted by turning the hooks at both ends one way, and, as the rope cloſes, the top moves towards the upper end.

When the top is put in, ſome of the weight ſhould be taken off the ſledge or drag, for if laid with as much weight as is uſed in the hardening, it would be too ſtiff, but, by removing a part of the weight, the ſtrands will couch better.

The ſtrength of the men at the hooks being greatly inadequate to the force required for twiſting of cables, woolders are uſed, according to the ſize of the cable, at equal diſtances along the whole length.

Cables ſhould be rounded by the lower hook after they are laid, to throw the turn well up. They are generally thought to wear beſt when ſlack-laid; but ſome think when ſhort-laid.

Cablets uſed for tow-lines or hawſers, require the ſtrands to be laid ſhorter than cable-ſtrands, but not ſo ſhort-laid in cloſing; for being uſed in water, they would become ſtiff, hard, unhandy to coil away, and liable to break in cold weather.

In all cable-laid ropes, the proportion of the circumference is to the length of the ſtrand in one round, as 11 is to 15; that is, if the circumference be $14\frac{1}{3}$ inches, the length of the ſtrand in one circumference is $19\frac{7}{8}$ inches. In all hawſer-laid rope, the proportion is as 12 to 16; that is, if the circumference be 7 inches, the length of the ſtrand in one circumference is near $9\frac{3}{8}$.

The ſtrength of ropes depends on the hardening or well manufacturing, and not on the bare ſtrength of the hemp; for it ſtrengthens through every ſtage; *viz.* when firſt ſpun into yarn it is little better than hemp extended; when twiſted into ſtrands, it ſhortens and ſtrengthens as above, and increaſes in the ſame manner when laid into rope.

Where the diameter and circumference of one rope to another is as two to one, that is, where one rope is twice as big as another, the ſquare of the diameter is as four to one; which ſhews, that one rope has four times as much yarn in it as the other, and conſequently is four times as ſtrong, according to the different magnitudes.

Cable-laid ropes ſhorten as five to three, and hawſer-laid ropes as three to two; conſequently the length of the yarn and ſtrength will be accordingly; that is, the ſtrength will be in the yarn, after it is laid in the rope, as much as if the rope-maker, in ſpinning, had allowed the ſame quantity of hemp in two feet as he did in three feet, ſo that the ſtrength communicated by the proceſs is two-thirds.

A rope is the ſame ſize when laid as the yarns were before twiſted; ſo that what the yarns are leſſened by twiſting it is made up by ſhortening; from which it is inferred, that the yarns are always of an equal bigneſs, ſince the hemp is the ſame at one time as at another, and not any way diminiſhed.

Were the ſtrands ſingle, without being twiſted one about another, the ſtrength would then be only in proportion as the area of each particular ſtrand is in itſelf; but if the ſtrands could poſſibly be twiſted ſo as to be directly perpendicular to the baſe, the ſtrength would then be found, by multiplying the diameter of the ſtrands and the diameter of the whole rope one into the other, and the half of the product would be the ſtrength of the ſaid ſtrands; but more particularly take the area of the ſingle ſtrand and area of the whole cable, and add them together, and the half of that will ſhew the ſtrength of each ſtrand when they are well twiſted together.

But as it may be obſerved the ſtrands lie at a certain angle between a perpendicular and the baſe, ſo that, as the angle of incidence is to radius, ſo is the relative to the abſolute ſtrength.

Reſpecting the *Banding of Cordage.*—In the calculations ſpecifying the weights of the different lengths of cordage, ſuch weights are to be conſidered as the neat weights of the rope without bandage.

N. B. To every hundred weight of cordage the manufacturer is allowed to put on four pounds weight of bands; thoſe bands are compoſed of the ſhakings, flyings, and ſtrings with which the hemp is tied together, formed into an inferior kind of cordage; but it is to be obſerved thoſe are all weighed to the rope-makers as good hemp, and paid for accordingly, therefore if he was not allowed to apply the refuſe to ſuch purpoſe, he muſt either put a higher price on his cordage, or be a very conſiderable loſer. At the ſame time it ſhould be conſidered, that as it is neceſſary that every coil of rope ſhould be bound together for the convenience of carriage, ſtowage, &c. this kind of bandage anſwers ſuch purpoſe in every degree, as well as if the coils were bound with bands made from the beſt hemp.

Table I.

These sizes of Yarn are warped 336 Threads, and from 19 are warped 400 Threads in a Hawl.

	16	17	18	19	20	21	22	23	24	25

N. B. The calculations of B and C will be found extremely useful, provided the yarn be spun and tarred regular, as by weighing one single yarn, or even ten fathoms, the size of the yarn may be ascertained, without being at the trouble of weighing the hawls.

Table II.

Shewing the Number of Threads to work *per* Hook for three-strand cable-laid Cordage of 6, 12, 18, and 24 Inches in Circumference, of the undermentioned Sizes of Yarn, with the Girt of each Strand, and Weight of each Cable: also the Number of Men required to lay both Strands and Cable, with the Allowance to each Man for his Labour.

The N° of Threads here mentioned weigh 99 lb. to 100 lb.		Sizes of Yarn										Weight of each Cable 120 Fathoms long.	Men for Strands.	Threads *per* Strand.	Men for Cables.	Threads *per* Cable.

* Six threads are called a quarter of a day's work, for which each workman is paid 7*d.*, and so on in proportion for a greater or less number.

Remarks and Directions how to apply Tables I. and II.

Example.—Suppose a cable of 12 inches in circumference is wanted to be made, the hawls of yarn out of which, upon examining the weights, are found to weigh 16 cwt. 2 qr. 10 lb. *per* hawl of 336 threads. A reference is to be made to Table I. line E, and the weight, being between 16 cwt. 2 qr. 0 lb. and 16 cwt. 2 qr. 18 lb. will be found to answer to 18-thread yarn. Then look down the 18-thread column, Table II., and upon the line of 12, (the size in the margin,) is found 80 threads *per* hook, which is the number of threads to be laid up *per* hook for the cable to be made of the weight *per* hawl of yarn of 336 threads above specified.

Again, if the hawls of yarn should be tarred of such a weight (say for example) requires to be worked between a 17 and an 18-thread yarn, in such case take the number of threads *per* hook to be worked for the size of the cable demanded, as should be worked both for 17 and 18-thread yarn; add them together, and take half the number of threads so added, to work *per* hook for the cable; but if there should happen in dividing to be an odd thread remaining, you must observe to which side the weight of your hawl of yarn is most inclining, and throw the thread in dispute to the heaviest side. The same rules must be observed in consulting all the following tables.

Remarks.—In laying three-strand cable-laid cordage, if you are in doubt respecting the size of your yarn, you must girt the yarn you purpose laying in one strand, and that should be half the size of your cable.

In hardening the strands in the laying of cable-laid cordage,

cordage, you muſt work with (in addition to your ſledge) one preſs-barrel to every 20 threads contained in your ſtrand; but in laying the ſtrand, hardening, and laying the cable, you muſt have only one preſs-barrel to every 40 threads contained in your ſtrand or cable. The above is to be conſidered as a ſtanding rule in covered rope-grounds, but in open grounds, the preſs muſt be varied according to the ſtate of the bottom of the ground, which, after a ſhower of rain, or in damp weather, will be naturally ſoft, and occaſion the ſledge to draw exceedingly heavy, and of courſe want the leſs weight of preſs.

N. B. The weight of a preſs-barrel ſhould be from $3\frac{1}{2}$ to 4 cwt.

Table III.

Shewing the different ſhrinking Proportions of the Yarns and Strands in each Proceſs in making the undermentioned Lengths of Cable.

	Length in fathoms of cable.	Length of yarns required to be warped.	In hardening the ſtrands, the yarn will ſhrink 1-5th part of the whole length warped, and is called the ſtrand's hardening mark.	In laying the ſtrands, the ſtrand will ſhrink 1-10th part of the whole length warped, and is called the ſtrand's going diſtance.	In hardening the cable-ſtrands previous to laying the cable, the ſtrands will ſhrink 1-30th part of the whole length warped, and is called the cable's hardening mark.	In laying the cable it will ſhrink 1-15th part of the whole length warped, which brings it to the length required.
The Sledge ſhould move up to the following Diſtances from the Tackle-Poſts.						
	fms.	fms. ft.	fms. ft.	fms. ft.	fms. ft. in.	fms.

It is neceſſary to be underſtood, that in rope-making (according to the nature of the rope), weight will give ſize, and ſize will give weight, if properly made.

Rule.—To calculate very nearly the weight of any ſized rope from 3 to 24 inches in circumference, 120 fathoms long, and leſſer lengths in proportion; as may be readily proved by the above table, *viz.* multiply the ſize of the rope by itſelf, and one-fourth of that product is the weight of a hundred of 112 pounds.

Example.—Suppoſe the rope 12 inches in circumference; 12 × 12 :: 144, the fourth of which is 36 hundred weight, or 3732 pounds, the weight of 120 fathoms of rope 12 inches in circumference. Again, 40 fathoms is the third of 120 fathoms; and the third of 36 cwt. is 12 cwt. the weight of 40 fathoms of 12-inch cable, as above.

Directions how to apply the following Tables.

In which is conſidered the four moſt principal ſorts of yarns made uſe of in cable-laid cordage, *viz.* 16, 18, 20, and 25-thread yarn, and in hawſer-laid cordage, to the three principal ſorts of yarn made uſe of, *viz.* 18, 20, and 25-thread yarn, as it is very ſeldom any other ſize yarn is made for either cable or hawſer-laid rope, except very particularly ordered to the contrary. The particulars of every rope of the ſizes mentioned in the tables are fully explained to the length of twenty fathoms, which will be found quite a ſufficient guide for a rope of any length required:

As for Example.—Suppoſe I want a taper cable-laid rope to be made out of 16-thread yarn, 60 fathoms long, and 6 inches in circumference, to be tapered ⅔ds the length, and ⅔ds the ſize of the rope. I refer to Table V., and find under the figure 6, (the ſize demanded,) that it muſt be worked 5 threads *per* hook in the ſhank, the length of yarn to be warped for which, for 20 fathoms (I find in the margin) requires to be 33 fathoms 2 feet, three times which is 100 fathoms, the length of yarn required to be warped for the ſhank of a rope of 60 fathoms long. I then obſerve, in the next column on the right in the margin, the length of yarn required in the head for 20 fathoms is 11 fathoms 0 feet 8 inches, three times which is 33 fathoms 2 feet, the length of yarn required in the head to the firſt taper for a rope of 60 fathoms. Next refer to the number of tapers to be worked, which, upon looking under the figure 6, (the ſize demanded,) I find to be 9, the diſtance between them I find (upon caſting my eye down the column) to be 14 feet $7\frac{7}{9}$ inches for 20 fathoms, three times which is 44 feet $5\frac{1}{3}$ inches, the diſtance to be obſerved between the tapers for a rope of 60 fathoms, being the length demanded. The ſame rule is be obſerved, either adding or multiplying, according as required in all the tables of a ſimilar deſcription.

Table

TABLE V.

Shewing the Number of Threads to work *per* Hook, both in the Shank and Tapers, in making three-ftrand taper cable-laid Cordage of the following Sizes, and the Lengths thereto prefixed, with the Lengths of Yarn required to be warped for the fame, and the Diftance to be obferved between the Tapers; for 16, 18, 20, and 25-thread Yarn.

To Taper two-thirds the Length, and two-thirds the Size of the Rope

Table VI.

Shewing the Number of Threads to work *per* Hook and Heart for cable-laid Stays, four Strands and a Heart, of 5, 10, 15, and 19 Inches in Circumference, of the undermentioned Sizes of Yarn, with the Girt of each Strand prefixed againſt each Size.

Number of Threads aſunder to weigh from 99 to 100lb.		16	17	18	19	20	21	22	23	24	25
Size in Inches.	Girt of each Strand.	Threads *per* Hook and Heart.									
5	2 $\frac{8}{9}$	9	9	10	11	11	12	12	13	13	14
10	$4\frac{1}{4}$ $\frac{7}{9}$	35	37	39	41	43	46	48	50	52	55
15	$6\frac{1}{2}$ $\frac{6}{9}$	79	84	89	94	99	104	109	114	119	124
19	$8\frac{1}{4}$ $\frac{7}{9}$	127	135	143	151	159	167	175	183	191	199

The ſhrinking proportions of cable-laid ſtays are exactly the ſame as in three-ſtrand cable-laid cordage, except in the cloſing the ſtay, which being compoſed of four ſtrands, lie much cloſer in the rope than three ſtrands, and having the heart of the ſtay to encompaſs, occaſions the ſtrands to ſhorten in a much greater proportion than in three-ſtrand cable-laid cordage. The ſtay, in cloſing, will ſhorten $\frac{2}{11}$ parts of the length of yarn firſt warped.

Table IX.

Shewing the Length of Yarn required to be warped, and the different ſhrinking Proportions in making the undermentioned Lengths of four-ſtrand cable-laid Cordage.

Fathoms demanded.	Lengths of Yarn warped.	Strand's Hardening Mark.	Strand's Going Diſtance.	Cable's Hardening Mark.	Cable's Length.
	fms. ft. in.	fms. ft. in.	fms. ft. in.	fms. ft. in.	
10	17 0 6	13 4 0	11 5 9	11 2 4	10
20	34 1 0	27 2 0	23 5 6	22 4 8	20
40	68 2 0	54 4 0	47 5 0	45 3 4	40
60	102 3 0	82 0 0	71 4 6	68 2 0	60
80	136 4 0	109 2 0	95 4 0	91 0 8	80
120	205 0 0	164 0 0	143 3 0	136 4 0	120

N.B. The ſhrinking proportions of four-ſtrand cable-laid cordage is exactly the ſame as three-ſtrand, except in cloſing the cable, which conſiſting of four ſtrands, lie much cloſer in the rope than three ſtrands, but not having a heart to encompaſs it, does not diminiſh in length ſo much as cable-laid ſtays. The cable in cloſing will ſhorten $\frac{10}{121}$ parts of the length of yarn firſt warped.

It being rather unuſual to lay cables with a greater number of ſtrands than four, the above tables are not laid down for a greater proportion,—but to know how to find the number of threads to work *per* hook for a greater number may at ſome time be neceſſary, therefore the following method muſt be purſued to lay a cable in as many ſtrands as may be thought expedient. Suppoſe a five-ſtrand cable-laid rope is wanted to be made, you firſt ſquare the ſize of the rope propoſed to be made, and multiply that product by the ſize yarn you mean to make your cable from, that product divide by 52, and the quotient will be the number of threads to work *per* hook for a five-ſtrand cable-laid rope. If for a ſix-ſtrand, proceed as before, and divide by 62; for a ſeven-ſtrand, divide by 72; for an eight-ſtrand, divide by 82; and ſo on, adding 10 to your diviſor for every ſtrand you mean to increaſe in number in your cable.

Table X.

Shewing the Prime Coſt to the Manufacturer in each Proceſs, in making the undermentioned Sizes of three-ſtrand cable-laid Cordage, with the Weight of Hemp and Tar required for each Rope.

Size.	Hatchelling, Wheel-turning, and Tending.	Expence at 5*d.* per Quarter	Spinning.	Expence at 7*d.* per Quarter.	Warping, Taking-up, and Tarring, at 9*s.* per Hawl.	Laying at 7*d.* *per* Quarter.	Total Expence of Manufacturing into Cordage.	Weight of Hemp required for each Rope.	Weight of Tar required for each Rope.
In.	qr. thds.	*L.* *s.* *d.*	qr. thds.	*L.* *s.* *d.*	*L.* *s.* *d.*	*L.* *s.* *d.*	*L.* *s.* *d.*	C. qr. lb.	C. qr. lb.
5	7 3	0 3 9	22 3	0 13 1	0 2 10½	0 15 5	1 15 1½	5 0 0	1 1 0
10	31 1½	0 15 7½	93 4½	2 14 7½	0 12 1	2 6 1	6 8 5	20 0 0	5 0 0
15	70 3¾	1 15 3¾	211 5¼	6 3 6¼	1 7 3	5 17 10	15 3 11	45 0 0	11 1 0
20	125 0	3 2 6	375 0	10 18 9	2 8 2	11 18 3	28 7 5	80 0 0	20 0 0
24	180 0	4 10 0	540 0	15 15 0	3 9 5	15 11 6	39 5 11	115 0 23	28 3 5

The above table is calculated according to the uſual mode of rope-making, and is termed by the trade working by the ſquare, which is performed in the following manner: Suppoſe a cable 15 inches in circumference, the ſquare of 15 is 225, the half of which is 112½; that is, 113 threads *per* hook muſt be laid up for a 15-inch cable, proceeding in the ſame manner for any ſize demanded, which mode of working anſwers to ſixteen-thread yarn in all ſizes of three-ſtrand cable-laid cordage.

Where the diameter and circumference of one rope to another is as 2 to 1, that is, where one rope is twice as big as another, the ſquare of the diameter is as 4 to 1, which ſhews that one rope has four times as much yarn in it as the other, and conſequently is four times as ſtrong, according to the different magnitudes.

Table XI.

Shewing the Number of Threads *per* Hook to work for three-ftrand hawfer-laid Cordage, of 3, 6, 9, and 12 Inches in Circumference, of the Sizes of Yarn undermentioned, with the Weight of each Rope, and the Number of Men required to lay the fame, with the Allowance to each Man for his Labour.

N° of Threads 99 to 100lb. Weight.	16	17	18	19	20	21	22	23	24	25	Weight of each Rope 133.2 long.	Men for Rope.	Threads *per* Rope.
Size in Inches.	Threads *per* Hook.										C. qr. lb.		
3	16	17	18	19	20	21	22	23	24	25	2 2 17	8 0	6
6	64	68	72	76	80	84	88	92	96	100	10 2 12	22 0	12
9	144	153	162	171	180	189	198	207	216	225	23 1 13	37 0	15
12	256	272	288	304	320	336	352	368	384	400	42 1 20	45 0	15

Remarks.—In hardening the ftrands, and in laying hawfer-laid cordage, it muft be worked with (in addition to the weight of the fledge) one prefs-barrel for every twenty threads contained in the rope. This is to be confidered as a ftanding rule in covered rope-grounds, but in open grounds the prefs muft be varied according to the ftate of the ground, as mentioned in cable-laid cordage.

In laying three-ftrand hawfer-laid cordage, if there is any doubt refpecting the fize of the yarn, you muft girt the yarn you propofe laying in two of your readys (or ftrands), and that fhould be juft the fize of the rope.

Table XII.

Shewing the Length of Yarn required to be warped, and the different fhrinking Proportions of the Yarn in each Procefs, in making the undermentioned Lengths of hawfer-laid Rope, and alfo the Weight.

	Fathoms of Rope in Length.	Length of Yarn to be warped.	The Sledge fhould move to the following Marks from the Tackle-Pofts. Rope's Hardening Mark.	Rope's Length.	¾-Inch. Weight.	1½-Inch. Weight.	2-Inch. Weight.	4-Inch. Weight.	6-Inch. Weight.	8-Inch. Weight.	10-Inch. Weight.	12-Inch. Weight.

	20 0	30	24	20 0	0 4 15	0 9 4	0 0 19 12½	0 2 23 3	1 2 10 3	2 3 8 12½	4 1 19 0	6 1 12 12
	40 0	60	48	40 0	0 9 14	0 19 12	0 1 11 9	1 1 18 6	3 0 20 6	5 2 17 9	8 3 10 0	12 2 25 8
Half Coil	66 4	100	80	66 4	0 16 8	1 5 0	0 2 10 0	2 1 12 0	5 1 6 0	9 1 20 0	14 2 26 0	21 0 24 0
	80 0	120	96	80 0	0 19 12	1 11 8	0 2 23 2	2 3 8 12	6 1 12 12	11 1 7 2	17 2 20 0	25 1 23 0
	100 0	150	120	100 0	0 24 11	1 21 6	0 3 14 14½	3 2 3 15	7 3 22 15	14 0 15 14½	22 0 11 0	31 3 7 12
	120 0	180	144	120 0	1 1 10	2 3 4	1 0 6 11	4 0 26 2	9 2 5 2	16 3 24 11	26 2 2 0	38 0 20 8
Whole Coil	133 2	200	160	133 2	1 5 0	2 10 0	1 0 20 0	4 2 24 0	10 2 12 0	18 3 12 0	29 1 24 0	42 1 20 0

Remarks.—In hardening the ftrands the yarn will fhrink one-fifth of the whole length, which is called the rope's hardening mark.

In laying the rope the ftrands will fhrink one-fixth of the remaining diftance, which brings the rope to the length required.

TABLE

Table XIII.

Shewing the exact Coft to the Manufacturer in each different Procefs as undermentioned, in making the following Sizes of three-ftrand hawfer-laid Cordage, with the proper Proportions of Hemp and Tar neceffary for each Rope.

Size in Inches.	Hatcheling, Wheel turning, and Tending.		Expence at 6*d.* per Quarter.			Spinning.		Expence at 7*d.* per Quarter.			Warping, Taking-up, and Tarring Expence at 9*s.* per Hawl.			Laying Expence at 7*d.* per Quarter.			Total Expence of manufacturing into Cordage.			Weight of Hemp required for each Rope.			Weight of Tar required for each Rope.

12	60	0	1	10	0	180	0	5	5	0	1	3	2	3	5	7	11	3	9	33	3	22	8	1	26

The foregoing table is grounded (as termed by the trade) upon the principle of the fquare, but the method of working upon this principle differs between cable and hawfer-laid cordage. The mode purfued for making hawfer-laid cordage is as follows: Suppofe it is wanted to make a three-ftrand hawfer-laid rope, fix inches in circumference; the fquare of 6 is 36, and twice 36 is 72, which is the number of threads to work *per* hook for a fix-inch three-ftrand hawfer-laid rope. The fame method muft be purfued, according to this way of working, for any other fize, and anfwers to eighteen-thread yarn in all three-ftrand hawfer-laid cordage. See Table XI.

Table XIV.

Shewing the Weight of Yarn (of the four moft general Sorts madeufe of) capable of being fpun by each of the following Number of Spinners, at eight Quarters, (or 48 Threads) *per* day, in 1 Day, 1 Week of 6 Days, 1 Month of 24 Days, and 1 Year of 13 Months; with the Yield of Cordage at the Year's End prefixed againft each Number of Spinner's Work.

Suppofe you want to make a rope either cable or hawfer-laid, to be tapered one-third the length, and one-third the fize; you muft refer to Table V. or XIV. for making taper-cable, or hawfer-laid cordage, two-thirds the length and two-thirds the fize, which you muft work almoft wholly the reverfe way, by working the number of threads there mentioned to be worked in the tapers in the fhank, and the number of threads in the fhank muft be worked in the tapers: the length of yarn there mentioned to be tapered muft be the length in the head to the firft taper, and the length there mentioned in the head muft be the length of the yarn to be tapered: the length of yarn requefted to be warped for the fhank will be the fame as there mentioned, and the diftance between the tapers will, in almoft all cafes, be the fame as there nominated; but if at any time there fhould be a difference, and you are at a lofs to find the diftance between the tapers you muft divide the length of yarn to be tapered by the number of threads you have to taper, and that will give the exact diftance between them.

Table XVI.

Shewing the Number of Threads to work *per* Hook for four-ftrand hawfer-laid Cordage, from 2 to 12 Inches in Circumference, of the Sizes of Yarn as undermentioned: the Ropes to be laid without Hearts, the Yarns comprifing which being equally divided in the Strands.

No. of Threads here mentioned to weigh 99 to 100lb.	16	17	18	19	20	21	22	23	24	25

Table XVII.

Shewing the Length of Yarn requefted to be warped for the undermentioned Lengths of four-ftrand hawfer-laid Cordage, with the Hardening Mark prefixed againft each refpective Length.

Fathoms demanded.	Length of Yarn required.			Hardening Mark.		
	fms.	ft.	in.	fms.	ft.	in.
10	15	2	6	12	2	0
20	30	5	0	24	4	0
40	61	4	0	49	2	0
60	92	3	0	74	0	0
80	123	2	0	98	4	0
100	154	1	0	123	2	0
120	185	0	0	148	0	0
130	200	2	6	160	2	0

Remarks.—It is very feldom that hawfer-laid cordage is compofed of more than four ftrands, but for the fake of experiment, or otherwife, it might be demanded to contain a greater number: as fuch, the following rule, carefully attended to, will inform our readers how to lay a hawfer-laid rope in as many ftrands as may be confidered expedient.

Suppofe you want a five-ftrand hawfer-laid rope, you muft fquare the fize of the rope propofed to be made; that product multiply by the fize yarn you propofe making your rope from; the product of which, divided by 15, will give the number of threads to work *per* hook for a five-ftrand hawfer-laid rope. If you want to make a fix-ftrand hawfer-laid-rope, you muft proceed as above, and divide by 18; if a feven-ftrand, divide by 21; if an eight-ftrand, by 24; and fo on, adding 3 to your divifor for every ftrand you mean to increafe in the rope.

The fhrinking proportion in making four-ftrand hawfer-laid cordage, in the firft procefs, is exactly the fame as in three-ftrand; the only difference is in clofing the rope, which, being compofed of four ftrands, occafions the rope to lay more round and clofe than in three-ftrand cordage, which makes the fhrinkage be in a much greater proportion. The rope, in clofing, will fhorten $\frac{3}{10}$th parts of the remaining length of yarn, after the rope is hard, inftead of $\frac{1}{6}$th, as in three-ftrand hawfer-laid cordage.

The weight of each coil of four-ftrand hawfer-laid cordage may be nearly afcertained, by referring to the table of the weight of three-ftrand (Table XII.), there being as near the number of threads in each fize rope as can poffibly be laid, for each ftrand to have an equal number. But it fhould be remembered, that a coil of four-ftrand hawfer-laid rope, made out of 200 fathoms of yarn, will be only 130 fathoms long, inftead of 133.2, as in three-ftrand hawfer-laid cordage.

Table XVIII.

Shewing the ſhrinking Proportions of the Yarn, in making the undermentioned Lengths of Bolt-Rope; alſo its Weight (untarred), from 1 to 8 Inches in Circumference.

Remarks.—In hardening the ſtrands, the yarn will ſhrink one-ſixth part of the whole length, which is called the rope's hardening mark.

In laying the rope, the ſtrands will ſhrink one-ſeventh part of the remaining diſtance, which brings the rope to the length required.

N. B. Bolt-rope is uſually made of 20 or 25-thread yarn, and generally delivered from the rope-maker white; the proceſs of tarring it being uſually performed by the ſail-maker, and is called ſtoving it, it being done in a ſtove or oven calculated for the purpoſe. In laying up your work, you muſt work with the ſame number of threads as in common hawſer-laid cordage. Bolt-rope, for exportation, is ſometimes lightly tarred; in which caſe, in calculating the weight, you muſt add one-ſixth to the weights hereunto annexed.

Table XIX.

Shewing the Number of Threads to work *per* Hook for three-ſtrand hawſer-laid white Cordage, from 1 to 12 Inches in Circumference, of the undermentioned Sizes of Yarn, with the Weight of each Rope prefixed.

No. of Threads here mentioned to weigh 88 lbs.	16	17	18	19	20	21	22	23	24	25	Weight of each Rope 133.2 Fathoms long.

N. B. The weight of the above ropes may be found by conſulting Table XVII. for three-ſtrand hawſer-laid white cordage; the number of threads in each rope of a ſize being of an equal number, as near as poſſible.

Cordage made by Contract for the Uſe of His Majeſty's Navy.—The under-mentioned ſhews the number of threads to work *per* hook; the loweſt weight, allowance in weight, bandage, and higheſt weight; the cordage is to be received and allowed for by the receiving officers of his majeſty's reſpective dock-yards, under the honourable commiſſioners of his majeſty's navy, to rope-makers who have made cordage (upon the uſual principle) by contract, in coils, hawſers, cablets, and cables, with the length of yarn to be warped for the ſame, and length of cordage when made, as ordered by the honourable navy-board.

N. B. The higheſt weight a hawl of yarn for each ſort of cordage ſhould weigh (and by no means more,) is here noted.

16½	157	57 1 16	1 1 20	58 3 8

It is to be obſerved, that the above ſizes in Tab. XX., *viz.* 2 to 9½ inches, are termed, in the navy contracts, cablets, the yarn for which ſhould be warped 200 fathoms long, and the cablets, when complete, to be 120 fathoms. A hawl of yarn containing 336 threads, ſhould weigh from 16 cwt. 0 qr. 8 lb. to 16 cwt. 1 qr. 25 lb., and no more, allowing one-ſixth part of ſuch weight for tar, which is the allowance made by the honourable navy-board, and no more.

Cablets from 4 to 9½ inches will not be rejected, if they are half an inch in girt above the dimenſions ordered.

The yarn for the above cables (Tab. XXII.) are warped 166 fms. 4 ft. long, and the cables, when complete, to be 100 fathoms long. A hawl of yarn containing 336 threads, 166 fms. 4 ft. long, ſhould weigh from 13 cwt. 2 qr. 6 lb. to 13 cwt. 3 qr. 16lb., and no more, tarred with the ſame proportion of tar as the yarn for the cablets before-mentioned.

Cables

Cables 10 inches and upwards, are allowed three-fourths of an inch in girt more than the dimenfions given.

In proportions of cordage wherein the cables contained in them do not exceed $13\frac{1}{2}$ inches in circumference, a proportion of $1\frac{1}{2}$ cwt. of fpun-yarn is allowed to be fent to every ton of cordage; but if the cables are 14 inches in circumference and upwards, then 3 cwt. for every ton is allowed, in order to work up the toppings (or hemp) which fhould be taken out of the hemp agreeable to contract, previous to its being fpun into cable-yarn (in particular), as it frequently happens that the great number of lives of fome of his majefty's moft valuable fubjects are at ftake upon the dependance of a fingle cable.

The cables made in the ufual mode, by contract, have of late never exceeded $16\frac{1}{2}$ inches in circumference, (Tab. XXII. extends no further): for all the higher fizes are made by patent machines, by which much manual labour is fpared, and the yarns and ftrands laid much clofer and more even, and bear the ftrain more equally.

Size.	Threads *per* Hook.	Loweft Weight.			Allowance in Weight.			Bandage.			Higheft Weight.

$2\frac{1}{2}$	14	2	0	5	0	0	6	0	0	6	2	0	17
3	20	2	3	20	0	0	8	0	0	9	3	0	9
$3\frac{1}{2}$	26	3	3	7	0	0	11	0	0	11	4	0	1
4	35	5	0	14	0	0	14	0	0	16	5	1	16
$4\frac{1}{2}$	44	6	1	22	0	0	18	0	0	20	6	3	4
5	54	7	3	19	0	0	22	0	0	24	8	1	9
$5\frac{1}{2}$	65	9	2	2	0	0	27	0	1	1	10	0	2
6	77	11	1	3	0	1	4	0	1	7	11	3	14
$6\frac{1}{2}$	91	13	1	11	0	1	9	0	1	13	14	0	5

The fizes of cordage hereunto annexed, from $\frac{3}{4}$ to $3\frac{1}{2}$ inches in circumference, are termed, in the navy, contract coils; all above, *viz.* 4 to $6\frac{1}{2}$ inch, are called hawfers. The yarn for both coils and hawfers fhould be warped 195 fathoms long, and the ropes, when completed, are to be 130 fathoms long. A hawl of yarn, confifting of 336 threads, 195 fathoms long, fhould weigh from 16 cwt. 1 qr. 7 lb. to 16 cwt. 2 qr. 24 lb. and no more, tarred in the fame proportion as cablets and cables.

All cordage delivered into his majefty's dock-yards undergo a trial, which is, by proving one ftrand out of each rope, each thread (or yarn) of which having a weight, weighing one-third of an cwt. made faft to it, which it fhould lift; but if a certain number of yarns (according to the fize of each rope) fhould break in the trial, the rope is rejected, otherwife it is received.

Particular attention fhould be paid not to fend any kind of cordage into his majefty's dock-yards above its higheft weight, allowed according to contract, as, in fuch cafe, all above that weight will be a lofs to the manufacturer; the receiving officer not being authorifed to allow any more than is fpecified in the contract.

N. B. It is to be obferved, that, in making cordage by contract for the ufe of his majefty's navy, his majefty finds his own hemp, the contractor tar and labour at a certain price *per* ton. All cables and cordage to be tarred with good Stockholm tar, without mixture of any other, except about one-third part, which may be of Ruffia tar.

A white thread, twifted the contrary way, (fometimes called the rogue's yarn,) is to be laid in all the ftrands of the cables and large cordage; and a twine in the fmall cordage for the king's mark, fo as to be feen on the outfide of the ftrands.

In any of the ftrands, there is to be no greater number of threads at the ends of the cables or cordage than in the middle.

The only parliamentary regulations, relative to the manufacture of cordage, are contained in the following act; "An act for more effectually preventing deceits in the manufacturing of cordage for fhipping; and to prevent the illicit importation of foreign-made cordage." 25 Geo. III. c. 56.

In July 1799, a patent was granted to W. Chapman and E. W. Chapman, of Newcaftle-upon-Tyne, for their improved method of making cords and ropes, twined and untwined, from the fpinning of the yarn inclufive, to the finifhing of the rope or cordage. This invention appears, by the fpecification, to include material improvements in the fpinning of rope-yarn, and in the manufacturing of cordage. Rope-yarns are at prefent fpun by men, at an expence of from half a crown to five fhillings *per* day, according to the fituation of the place, whether in the out-ports, or on the river Thames. Or it is wholly fpun by machinery.

In the practice of the firft method rope-walks are neceffary, and the fibres of the hemp are drawn into the yarn of different lengths proportionate in a given degree to their pofition in the outfide or infide of the yarn; accordingly, when this yarn is ftrained, and its diameter collapfes, the infide fibres of hemp bear the greateft ftrain, and thus they break progreffively from the infide.

In the fpinning by a mill the fibres are all brought forward in a pofition parallel to each other, previoufly to their receiving their twift. They are confequently all of one length; and, when twifted, the outfide fibres are moft fhortened by forming the fame number of fpirals round a greater axis than the interior, and thus they muft confequently break the firft, on the fame principle that the outfide yarns of ftrands of ropes manufactured in the old method break before the interior yarns; and, confequently, with lefs ftrain than ropes of the improved principle, where the ftrands, (or immediate component parts of the rope) have been formed in fuch a manner as that all the yarns fhall bear equally at the time of the rope's breaking.

Neverthelefs, yarns fpun by a mill have been found ftronger than common yarns, on account of the great evennefs with which they are fpun; the manual labour in manufacturing is much lefs than in the common method: but, on the other hand, there is the expence of machinery, and the greater wafte of hemp in preparing it for being drawn out in the progreffive ftages of its advance to the fpindle.

The method invented by Meffrs. Chapman differs from both the preceding, in having, by an eafy and fimple contrivance, the fibres of the hemp laid in the yarn in fuch a manner as the yarns themfelves are laid in the ftrands of the rope manufactured on the new principle.

Their machinery confifts only of a fpindle, divided into two parts, the upper containing apparatus to draw forward the hemp from the fpinner with twift fufficient to combine the fibres; which enables them to employ women, children, and invalids, and alfo to appropriate the rope-ground folely to the purpofe of laying ropes.

The part we have defcribed is only an improvement on the

the methods of fpinning, granted to Mr. William Chapman on the 8th day of November, 1798.

The remaining parts of their invention confift chiefly in the giving, from a ftationary power, internal motion to a locomotive machine, *viz.* to the roper's fledge, on which the ftrands and the rope itfelf are twifted, by which contrivance they are enabled to apply a water-wheel, or fteam-engine, to the whole procefs of making ropes of all kinds whatever.

Mr. Jofeph Huddart of Iflington obtained a patent in Auguft of the fame year for an improved method of regiftering or forming the ftrands in the machinery for the manufacture of cordage. Having previoufly taken out a patent for this purpofe, he contrived to effect it by the following means:

1. By keeping the yarns feparate from each other, and drawing them from bobbins, which revolve, to keep up the twift whilft the ftrand is forming.

2. By paffing them through a regifter, which divides them by circular fhells of holes; the number in each fhell being agreeable to the diftance from the centre of the ftrand, and the angle which the yarns make with a line parallel to it, and which gives them a proper pofition to enter.

3. A cylindrical tube, which compreffes the ftrand, and maintains a cylindrical figure to its furface.

4. A gauge to determine the angle which the yarns in the outfide fhell make with a line parallel to the centre of the ftrand when regiftering; and, according to the angle made by the yarns in this fhell, the length of all the yarns in the ftrand will be determined.

5. By hardening up the ftrand, and thereby increafing the angle in the outfide fhell, which compenfates for the ftretching of the yarns, and the compreffion of the ftrand.

The patent which Mr. Huddart took out in Auguft relates to the invention of a machine that may be worked by men, or any other power, and by means of which the regiftering may be commodioufly and effectually carried on. But figures are neceffary for defcribing intelligibly his peculiar contrivance. Mr. Huddart, in the following year, took out a patent for improvements in the method of turning cordage in the manufacture of it. But our limits forbid our enlarging on this article. The fpecifications of the patents for regiftering, as well as faftening, may be confulted by thofe who are concerned in this manufacture.

Rope *Walk*, or *Rope-houfe Ground*, is the place where ropes are manufactured. This fhould be 400 yards long, and about 10 broad. At the upper end are fixed the fpinning-wheels, over which is the hatchelling-loft, alfo the back-frame wheels, tackle-boards, and pofts, winches for winding the yarn on as it is fpun, and reels on which to reel the ropes. On each fide are ftake-pofts; in the middle is fixed the warping-poft, and at the lower end, the capftern and reaching-poft. Back-frame wheels for fmall, and fledges and drags for large ropes, are ufed towards the lower end; the back-frame wheel, for laying cordage from a fix-thread ratline to a two-inch rope, is about four or five feet in diameter, and is hung between two uprights, fixed by tenons on a truck, and fupported by a knee of wood. Over its top is a femicircular frame, called the head, to contain three whirls (that turns on the braffes) with iron fpindles, fecured by a hafp and pin. They are worked by means of a leather band encircling the whirls and the wheel. Three of the whirls are turned when hardening the ftrands, and one only when clofing the rope, the ftrands being hung together upon it. The truck, on which the back-frame wheel is fixed, runs on four wheels, and is made of three-inch oak plank, about nine feet long and thirteen inches broad at one end, and eleven inches broad at the other. The capftern, about eight feet high, and fourteen inches in diameter, is turned either by men or horfes; its ufe is to draw the yarn, when tarring, out of the copper, through the nipper, to be coiled away in the yarn-houfe, and there properly hardened before it is ufed; otherwife it will kink, *i. e.* twift or curl, by being twifted too hard in clofing. Another capftern, or crab, is fixed at the lower end of the walk, for ftretching the yarn to its fulleft extent, before it is worked into ftrands, by means of the tackle-fall, led from the *fledge* to the capftern; thefe being about eighteen yards diftant from each other. The crank-wheel, which is ufed for fpinning of lines, box-cord, &c. is fixed on an iron fpindle or axis, with a handle by which to turn it. It hangs between two pofts, and in its upper part, above the wheel, is let in a femicircular board to receive three fets of whirl-bolts, with wheels upon them, on which the fpinners hang their threads: at the front fide of the wheel is a fhort poft, fupported by a knee of oak, on which the fpindle refts. The *drags* refemble the hinder part of the fledge, to which they are faftened by ropes, and they are lined with a board on the upper fide: their weight ferves as a prefs, when the rope requires more than the fledge can carry properly to ftretch the ftrands, and prevent their kinking. The *hatchel* ferves to clear the ends of the hemp, by drawing it through, having forty fharp-pointed iron-teeth, fimilar to the hatchel in the *clearer*, which has finer teeth. Iron-jacks are fometimes ufed inftead of the table-wheel or back-frame wheel, and differ from the latter by having an iron-wheel with cogs, which work in the whirls, that have likewife iron-cogs. The *loper*, which is ufed to lay lines, has two iron fwivel-hooks (running round in a brafs or iron box) at each end, for the line to hang on and work, by the power of the fore-turn, from the wheel at the upper end. The *nipper* is formed of two fteel-plates, with a femi-oval hole in each, which, by the motion of the upper plate, enlarges or contracts as the tarring of the yarn requires. It is thus fixed: a poft is placed between the kettle and the capftern, with a mortife cut eighteen inches long from the kettle's furface, and five inches wide. The under plate is turned up on each fide, to form two grooves, and is let into the front fide of the poft from the lower part of the mortife. The upper plate has a dove-tail on the back, that flides up and down in a groove into the grooves of the lower plate; and by a ftaff, made faft to its front, it is raifed or lowered, and regulated by a weight fufpended at the other end, fo that the yarn receives no more tar than is required, and that which is fqueezed out drops into a trough, and returns into the kettle. *Prefs-barrels* are old tar-barrels filled with clay, and laid on the fledge or drag to add weight when the rope is clofing. The *reaching-poft* is a poft in the ground at the lower end of the walk; ufed in ftretching the yarn by means of a tackle, one of the blocks of which is hooked to a ftrap round the poft, the other block to a pendant at the fledge, being about eighteen yards diftant from each other. *Sledges* are frames made of ftrong oak, clamped with iron in different parts; the two fides are the length of the fledge, made of oak, and tied in with oak bars at each end; near the front are two uprights, let into the fides, and fupported by two flanting pieces from the upper end. A breaft-board is faftened with iron pins to the uprights, and contains holes for the hooks to pafs through, on which the hooks are hung; which, being turned by men, is twifted into rope, and fo clofed or finifhed. Thefe fledges are loaded as the occafion of making the rope requires. The *fpinning-wheel* is hung between two pofts fixed

fixed in the ground; over its top is a semicircular frame, called the head, which contains twelve whirls, if it be for twelve spinners to spin at the same time; these whirls turn on iron spindles, with hooks to their front ends to hang the hemp on, and are worked by means of a leather band encircling the wheels and whirls. The tools and terms appropriate to rope-making are described in their proper places.

Rope-*Yarn*, the yarn of any rope untwisted. It commonly consists of cable-ends which are worn out; and are called *junks of the cables*. It serves for many purposes among the sailors.

Rope-yarn properly denotes the smallest and simplest part of any rope, being one of the threads of which a strand is composed; so that the size of the latter, and of the rope into which it is twisted, are determined by the number of rope-yarns.

Ropes, *Standing*, in a *Ship*, the shrouds and stays are so called, because they are not removed, unless to be eased or set taught. See Shrouds, and Stays.

Ropes, *Staple*, ropes made of hemp, not inferior to clean Petersburgh.

Rope-*Bands*, braided cordage, used to fasten the heads of sails to their respective yards. See Robbins.

Rope-*Deck*. See Deck.

Rope, in *Agriculture*, a thick sort of cord formed of hemp, or other material; much used by farmers. See Cordage.

A very useful sort of rope for traces, and other similar purposes, has lately been formed of the coarse wool of sheep.

Rope, *Cart*, that sort of rope used in loading hay, straw, or other bulky loads, by the farmer. These ropes should always be strong, and formed of the best materials, whatever the nature of them may be.

Rope is also a word signifying to tedder, as a horse, or other animal. It is a very injudicious practice, and one which should by no means be generally followed by farmers.

Rope, *Cord*, or *Strap*, in the *Manege*, is any of these tied round a pillar, to which the horse is fastened, when they begin to quicken, and supple, to teach him to fly from the chambrier, and not gallop fastly or incompactly.

In those maneges where there is no pillar, a man stands in the centre of the ground, and holds the end of the rope.

Ropes, *Drag*, in the *Artillery*, are those by which the soldiers pull the guns backwards and forwards both in their exercise, and in an engagement. They are of various lengths and dimensions, as they are used for guns or howitzers of different weights.

Ropes, *Foot*. See Foot-*Ropes*.

Ropes *of two Pillars*, are the ropes or reins of a caveson, used to a horse that works between two pillars. See Pillar.

Rope-*Dancer*. See Dancer, and Nusance.

Rope *of Sand*, a phrase familiarly used to denote disunion, or want of adhesion and continuity. In this sense it is applicable to a variety of cases, and in military language to the disagreement that subsists between the colonel and the captains of a regiment.

Rope *Machine for raising Water*, in *Hydraulics*.—If a vertical grooved wheel, fixed in a frame, be situated within the water at the bottom of a well, and another similar wheel, having a handle affixed to its axis, be situated in another frame at the upper part of the well; also an endless rope (*viz.* a rope whose two extremities are spliced into each other) be passed round both wheels; then, on turning the handle, the wheels and the rope will be caused to move, *viz.* the rope will ascend on one side, and will descend on the other, passing successively through the water of the well; but the ascending part will carry up a quantity of water adhering to its surface; and this water differs in quantity, according to the size of the rope, the depth of the well, and the quickness of the motion; *viz.* with a larger rope, in a less deep well and quickest motion, a greater quantity of water will be raised, than otherwise.

In order to intercept the water at the top of the well, the upper wheel is inclosed in a pretty large box, in the bottom of which there are two holes, through which the ascending and descending parts of the rope pass. To these holes are affixed two short tubes, which prevent the exit of the water which falls to the bottom of the box. There is also a lateral spout on the side of the box, close to the bottom, for the water to come out of; and on the broad sides of the box there are two holes for the axis of the wheel. The 9th and 10th figures of *Plate* XIV. *Hydraulics*, exhibit a section and a front view of a machine of this sort, which was put up in the year 1782, on the castle hill at Windsor, where the depth of the well is 95 feet. A similar machine was also placed on the round tower of Windsor castle, which draws the water from the depth of 178 feet.

The same letters refer to the like parts in both figures.

The wheel, H, at the bottom of the well is of lignum vitæ, one foot in diameter. Its axis is of steel, and turns with its extremities in sockets of bell-metal.

The frame, I I, is of iron.

The wheel, E E, at the top of the well is of iron; but its rim, with the groove which receives the rope, are of lead. The diameter of this wheel is three feet.

The axis, *d d*, is of steel, and its extremities turn in bell-metal sockets, which are fixed in two upright posts, A, A, that support the machine. T is the handle affixed to the axis, which handle describes a circle of 28 inches in diameter; *b b* is the wooden box, lined with lead, which incloses the wheel E. F, F, are the holes at the bottom of the box through which the rope passes. Their diameter is about two inches.

On the same axis, *d d*, another wheel, C C, of about four feet in diameter, is fixed. This wheel is of wood, loaded on the edge with lead, and it serves as a fly to facilitate the motion.

The rope is of horse-hair, and measures half an inch in diameter.

With this identical machine, several experiments were tried, the result of which is as follows:

When the machine was worked slowly, *viz.* so as to make about 30 revolutions of the handle in one minute, then very little water came up adhering to the rope; and of this water a very small portion was separated from the rope within the box, so as to come out of the spout Z, in the side of the box.

When the revolutions of the handle were about 50 in a minute, then a considerable quantity of water came up adhering to the rope; and on turning the wheel E E round, the greatest part of that water, having acquired a considerable velocity, flew off in a tangent from the rope, and formed a jet within the box. This water, falling to the bottom of the box, came out of the spout Z.

It was found, that the utmost exertion of an ordinary working man could not make more than 60 revolutions of the handle in a minute; in which case the rope moved at the rate of about 16 feet *per* second. With this velocity the quantity of water that came out of the spout, Z, was about six gallons *per* minute: but it would have been impossible

poſſible for the man to have worked at that rate for more than three or four minutes.

This machine may evidently be placed aſlant, *viz.* ſo as to convey the water from one place to another, which is not quite perpendicularly over the former. The ſame conſtruction, and almoſt the ſame expence, will adapt the machine to wells of different depths, though the effects will not be always the ſame.

More than one rope, or a broad band inſtead of a rope, might be adapted to this machine, for which purpoſe, the wheels muſt have more than one (or a broad) groove, &c.

The greateſt diſadvantage of this machine is, that the rope does not laſt long. Its being always wet deſtroys it very ſoon. In putting on the rope, care muſt be had to ſoke it well in water before it be ſpliced; otherwiſe it will either be too tight, or it will break. A hair rope has been found to laſt longer than one of hemp. See Cavallo's Elem. of Nat. and Exp. Philoſophy, vol. ii.

ROPI, in *Geography*, a town of South America, in the juriſdiction of Guamanga.

ROPITZ. See REPITZ.

ROPOUREA, in *Botany*. See CAMAX.

ROPPEN, in *Geography*, a town of the Tyrolese; 4 miles S.W. of Stambs.

ROQUE, JOHN DE LA, in *Biography*, a writer of voyages and travels, was the ſon of a merchant at Marſeilles. He ſtudied in his native city, and afterwards travelled into the Eaſt, but in what capacity is not known. In 1689 he viſited Syria, mount Lebanon, and other countries in the Eaſt. In 1715 he was a reſident in Paris, and was there aſſociated with his brother in publiſhing the "Mercure de France." He died in 1745, in his 84th year. The following is a liſt of his principal publications: "Voyage de l'Arabie Heureuſe par l'Ocean oriental et le detroit de la Mer Rouge, fait par les François, &c. avec un Memoire concernant l'Arbre du Caffe," 1716. "Voyage de la Paleſtine, fait par l'Ordre de Louis XIV." 1717: to this is annexed a tranſlation of Abulfeda's Deſcription of Arabia. "Voyage de Syrie et du Mont Liban, &c. avec un Abrègè de la Vie de M. M. de Chaſtenil," 2 vols. He was a member of the Royal Academy of Belles Lettres at Marſeilles.

ROQUE, *La*, in *Geography*, a town of France, in the department of the Var; 6 miles S.W. of Brignoles.

ROQUE, *Cape*, a cape on the coaſt of Braſil. S. lat. 5°. W. long. 35° 40′.

ROQUEBROUE, LA, a town of France, in the department of the Cantal, and chief place of a canton, in the diſtrict of Aurillac; 12 miles W. of Aurillac. The place contains 1277, and the canton 9812 inhabitants, on a territory of 310 kiliometres, in 15 communes.

ROQUEBRUSSANNE, LA, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Brignoles. The place contains 1436, and the canton 5220 inhabitants, on a territory of 187½ kiliometres, in 8 communes.

ROQUECOR, a town of France, in the department of the Lot and Garonne; 7 miles N.E. of Agen.

ROQUE-COURBE, a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Caſtres; 4 miles N.N.E. of Caſtres. The place contains 1294, and the canton 3829 inhabitants, on a territory of 132½ kiliometres, in 6 communes.

ROQUEFEUIL, a town of France, in the department of the Aude; 15 miles S.W. of Alet.

ROQUEFORT, a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Limoux; 7 miles S. of Quellan. The place contains 567, and the canton 4920 inhabitants, on a territory of 322½ kiliometres, in 13 communes.—Alſo, a town of France, in the department of the Landes, and chief place of a canton, in the diſtrict of Mont-de-Marſan; 12 miles N.E. of Mont-de-Marſan. The place contains 1077, and the canton 8380 inhabitants, on a territory of 565 kiliometres, in 14 communes.

ROQUELAURE, a town of France, in the department of the Gers; 3 miles from Auche.

ROQUE-LIMBAUT, LA. See ROQUETAIMBAUT.

ROQUEMADOUR, a town of France, in the department of the Dordogne; 12 miles S.E. of Sarlat.

ROQUEMAURE, a town of France, in the department of the Gard, and chief place of a canton, in the diſtrict of Uzés, on the W. ſide of the Rhone; 6 miles N. of Avignon.

ROQUE-D'OLMES, a town of France, in the department of the Arriège; 7 miles S. of Mirepoix.

ROQUEPIC, an iſland in the Indian ſea, covered with cocoa and other trees, flowers, and odoriferous plants. N. lat. 9° 56′. E. long 95° 14′.

ROQUES, PETER, in *Biography*, a French Proteſtant divine in the 18th century, was born at Caune, in Upper Languedoc, in 1685. Having been educated for the miniſtry, he was choſen, at the age of 25, paſtor of the French Proteſtant church at Baſil, in connection with which he ſpent the remainder of his life. He died in 1748, at the age of 63. He was author of many works, which bore teſtimony to his learning, and the excellence of his judgment: of theſe, the principal are, "A Picture of the Behaviour of a Chriſtian;" "The Evangelical Paſtor;" "Elements of the Hiſtorical, Dogmatic, and Moral Truths contained in the Sacred Scriptures." He was the author of numerous papers inſerted in the "Journal Helvetique," and "Bibliotheque Germanique."

ROQUESTARON, in *Geography*, a town of France, in the department of the Maritime Alps, in the diſtrict of Puget-Theniers. The place contains 344, and the canton 2224 inhabitants, on a territory of 217½ kiliometres, in 7 communes.

ROQUET, in *Zoology*, the name of a ſpecies of American lizard, of ſmall ſize, and of a reddiſh-brown colour, variegated with black and yellow ſpots. Its fore-legs are remarkably long for a creature of this kind; its eyes are particularly vivid and ſparkling, and its head is carried continually erect; and the creature is almoſt always in motion, hopping about like a bird, and it uſually carries its tail bent into a ſemicircle over the back. It is far from being ſhy or timorous, and is delighted at the ſight of men; when tired with play or with running, it will open its mouth and pant, and loll out its tongue as the dogs do.

ROQUETAIMBAUT, in *Geography*, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Agen; ſeven miles N.E. of Agen. The place contains 1294, and the canton 5494 inhabitants, on a territory of 87½ kiliometres, in 10 communes.

ROQUETAS, a town of Spain, in the province of Grenada, on the coaſt of the Mediterranean; 10 miles S.W. of Almeria.

ROQUEVAIRE, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the diſtrict of Marſeilles; 12 miles E.N.E. of Marſeilles. The place contains 3182, and the canton 17,926 inhabitants, on a territory of 275 kiliometres, in 10 communes.

ROQUILLE, a meafure of capacity in the Weft Indies; thus, the Englifh gallon is divided into two pots, four pintes, eight chopines, fixteen roquilles, thirty-two muces, or fixty-four demi-muces.

ROQUITE, in *Geography*, a river of Africa, which runs into the Atlantic; 70 miles S.E. of cape Bajador.

ROR, a town of Bavaria; four miles S.W. of Abenfperg.

RORAAS, a town of Norway, in the province of Drontheim; near which is a large copper mine, difcovered in the year 1644; 68 miles S.S.E. of Drontheim. This mine is in the fouthern flope of the chain of Dofra, in a rock of what the Germans call horn-fchiffer, or hornblende flate. The veins are from fix inches to fix ells in thicknefs; and the ore of a pale yellow. The mines of Roraas are very productive, and a fource of confiderable revenue.

RORARIUS, Jerome, in *Biography*, who flourifhed about the middle of the 16th century, was a native of Pordenonè, in Italy, and in the courfe of time he became nuncio from pope Clement VII. at the court of Ferdinand, king of Hungary. He was author of a curious work, entitled "Quod animalia Bruta Ratione utantur melius Homine," in which he undertakes to fhew, not only that beafts are rational creatures, but alfo that they make a better ufe of their reafon than man. This work, after lying concealed in the obfcure receffes of libraries 100 years, was publifhed by M. Naude at Paris in 1645. Bayle.

RORBACH, in *Geography*, a town of Auftria; 18 miles W. of Freyftatt.—Alfo, a town of France, in the department of the Mofelle, and chief place of a canton, in the diftrict of Sarreguemines; fix miles W. of Bitche. The place contains 655, and the canton 10,280 inhabitants, on a territory of $187\frac{1}{2}$ kiliometres, in 20 communes.—Alfo, a town of Germany, in the principality of Culmbach; feven miles S.S.E. of Gemunden.

RORE, in *Biography*. See Cipriano.

RORENTZBERG, in *Geography*, a mountain of Germany, on the Brifgau; two miles S. of Triberg.

RORHAW, a town of Auftria; eight miles W.S.W. of Hainburg.

RORICHE, a river of Brandenburg, which runs into the Oder; three miles N.W. of Königfberg.

RORIDULA, in *Botany*, from *roridus*, moift with dew, in allufion to the glandular moifture which clothes its herbage, like that of *Drofera*, the Sun-dew.—Linn. Gen. 567. Schreb. 157. Willd. Sp. Pl. v. 1. 1184. Mart. Mill. Dict. v. 4. Juff. 426. Lamarck Illuftr. t. 141. Gærtn. t. 62.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. uncertain, Juff.

Gen. Ch. *Cal.* Perianth inferior, of five lanceolate, equal, permanent leaves. *Cor.* Petals five, ovate-oblong, equal, larger than the calyx. *Stam.* Filaments five, awl-fhaped, half the length of the corolla; anthers inferted a little above their bafe, oblong, of two parallel, nearly cylindrical lobes, opening obliquely at the top, and feparated almoft half way down; their bafe pouch-like, projecting downwards, termed by Linnæus the nectary. *Pift.* Germen fuperior, oblong; ftyle thread-fhaped, the length of the ftamens; ftigma abrupt, flightly three-lobed. *Peric.* Capfule oblong, triangular, of three cells and three valves, the partitions contrary to the valves. *Seeds* folitary, oval, angular at one fide, minutely dotted in rows.

Eff. Ch. Corolla of five petals. Calyx of five leaves. Anthers with a pouch at the bafe. Capfule of three valves and three cells. Seeds folitary.

Obf. Linnæus defcribes numerous feeds, but Gærtner and Juffieu found them folitary in each cell. There is no reafon to fuppofe thefe writers did not examine the very identical fpecies.

1. R. *dentata*. Linn. Gen. Pl. 567. Syft. Veg. ed. 14. 244. Willd. n. 1. (R. mufcicapa; Gærtn. v. 1. 298. Ireon verticillata; Burm. Prodr. Cap. 6.) Native of bogs at the Cape of Good Hope, but apparently either in fome remote tract, or not of frequent occurrence. The *ftem* is fhrubby, branched, round, fmooth, purplifh. *Leaves* numerous, crowded about the ends of the lateral fhoots, linear-lanceolate, pointed, about two inches long, finely downy, deeply pinnatifid, or pectinate; their fegments awl-fhaped, fringed with glandular-tipped briftles. *Flower-ftalks* firft terminal, then lateral, folitary, racemofe, woolly, longer than the leaves, each bearing about four large and handfome *flowers*. *Bracteas* and *calyx* fringed like the leaves. The *petals* feem to be white, or blufh-coloured. This is a very fine and fingular plant, with which it is pity we are not acquainted in a recent ftate. May it not be allied to Juffieu's *Tiliaceæ*?

RORIFEROUS Duct, *q. d. dew dropping-pipe*; a name given by fome to the thoracic duct; from its flow manner of conveying, and, as it were, diftilling, the chyle into the common ftream of blood.

RORIPA, or Rorippa, in *Botany*, Scop. Carn. ed. 1. 520. Adanfon Fam. v. 2. 417, a name which Scopoli fays he borrowed from Gefner, and by which he defignated a genus, which he feparated from *Sifymbrium*, on account of its coloured calyx, four converging glands, and fhort pods. The fame author, in his fecond edition of *Flora Carniolica*, reduces this genus, as moft others have done, to Sisymbrium; fee that article.

RORNBACH, in *Geography*, a town of the bifhopric of Paffau; two miles N. of Paffau.

RORSBACH, a town of the Helvetian republic, belonging to the abbey of St. Gall; fix miles N.E. of St. Gall.

RORSHEIM, a town of Weftphalia, in the principality of Halberftadt; fix miles N.E. of Ofterwick.

ROS, Dew. See Dew.

Ros *Solis*, in *Botany*, Sun Dew, a plant fo called from the clear drops of vifcid moifture, ftanding on the briftles which clothe its foliage; moft abundant and confpicuous in hot bright weather. See Drosera.

Ros *Vitrioli*, among *Chemifts*, is fometimes ufed for the firft phlegm diftilled from vitriol in balneo Mariæ.

Ros *fur Couefnon*, in *Geography*, a town of France, in the department of the Ille and Vilaine; feven miles E.N.E. of Dol.

ROSA, in *Botany*, an ancient and popular name, derived, with moft probability, from the Celtic, *rôs* or *rhos*; whence comes alfo its Greek fynonym, ῥόδον; and the name of the fame flower in various modern languages, Rofe, Rofa, &c. De Theis remarks, that the Celtic *rhodd*, or *rhudd*, red, is the primary root of thefe words, the rofe colour being almoft fynonimous with rednefs. Hence alfo came *Rhus*, *Rubia*, *Rubus*, and the Greek name of the Pomegranate, ῥόα, or ῥοδία, ftill in ufe. All thefe words have a manifeft reference to a red colour, in fome part of each of the plants. —Linn. Gen. 254. Schreb. 341. Willd. Sp. Pl. v. 2. 1063. Mart. Mill. Dict. v. 4. Sm. Fl. Brit. 537. Prodr. Fl. Græc. Sibth. v. 1. 347. Ait. Hort. Kew. v. 3. 257. Purfh 344. Juff. 335. Lamarck Illuftr. t. 440. Gærtn. t. 73.—Clafs and order, *Icofandria Polygynia*. Nat. Ord. *Senticofæ*, Linn. *Rofaceæ*, Juff.

Gen. Ch. *Cal.* Perianth of one leaf; tube fwelling, ovate or globofe, contracted at the top; limb fpreading, in five deep,

deep, converging, long, narrow-lanceolate fegments, two of which are ufually fringed, at both edges, with unequal leafy appendages, the third at one edge only, the two remaining having both edges naked; in fome fpecies all are fimple and naked. *Cor.* Petals five, inverfely heart-fhaped, the length of the calyx, and inferted into its neck. *Stam.* Filaments very numerous, capillary, fhort, inferted into the neck of the calyx; anthers roundifh-triangular. *Pift.* Germens numerous, in the cavity of the calyx; ftyles as many, villous, very fhort, inferted laterally into each germen, and clofely compreffed by the neck of the calyx; ftigmas obtufe. *Peric.* none, except a fpurious berry, formed of the turbinate tube of the calyx become foft and coloured, of one cell, contracted and clofed at the neck, crowned with the faded hardened fegments of the limb. *Seeds* numerous, oblong, hard, angular, hifpid, lining the interior furface of the calyx.

Eff. Ch. Petals five. Calyx urceolate, five-cleft, flefhy, contracted at the neck. Seeds numerous, hifpid, lining the infide of the calyx.

No genus more natural than this, in habit, or technical characters, can poffibly be found. The Rofe is alfo the moft favourite of plants in all countries of the globe, the type of beauty and love, beftowing its name to enrich other flowers, which derive from thence their chief celebrity, and taking unqueftioned precedence in all matters of ornament or tafte. But thorns are proverbially the accompaniments of rofes; nor can any one be more fenfible of this, than the botanift, who attempts to extricate and define the fpecies of this beautiful family. Cultivated plants in general are known to fport in luxuriant varieties, often tranfient indeed, but fufficiently durable to caufe much perplexity to the accurate obferver. No wonder therefore that rofes, fo abundant in every garden, fhould affume various afpects from difference of foil and treatment; though lefs perhaps, than moft other tribes, from crofs impregnation. The habit of this genus is invariably fhrubby, and almoft univerfally prickly; the branches round; leaves alternate, pinnate with an odd leaflet, ferrated, frequently prickly or glandular; one fpecies only being known to have fimple leaves, or, in other words, to want the lateral leaflets. Stipulas almoft always united to the bafe of the common footftalk. Flowers terminal, ftalked, ufually red, varioufly and delicioufly fragrant; fometimes white; very rarely yellow, and in that cafe either inodorous or fœtid. Fruit harmlefs, but feldom pleafant. Seeds flow in germination.

The generality of writers on Rofes have come under the defcription of florifts rather than botanifts, and their figures have been executed accordingly. Linnæus found the determination of fpecies very difficult. Ehrhart paid confiderable attention to the fubject, and in his *Beiträge* has thrown much light upon it, by which Willdenow has profited. The garden Rofes are well arranged in the new edition of Aiton's Hortus Kewenfis, where we fhall find but little to improve or correct; and they are elegantly difplayed in Mifs Lawrance's ample collection of figures, publifhed in 1799, except that we could have wifhed for much more delicacy, and difcrimination of tints, in their various foliage. Several new Britifh ones have been firft defcribed, by the writer of the prefent article, in *Englifh Botany*, where Mr. Sowerby has, as ufual, been happy in his reprefentations of their diftinctive habits and characters.

The fpecies are diftributed by Linnæus, and all his followers, into two fections, diftinguifhed by the fhape of the tube of the calyx, inaccurately termed by him the germen. Of this error Willdenow takes notice, without correcting it, not being at that time aware of the meafure adopted in our *Flora Britannica*, where, by fubftituting *fruit* for *germen*, every inconvenience and inaccuracy is avoided. Mr. Dryander and Mr. Aiton in *Hort. Kew.*, while they follow, as we fhall here do, Willdenow's general and particular diftribution of the fpecies, have, in the point juft mentioned, corrected his phrafeology. Our new fpecies, chiefly fupplied by Englifh Botany, and Purfh's Flora of North America, will be inferted, as nearly as poffible, according to their affinities. Perhaps fome of the old ones might have been better placed; but except any glaring impropriety prefented itfelf, more inconvenience than benefit would arife from difturbing an arrangement fo generally received, and which Linnæus firft formed in his *Syftema Naturæ*, ed. 12. We have only brought *canina* and its allies nearer together than they are placed in the above-mentioned books.

Section 1. *Fruit nearly globofe.*

1. R. *berberifolia.* Barberry-leaved Rofe. "Pallas in Nov. Act. Petrop. v. 10. 379. t. 10. f. 5." Willd. n. 1. Ait. n. 1. (R. fimplicifolia; Salif. Hort. 359. Parad. t. 101. Poiret in Lamarck Dict. v. 6. 276.)—Fruit globofe, prickly, as well as the flower-ftalk. Leaves fimple, nearly feffile, with ftipulary recurved prickles. Found by Michaux and Olivier in the north of Perfia. Seeds fent by the former to fir J. Banks were raifed at Kew about the year 1790, but the plants did not long furvive. This fpecies is extremely remarkable for its fimple *leaves*, which are obovate, glaucous, coarfely ferrated, about an inch long, fmooth, on fhort ftalks, without *ftipulas*, but having in their ftead a pair of recurved taper prickles, fpreading from the bafe of each footftalk. The *branches* are alfo befet with fhorter prickles. *Flowers* folitary, on fhort, terminal, prickly, downy ftalks. *Petals* yellow, crimfon at the bafe. *Fruit* globular, very prickly, crowned with the fimple narrow fegments of the *calyx*. We wifh the name *fimplicifolia* had been retained, as much the beft; and if Juffieu had actually given it as a name, in his Gen. Pl. 452, it might, by the right of priority, have fuperfeded Pallas's appellation.

2. R. *lutea.* Yellow Sweet-briar. Mill. Dict. ed. 8. n. 11. Willd. n. 2. Ait. n. 2. Curt. Lond. t. 363. Lawr. Rof. t. 12. Lob. Ic. v. 2. 209. Ger. Em. 1267. (R. lutea fimplex; Bauh. Pin. 483. R. Eglanteria; Linn. Sp. Pl. 703. R. chlorophylla unicolor; Ehrh. Beitr. v. 2. 70. Arb. 156. R. fœtida; Herm. Rof. 18. Allion. Ped. v. 2. 138.)

β. bicolor. Auftrian Rofe, or Copper Sweet-briar; Jacq. Hort. Vind. v. 1. t. 1. Curt. Mag. t. 1077. Lawr. Rof. t. 6. (R. fylveftris auftriaca, flore phœniceo; Hort. Angl. 66. t. 18.)—Fruit globofe, fmooth, as well as the flower-ftalk. Calyx and leaf-ftalks minutely prickly. Prickles of the branches ftraight. Leaflets obovate, doubly ferrated, rather glutinous, fmooth.—Native of Germany and Italy; but not, as Willdenow reports, of England. It is however frequent here in old country gardens, in a pure air, flowering in June. Gerarde cultivated this fpecies, and even raifed it from feed, in order to refute a vulgar error, of its being fome common rofe, turned yellow by grafting on a broom-ftock. The beautiful red or copper-coloured variety, β, is more difficult of cultivation, efpecially with refpect to air. The *ftem* is bufhy, four or five feet high. *Leaves* deciduous, of five or feven obovate, ftrongly ferrated, deep green, fhining leaflets, rather vifcid to the touch, and exhaling a moft fweet and peculiar aromatic odour, more grateful to us than that of the Common Sweet-briar. *Flowers* copious, large, ufually of an uniform golden yellow, with the fmell of bugs; but in the variety β the upper fide of the *petals* is of a tawny red, and the difagreeable

agreeable odour is lefs. We have, under the article Eglanteria, given the hiftory of Linnæus's miftake, in confounding the prefent fpecies, firft with the Common Sweet-briar, and then with the Double Oriental Yellow Rofe, (fee hereafter *R. fulphurea* and *R. rubiginofa*); as well as our reafons for following the Hort. Kew., Willdenow, &c. in thefe names. The *fruit* of *R. lutea* has never been feen or heard of by us, in a ftate of maturity.

3. R. *fulphurea.* Double Yellow Rofe. Ait. Hort. Kew. ed. 1. n. 2. ed. 2. n. 3. Willd. n. 3. Lawr. Rof. t. 77. (R. glaucophylla; Ehrh. Beitr. v. 2. 69. R. hemifphærica; Herm. Rof. 18. R. lutea multiplex; Ger. Em. 1267. Hort. Angl. 66. t. 18. R. lutea maxima, flore pleno; Hort. Eyft. vern. ord. 6. t. 2. f. 4. R. flava, pleno flore; Cluf. Cur. Poft. 6.)—Fruit globofe, fomewhat prickly. Flower-ftalks fmooth. Stem with two fets of copious ftraight prickles. Stipulas jagged. Leaflets obovate, fimply ferrated, glaucous, fmooth. This fine and fingular fpecies, ftrangely confounded, by many botanifts, with the laft, was received by Clufius from the Levant, but its native country is not precifely known. It has been cultivated in England for near 200 years, and is perfectly hardy as to cold, but very impatient of low, confined, or fmoky fituations; nor does it, in the moft favourable, often expand its copious and truly glorious flowers to advantage. We have feen them in the greateft perfection, on a poor gravelly foil, expofed to eaft winds, about outhoufes and hovels, where no care was taken of the plant. The bufh is larger than *R. lutea*, and evidently diftinguifhable by the pale glaucous hue of its fmooth inodorous *leaves*. The prickles of the *ftem* are of two kinds; fome twice as large as the others. *Flowers* large and very double, without fcent, of a rich but delicate golden yellow; their inner petals, when perfect, fo profufely and elegantly crumpled, and fo brightly tranfparent, that neither the ftructure, nor the colour, of any other rofe, can give the flighteft idea of their beauty; much lefs has any artift, except perhaps Van Huyfum, in one or two of his fineft pictures, done this flower tolerable juftice. The foliage in Mifs Lawrance's plate is much too dark, and wants the glaucous pale afpect which characterizes the fpecies. The flower is well drawn in the old Hortus Eyftetenfis.

4. R. *Bankfiæ.* Lady Banks's Rofe. Ait. n. 4.—"Smooth, naked, and without prickles. Fruit globofe. Leaves ternate or pinnate, fhining. Stipulas fetaceous, diftinct."—Native of China, from whence it is faid to have been brought, by Mr. W. Kerr, in 1807. It is marked, by Mr Aiton, as a green-houfe *fhrub*, bloffoming in June and July. We have feen neither fpecimen nor figure.

5. R. *blanda.* Labrador, or Hudfon's bay, Rofe. Ait. Hort. Kew. ed. 1. n. 3. ed. 2. n. 5. Willd. n. 4. Purfh n. 1. Lawr. Rof. t. 27.—Fruit globofe, fmooth. Adult ftems, like the flower-ftalks, quite fmooth, and without prickles.—Native of the moft northern parts of America, on the eaft, as well as weft, coafts, flowering there, as in our gardens, from May to Auguft. Mr. Gordon is known to have cultivated it in 1773, but the fpecies has not excited general notice. The young *branches*, and their *leaf-ftalks*, bear copious, ftraight, red prickles, but they afterwards become fmooth, naked, red and fhining. The *leaflets* are ufually feven, oblong, or obovate, large, varying in breadth. *Stipulas* broad and long, with glandular fpreading points. *Flowers* folitary, moderately large, crimfon. Tube of the *calyx* fhort, and almoft hemifpherical; fegments long and fimple, tapering gradually to a point.

6. R. *cinnamomea.* Cinnamon Rofe. Linn. Sp. Pl. 703. Willd. n. 5. Ait. n. 6. Engl. Bot. t. 2388. Ger. Em. 1268. Lawr. Rof. t. 34. (R. fluvialis; Fl. Dan. t. 868. Retz. Scandin. ed. 2. 120. R. majalis; Herm. Rof. 8. Rofier printanier; Reynier Mém. de la Suiffe, v. 1. 222.)

β. R. collincola; Ehrh. Beitr. v. 2. 70. Arb. 25.

Fruit globofe, fmooth as well as the flower-ftalks. Stem with occafional, fmall, twin prickles, below the ftipulas. Footftalks fcarcely prickly. Leaflets oblong, finely downy, glaucous beneath.—Native of Germany, Switzerland, Sweden, and Denmark; firft obferved wild in England by Mr. Salifbury, in the wood in Aketon pafture, near Pontefract, Yorkfhire. In gardens the double variety is common. This is one of our earlieft Rofes, flowering in May. The bufh is rather tall, with brown or reddifh twigs, fhining and fmooth, except the fmall, and not univerfal, twin prickles, under each *ftipula*. The *leaves* have a dull glaucous afpect, and are ufually elliptic-oblong, unequally ferrated; in β, Ehrhart's *collincola*, which our friend Dr. Afzelius is inclined to make a diftinct fpecies, they are broader and more obtufe, but we can find no permanent fpecific mark. Still lefs can we diftinguifh, even as a variety, the *fluvialis* of Fl. Dan. The *flowers* are of a delicate purplifh blufh-colour, at leaft fuch are the double ones, feen in gardens; in which we could never detect any of the cinnamon fcent, mentioned by Bauhin, to juftify the name. The *fruit* of the wild kind is fmall, globofe, fcarlet. Segments of the *calyx* fimple, long, and flender, for the moft part flightly fpatulate at the end, but not invariably fo. The bufh, when young, is fometimes very prickly.

7. R. *kamtfchatica.* Kamtfchatka Rofe. Venten. Hort. Cels. t. 67, not 68. Ait. n. 7.—Fruit globofe, fmooth as well as the flower-ftalks. Stem downy, very prickly. Leaf-ftalks fomewhat prickly. Leaflets obovate, abrupt.—Native of Kamtfchatka.—Sent to Kew by M. Cels, from his garden at Paris, in 1802; but it was, long before, cultivated in Chelfea garden, from whence we received a fpecimen in 1791. Every part is larger than the preceding. The *ftem* is downy, and armed with numerous, fcattered, ftraight, pale, flender prickles; fome of which are alfo found on the leaf-ftalks. *Leaflets* ufually feven, of a pale glaucous green, veiny and rugged; fomewhat downy beneath; coarfely ferrated, abrupt and emarginate. *Stipulas* obovate, dilated, obtufe, veiny and downy. *Flowers* folitary, purplifh rofe-coloured, fragrant. Segments of the *calyx* fimple, entire, fpatulate at the ends. *Fruit* fmall, globofe, red. Perhaps this fpecies ought to have been introduced between *blanda* and *cinnamomea*.

8. R. *arvenfis.* White Dog Rofe. Hudf. Angl. ed. 1. 192. Linn. Mant. 2. 245. Willd. n. 6. Ait. n. 8. Fl. Brit. n. 2. Engl. Bot. t. 188. Lawr. Rof. t. 86. (R. fylveftris; Herm. Rof. 10. R. Herporhodon; Ehrh. Beitr. v. 2. 71. R. ferpens; Ehrh. Arb. 35. R. fylveftris folio glabro, flore planè albo; Bauh. Hift. v. 2. 44.)—Fruit nearly globofe, fmooth. Flower-ftalks glandular, fomewhat cymofe. Prickles of the ftem and leaf-ftalks hooked. Styles elongated, combined.—Native of England, Germany, and Switzerland. It often decorates, in profufion, the hedges and thickets of the gravelly counties of England, flowering in June and July, when its long, trailing, purplifh-brown twigs, and copious milk-white bloffoms, are highly ornamental. We believe this fpecies is unknown in Sweden and Denmark; for the t. 398 of Fl. Dan. cited by Linnæus, whom Willdenow like Hudfon copies, is moft evidently, as it calls itfelf, *fpinofiffima*. There is a glaucous hue on the young *fhoots*, as well as on the backs of the *leaflets*, which are moftly five, oval, pointed, fmooth, with fharp unequal ferratures. *Stipulas* linear, pointed. *Flower-ftalks* rough with glandular briftles, not prickly. Bafe of the *calyx* fmooth and ovate, but

but the *fruit* is globose, of a deep red, crowned with the elongated *styles*, so combined as to seem one.

9. R. *spinosissima*. Burnet Rose. Linn. Sp. Pl. ed. 1. 491. ed. 2. 705? Willd. n. 8. Ait. n. 9. Fl. Brit. n. 1. Engl. Bot. t. 187. Fl. Dan. t. 398. Lawr. Ros. t. 48 and t. 78. Ehrh. Arb. 85. (R. pimpinellifolia; Linn. Syst. Nat. ed. 10. 1062. Sp. Pl. 703. R. n. 1106; Hall. Hist. v. 2. 40. R. campestris spinosissima, flore albo odoro; Bauh. Pin. 483. R. campestris odora; Clus. Pan. 111. R. campestris odorato flore; Clus. Hist. 116. R. pimpinellæ folio; Ger. Em. 1270.)—Fruit globose, smooth as well as the flower-stalks. Prickles of the stem very numerous, straight and setaceous. Leaflets roundish, smooth. Calyx of the fruit reflexed.—Native of sandy downs near the sea, as well as the borders of fields, and mountains, in various parts of Europe; not uncommon in Britain, flowering in July.—This is a bush of humble growth, seldom more than two or three feet high, and much branched. The *stem* is copiously clothed with innumerable, straight, crowded, needle-like, pale prickles. The *leaf-stalks* are occasionally prickly. *Leaflets* seven or nine, roundish, or slightly elliptical, obtuse, serrated, small, even and smooth, a little glaucous, not shining. *Flower-stalks* terminal, solitary, single-flowered, rather swelling upwards, always, as far as we have seen, smooth and naked. *Germen* depressed, and nearly hemispherical. Segments of the *calyx* tapering, smooth, and entire. *Flowers* with a light pleasant scent, usually cream-coloured, yellow in the middle; but Miss Lawrance's t. 78 represents the red variegated variety, first described by Sibbald in his Scotia Illustrata, p. 2. 46. t. 2, under the name of *R. Ciphiana*. The *fruit* is much larger than the leaflets, globose, dark purple, and finally quite black, with large *seeds*, and crowned with the reflexed *calyx*.——We feel no scruple in referring the *pimpinellifolia* of Linnæus to his *spinosissima*, of which it is not even a variety; but we cannot take into consideration all the different things which various authors have supposed one or other of these species. We shall notice *pimpinellifolia* of Villars under *alpina*. Miss Lawrance's t. 15 and t. 19, are doubtful, on many accounts. The former indeed answers to our next species. Her t. 63 is surely different from both. The synonyms of old writers, regarding this Rose, are very puzzling, nor have they ever been well explained. The figure in Clusius's Stirp. Pannon. 114, belongs in truth to *spinosissima*, as he gives it in his Historia; while his 4th Rose, or χαμαιρόδον of the former work, to which that figure seems annexed, is *pumila* of Jacquin. His other cut, at p. 111, more resembles *cinnamomea*, which is often very prickly the first season, as professor Swartz remarks. Our learned correspondent just named likewise suggests that the *cinnamomea* is one of various things which Linnæus in Fl. Suec. confounded under the name of *spinosissima*. Haller has certainly not adverted to all the Roses known to be found in Switzerland, but his n. 1106 can be no other than our *spinosissima*.

10. R. *rubella*. Red-fruited Dwarf Rose. Sm. Engl. Bot. t. 2521. (R. spinosissima γ; Fl. Brit. 537? β; Lawr. Ros. t. 15.)—Fruit globose, somewhat bristly. Flower-stalks bristly. Prickles of the stem very numerous, straight, and setaceous. Leaflets elliptical, smooth. Calyx of the fruit inflexed.—Gathered near Newcastle, by Mr. Winch. We have also specimens from Mr. James Backhouse, who has just informed us that he finds the inflexed *calyx*, after flowering, an invariable character of this species, that of the foregoing being always reflexed. The rough *flower-stalks* are less unalterable, though tolerably constant. The scarlet *fruit* is a very remarkable difference. The *flowers* are elegantly tinged with red. Mr. Backhouse thinks this rather the taller-growing shrub of the two, and he observes that the *leaves* fold together, or *sleep*, at night. We know not whether this is the case with *spinosissima*.

11. R. *involuta*. Dr. Walker's Rose. Fl. Brit. 1398. Engl. Bot. t. 2068. Ait. n. 10.—Fruit globose, very prickly as well as the flower-stalks. Prickles of the stem very numerous, and nearly straight. Petals involute and imperfectly expanded. Leaflets elliptical, hairy beneath.—Native of the Hebrides, where it was gathered by the Rev. Dr. Walker, and Mr. J. Mackay.—The present species has the general habit, and very prickly *stem*, of the two last. But the *flower-stalks*, *leaf-stalks*, and young *fruit*, are all extremely prickly, the latter being more disposed to be ovate than depressed. The *leaflets* are more elliptical, their under side hairy, especially the ribs. Segments of the *calyx* long, simple, pointed, rough externally with glandular prickles. *Petals* pale blush, with deeper tints here and there, concave and involute, seldom more than half expanded. Ripe *fruit* unknown to us.

12. R. *parviflora*. Small American Rose. Ehrh. Beitr. v. 4. 21. Willd n. 9. Pursh n. 2. (R. caroliniana; Mich. Boreal-Amer. v. 1. 295. R. carolina; Sm. Inf. of Georgia, v. 1. 49. t. 25.)—Fruit globose, slightly depressed, bristly as well as the flower-stalks and calyx. Leaf-stalks downy, somewhat prickly. Prickles in pairs under the stipulas, straight. Leaflets elliptic-lanceolate, simply serrated, smooth. Flowers solitary or in pairs.—"Native of woods on the sides of hills, from New York to Carolina, flowering in June and July. About two feet high. There are a number of varieties of this species." *Pursh*. Our specimens, sent by the Rev. Dr. Muhlenberg, answer well to the figure above cited, and have, like that, solitary *flowers*, of a pale pink hue. The *stem* is slender and smooth, except a pair of awl-shaped, slender, straight prickles under each *stipula*. *Leaflets* five, elegantly elliptical; their common *stalk* reddish, channelled, prickly, somewhat downy, or hairy. The Rose in Dill. Elth. t. 245. f. 316, is exactly our's, though quoted by authors for the *lucida*.

13. R. *nitida*. Polished American Rose. "Willd. Enum. 544." Pursh n. 3.—"Fruit globose. Calyx, flower-stalks, and branches hispid. Leaf-stalks rather downy, without prickles. Leaflets oblong-lanceolate, polished and smooth on both sides."—In Pennsylvania and Virginia, flowering from June to August. *Petals* red, obcordate. *Leaflets* seven. *Pursh*. We have not met with any specimen or figure.

14. R. *lucida*. Shining American Rose. Ehrh. Beitr. v. 4. 22. Arb. 76. Willd. n. 10. Pursh n. 4; excluding the synonym of Dillenius. (R. alpina β; Ait. n. 27. Lawr. Ros. t. 75.)—Fruit globose, depressed, rather hispid as well as the flower-stalks. Leaf-stalks somewhat prickly, not downy. Prickles usually in pairs under the stipulas, straight. Leaflets ovato-lanceolate, bluntish, coarsely serrated, very smooth, shining. Corymbs of few flowers.—On the borders of swamps, from New York to Carolina, flowering in July and August. From four to six feet high. *Pursh*. By Ehrhart's specimen, the only one we have seen, it evidently appears, that the R. carolina fragrans, foliis mediotenus serratis; Dill. Elth. 325. t. 245. f. 316, is very erroneously referred by Willdenow and Pursh to the present species; belonging, if we are right in what we take for *parviflora*, n. 12, indubitably to that plant. The present has seven *leaflets*, of a larger size and firmer texture. Stipulary *prickles* shorter, thicker, not always present. *Flowers* corymbose, four or five together. If we are right in Miss Lawrance's figure, this species, as well as *parviflora*, ought to be placed on the list of our garden plants.

15. R. *gemella.* Twin-flowered American Rofe. "Willd. Enum. 544." Purfh n. 5.—Fruit globofe, fmooth as well as the flower-ftalks. Flowers moftly in pairs. Leaflets elliptic-oblong, opaque; their veins hairy beneath. Leaf-ftalks downy. Prickles in pairs under the ftipulas, hooked. —On dry funny hills, from New England to Carolina, flowering in July and Auguft. A low *fhrub*, with large red *flowers*. *Purfh.* Specimens in the herbarium of Linnæus, referred by him to *R. carolina*, have flender *branches*, quite fmooth, and fomewhat glaucous. *Leaflets* feven, fmaller, thinner, and more acutely ferrated than the laft; rather glaucous and downy beneath; their veins as if fringed. *Leaf-ftalks* and *ftipulas* finely downy and hoary. *Flowers* terminal, in pairs, on fhort fmooth *ftalks*, enveloped in large downy *bracteas*. *Germen* exactly globular, quite fmooth and naked. Segments of the *calyx* fmooth at the bafe, downy at the edges and upper part, fimple; fpatulate at the end.

16. R. *Lyonii.* Lyon's American Rofe. Purfh n. 6.—"Fruit nearly globofe, fmoothifh. Flower-ftalks hifpid, moftly ternate. Leaf-ftalks rather prickly. Stem with ftraight fcattered prickles, not hairy. Leaflets ovate-oblong, acute, ferrated; fmoothifh above; downy beneath: the upper leaves fimple. Stipulas linear. Segments of the calyx downy, linear, fcarcely laciniated."—Gathered by Mr. Lyon in Teneffee, North America, flowering in July. The *leaflets* are three or five, fmall, with coloured veins. *Flowers* pale red. *Purfh.*

17. R. *fetigera.* Fringe-cupped American Rofe. Mich. Boreal-Amer. v. 1. 295. Purfh n. 7.—"Fruit globofe. Stalks and ribs of the leaves prickly. Branches not hairy; their prickles in pairs or fcattered. Leaflets pointed, fmooth. Segments of the calyx fringed with briftles."—In fwamps of Virginia and Lower Carolina, flowering in June and July. From five to eight feet high. *Leaflets* three or five. *Purfh.*

18. R. *carolina.* Carolina Rofe. Linn. Sp. Pl. 703, omitting the reference to Dillenius. Willd. n. 11. Ait. n. 11. Purfh n. 8. Lawr. Rof. t. 24. t. 3. t. 54; alfo perhaps t. 68, and t. 66; fcarcely t. 36. (R. corymbofa; Ehrh. Beitr. v. 4. 21.)—Fruit globofe, briftly as well as the flower-ftalks. Leaf-ftalks hairy, fomewhat prickly. Stem fmooth. Stipulary prickles flightly hooked. Leaflets elliptic-lanceolate, acute, finely ferrated; downy and glaucous beneath. Flowers corymbofe.—In fwamps, and on the banks of ponds, from New England to Virginia, flowering in June and July. Purfh fays, "there are a great many varieties of this fpecies." So little, however, have thefe been attended to, that five or fix of thofe fpecies which we have laft defcribed have, by Linnæus and others, been ufually referred to *R. carolina.* The true *carolina* common in our fhrubberies, flowering in June and July, is well diftinguifhed by the above characters, firft pointed out by the accurate and obferving Ehrhart. This *fhrub* is five or fix feet high, bufhy, but erect, with red, fmooth, a little glaucous, twigs. *Leaflets* large, more copioufly and minutely ferrated than in *lucida*, n. 14, which this fpecies, at firft fight, moft refembles; but they differ alfo from that in their glaucous and downy under fide, as well as in having a fine taper point. The *flowers* are more numerous in each *corymb*, large, of a full crimfon. The Penfylvanian Rofe of the gardens, figured by Mifs Lawrance, t. 68, and t. 66, differs in fome refpects from the common *carolina.* Its *leaflets* are more coarfely and fharply ferrated; pale, but not glaucous nor downy, beneath. *Flowers* fmaller and paler; in the double variety peculiarly beautiful, moft of the outer petals being of a light flefh-colour, the central ones involute or tufted, of a rich crimfon.

19. R. *rubifolia.* Bramble-leaved Rofe. Ait. n. 12. Purfh n. 9.—"Fruit globofe, rather hifpid as well as the flower-ftalks. Calyx unexpanded, pointlefs. Leaves ternate; downy beneath. Leaf-ftalks glandular and prickly. Stem with fomewhat hooked, ftipulary and fcattered, prickles, not hairy. Flowers corymbofe."—Difcovered in North America, by the late Mr. Francis Maffon, who fent it to Kew in 1800. It is a hardy *fhrub*, flowering in June and July, but has not yet fallen under our obfervation.

20. R. *villofa.* Apple Rofe. Linn. Sp. Pl. 704. Willd. n. 12. Ait. n. 13. Fl. Brit. n. 3. Engl. Bot. t. 583. Lawr. Rof. t. 33, and t. 29. (R. pomifera major; Park. Parad. 418. f. 7.)—Fruit globofe, briftly as well as the flower-ftalks. Prickles of the ftem nearly ftraight. Leaflets elliptic-oblong, downy on both fides. Segments of the calyx the length of the ripe fruit.—Native of mountainous woods and thickets, in the north of Europe. Plentiful in Weftmoreland, Cumberland, and the north of Yorkfhire, flowering in June. It is often cultivated in fhrubberies for the fake of the beauty of its large fcarlet briftly fruit, above an inch in diameter. The double-flowered variety, when luxuriant, is one of our handfomeft flowering fhrubs. Mifs Lawrance's figures of this fpecies are not happy. The bufh is from four to fix feet high, with ftrong, ftraight, fcattered *prickles*. *Leaflets* five or feven, large, of a peculiar elliptic-oblong fhape, fomewhat rounded at the end, doubly ferrated and glandular at the edges, finely downy and hoary on both fides, aromatic or pungent, in fome degree, when rubbed. *Flowers* one or two at the end of each branch, lightly fcented, of a fine pale pink. *Fruit* at every period armed with ftrong thorns, and crowned when ripe with the hifpid, involute, twifted *calyx*, which then hardly exceeds it in length.

21. R. *mollis.* Soft-leaved Round-fruited Rofe. Sm. Engl. Bot. t. 2459. (R. villofa β; Fl. Brit. 538. Relh. Cant. 193. R. fylveftris, folio molliter hirfuto, fructu rotundo glabro, calyce et pediculo hifpidis; Dill. in Raii Syn. 478.)—Fruit globofe, half as long as the fegments of the calyx, briftly as well as the flower-ftalks. Prickles of the ftem ftraight. Leaflets elliptic-ovate, downy on both fides.—Native of bufhy places, in England, Scotland, and Wales, flowering in June or July. A much more humble fhrub than the *villofa;* the *leaflets* lefs oblong, and more ovate; *petals* of a deeper red; ripe *fruit* much fmaller, purplifh, not fcarlet, its length or diameter not above half the length of the permanent *calyx*, one fegment of which, and no more, is often very diftinctly pinnated. The Rev. H. Davies has found the *fruit* variable in Anglefea, from perfect fmoothnefs, as mentioned by Dillenius, to every degree of roughnefs. The prickles of the *ftem* vary in fize, and are frequently hooked.

22. R. *glutinofa.* Clammy Cretan Rofe. Sm. Prodr. Fl. Græc. Sibth. v. 1. 348. Fl. Græc. t. 482, unpublifhed. (R. cretica montana, foliis fubrotundis glutinofis et villofis; Tourn. Cor. 43. R. pumila alpina, pimpinellæ exactè foliis fparfis, fpinis incurvis, aquatè purpurea; Cupan. Panphyt. ed. 1. v. 1. t. 61.)—Fruit globofe, hifpid as well as the flower-ftalks. Prickles of the ftem copious, hooked. Leaflets roundifh; downy and glandular on both fides.—Native of the Sphaciote mountains of Crete, and, from Cupani's fynonym, of the mountains of Sicily. By a fpecimen fent to Linnæus, the plant feems to have been cultivated in the French gardens, but we know it not in England. The *ftem* is low, bufhy, with numerous ftout *branches*, armed with many, fcattered, ftrong, hooked prickles. *Leaflets* feven, roundifh and obtufe, ftrongly and

often doubly ferrated; downy, fomewhat hoary, glandular and vifcid on both fides, as are alfo the *leaf-ftalks*. *Flowers* fmall, pale-blufh, terminal, folitary, on fhort, briftly, vifcid *ftalks*. *Fruit* globofe, fcarlet, covered with rigid glandular-pointed briftles, its diameter full half an inch, which nearly equals the length of the permanent, upright, converging, hifpid *calyx*.

23. R. *hibernica*. Irifh Rofe. Sm. Engl. Bot. t. 2196. Ait. n. 14.—Fruit nearly globofe, fmooth as well as the flower-ftalks. Prickles of the ftem flightly hooked. Leaflets elliptical, fmooth; their ribs hairy beneath.—Difcovered by John Templeton, efq. in the county of Down, about Belfaft harbour, where it grows abundantly, flowering from the early part of June, till the middle of November. The difcoverer thus became entitled to the liberal premium of fifty pounds, offered by the patrons of botany at Dublin, for the detection of any new Irifh plant. The above characters readily diftinguifh this fpecies, from every other defcribed rofe. The *ftem* is fix feet high, erect, much branched, and very prickly. *Leaflets* broadly ovate, deeply and acutely ferrated, fmooth, except the back of their ribs and veins, which are hairy. Sometimes a few coarfe hairs occur on the upper furface. *Flower-ftalks* often folitary, fometimes two or three together. *Petals* pale blufh-coloured. *Fruit* fcarlet, fmooth, accurately globofe when young, but in ripening fometimes elongated at the fummit, fo as to become flightly ovate.

This is not the only new Irifh Rofe that has been difcovered of late; Dr. Taylor having favoured us with incomplete fpecimens of what will certainly prove two or three others, hitherto nondefcript; one of them with remarkably large, twin, hooked, ftipulary *prickles*, unlike any other fpecies with which we are acquainted.

24. R. *finica*. Three-leaved Chinefe Rofe. Linn. Syft. Veg. ed. 13. 394. Ait. n. 15.—"Fruit nearly globofe, fmooth. Flower-ftalks prickly, hifpid. Stem and leaf-ftalks prickly. Segments of the calyx lanceolate, fomewhat ftalked."—Native of China. Cultivated by Miller in 1759. A hardy fhrub, flowering from May to July. *Aiton*. We adopt this entirely on the authority of the *Hortus Kewenfis*, having never feen the garden plant; nor have we any authentic fpecimen to prove what *R. finica* of Linnæus really is; he having mentioned it only, under the above characters, in his *Syftema Vegetabilium*. There occurs in his herbarium, a fpecimen from the Upfal garden, marked *China*, which anfwers to the above characters; efpecially in the paradoxical account of the ftalked leaves, or fegments of the *calyx*, they being here in a deformed or monftrous ftate. But the leaflets are five, not three, as Mr. Aiton's Englifh name implies; and the very young *fruit*, though "nearly globofe," has all the appearance of being truly oval when perfectly formed. Indeed we believe this fpecimen to be not effentially different from *R. indica*, the Pale China Rofe, now fo common in gardens.

25. R. *rugofa*. Rugofe Japan Rofe. Thunb. Jap. 213. Willd. n. 13.—" Fruit globofe, fmooth. Flower-ftalks, leaf-ftalks, and ftem prickly. Leaflets obtufe with a point, rugofe, downy beneath."—Native of Miaco in Japan, flowering in May and June, and known by the name of Ramanas.—*Stem* fhrubby. *Branches* fomewhat downy, armed with larger and fmaller, very denfe, fpreading, white prickles. *Leaflets* nine, an inch long, ovate, blunt, with a point, ferrated; green and rugofe above; downy, veiny and rugofe beneath; their *common ftalk* downy, befet with fcattered, fpreading, white prickles. *Flowers* folitary, on downy *ftalks*, furnifhed alfo with copious, very flender, fpreading, white prickles. *Calyx* downy within; hairy without. Young *fruit* globofe, deftitute of prickles or pubefcence. *Thunberg*.

26. R. *provincialis*. Provins Rofe. Mill. Dict. ed. 8. n. 18. Ait. Hort. Kew. ed. 1. n. 11. ed. 2. n. 16. Willd. n. 14. Lawr. Rof. t. 8. t. 22. t. 1. t. 4. t. 43. t. 21.

β. R. mufcofa; Ait. n. 25. Willd. n. 22. Curt. Mag. t. 69. Lawr. Rof. t. 14. (R. rubra plena fpinofiffima, pedunculo mufcofo; Mill. Ic. 148. t. 221. f. 1. R. provincialis fpinofiffima, pedunculo mufcofo; Hort. Angl. 66. t. 18.)

γ. Leaves and flowers much fmaller. Rofe de Meaux, &c.; Lawr. Rof. t. 31. t. 50. t. 71. Curt. Mag. t. 407. To which are moft akin Lawr. Rof. t. 88 and t. 76; mere evanefcent varieties.

Fruit roundifh. Flower-ftalks and leaf-ftalks hifpid. Prickles of the branches fcattered, fomewhat hooked. Leaflets roundifh-ovate; hairy beneath; with glandular ferratures.—Native of the fouth of Europe; at leaft it is fo confidered; though a plant too generally cultivated for any thing to be averred on this fubject. With us it is hardy, flowering in June and July. Moft of the varieties are increafed by roots or layers, and remain tolerably diftinct; the different forms of variety γ are leaft permanent. *Stems* ufually three or four feet high, ftraight, very prickly. *Leaflets* five, of a rounded bluntifh figure, veiny and rugofe. *Stipulas* linear-lanceolate, acute, undivided; moft entire in their lower part. *Flowers* two or three, or more, at the top of each branch, large, delightfully fragrant, of that peculiar bright crimfon hue popularly termed a rofe-colour, with broad brown ftains on the backs of the outer *petals*, which are permanent in the otherwife white variety, reprefented in Mifs Lawrance's t. 4. In all our cultivated varieties the *flowers* are double, with flight remains of *ftamens* or *ftyles*; fo that the *fruit* never ripens. We have however feen, in the ample collection of rofes at Meffrs. Lee and Kennedy's, perfectly fingle *flowers* of the Mofs Rofe, which thofe experienced cultivators have proved to be only a variety of the Common Provins Rofe. Indeed we have been told in Italy, that this variety lofes its moffinefs, almoft immediately, in that climate.

27. R. *ferox*. Hedge-hog Rofe. Ait. n. 17. Lawr. Rof. t. 42.—Fruit globofe, hifpid. Leaflets elliptic-oblong, rugofe, four pair with an odd one. Stem, leaf-ftalks, and young branches, very denfely fpinous.—Native of mount Caucafus. Introduced about 1796, by Lee and Kennedy. Hardy, flowering from June to Auguft.—A ftout bufhy *fhrub*, very remarkable for its copious, long, ftraight prickles. The *leaflets* are recurved, convex, and rugofe, of a glaucous hue. *Flowers* large, crimfon, on fhort ftalks.

Section 2. *Fruit ovate, or oblong.*

28. R. *gallica*. Red Officinal Rofe. Linn. Sp. Pl. 704. Willd. n. 16. Ait. n. 19. Ehrh. Off. 324. Woodv. Med. Bot. t. 141. Lawr. Rof. t. 16. t. 13. t. 57. t. 7, and t. 49. (R. rubra; Ger. Em. 1261. Bauh. Pin. 481. Rofa; Matth. Valgr. v. 1. 168. R. milefia rubra, flore fimplici; Hort. Eyft. vern. ord. 6. t. 6. f. 3. R. præneftina variegata; ibid. t. 2. f. 2. Mill. Ic. 148. t. 221. f. 2.

β. R. *centifolia*. Linn. Sp. Pl. 704. Willd. n. 15. Ait. n. 18. Lawr. Rof. t. 11. t. 40. t. 85. t. 44. t. 51. t. 2. t. 35. t. 46. t. 67. t. 20. t. 59. t. 47. t. 55. t. 39. t. 73. t. 82. t. 87. t. 79. t. 89. (R. centifolia rubra; Hort. Eyft. vern. ord. 6. t. 2. f. 1. R. hollandica, five batava; Ger. Em. 1262.)

Fruit ovate, hifpid as well as the flower-ftalks. Stem hifpid hispid and finely prickly. Leaflets ovate; hairy beneath. Calyx half-pinnate.—Native of the southern parts of Europe. This, in its nearly single state, is the Rose always used medicinally, for conserve, tincture, &c. on account of the richer colour, and more astringent quality, of its petals. Its numerous varieties are common in gardens throughout Europe, blooming in June and July. We perfectly agree with our friend Mr. Lee of Hammersmith, that the *R. centifolia* of authors, of which so many trifling varieties are indicated above, is itself merely a variety of the *gallica*. This a comparison of their *leaves* will readily prove. The roughness of their *leaf-stalks* is undoubtedly variable. *R. gallica* in its natural state, as it is said to be in the south of France, and as we see it usually in country gardens and shrubberies, is scarcely three feet high, throwing up, from its creeping *roots*, many *stems*, armed with fine, dispersed, and not numerous, straight, short *prickles*. *Leaflets* five, large, ovate, doubly serrated, overlapping each other at their heart-shaped base; the under side pale, downy or hairy, often whitish; the upper smooth, of a fine, rather shining, green. *Stipulas* linear-lanceolate, pointed, entire, downy and glandular. *Flowers* of a few large spreading *petals*, whose colour is a peculiarly rich and deep crimson, their base, like the *stamens*, of a fine golden yellow. Segments of the *calyx* downy, broad at the base, some of them fringed at the keel or margin, with a row of linear-lanceolate leaflets, as if pinnate. *Fruit* globular, pale scarlet, becoming nearly smooth as it ripens. The red and white parti-coloured variety, or *Rosa mundi*, Miss Lawrance's t. 13, differs only in colour. This is often termed the York and Lancaster Rose. The Giant Rose, her t. 49, is gigantic in size and height, but paler in colour. The Velvet Rose, her t. 51 and t. 2, Hort. Angl. t. 18, is of so very dark a colour, at least those flowers which first expand, that some persons take the liberty of calling it black, and confirm the misnomer by a round assertion of its being produced by grafting on a black-currant bush. The innumerable varieties of the *centifolia* differ chiefly in the disposition of their richly multiplied, though diminished, *petals*, and are, many of them, very beautiful from their fullness, and precise neatness of figure; their colours are different shades of crimson, verging to pink, or to a blueish-purple.

29. R. *damascena*. Damask Rose. Mill. Dict. ed. 8. n. 15. Willd. n. 17. Ait. n. 20. Lob. Ic. v. 2. 206. Lawr. Ros. t. 38. t. 52. t. 10. t. 5. t. 17. t. 70. t. 58. t. 18. t. 83. t. 80, and t. 90.—Fruit ovate, turgid, hispid as well as the flower-stalks. Stem and leaf-stalks with hooked prickles. Leaflets ovate, pointed, hoary; villous beneath. Calyx half-pinnate.—Native of the south of Europe, and cultivated, time out of mind, in our gardens, flowering in June and July. The specific name seems to have originated with Lobel, and indicates that this species of Rose came from Damascus. Perhaps it may be what is reported to have been brought from Syria by a Comte de Brie, at his return from the crusades, of which the abbé Rozier speaks in his Cours complèt d'Agriculture; though that author's description accords with the common *R. gallica*, and not with our *damascena*, and he calls it moreover *R. provincialis*. We have seen an extract only from his work, communicated by a learned friend, to whom we, as well as Mr. Aiton, are indebted for the more correct orthography of Provins, instead of Provence, Rose, for our n. 26. We cite Rozier to shew that some particular sort of Rose was brought from Syria to France; but whether it might be our *damascena*, or the *moschata* hereafter mentioned, which many old authors have termed *damascena*, and which is certainly an oriental Rose; we have not materials even to form a conjecture. The Damask Rose is proverbially sweet, nor can any be more so than the species now under our consideration, which forms a bush four or five feet high. The *leaves* are distinguished, at first sight, by a hoary aspect, and more downy surface, than the *provincialis* or *gallica*, as well as by the longer, more pointed, shape of their *leaflets*. The prickles of the *stem* are broader, and hooked. *Flowers* more copious, with more slender and hoary *stalks*, as well as *calyx*. Their usual colour is a delicate uniform pink, verging rather towards purple than scarlet, and their fragrance is deliciously sweet as well as lasting. The name of York and Lancaster Rose, given to a very casual and transient variety of this, Lawr. t. 10, some of whose petals are white, others blush-coloured, appears much more suitable to the red and white *R. gallica*.

30. R. *sempervirens*. Evergreen Rose. Linn. Sp. Pl. 704. Willd. n. 18. Ait. n. 21. Sm. Prodr. Fl. Græc. Sibth. v. 1. 348. Fl. Græc. t. 483, unpublished. Lawr. Ros. t. 45. Clus. Exot. append. alt. Dill. Elth. 326. t. 246. (R. moschata sempervirens; Tourn. Inst. 637.)—Fruit ovate, hispid as well as the calyx and flower-stalks. Stem and leaf-stalks with hooked prickles. Leaflets ovate, pointed, smooth and shining. Flowers somewhat umbellate. Bracteas lanceolate, recurved.—Native of Germany, in hedges near Tubingen. *Roth*. Dr. Sibthorp found it very frequent in the hedges of Greece, and the neighbouring islands, and judiciously considered it as the genuine κυνοσβατον of Dioscorides, with whose rather ample description it exactly agrees. The reader may see in John Bauhin's Hist. v. 2. 33, what uncertainty has enveloped this subject. This Rose has been cultivated about two hundred years, or perhaps longer, in England, being, on account of its singularly luxuriant and rapid growth, as well as the beauty of its shining evergreen *leaves*, very fit for covering tall buildings, as well as for making an impervious hedge or trellis. The *flowers* moreover are beautiful, sweet, of a delicate white, and plentiful whenever they appear at all, lasting through June, July, and August; but we have, like Clusius, found this shrub little disposed to blossom. Its general aspect, both in *leaf* and *flower*, is most like our wild *R. arvensis*, n. 8; but the ovate *fruit*, yellow when ripe, and the want of a glaucous hue about the *foliage*, *flower-stalks* or *buds*, are, among other things, sufficient marks of difference.

31. R. *lævigata*. Climbing American Rose. Mich. Boreal-Amer. v. 1. 295. Pursh n. 10.—"Fruit ovate, very densely hispid. Segments of the calyx nearly entire. Prickles in pairs, recurved. Leaf-stalks slightly prickly. Leaflets lanceolate-oval, almost ribless, polished. Stipulas narrow, with awl-shaped points."—Found in the shady woods of Georgia, North America, climbing to a great height. An evergreen *shrub*. *Leaflets* three or five. Tube of the *calyx* clothed with long and slender *spines*. *Pursh*, *Michaux*.

32. R. *pumila*. Dwarf Austrian Rose. Clus. Hist. 117. Linn. Suppl. 262. Willd. n. 19. Ait. n. 22. Jacq. Austr. v. 2. 59. t. 198. (R. austriaca; Crantz Fasc. 2. 33.)—Fruit obovate, hispid as well as the flower-stalks. Leaf-stalks and stem with straightish prickles. Leaflets elliptical, glaucous beneath; their serratures glandular.—Common in Austria, on dry grassy hills, especially about woods and thickets, flowering in May and June. *Jacquin*. *Root* creeping. *Stems* twelve or eighteen inches high, erect, simple, or slightly branched, beset, in the upper part chiefly, with copious, small, slender, nearly straight *prickles*. *Leaflets* five, sometimes but three, drooping, of a roundish-elliptical shape, with double glandular serratures; smooth and green

green above; paler, glaucous, and fometimes downy, beneath. *Flowers* folitary, rather large, crimfon; pale or whitifh in the centre; very fweet-fcented. Segments of the *calyx* partly pinnate, downy within and without. *Fruit* obovate, or pear-fhaped, fcarlet, more or lefs hifpid, its pulp fweet and agreeable.—We are much inclined to refer this, as a variety, to *R. gallica*, n. 28; at leaft, if a more natural arrangement of the fpecies were attempted, they ought to ftand next to each other. Schleicher has found the *pumila* in Switzerland, nor can we doubt its being Haller's n. 1104, though Jacquin fays the contrary, on the authority of a dried fpecimen, of what authority we know not. Haller, in his *Hiftoria*, adopted his n. 1104 from other authors, nor did he there attempt a fpecific character; but in his *Nomenclator*, he has given one which precifely anfwers to Jacquin's plant.

33. R. *turbinata*. Frankfort Rofe. Ait. ed. 1. n. 17. ed. 2. n. 23. Willd. n. 20. Lawr. Rof. t. 69, marked 63. (R. campanulata; Ehrh. Beitr. v. 6. 97. R. inapertis floribus, alabaftro craffiore, francofurtenfis quibufdam; Tourn. Inft. 639. R. francofurtenfis; Park. Parad. 414. t. 415. f. 3.)—Fruit turbinate, hairy as well as the flower-ftalks. Leaf-ftalks and leaflets villous. Prickles fcattered, hooked. —The native country of this Rofe is not known; but the fhrub has been cultivated in gardens, ever fince the days of Parkinfon, from June to Auguft. There is an appearance of monftrofity about the *calyx*, whofe tube is bell-fhaped, thick, and dilated at the top; the fegments however are, moft of them, quite fimple and entire. *Petals* large, crimfon. *Leaves* broad, villous.

34. R. *rubiginofa*. Common Sweet-briar, or Eglantine. Linn. Mant. 2. 564. Willd. n. 21. Ait. n. 24. Fl. Brit. n. 5. Engl. Bot. t. 991. Jacq. Auftr. t. 50. Ehrh. Beitr. v. 4. 22. Arb. 75. Lawr. Rof. t. 56. t. 65. t. 72. t. 41. t. 61. t. 74. (R. eglanteria; Herm. Rof. 17. Hudf. Angl. 218. R. fuavifolia; Lightf. Scot. 262. Fl. Dan. t. 870. R. fylveftris odora; Ger. Em. 1269. f. 1. R. n. 1103; Hall. Hift. v. 2. 39.)—Fruit obovate, briftly as well as the flower-ftalks. Prickles of the ftem and leaf-ftalks hooked. Leaflets elliptical, clothed beneath with rufty-coloured glands.—Native of dry funny banks in various parts of Europe, flowering in June and July; truly wild in many places in England, where the foil is gravelly or fandy, fometimes even in wet fituations about rivers. The *ftem* is bufhy, much branched, about a yard high, with copious, broad, ftrongly hooked prickles, of a pale brown, all over its green branches. *Leaflets* five or feven, of a roundifh, elliptical figure, with ftrong, double, glandular ferratures; their upper furface bright green, flightly hairy; the under clothed with reddifh vifcid glands, the feat of a delightful fragrance, which renders the plant acceptable to moft people, though often compared to the fcent of apples, which many perfons diflike. *Flowers* alfo fweet-fcented, of a full and uniform pink: occafionally double, and fometimes pale or whitifh, as reprefented in fome of Mifs Lawrance's plates. *Fruit* fcarlet, more or lefs obovate, briftly, often nearly fmooth; internally mealy and infipid. This well-known fhrub makes beautiful and fragrant, though not long-lived, hedges. It bears forcing well, and hence is generally introduced, in winter or fpring, into the apartments of thofe who delight in fuch innocent luxuries. Care fhould be taken to obtain the true fort, and not the following fpecies.

35. R. *micrantha*. Small-flowered Sweet-briar. Sm. Engl. Bot. t. 2490.—Fruit ovate, fomewhat briftly, as well as the flower-ftalks. Stem ftraggling, with fcattered hooked prickles. Leaflets ovate, acute, clothed beneath with rufty-coloured glands.—Mr. W. Borrer finds this fpecies of Rofe common in hedges and thickets, in England, flowering about June and July. We have alfo met with it in gardens, confounded with the genuine Sweet-briar, from which it differs as follows. The *ftem* is lefs prickly, lefs bufhy, and of a more elevated and ftraggling form of growth, like *R. canina*. *Leaflets* lefs rounded, lefs rufty beneath, and not fo fragrant as thofe of *rubiginofa*. *Flowers* paler, and fmaller, being lefs than thofe of any other Britifh Rofe. *Fruit* ovate, with a more gradual neck, not obovate or pear-fhaped. It varies in roughnefs. *Footftalks*, and backs of the *leaves*, downy as well as glandular.

36. R. *fuaveolens*. American Sweet-briar. Purfh n. 11. ("R. eglanteria americana; Andrews's Rofes, with a figure.")—Fruit ovate. Flower-ftalks, and prickly leaf-ftalks, rough with glandular briftles. Stem fmooth; its prickles long, flender, flightly curved. Leaflets roundifh-elliptical; downy above; fomewhat glandular beneath.—Native of North America. We received fpecimens from Pennfylvania, gathered by the Rev. Dr. Muhlenberg. Linnæus cultivated this fpecies at Upfal, and has preferved a branch, without name or defcription, in his herbarium. The plant differs from both the foregoing, in its long, flender, flightly curved, but by no means hooked, *prickles*, which often ftand, two together, near, or clofe to, the bafe of the *leaf-ftalks*. The *leaflets* are of a broad roundifh form; finely hairy above; loofely befprinkled with ftalked glands, though not rufty, beneath. *Flowers* pink, fmall, often, but not always, folitary, nor are the fegments of the *calyx*, as Mr. Purfh defcribes them, always fimple or entire; fome of them are pinnate. *Fruit* fmooth, or fomewhat prickly.

37. R. *fcabriufcula*. Roughifh-leaved Dog Rofe. Sm. Engl. Bot. t. 1896. (R. n. 459; Winch Guide, v. 1. 48. v. 2. preface, 5.)—Fruit roundifh-ovate, briftly as well as the flower-ftalks. Prickles awl-fhaped, nearly ftraight. Leaflets elliptical, roughifh with minute hairs.—Native of hedges in Durham and Northumberland, as well as on the north fide of Bury in Suffolk, flowering in June.—This Rofe has a general refemblance to *canina* and *tomentofa*, hereafter defcribed; but its *pubefcence* is hairy, more of the nature of the two or three laft, as are alfo the glandular ferratures of the *leaves*. There is a harfhnefs about them, very unlike the *tomentofa*, nor have they any greyifh hoary hue. Their fcent is fcarcely any. The *ftem* is tall, with copious, fcattered, nearly ftraight, and rather flender, brown *prickles*. *Leaf-ftalks* hairy, prickly, and clothed with glandular briftles. *Leaflets* elliptical, pointed, doubly and fharply ferrated, of a light bright green; finely hairy all over their upper furface, but moft fo on the rib and veins beneath. *Flower-ftalks* and young *fruit* befet with ftrong glandular briftles. *Calyx* partly pinnate; downy within; glandular and briftly at the outfide. *Petals* moderately large; Mr. Winch finds them always white, tinged or blotched with red; in Suffolk they are moftly of a pale pink. *Fruit* large, red, inclining to a globular figure.

38. R. *cæfia*. Glaucous-leaved Dog Rofe. Sm. Engl. Bot. t. 2367. (R. canina pubefcens; Afzel. in Sims and Kon. Ann. of Bot. v. 2. 211.)—Fruit roundifh-ovate, fmooth. Prickles of the ftem hooked. Leaflets ovate, pointed, doubly ferrated, downy; very glaucous as well as the germen and young branches.—Found by Dr. Adam Afzelius in Sweden, and by Mr. W. Borrer in the highland valleys of Perthfhire and Argylefhire, flowering profufely in July. Mr. Borrer defcribes the *bufh* as "compact, not fo tall as the *canina*. *Flowers* ufually folitary; fometimes in pairs, generally of an uniform, but very beautiful, carnation hue; occafionally white. *Calyx* fometimes fprinkled with glands, fometimes not. Young *twigs*, *leaves* and *germen*

men remarkably cæsious." His specimens accord precisely with those sent by Dr. Afzelius. The very glaucous *leaves*, clothed on both sides with fine hairy pubescence, essentially distinguishes this plant from *canina*, under which so many distinct species have been negligently confounded, by most botanists, till within a few years past. The *fruit* has been observed by Dr. Swartz to vary somewhat in form, being occasionally oblong, obovate, or nearly globose: in a young state it is glaucous and blueish; always smooth. *Calyx* partly pinnate.

39. R. *tomentosa*. Downy-leaved Dog Rose. Fl. Brit. n. 4. Engl. Bot. t. 990. Ait. n. 31. (R. villosa; Ehrh. Arb. 45. Villars Dauph. v. 3. 551. R. sylvestris alba, cum aliquo rubore, folio hirsuto; Bauh. Hist. v. 2. 44.)—Fruit ovate, bristly as well as the flower-stalks. Prickles of the stem hooked. Leaflets ovate, downy on both sides.—Native of woods, hedges, and thickets, in various parts of England, flowering in June and July. It is also found in Germany and Dauphiny. The *stem* is bushy, and moderately tall. *Prickles* hooked, generally placed under the insertion of each leaf-stalk, either solitary or in pairs. *Leaflets* five or seven, ovate, acute, with fine double glandular serratures, of a grey hoary green, densely clothed on both sides with soft pubescence, and, when rubbed, exhaling a slight acescent fragrance, most like the smell of *R. villosa*, n. 20. *Calyx* pinnate, in the manner described in the generic character, clothed externally with glandular bristles. *Fruit* in every state, more or less bristly, though sometimes nearly smooth, while the *flower-stalks* are always very bristly; its colour when ripe is a tawny scarlet. *Petals* almost white towards their base, otherwise elegantly rose-coloured, and a little fragrant. Specimens from Ehrhart and Villars have determined their synonyms; though the latter, at least, by his description, has apparently confounded the true *villosa* with our *tomentosa*. So little were Roses understood or considered at one time, that we recollect many grave debates among the Norwich botanists, about thirty years ago, whether this most distinct species were different or not from the common *canina*!

40. R. *canina*. Common Dog Rose, Wild Briar, or Hep-tree. Linn. Sp. Pl. 704. Willd. n. 31. Ait. n. 30. Fl. Brit. n. 6. Engl. Bot. t. 992. Curt. Lond. fasc. 5. t. 34. Woodv. Med. Bot. t. 139. Fl. Dan. t. 555. Lawr. Rof. t. 81. t. 60. Ehrh. Arb. 55. (R. n. 1101; Hall. Hist. v. 2. 38.)—Fruit ovate, smooth as well as the flower-stalks. Prickles of the stem scattered, hooked. Leaflets ovate, pointed, very smooth, unequally serrated.—Very common in hedges and thickets in Britain, as well as throughout Europe, flowering in June. Few plants contribute so much to the ornament of the country, for it is certainly the most elegant of our Roses; the scent of its *flowers*, and the flavour of its *fruit*, are both peculiarly grateful. The latter, when mellowed by frost, affords a most agreeable conserve, kept in the apothecaries' shops. The *stem* is often six or seven feet high, erect and straggling, with irregularly dispersed, pale brown, broad *prickles*. *Leaflets* usually seven, of a dark shining myrtle-like green; paler, or glaucous in some degree, underneath; with numerous, sharp, unequal, not glandular, serratures. *Leaf-stalks* smooth, armed with a few hooked prickles. *Flower-stalks* terminal, naked and very smooth, often solitary, sometimes two, three, or four in a kind of umbel. *Calyx* downy, scarcely ever glandular. *Fruit* oblong-ovate, of a coral red, almost always quite smooth.

41. R. *collina*. Rough-stalked Dog Rose. Jacq. Austr. v. 2. 58. t. 197. Willd. n. 32. Ait. n. 32. Engl. Bot. t. 1895.—Fruit ovate, smooth. Flower-stalks bristly, clustered. Prickles of the stem scattered, hooked. Leaflets ovate, downy beneath, simply serrated. Leaf-stalks downy.—Gathered by Jacquin on hills in Austria. Mr. W. Borrer finds it common in Sussex, flowering in July, and ripening fruit in October.—Its habit and general aspect are like the *canina*. The *prickles* are dispersed, hooked. *Leaflets* usually seven, variable in length and roundness, simply, and tolerably equally, serrated; always downy, or finely hairy, beneath, especially the rib; sometimes slightly so above. They have no scent, and are thicker, as well as less shining, than those of *canina*. *Leaf-stalks* downy and prickly. *Flowers* pale pink, fragrant, commonly two or three together, on *stalks* covered with glandular bristles. *Fruit* in every stage ovate and smooth, except now and then a straggling bristle or two; scarlet when ripe, and said not to be distinguishable from *canina*. We have never tasted it. The *styles*, after flowering, are combined and elongated, as in *R. arvensis*.

42. R. *dumetorum*. Downy-stalked Dog Rose. "Pers. Syn. part 2. sect. 1. 50?" Engl. Bot. t. 2579.—Fruit ovate, smooth. Flower-stalks villous, somewhat bristly, clustered. Prickles of the stem hooked, rather aggregate. Leaflets ovate, doubly serrated; slightly hairy beneath. Leaf-stalks very downy.—Gathered by Mr. W. Borrer, in bushy places in Sussex, flowering in July, and ripening fruit in October. We believe it also to have been found in Switzerland, near Orbe, by the late Mr. Davall, and there is a specimen, without name, or any mark, in the Linnæan herbarium. The synonym of Persoon was suggested by Mr. Borrer, nor have we any further authority for its application. The habit of the *shrub* is more robust than *R. canina*, with very strong hooked *prickles*, usually placed in pairs under each *footstalk*, and sometimes three or more together under the lateral branches. It differs also from that species in having very downy *footstalks*; *leaflets* rounder and flatter, doubly serrated, their ribs and veins hairy beneath; the *flower-stalks* either villous and bristly, or only villous, with soft, spreading, permanent hairs; rarely smooth. These hairs, and the double serratures, distinguish it from *collina*, with which its downy *leaf-stalks* agree. The *flowers* are smaller and paler than in either of those species. The *styles* accord with *canina*, not with those of *collina*.
